- Show the directory where PostgreSQL binaries are installed:

```
pg_config --bindir
```

- Show the directory for library files:

```
pg_config --libdir
```

- Show the directory for include files (C headers):

```
pg_config --includedir
```

- Show the directory for shared data files:

```
pg_config --sharedir
```

- Show the directory for locale data:

```
pg_config --localedir
```

- Display help:

```
pg_config {{[-?|--help]}}
```

- Display version:

```
pg_config --version
```

pg_controldata

Display control information of a PostgreSQL database cluster.

More information: https://www.postgresql.org/docs/current/app-pgcontroldata.html.

- Display control information for a specific data directory:

```
pg_controldata {{[-D|--pgdata]}} {{path/to/data}}
```

- Display help:

```
pg_controldata {{[-?|--help]}}
```

- Display version:

```
pg_controldata {{[-V|--version]}}
```

pg_createsubscriber

Convert a physical replica into a new logical replica.

More information: https://www.postgresql.org/docs/current/app-pgcreatesubscriber.html.

- Convert a physical replica to a logical replica for a specific database:

```
pg_createsubscriber {{[-d|--database]}} {{dbname}} {{[-D|--pgdata]}} {{path/to/data}} {{[-P|--publisher-server]}} {{connstr}}
```

- Simulate converting a physical replica to a logical replica without modifying the target directory:

```
pg_createsubscriber {{[-n|--dry-run]}} {{[-d|--database]}} {{dbname}} {{[-D|--pgdata]}} {{path/to/data}} {{[-P|--publisher-server]}} {{connstr}}
```

- Enable two-phase commit for the subscription:

```
pg_createsubscriber {{[-T|--enable-two-phase]}} {{[-d|--database]}} {{dbname}} {{[-D|--pgdata]}} {{path/to/data}} {{[-P|--publisher-server]}} {{connstr}}
```

- Convert with verbose output:

```
pg_createsubscriber {{[-v|--verbose]}} {{[-d|--database]}} {{dbname}} {{[-D|--pgdata]}} {{path/to/data}} {{[-P|--publisher-server]}} {{connstr}}
```

- Display help:

```
pg_createsubscriber {{[-?|--help]}}
```

pg_ctl

Utility for controlling a PostgreSQL server and database cluster.

More information: https://www.postgresql.org/docs/current/app-pg-ctl.html.

- Initialize a new PostgreSQL database cluster:

```
pg_ctl {{[-D|--pgdata]}} {{data_directory}} init
```

- Start a PostgreSQL server:

```
pg_ctl {{[-D|--pgdata]}} {{data_directory}} start
```

- Stop a PostgreSQL server:

```
pg_ctl {{[-D|--pgdata]}} {{data_directory}} stop
```

- Restart a PostgreSQL server:

```
pg_ctl {{[-D|--pgdata]}} {{data_directory}} restart
```

- Reload the PostgreSQL server configuration:

```
pg_ctl {{[-D|--pgdata]}} {{data_directory}} reload
```

pg_dump

Extract a PostgreSQL database into a script file or other archive file.

More information: https://www.postgresql.org/docs/current/app-pgdump.html.

- Dump database into an SQL-script file:

```
pg_dump {{db_name}} > {{output_file.sql}}
```

- Dump a database into an SQL-script file, using a specific username:

```
pg_dump {{[-U|--username]}} {{username}} {{db_name}} >
{{output_file.sql}}
```

- Dump a database into an SQL-script file, using a specific host and port:

```
pg_dump {{[-h|--host]}} {{host}} {{[-p|--port]}} {{port}}
{{db_name}} > {{output_file.sql}}
```

- Dump a database into a custom-format archive file:

```
pg_dump {{[-F|--format]}} {{[c|custom]}} {{db_name}} >
{{output_file.dump}}
```

- Dump only database data into an SQL-script file:

```
pg_dump {{[-a|--data-only]}} {{db_name}} > {{path/to/
output_file.sql}}
```

- Dump only schema (data definitions) into an SQL-script file:

```
pg_dump {{[-s|--schema-only]}} {{db_name}} > {{path/to/
output_file.sql}}
```

pg_dumpall

Extract a PostgreSQL database cluster into a script file or other archive file.

More information: https://www.postgresql.org/docs/current/app-pg-dumpall.html.

- Dump all databases:

```
pg_dumpall > {{path/to/file.sql}}
```

- Dump all databases using a specific username:

```
pg_dumpall {{[-U|--username]}} {{username}} > {{path/to/file.sql}}
```

- Dump all databases using a specific host and port:

```
pg_dumpall {{[-h|--host]}} {{host}} {{[-p|--port]}} {{port}} > {{output_file.sql}}
```

- Dump only database data into an SQL-script file:

```
pg_dumpall {{[-a|--data-only]}} > {{path/to/file.sql}}
```

- Dump only schema (data definitions) into an SQL-script file:

```
pg_dumpall {{[-s|--schema-only]}} > {{output_file.sql}}
```

pg_isready

Check the connection status of a PostgreSQL server.

More information: https://www.postgresql.org/docs/current/app-pg-isready.html.

- Check connection:

```
pg_isready
```

- Check connection with a specific hostname and port:

```
pg_isready {{[-h|--host]}} {{hostname}} {{[-p|--port]}} {{port}}
```

- Check connection displaying a message only when the connection fails:

```
pg_isready {{[-q|--quiet]}}
```

pg_receivewal

Stream the write-ahead log from a running PostgreSQL cluster.

More information: https://www.postgresql.org/docs/current/app-pgreceivewal.html.

- Stream WAL to a local directory (minimum required):

```
pg_receivewal {{[-D|--directory]}} {{directory}}
```

- Stream WAL to a local directory, specifying host, port, and username, with verbose output:

```
pg_receivewal {{[-v|--verbose]}} {{[-h|--host]}} {{host}} {{[-p|--port]}} {{port}} {{[-U|--username]}} {{username}} {{[-D|--directory]}} {{directory}}
```

- Use replication slot (create-if-needed):

```
pg_receivewal {{[-S|--slot]}} {{slot_name}} --create-slot {{[-h|--host]}} {{host}} {{[-p|--port]}} {{port}} {{[-U|--username]}} {{username}} {{[-D|--directory]}} {{directory}}
```

- Stop at a given WAL position (LSN):

```
pg_receivewal {{[-E|--endpos]}} {{lsn}} {{[-D|--directory]}} {{directory}} {{[-h|--host]}} {{host}} {{[-p|--port]}} {{port}} {{[-U|--username]}} {{username}}
```

- Control looping on failure:

```
pg_receivewal {{[-n|--no-loop]}} {{[-D|--directory]}} {{directory}} {{[-h|--host]}} {{host}} {{[-p|--port]}} {{port}} {{[-U|--username]}} {{username}}
```

- Flush data synchronously (force WAL writes immediately):

```
pg_receivewal --synchronous {{[-D|--directory]}} {{directory}} {{[-h|--host]}} {{host}} {{[-p|--port]}} {{port}} {{[-U|--username]}} {{username}}
```

- Compress WAL output (`gzip`, level 0-9):

```
pg_receivewal {{[-Z|--compress]}} {{level|method}} {{[-D|--directory]}} {{directory}} {{[-h|--host]}} {{host}} {{[-p|--port]}} {{port}} {{[-U|--username]}} {{username}}
```

- Set status reporting interval:

```
pg_receivewal {{[-s|--status-interval]}} {{seconds}} {{[-D|--
directory]}} {{directory}} {{[-h|--host]}} {{host}} {{[-p|--
port]}} {{port}} {{[-U|--username]}} {{username}}
```

pg_recvlogical

Control PostgreSQL logical decoding streams.

More information: https://www.postgresql.org/docs/current/app-pgrecvlogical.html.

- Create a new logical replication slot:

```
pg_recvlogical {{[-d|--dbname]}} {{dbname}} {{[-S|--slot]}} {{slot_name}} --create-slot
```

- Start streaming changes from a logical replication slot to a file:

```
pg_recvlogical {{[-d|--dbname]}} {{dbname}} {{[-S|--slot]}} {{slot_name}} --start {{[-f|--file]}} {{filename}}
```

- Drop a logical replication slot:

```
pg_recvlogical {{[-d|--dbname]}} {{dbname}} {{[-S|--slot]}} {{slot_name}} --drop-slot
```

- Create a slot with two-phase commit enabled:

```
pg_recvlogical {{[-d|--dbname]}} {{dbname}} {{[-S|--slot]}} {{slot_name}} --create-slot {{[-t|--enable-two-phase]}}
```

- Display help:

```
pg_recvlogical {{[-?|--help]}}
```

pg_resetwal

Reset the write-ahead log and other control information of a PostgreSQL database cluster.

More information: https://www.postgresql.org/docs/current/app-pgresetwal.html.

- Reset the WAL and control information for a specific data directory:

```
pg_resetwal {{[-D|--pgdata]}} {{path/to/data}}
```

- Simulate resetting without actually doing it:

```
pg_resetwal {{[-D|--pgdata]}} {{path/to/data}} {{[-n|--dry-run]}}
```

- Force the WAL and control information reset:

```
pg_resetwal {{[-D|--pgdata]}} {{path/to/data}} {{[-f|--force]}}
```

- Display help:

```
pg_resetwal {{[-?|--help]}}
```

- Display version:

```
pg_resetwal {{[-V|--version]}}
```

pg_restore

Restore a PostgreSQL database from an archive file created by pg_dump.

More information: https://www.postgresql.org/docs/current/app-pgrestore.html.

- Restore an archive into an existing database:

```
pg_restore {{[-d|--dbname]}} {{db_name}}
{{archive_file.dump}}
```

- Restore an archive into an existing database, using a specific username:

```
pg_restore {{[-U|--username]}} {{username}} {{[-d|--dbname]}}
{{db_name}} {{archive_file.dump}}
```

- Restore an archive into an existing database, using a specific host and port:

```
pg_restore {{[-h|--host]}} {{host}} {{[-p|--port]}} {{port}}
{{[-d|--dbname]}} {{db_name}} {{archive_file.dump}}
```

- List database objects included in the archive:

```
pg_restore {{[-l|--list]}} {{archive_file.dump}}
```

- Clean database objects before creating them:

```
pg_restore {{[-c|--clean]}} {{[-d|--dbname]}} {{db_name}}
{{archive_file.dump}}
```

- Use multiple jobs to do the restoring:

```
pg_restore {{[-j|--jobs]}} {{2}} {{[-d|--dbname]}}
{{db_name}} {{archive_file.dump}}
```

pg_rewind

Synchronize a PostgreSQL data directory with another data directory that was forked from it.

More information: https://www.postgresql.org/docs/current/app-pgrewind.html.

- Synchronize target directory with source directory:

```
pg_rewind {{[-D|--target-pgdata]}} {{path/to/target_data}} --source-pgdata {{path/to/source_data}}
```

- Synchronize target with source server using connection string:

```
pg_rewind {{[-D|--target-pgdata]}} {{path/to/target_data}} --source-server {{connstr}}
```

- Simulate a synchronization without actually doing it:

```
pg_rewind {{[-D|--target-pgdata]}} {{path/to/target_data}} --source-pgdata {{path/to/source_data}} {{[-n|--dry-run]}}
```

- Show progress during synchronization:

```
pg_rewind {{[-D|--target-pgdata]}} {{path/to/target_data}} --source-pgdata {{path/to/source_data}} {{[-P|--progress]}}
```

- Display help:

```
pg_rewind {{[-?|--help]}}
```

pg_test_fsync

Determine the fastest wal_sync_method on your system.

More information: https://www.postgresql.org/docs/current/pgtestfsync.html.

- Run the default fsync benchmark (5 seconds):

```
pg_test_fsync
```

- Specify a custom test duration:

```
pg_test_fsync {{[-s|--secs-per-test]}} {{seconds}}
```

- Use a specific filename (it must be in same filesystem that the pg_wal directory is or will be placed in):

```
pg_test_fsync {{[-f|--filename]}} {{path/to/file}}
```

pg_test_timing

Measure timing overhead on your system (ensure clock monotonicity).

More information: https://www.postgresql.org/docs/current/pgtesttiming.html.

- Run the default timing test (3 seconds):

```
pg_test_timing
```

- Run for a custom duration:

```
pg_test_timing {{[-d|--duration]}} {{seconds}}
```

pg_upgrade

Upgrade a PostgreSQL database cluster to a new major version.

More information: https://www.postgresql.org/docs/current/pgupgrade.html.

- Check clusters before upgrading:

```
pg_upgrade {{[-c|--check]}} {{[-b|--old-bindir]}} {{path/to/old_bin}} {{[-B|--new-bindir]}} {{path/to/new_bin}} {{[-d|--old-datadir]}} {{path/to/old_data}} {{[-D|--new-datadir]}} {{path/to/new_data}}
```

- Perform the actual upgrade:

```
pg_upgrade {{[-b|--old-bindir]}} {{path/to/old_bin}} {{[-B|--new-bindir]}} {{path/to/new_bin}} {{[-d|--old-datadir]}} {{path/to/old_data}} {{[-D|--new-datadir]}} {{path/to/new_data}}
```

- Use multiple parallel jobs during the upgrade:

```
pg_upgrade {{[-j|--jobs]}} {{njobs}} {{[-b|--old-bindir]}} {{path/to/old_bin}} {{[-B|--new-bindir]}} {{path/to/new_bin}} {{[-d|--old-datadir]}} {{path/to/old_data}} {{[-D|--new-datadir]}} {{path/to/new_data}}
```

- Specify the old and new PostgreSQL ports:

```
pg_upgrade {{[-p|--old-port]}} {{port}} {{[-P|--new-port]}} {{port}} {{[-b|--old-bindir]}} {{path/to/old_bin}} {{[-B|--new-bindir]}} {{path/to/new_bin}} {{[-d|--old-datadir]}} {{path/to/old_data}} {{[-D|--new-datadir]}} {{path/to/new_data}}
```

- Use hard links instead of copying files to the new cluster:

```
pg_upgrade {{[-k|--link]}} {{[-b|--old-bindir]}} {{path/to/old_bin}} {{[-B|--new-bindir]}} {{path/to/new_bin}} {{[-d|--old-datadir]}} {{path/to/old_data}} {{[-D|--new-datadir]}} {{path/to/new_data}}
```

- Display help:

```
pg_upgrade {{[-?|--help]}}
```

pg_verifybackup

Verify the integrity of a base backup of a PostgreSQL cluster.

More information: https://www.postgresql.org/docs/current/app-pgverifybackup.html.

- Verify a backup stored in a specific directory:

```
pg_verifybackup {{path/to/backup}}
```

- Verify a backup showing progress information:

```
pg_verifybackup {{[-P|--progress]}} {{path/to/backup}}
```

- Verify a backup and exit immediately on first error:

```
pg_verifybackup {{[-e|--exit-on-error]}} {{path/to/backup}}
```

- Verify a backup ignoring specific files or directories:

```
pg_verifybackup {{[-i|--ignore]}} {{path/to/
file_or_directory}} {{path/to/backup}}
```

- Verify a backup with a manifest file in a different location:

```
pg_verifybackup {{[-m|--manifest-path]}} {{path/to/
backup_manifest}} {{path/to/backup}}
```

- Display help:

```
pg_verifybackup {{[-?|--help]}}
```

pg_waldump

Display a human-readable rendering of the write-ahead log (WAL) of a PostgreSQL database cluster.

More information: https://www.postgresql.org/docs/current/pgwaldump.html.

- Display WAL records from a specific segment:

```
pg_waldump {{start_segment}}
```

- Display WAL records between two segments:

```
pg_waldump {{start_segment}} {{end_segment}}
```

- Specify the WAL file directory:

```
pg_waldump {{start_segment}} {{end_segment}} {{[-p|--path]}} {{path}}
```

- Follow new WAL entries as they arrive:

```
pg_waldump {{start_segment}} {{end_segment}} {{[-f|--follow]}}
```

- Limit number of records shown:

```
pg_waldump {{start_segment}} {{end_segment}} {{[-n|--limit]}} {{count}}
```

- Display summary statistics instead of individual records:

```
pg_waldump {{start_segment}} {{end_segment}} {{[-z|--stats]}}
```

- Filter by resource manager:

```
pg_waldump {{start_segment}} {{end_segment}} {{[-r|--rmgr]}} {{rmgr_name}}
```

- Display help:

```
pg_waldump {{[-?|--help]}}
```

pg_walsummary

Print contents of WAL summary files.

More information: https://www.postgresql.org/docs/current/app-pgwalsummary.html.

- Convert a WAL summary file to text:

```
pg_walsummary {{path/to/file}}
```

- Print one line per individual modified block (rather than ranges):

```
pg_walsummary {{[-i|--individual]}} {{path/to/file}}
```

- Suppress normal output (only errors):

```
pg_walsummary {{[-q|--quiet]}} {{path/to/file}}
```

pgbench

Run a benchmark test on PostgreSQL.

More information: https://www.postgresql.org/docs/current/pgbench.html.

- Initialize a database with a scale factor of 50 times the default size:

```
pgbench --initialize --scale={{50}} {{database_name}}
```

- Benchmark a database with 10 clients, 2 worker threads, and 10,000 transactions per client:

```
pgbench --client={{10}} --jobs={{2}} --transactions={{10000}}
{{database_name}}
```

pgcli

A modern PostgreSQL CLI with auto-completion and syntax highlighting.

More information: https://www.pgcli.com/#usage.

- Connect to a PostgreSQL database using a connection string:

```
pgcli postgresql://{{user}}@{{host}}/{{database}}
```

- Connect to a database using flags:

```
pgcli {{[-h|--host]}} {{host}} {{[-U|--username]}}
{{username}} {{[-d|--dbname]}} {{database}}
```

- Display help:

```
pgcli --help
```

pgmbentley

Bentleyize a PGM image.

More information: https://netpbm.sourceforge.net/doc/pgmbentley.html.

- Apply the Bentley Effect on a PGM image:

```
pgmbentley {{path/to/input_file.pgm}} > {{path/to/
output_file.pgm}}
```

pgmcrater

This command has been superseded by **`pamcrater`**, **`pamshadedrelief`**, and **`pamtopnm`**.

More information: https://netpbm.sourceforge.net/doc/pgmcrater.html.

- View documentation for `pamcrater`:

```
tldr pamcrater
```

- View documentation for `pamshadedrelief`:

```
tldr pamshadedrelief
```

- View documentation for `pamtopnm`:

```
tldr pamtopnm
```

pgmdeshadow

Deshadow a PGM image.

More information: https://netpbm.sourceforge.net/doc/pgmdeshadow.html.

- Remove grey shadows from a PGM image:

```
pgmdeshadow {{path/to/input_file.pgm}} > {{path/to/
output_file.pgm}}
```

pgmedge

This command has been superseded by **pamedge**.

More information: https://netpbm.sourceforge.net/doc/pgmedge.html.

- View documentation for the current command:

```
tldr pamedge
```

pgmenhance

Edge-enhance a PGM image.

See also: **pamedge**.

More information: https://netpbm.sourceforge.net/doc/pgmenhance.html.

- Edge-enhance a PGM image:

```
pgmenhance {{path/to/image.pgm}} > {{path/to/output.pgm}}
```

- Specify the level of enhancement:

```
pgmenhance -{{1..9}} {{path/to/image.pgm}} > {{path/to/
output.pgm}}
```

pgmhist

Print a histogram of the values present in a PGM image.

See also: **`ppmhist`**.

More information: https://netpbm.sourceforge.net/doc/pgmhist.html.

- Display the histogram for human reading:

```
pgmhist {{path/to/image.pgm}}
```

- Display the median grey value:

```
pgmhist {{[-me|-median]}} {{path/to/image.pgm}}
```

- Display the four quartile grey values:

```
pgmhist {{[-qua|-quartile]}} {{path/to/image.pgm}}
```

- Report the existence of invalid grey values:

```
pgmhist {{[-f|-forensic]}} {{path/to/image.pgm}}
```

- Display machine-readable output:

```
pgmhist {{[-ma|-machine]}} {{path/to/image.pgm}}
```

pgmkernel

Generate a convolution kernel to be used with **pnmconvol**.

See also: **pnmconvol**.

More information: https://netpbm.sourceforge.net/doc/pgmkernel.html.

- Generate a convolution kernel:

```
pgmkernel {{width}} {{height}} > {{path/to/output.pgm}}
```

- Generate a quadratic convolution kernel:

```
pgmkernel {{size}} > {{path/to/output.pgm}}
```

- Specify the weight of the center in the generated kernel:

```
pgmkernel {{[-w|-weight]}} {{value}} {{width}} {{height}} >
{{path/to/output.pgm}}
```

pgmmake

Create PGM image with a uniform gray level.

More information: https://netpbm.sourceforge.net/doc/pgmmake.html.

- Create PGM image with a uniform gray level (specified as a number between 0 and 1) and the specified dimensions:

```
pgmmake {{graylevel}} {{width}} {{height}} > {{path/to/output_file.pgm}}
```

pgmnoise

Generate white noise.

More information: https://netpbm.sourceforge.net/doc/pgmnoise.html.

- Generate a PGM image containing white noise:

```
pgmnoise {{width}} {{height}} > {{path/to/output.pgm}}
```

- Specify the seed for the pseudo-random number generator:

```
pgmnoise {{width}} {{height}} -randomseed {{value}} > {{path/to/output.pgm}}
```

pgmnorm

This command has been superseded by **pnmnorm**.

More information: https://netpbm.sourceforge.net/doc/pgmnorm.html.

- View documentation for the current command:

```
tldr pnmnorm
```

pgmoil

This command has been superseded by **`pamoil`**.

More information: https://netpbm.sourceforge.net/doc/pgmoil.html.

- View documentation for the current command:

```
tldr pamoil
```

pgmramp

Generate a greyscale map.

More information: https://netpbm.sourceforge.net/doc/pgmramp.html.

- Generate a left-to-right greyscale map:

```
pgmramp -lr > {{path/to/output.pgm}}
```

- Generate a top-to-bottom greyscale map:

```
pgmramp -tb > {{path/to/output.pgm}}
```

- Generate a rectangular greyscale map:

```
pgmramp -rectangle > {{path/to/output.pgm}}
```

- Generate an elliptical greyscale map:

```
pgmramp -ellipse {{path/to/image.pgm}} > {{path/to/
output.pgm}}
```

- Generate a greyscale map from the top-left corner to the bottom-right corner:

```
pgmramp -diagonal {{path/to/image.pgm}} > {{path/to/
output.pgm}}
```

pgmslice

This command has been superseded by **`pamslice`**.

More information: https://netpbm.sourceforge.net/doc/pgmslice.html.

- View documentation for the current command:

```
tldr pamslice
```

pgmtexture

Extract textural features from a PGM image.

More information: https://netpbm.sourceforge.net/doc/pgmtexture.html.

- Extract textural features from a PGM image:

```
pgmtexture {{path/to/image.pgm}} > {{path/to/output.pgm}}
```

- Specify the distance parameter for the feature extraction algorithm:

```
pgmtexture -d {{distance}} {{path/to/image.pgm}} > {{path/to/
output.pgm}}
```

pgmtofs

Convert a PGM image to Usenix FaceSaver format.

See also: **`fstopgm`**.

More information: https://netpbm.sourceforge.net/doc/pgmtofs.html.

- Convert the specified PGM image to Usenix FaceSave format:

```
pgmtofs {{path/to/input.pgm}} > {{path/to/output.fs}}
```

pgmtolispm

Convert a PGM image to Lisp Machine format.

See also: **`lispmtopgm`**.

More information: https://netpbm.sourceforge.net/doc/pgmtolispm.html.

- Convert the specified PGM image to Lisp Machine format:

```
pgmtolispm {{path/to/input.pgm}} > {{path/to/output.lispm}}
```

pgmtopbm

This command has been superseded by **pamditherbw**.

More information: https://netpbm.sourceforge.net/doc/pgmtopbm.html.

- View documentation for the current command:

```
tldr pamditherbw
```

pgmtopgm

Copy a PGM image file.

More information: https://netpbm.sourceforge.net/doc/pgmtopgm.html.

- Copy PGM file from `stdin` to `stderr`:

  `pgmtopgm`

- Display version:

  `pgmtopgm -version`

pgmtoppm

Colorize a PGM image.

More information: https://netpbm.sourceforge.net/doc/pgmtoppm.html.

- Map all greyscale values of the input image to all colors between the two specified colors:

```
pgmtoppm {{[-b|-black]}} {{red}} {{[-w|-white]}} {{blue}} {{path/to/input.pgm}} > {{path/to/output.ppm}}
```

- Map all greyscale values of the input image to colors according to the specified colormap:

```
pgmtoppm {{[-m|-map]}} {{path/to/colormap.ppm}} {{path/to/input.pgm}} > {{path/to/output.ppm}}
```

pgmtosbig

Convert a PGM image to the SBIG CCDOPS format.

More information: https://netpbm.sourceforge.net/doc/pgmtosbig.html.

- Convert a PGM image file to the SBIG CCDOPS format:

```
pgmtosbig {{path/to/input_file.pgm}} > {{path/to/
output.sbig}}
```

pgmtost4

Convert a PGM image to the SBIG ST-4 format.

More information: https://netpbm.sourceforge.net/doc/pgmtost4.html.

- Convert a PGM image file to the SBIG ST-4 format:

```
pgmtost4 {{path/to/input_file.pgm}} > {{path/to/output.st4}}
```

pgrep

Find processes by name.

More information: https://keith.github.io/xcode-man-pages/pgrep.1.html.

- Return PIDs of any running processes with a matching command string:

```
pgrep {{process_name}}
```

- Print the process name in addition to the PID ([l]ong output):

```
pgrep -l {{process_name}}
```

- Match processes against the [f]ull argument list instead of just the process name:

```
pgrep -f "{{process_name}} {{parameter}}"
```

- Print the PID together with the [f]ull argument [l]ist for each match:

```
pgrep -fl "{{process_name}}"
```

- Search for processes run by a specific [u]ser (effective UID):

```
pgrep -u {{username}} {{process_name}}
```

- Select only the [n]ewest (most recently started) matching process:

```
pgrep -n {{process_name}}
```

phan

A static analysis tool for PHP.

More information: https://github.com/phan/phan.

- Generate a `.phan/config.php` in the current directory:

```
phan --init
```

- Generate a Phan configuration file using a specific level (1 being strictest to 5 being the least strict):

```
phan --init --init-level {{level}}
```

- Analyze the current directory:

```
phan
```

- Analyze one or more directories:

```
phan {{--directory path/to/directory1 --directory path/to/directory2 ...}}
```

- Specify a configuration file (defaults to `.phan/config.php`):

```
phan --config-file {{path/to/config.php}}
```

- Specify the output mode:

```
phan --output-mode {{text|verbose|json|csv|codeclimate|checkstyle|pylint|html}}
```

- Specify the number of parallel processes:

```
phan --processes {{number_of_processes}}
```

phing

A PHP build tool based on Apache Ant.

More information: https://www.phing.info/guide/chunkhtml/ch03s03.html.

- Perform the default task in the `build.xml` file:

```
phing
```

- Initialize a new build file:

```
phing {{[-i|--init]}} {{path/to/build.xml}}
```

- Perform a specific task:

```
phing {{task_name}}
```

- Use the given build file path:

```
phing {{[-f|-buildfile]}} {{path/to/build.xml}} {{task_name}}
```

- Log to the given file:

```
phing -logfile {{path/to/log_file}} {{task_name}}
```

- Use custom properties in the build:

```
phing -D{{property}}={{value}} {{task_name}}
```

- Specify a custom listener class:

```
phing -listener {{class_name}} {{task_name}}
```

- Build using verbose output:

```
phing -verbose {{task_name}}
```

phive

The Phar Installation and Verification Environment for secure PHP application deployment.

More information: https://phar.io/#Usage.

- Display a list of available aliased Phars:

```
phive list
```

- Install a specified Phar to the local directory:

```
phive install {{alias|url}}
```

- Install a specified Phar globally:

```
phive install {{alias|url}} {{[-g|--global]}}
```

- Install a specified Phar to a target directory:

```
phive install {{alias|url}} {{[-t|--target]}} {{path/to/directory}}
```

- Update all Phar files to the latest version:

```
phive update
```

- Remove a specified Phar file:

```
phive remove {{alias|url}}
```

- Remove unused Phar files:

```
phive purge
```

- List all available commands:

```
phive help
```

php artisan

Laravel's Artisan command-line interface.

More information: https://laravel.com/docs/artisan.

- Start PHP's built-in web server for the current Laravel application:

  ```
  php artisan serve
  ```

- Start an interactive PHP command-line interface:

  ```
  php artisan tinker
  ```

- Generate a new Eloquent model class with a migration, factory, and resource controller:

  ```
  php artisan make:model {{ModelName}} --all
  ```

- Display a list of all available commands:

  ```
  php artisan help
  ```

php-coveralls

A PHP client for Coveralls.

More information: https://php-coveralls.github.io/php-coveralls/#cli-options.

- Send coverage information to Coveralls:

```
php-coveralls
```

- Send coverage information to Coveralls for a specific directory:

```
php-coveralls {{[-r|--root_dir]}} {{path/to/directory}}
```

- Send coverage information to Coveralls with a specific config:

```
php-coveralls {{[-c|--config]}} {{path/to/.coveralls.yml}}
```

- Send coverage information to Coveralls with verbose output:

```
php-coveralls {{[-v|--verbose]}}
```

- Send coverage information to Coveralls excluding source files with no executable statements:

```
php-coveralls --exclude-no-stmt
```

- Send coverage information to Coveralls with a specific environment name:

```
php-coveralls {{[-e|--env]}} {{test|dev|prod}}
```

- Specify multiple Coverage Clover XML files to upload:

```
php-coveralls {{[-x|--coverage_clover]}} {{path/to/
first_clover.xml}} --coverage_clover {{path/to/
second_clover.xml}}
```

- Output the JSON that will be sent to Coveralls to a specific file:

```
php-coveralls {{[-o|--json_path]}} {{path/to/coveralls-
upload.json}}
```

php-cs-fixer

Automatic coding style fixer for PHP.

More information: https://github.com/PHP-CS-Fixer/PHP-CS-Fixer.

- Execute code style fixing in the current directory:

```
php-cs-fixer fix
```

- Execute code style fixing for a specific directory:

```
php-cs-fixer fix {{path/to/directory}}
```

- Simulate fixing code style, reporting issues without applying changes:

```
php-cs-fixer fix --dry-run
```

- Execute code style fixes using specific rules:

```
php-cs-fixer fix --rules={{rules}}
```

- Display the rules that have been applied:

```
php-cs-fixer fix --verbose
```

- Output the results in a different format:

```
php-cs-fixer fix --format={{txt|json|xml|checkstyle|junit|gitlab}}
```

- Display files that require fixing:

```
php-cs-fixer list-files
```

- Describe a rule or ruleset:

```
php-cs-fixer describe {{rule}}
```

php yii

Yii Framework's command-line interface.

More information: https://www.yiiframework.com/doc/guide/2.0/en/tutorial-console.

- Start PHP's built-in web server for the current Yii application:

```
php yii {{serve}}
```

- Generate a controller, views, and related files for the CRUD actions on the specified model class:

```
php yii {{gii/crud}} --modelClass={{ModelName}} --controllerClass={{ControllerName}}
```

- Display help:

```
php yii {{help}}
```

php

PHP command-line interface.

More information: https://www.php.net/manual/en/features.commandline.options.php.

- Parse and execute a PHP script:

```
php {{path/to/file}}
```

- Check syntax on (i.e. [l]int) a PHP script:

```
php {{[-l|--syntax-check]}} {{path/to/file}}
```

- Run PHP inter[a]ctively:

```
php {{[-a|--interactive]}}
```

- Run PHP code (Notes: Don't use `<? ?>` tags; escape double quotes with backslash):

```
php {{[-r|--run]}} "{{code}}"
```

- Start a PHP built-in web server in the current directory:

```
php {{[-S|--server]}} {{host}}:{{port}}
```

- List installed PHP extensions:

```
php {{[-m|--modules]}}
```

- Display information about the current PHP configuration:

```
php {{[-i|--info]}}
```

- Display information about a specific function:

```
php {{[--rf|--rfunction]}} {{function_name}}
```

phpbu

A backup utility framework for PHP.

More information: https://phpbu.de/manual/current/en/phpbu-manual.html#cli.

- Run backups using the default `phpbu.xml` configuration file:

  ```
  phpbu
  ```

- Run backups using a specific configuration file:

  ```
  phpbu --configuration={{path/to/configuration_file.xml}}
  ```

- Only run the specified backups:

  ```
  phpbu --limit={{backup_task_name}}
  ```

- Simulate the actions that would have been performed:

  ```
  phpbu --simulate
  ```

phpcbf

Fix violations detected by phpcs.

More information: https://github.com/squizlabs/PHP_CodeSniffer.

- Fix issues in the specified directory (defaults to the PEAR standard):

```
phpcbf {{path/to/directory}}
```

- Display a list of installed coding standards:

```
phpcbf -i
```

- Specify a coding standard to validate against:

```
phpcbf {{path/to/directory}} --standard {{standard}}
```

- Specify comma-separated file extensions to include when sniffing:

```
phpcbf {{path/to/directory}} --extensions
{{file_extension1,file_extension2,...}}
```

- Specify a comma-separated list of files to load before processing:

```
phpcbf {{path/to/directory}} --bootstrap {{path/to/
file1,path/to/file2,...}}
```

- Don't recurse into subdirectories:

```
phpcbf {{path/to/directory}} -l
```

phpcpd

A copy and paste detector for PHP code.

More information: https://github.com/sebastianbergmann/phpcpd.

- Analyze duplicated code for a specific file or directory:

```
phpcpd {{path/to/file_or_directory}}
```

- Analyze using fuzzy matching for variable names:

```
phpcpd --fuzzy {{path/to/file_or_directory}}
```

- Specify a minimum number of identical lines (defaults to 5):

```
phpcpd --min-lines {{number_of_lines}} {{path/to/
file_or_directory}}
```

- Specify a minimum number of identical tokens (defaults to 70):

```
phpcpd --min-tokens {{number_of_tokens}} {{path/to/
file_or_directory}}
```

- Exclude a directory from analysis (must be relative to the source):

```
phpcpd --exclude {{path/to/excluded_directory}} {{path/to/
file_or_directory}}
```

- Output the results to a PHP-CPD XML file:

```
phpcpd --log-pmd {{path/to/log_file}} {{path/to/
file_or_directory}}
```

phpcs

Tokenize PHP, JavaScript, and CSS files to detect violations of a defined set of coding standards.

More information: https://github.com/squizlabs/PHP_CodeSniffer.

- Sniff the specified directory for issues (defaults to the PEAR standard):

```
phpcs {{path/to/directory}}
```

- Display a list of installed coding standards:

```
phpcs -i
```

- Specify a coding standard to validate against:

```
phpcs {{path/to/directory}} --standard {{standard}}
```

- Specify comma-separated file extensions to include when sniffing:

```
phpcs {{path/to/directory}} --extensions
{{file_extension1,file_extension2,...}}
```

- Specify the format of the output report (e.g. `full`, `xml`, `json`, `summary`):

```
phpcs {{path/to/directory}} --report {{format}}
```

- Set configuration variables to be used during the process:

```
phpcs {{path/to/directory}} --config-set {{key}} {{value}}
```

- Specify a comma-separated list of files to load before processing:

```
phpcs {{path/to/directory}} --bootstrap {{path/to/file1,path/
to/file2,...}}
```

- Don't recurse into subdirectories:

```
phpcs {{path/to/directory}} -l
```

phpdox

A PHP documentation generator.

More information: https://manned.org/phpdox.

- Display an annotated skeleton configuration XML file:

```
phpdox --skel
```

- Generate documentation for the current working directory:

```
phpdox
```

- Generate documentation using a specific configuration file:

```
phpdox {{[-f|--file]}} {{path/to/phpdox.xml}}
```

- Only run the metadata collection process:

```
phpdox {{[-c|--collector]}}
```

- Only run the documentation generator process:

```
phpdox {{[-g|--generator]}}
```

phpenv

A PHP version manager for development purposes.

More information: https://github.com/phpenv/phpenv.

- Install a PHP version globally:

```
phpenv install {{version}}
```

- Refresh shim files for all PHP binaries known to `phpenv`:

```
phpenv rehash
```

- List all installed PHP versions:

```
phpenv versions
```

- Display the currently active PHP version:

```
phpenv version
```

- Set the global PHP version:

```
phpenv global {{version}}
```

- Set the local PHP version, which overrides the global version:

```
phpenv local {{version}}
```

- Unset the local PHP version:

```
phpenv local --unset
```

phpize

Prepare a PHP extension for compiling.

More information: https://manned.org/phpize.

- Prepare the PHP extension in the current directory for compiling:

```
phpize
```

- Delete files previously created by phpize:

```
phpize --clean
```

phploc

Quickly measure the size and analyzing the structure of a PHP project.

More information: https://github.com/sebastianbergmann/phploc.

- Analyze a directory and print the result:

```
phploc {{path/to/directory}}
```

- Include only specific files from a comma-separated list (`glob`s are allowed):

```
phploc {{path/to/directory}} --names '{{path/to/file1,path/to/file2,...}}'
```

- Exclude specific files from a comma-separated list (`glob`s are allowed):

```
phploc {{path/to/directory}} --names-exclude '{{path/to/file1,path/to/file2,...}}'
```

- Exclude a specific directory from analysis:

```
phploc {{path/to/directory}} --exclude {{path/to/exclude_directory}}
```

- Log the results to a specific CSV file:

```
phploc {{path/to/directory}} --log-csv {{path/to/file}}
```

- Log the results to a specific XML file:

```
phploc {{path/to/directory}} --log-xml {{path/to/file}}
```

- Count PHPUnit test case classes and test methods:

```
phploc {{path/to/directory}} --count-tests
```

phpmd

PHP mess detector: check for common potential problems.

More information: https://github.com/phpmd/phpmd#command-line-options.

- Display a list of available rulesets and formats:

```
phpmd
```

- Scan a file or directory for problems using comma-separated rulesets:

```
phpmd {{path/to/file_or_directory}} {{xml|text|html}}
{{ruleset1,ruleset2,...}}
```

- Specify the minimum priority threshold for rules:

```
phpmd {{path/to/file_or_directory}} {{xml|text|html}}
{{ruleset1,ruleset2,...}} --minimumpriority {{priority}}
```

- Include only the specified extensions in analysis:

```
phpmd {{path/to/file_or_directory}} {{xml|text|html}}
{{ruleset1,ruleset2,...}} --suffixes {{extensions}}
```

- Exclude the specified comma-separated directories:

```
phpmd {{path/to/file_or_directory1,path/to/
file_or_directory2,...}} {{xml|text|html}}
{{ruleset1,ruleset2,...}} --exclude {{directory_patterns}}
```

- Output the results to a file instead of `stdout`:

```
phpmd {{path/to/file_or_directory}} {{xml|text|html}}
{{ruleset1,ruleset2,...}} --reportfile {{path/to/
report_file}}
```

- Ignore the use of warning-suppressive PHPDoc comments:

```
phpmd {{path/to/file_or_directory}} {{xml|text|html}}
{{ruleset1,ruleset2,...}} --strict
```

phpspec

A behavior-driven development tool for PHP.

More information: https://phpspec.net/en/stable/cookbook/console.html.

- Create a specification for a class:

```
phpspec describe {{class_name}}
```

- Run all specifications in the "spec" directory:

```
phpspec run
```

- Run a single specification:

```
phpspec run {{path/to/class_specification_file}}
```

- Run specifications using a specific configuration file:

```
phpspec run {{[-c|--config]}} {{path/to/configuration_file}}
```

- Run specifications using a specific bootstrap file:

```
phpspec run {{[-b|--bootstrap]}} {{path/to/bootstrap_file}}
```

- Disable code generation prompts:

```
phpspec run --no-code-generation
```

- Enable fake return values:

```
phpspec run --fake
```

phpstan

A PHP static analysis tool to discover bugs in code.

More information: https://phpstan.org/user-guide/command-line-usage.

- Analyze one or more directories:

```
phpstan analyse {{path/to/directory1 path/to/directory2 ...}}
```

- Analyze a directory using a configuration file:

```
phpstan analyse {{path/to/directory}} {{[-c|--
configuration]}} {{path/to/config}}
```

- Analyze using a specific rule level (0-10, higher is stricter):

```
phpstan analyse {{path/to/directory}} {{[-l|--level]}}
{{level}}
```

- Specify an autoload file to load before analyzing:

```
phpstan analyse {{path/to/directory}} {{[-a|--autoload-
file]}} {{path/to/autoload_file}}
```

- Specify a memory limit during analysis:

```
phpstan analyse {{path/to/directory}} --memory-limit
{{memory_limit}}
```

- Display available options for analysis:

```
phpstan analyse --help
```

phpstorm

A cross-platform IDE for PHP based on the JetBrains IntelliJ platform.

More information: https://www.jetbrains.com/help/phpstorm/working-with-the-ide-features-from-command-line.html#arguments.

- Open a specific directory:

```
phpstorm {{path/to/directory}}
```

- Open a file:

```
phpstorm {{path/to/file}}
```

- Open a file at a specific line:

```
phpstorm --line {{line_number}} {{path/to/file}}
```

- View the differences between two files:

```
phpstorm diff {{path/to/left_file}} {{path/to/right_file}}
```

phpunit

PHPUnit test runner.

More information: https://docs.phpunit.de/en/12.4/textui.html#command-line-options.

- Run tests in the current directory. Note: Expects you to have a `phpunit.xml'`:

```
phpunit
```

- Run tests in a specific file:

```
phpunit {{path/to/TestFile.php}}
```

- Run tests annotated with the given group:

```
phpunit --group {{name}}
```

- Run tests and generate a coverage report in HTML:

```
phpunit --coverage-html {{path/to/directory}}
```

pi1toppm

Convert an Atari Degas PI1 image to a PPM image.

See also: **ppmtopi1**.

More information: https://netpbm.sourceforge.net/doc/pi1toppm.html.

- Convert an Atari Degas PI1 image into PPM image:

```
pi1toppm {{path/to/atari_image.pi1}} > {{path/to/image.ppm}}
```

pi3topbm

Convert an Atari Degas PI3 image to PBM image.

See also: **pbmtopi3**.

More information: https://netpbm.sourceforge.net/doc/pi3topbm.html.

- Convert an Atari Degas PI3 image to PBM image:

```
pi3topbm {{path/to/atari_image.pi3}} > {{path/to/
output_image.pbm}}
```

piactl

The tool for Private Internet Access, a commercial VPN provider.

More information: https://helpdesk.privateinternetaccess.com/hc/en-us/articles/46815372532123-PIA-Desktop-Command-Line-Interface.

- Log in to Private Internet Access:

```
piactl login {{path/to/login_file}}
```

- Connect to Private Internet Access:

```
piactl connect
```

- Disconnect from Private Internet Access:

```
piactl disconnect
```

- Enable or disable the Private Internet Access daemon in the background:

```
piactl background {{enable|disable}}
```

- List all available VPN regions:

```
piactl get regions
```

- Display the current VPN region:

```
piactl get region
```

- Set your VPN region:

```
piactl set region {{region}}
```

- Log out of Private Internet Access:

```
piactl logout
```

pic

Picture preprocessor for the groff (GNU Troff) document formatting system.

See also: **`groff`**, **`troff`**.

More information: https://manned.org/pic.

- Process input with pictures, saving the output for future typesetting with groff to PostScript:

```
pic {{path/to/input.pic}} > {{path/to/output.roff}}
```

- Typeset input with pictures to PDF using the [me] macro package:

```
pic -T {{pdf}} {{path/to/input.pic}} | groff -{{me}} -T
{{pdf}} > {{path/to/output.pdf}}
```

picard

Next generation MusicBrainz tagging application.

More information: https://picard-docs.musicbrainz.org/en/latest/appendices/command_line.html.

- Start Picard:

```
picard
```

- Open a set of files:

```
picard {{path/to/file1.mp3 path/to/file2.mp3 ...}}
```

- Display version:

```
picard {{[-V|--long-version]}}
```

picgo

Upload an image to an image hosting service (default is SM.MS).

More information: https://github.com/PicGo/PicGo-Core.

- Interactively select a hosting service:

  ```
  picgo set uploader
  ```

- Upload the image in current clipboard:

  ```
  picgo upload
  ```

- Upload an image from a specific path:

  ```
  picgo upload {{path/to/image}}
  ```

pickle

A PHP extension installer based on Composer.

More information: https://github.com/FriendsOfPHP/pickle#usage.

- Install a specific PHP extension:

```
pickle install {{extension_name}}
```

- Convert an existing PECL extension configuration to a Pickle configuration file:

```
pickle convert {{path/to/directory}}
```

- Validate a PECL extension:

```
pickle validate {{path/to/directory}}
```

- Package a PECL extension for release:

```
pickle release {{path/to/directory}}
```

pico

Text editor styled after the Alpine Composer.

More information: https://manned.org/pico.

- Start the editor:

```
pico {{path/to/file}}
```

- Start the editor with the cursor located n lines into the file:

```
pico +{{n}} {{path/to/file}}
```

- Start the editor with the cursor shown before the current selection:

```
pico -g {{path/to/file}}
```

- Define the quote string for files such as email:

```
pico -Q "{{quotestring}}" {{path/to/file}}
```

- Enable mouse functionality when run within an `xterm` window:

```
pico -m {{path/to/file}}
```

- Set the operating directory for `pico`:

```
pico -o {{path/to/directory}}
```

- Enable "view only" mode, which disallows any edits:

```
pico -v {{path/to/file}}
```

- Display all files including those beginning with a period:

```
pico -a
```

picocom

Minimal program to emulate serial consoles.

See also: **`minicom`**, **`cu`**, **`tio`**.

More information: https://manned.org/picocom.

- Connect to a serial console with the default baud rate of 9600:

```
sudo picocom {{/dev/ttyXYZ}}
```

- Connect to a serial console with a specified baud rate:

```
sudo picocom {{/dev/ttyXYZ}} {{[-b|--baud]}} {{baud_rate}}
```

- Map special characters (e.g. LF to CRLF):

```
sudo picocom {{/dev/ttyXYZ}} --imap {{lfcrlf}}
```

- Exit picocom:

```
<Ctrl a><Ctrl x>
```

- Display help:

```
picocom {{[-h|--help]}}
```

picom-trans

Set the window opacity for the **picom** window compositor.

More information: https://github.com/yshui/picom/blob/next/man/picom-trans.1.adoc.

- Set the currently focused window opacity to a specific percentage:

```
picom-trans {{[-c|--current]}} {{[-o|--opacity]}} {{percentage}}
```

- Set the opacity of a window with a specific name:

```
picom-trans {{[-n|--name]}} {{Firefox}} {{[-o|--opacity]}} {{percentage}}
```

- Set the opacity of a specific window selected via mouse cursor:

```
picom-trans {{[-s|--select]}} {{[-o|--opacity]}} {{percentage}}
```

- Toggle the opacity of a specific window:

```
picom-trans {{[-n|--name]}} {{Firefox}} {{[-t|--toggle]}}
```

picom

Standalone compositor for Xorg.

More information: https://github.com/yshui/picom/blob/next/man/picom.1.adoc.

- Enable `picom` during a session:

```
picom &
```

- Start `picom` as a background process:

```
picom {{[-b|--daemon]}}
```

- Use a custom configuration file:

```
picom --config {{path/to/config_file}}
```

picotool

Manage Raspberry Pi Pico boards.

More information: https://github.com/raspberrypi/picotool#overview.

- Display information about the currently loaded program on a Pico:

```
picotool info
```

- Load a binary onto a Pico:

```
picotool load {{path/to/binary}}
```

- Convert an ELF or BIN file to UF2:

```
picotool uf2 convert {{path/to/elf_or_bin}} {{path/to/output}}
```

- Reboot a Pico:

```
picotool reboot
```

- List all known registers:

```
picotool otp list
```

- Display help:

```
picotool help
```

- Display version:

```
picotool version
```

picttoppm

Convert a Macintosh PICT file to a PPM image.

More information: https://netpbm.sourceforge.net/doc/picttoppm.html.

- Convert a PICT file to a PPM image:

```
picttoppm {{path/to/file.pict}} > {{path/to/file.ppm}}
```

- Force any images in the PICT file to be output at full resolution:

```
picttoppm {{[-fu|-fullres]}} {{path/to/file.pict}} > {{path/to/file.ppm}}
```

- Do not assume that the input file contains a PICT header and execute quickdraw operations only:

```
picttoppm {{[-n|-noheader]}} {{[-quic|-quickdraw]}} {{path/to/file.pict}} > {{path/to/file.ppm}}
```

pie

The PHP Installer for Extensions.

More information: https://github.com/php/pie/blob/1.4.x/docs/usage.md.

- Install or update an extension:

```
pie install {{vendor}}/{{extension}}
```

- List installed extensions and their versions:

```
pie show
```

- Display information about a specific package:

```
pie info {{vendor}}/{{extension}}
```

- List the configured repositories:

```
pie repository:list
```

- Add a repository:

```
pie repository:add {{type}} {{url}}
```

- Remove a repository:

```
pie repository:remove {{url}}
```

pigz

Multithreaded zlib compression utility.

More information: https://manned.org/pigz.

- Compress a file with default options:

```
pigz {{path/to/file}}
```

- Compress a file using the best compression method:

```
pigz {{[-9|--best]}} {{path/to/file}}
```

- Compress a file using no compression and 4 processors:

```
pigz -0 {{[-p|--processes]}} {{4}} {{path/to/file}}
```

- Compress a directory using `tar`:

```
tar cf - {{path/to/directory}} | pigz > {{path/to/
file.tar.gz}}
```

- Decompress a file:

```
pigz {{[-d|--decompress]}} {{archive.gz}}
```

- List the contents of an archive:

```
pigz {{[-l|--list]}} {{archive.tar.gz}}
```

ping

Send ICMP ECHO_REQUEST packets to network hosts.

See also: **`mtr`**.

More information: https://manned.org/ping.

- Ping a host with IP `10.0.0.1` (Note: `10.0.0.1` can be shortened to `10.1`):

```
ping 10.0.0.1
```

- Ping a host only a specific number of times:

```
ping -c {{count}} {{host}}
```

- Ping host, specifying the interval in seconds between requests (default is 1 second):

```
ping -i {{seconds}} {{host}}
```

- Ping host without trying to look up symbolic names for addresses:

```
ping -n {{host}}
```

- Ping host and ring the bell when a packet is received (if your terminal supports it):

```
ping -a {{host}}
```

- Also display a message if no response was received:

```
ping -O {{host}}
```

- Ping a host with specific [c]ount of pings, per-packet time to [W]ait for a response, and total [w]ait time limit of the entire ping run:

```
ping -c {{count}} -W {{seconds}} -w {{seconds}} {{host}}
```

- Ping all IPv6 local network hosts:

```
ping -6 ff02::1%{{eth0}}
```

ping.py

Check if an IPv4 host is reachable using ICMP.

Sends ICMP echo requests and listens for echo replies.

Note: Requires root privileges for raw socket access (e.g., run with **sudo**).

Part of the Impacket suite.

More information: https://github.com/fortra/impacket.

- Ping a host from a specified source IPv4 address:

```
ping.py {{source_ipv4}} {{destination_ipv4}}
```

- Ping 192.168.1.100 from 192.168.1.10:

```
ping.py 192.168.1.10 192.168.1.100
```

ping6

Send ICMP ECHO_REQUEST packets to network hosts via IPv6 address.

Note: **`ping6`** has been merged to **`ping`** in modern systems.

More information: https://manned.org/ping6.

- Ping a host:

```
ping6 {{host}}
```

- Ping a host only a specific number of times:

```
ping6 -c {{count}} {{host}}
```

- Ping a host, specifying the interval in seconds between requests (default is 1 second):

```
ping6 -i {{seconds}} {{host}}
```

- Ping a host without trying to look up symbolic names for addresses:

```
ping6 -n {{host}}
```

- Ping a host and ring the bell when a packet is received (if your terminal supports it):

```
ping6 -a {{host}}
```

ping6.py

Check if an IPv6 host is reachable using ICMPv6.

Sends ICMPv6 echo requests and listens for echo replies.

Note: Requires root privileges for raw socket access (e.g., run with **sudo**).

Part of the Impacket suite.

More information: https://github.com/fortra/impacket.

- Ping an IPv6 host from a specified source IPv6 address:

```
ping6.py {{source_ipv6}} {{destination_ipv6}}
```

- Ping 2001:db8::2 from 2001:db8::1:

```
ping6.py 2001:db8::1 2001:db8::2
```

pinky

Print user information using the **`finger`** protocol.

More information: https://manned.org/pinky.

- Display details about the current user:

```
pinky
```

- Display details for a specific user:

```
pinky {{user}}
```

- Display details in the long format:

```
pinky {{user}} -l
```

- Omit the user's home directory and shell in long format:

```
pinky {{user}} -lb
```

- Omit the user's project file in long format:

```
pinky {{user}} -lh
```

- Omit the column headings in short format:

```
pinky {{user}} -f
```

pint

An opinionated PHP code style fixer based on PHP-CS-Fixer.

More information: https://laravel.com/docs/pint.

- Execute code style fixing:

  ```
  pint
  ```

- Display all files that are changed:

  ```
  pint -v
  ```

- Execute code style linting without applying changes:

  ```
  pint --test
  ```

- Execute code style fixes using a specific configuration file:

  ```
  pint --config {{path/to/pint.json}}
  ```

- Execute code style fixes using a specific preset:

  ```
  pint --preset {{psr12}}
  ```

pinta

A free, open source program for drawing and image editing.

More information: https://www.pinta-project.com/user-guide/overview/.

- Start Pinta:

```
pinta
```

- Open specific files:

```
pinta {{path/to/image1 path/to/image2 ...}}
```

pio access

Set the access level on published resources (packages) in the registry.

More information: https://docs.platformio.org/en/latest/core/userguide/access/.

- Grant a user access to a resource:

```
pio access grant {{guest|maintainer|admin}} {{username}}
{{resource_urn}}
```

- Remove a user's access to a resource:

```
pio access revoke {{username}} {{resource_urn}}
```

- Show all resources that a user or team has access to and the access level:

```
pio access list {{username}}
```

- Restrict access to a resource to specific users or team members:

```
pio access private {{resource_urn}}
```

- Allow all users access to a resource:

```
pio access public {{resource_urn}}
```

pio account

Manage your PlatformIO account.

More information: https://docs.platformio.org/en/latest/core/userguide/account/.

- Register a new PlatformIO account:

```
pio account register {{[-u|--username]}} {{username}} {{[-e|--email]}} {{email}} {{[-p|--password]}} {{password}} --firstname {{firstname}} --lastname {{lastname}}
```

- Permanently delete your PlatformIO account and related data:

```
pio account destroy
```

- Log in to your PlatformIO account:

```
pio account login {{[-u|--username]}} {{username}} {{[-p|--password]}} {{password}}
```

- Log out of your PlatformIO account:

```
pio account logout
```

- Update your PlatformIO profile:

```
pio account update {{[-u|--username]}} {{username}} {{[-e|--email]}} {{email}} --firstname {{firstname}} --lastname {{lastname}} --current-password {{password}}
```

- Show detailed information about your PlatformIO account:

```
pio account show
```

- Reset your password using your username or email:

```
pio account forgot {{[-u|--username]}} {{username_or_email}}
```

pio boards

List pre-configured embedded boards available in PlatformIO.

More information: https://docs.platformio.org/en/latest/core/userguide/cmd_boards.html.

- List all available boards:

```
pio boards
```

- List only boards from installed platforms:

```
pio boards --installed
```

pio check

Perform a static analysis check on a PlatformIO project.

More information: https://docs.platformio.org/en/latest/core/userguide/cmd_check.html.

- Perform a basic analysis check on the current project:

```
pio check
```

- Perform a basic analysis check on a specific project:

```
pio check {{[-d|--project-dir]}} {{project_directory}}
```

- Perform an analysis check for a specific environment:

```
pio check {{[-e|--environment]}} {{environment}}
```

- Perform an analysis check and only report a specified defect severity type:

```
pio check --severity {{low|medium|high}}
```

- Perform an analysis check and show detailed information when processing environments:

```
pio check {{[-v|--verbose]}}
```

pio ci

Build PlatformIO projects with an arbitrary source code structure.

This will create a new temporary project which the source code will be copied into.

More information: https://docs.platformio.org/en/latest/core/userguide/cmd_ci.html.

- Build a PlatformIO project in the default system temporary directory and delete it afterwards:

  ```
  pio ci {{path/to/project}}
  ```

- Build a PlatformIO project and specify specific libraries:

  ```
  pio ci {{[-l|--lib]}} {{path/to/library_directory}} {{path/to/project}}
  ```

- Build a PlatformIO project and specify a specific board (`pio boards` lists all of them):

  ```
  pio ci {{[-b|--board]}} {{board}} {{path/to/project}}
  ```

- Build a PlatformIO project in a specific directory:

  ```
  pio ci --build-dir {{path/to/build_directory}} {{path/to/project}}
  ```

- Build a PlatformIO project and don't delete the build directory:

  ```
  pio ci --keep-build-dir {{path/to/project}}
  ```

- Build a PlatformIO project using a specific configuration file:

  ```
  pio ci {{[-c|--project-conf]}} {{path/to/platformio.ini}}
  ```

pio debug

Debug PlatformIO projects.

More information: https://docs.platformio.org/en/latest/core/userguide/cmd_debug.html.

- Debug the PlatformIO project in the current directory:

```
pio debug
```

- Debug a specific PlatformIO project:

```
pio debug {{[-d|--project-dir]}} {{path/to/
platformio_project}}
```

- Debug a specific environment:

```
pio debug {{[-e|--environment]}} {{environment}}
```

- Debug a PlatformIO project using a specific configuration file:

```
pio debug {{[-c|--project-conf]}} {{path/to/platformio.ini}}
```

- Debug a PlatformIO project using the `gdb` debugger:

```
pio debug --interface {{gdb}} {{gdb_options}}
```

pio device

Manage and monitor PlatformIO devices.

More information: https://docs.platformio.org/en/latest/core/userguide/device/.

- List all available serial ports:

```
pio device list
```

- List all available logical devices:

```
pio device list --logical
```

- Start an interactive device monitor:

```
pio device monitor
```

- Start an interactive device monitor and listen to a specific port:

```
pio device monitor {{[-p|--port]}} {{/dev/ttyUSBX}}
```

- Start an interactive device monitor and set a specific baud rate (defaults to 9600):

```
pio device monitor {{[-b|--baud]}} {{57600}}
```

- Start an interactive device monitor and set a specific EOL character (defaults to CRLF):

```
pio device monitor --eol {{CRLF|CR|LF}}
```

- Go to the menu of the interactive device monitor:

```
<Ctrl t>
```

pio home

Launch the PlatformIO Home web server.

More information: https://docs.platformio.org/en/latest/core/userguide/cmd_home.html.

- Open PlatformIO Home in the default web browser:

```
pio home
```

- Use a specific HTTP port (defaults to 8008):

```
pio home --port {{port}}
```

- Bind to a specific IP address (defaults to 127.0.0.1):

```
pio home --host {{ip_address}}
```

- Do not automatically open PlatformIO Home in the default web browser:

```
pio home --no-open
```

- Automatically shutdown the server on timeout (in seconds) when no clients are connected:

```
pio home --shutdown-timeout {{time}}
```

- Specify a unique session identifier to keep PlatformIO Home isolated from other instances and protected from 3rd party access:

```
pio home --session-id {{session_id}}
```

pio init

This command is an alias of **`pio project init`**.

- View documentation for the original command:

  ```
  tldr pio project
  ```

pio lib

Manage PlatformIO libraries.

More information: https://docs.platformio.org/en/latest/core/userguide/lib/.

- List installed libraries:

```
pio lib list
```

- List built-in libraries based on installed development platforms and their frameworks:

```
pio lib builtin
```

- Search for existing libraries:

```
pio lib search {{keyword}}
```

- Show details about a library:

```
pio lib show {{library}}
```

- Install a library:

```
pio lib install {{library}}
```

- Update installed libraries:

```
pio lib update
```

- Uninstall a library:

```
pio lib uninstall {{library}}
```

- Show PlatformIO library registry statistics:

```
pio lib stats
```

pio org

Manage PlatformIO organizations and their owners.

More information: https://docs.platformio.org/en/latest/core/userguide/org/.

- Create a new organization:

```
pio org create {{organization_name}}
```

- Delete an organization:

```
pio org destroy {{organization_name}}
```

- Add a user to an organization:

```
pio org add {{organization_name}} {{username}}
```

- Remove a user from an organization:

```
pio org remove {{organization_name}} {{username}}
```

- List all organizations the current user is a member of and their owners:

```
pio org list
```

- Update the name, email, or display name of an organization:

```
pio org update --orgname {{new_organization_name}} --email
{{new_email}} --displayname {{new_display_name}}
{{organization_name}}
```

pio pkg

Manage packages in the registry.

Packages can only be removed within 72 hours (3 days) from the date that they are published.

More information: https://docs.platformio.org/en/latest/core/userguide/package/.

- Create a package tarball from the current directory:

```
pio pkg pack {{[-o|--output]}} {{path/to/package.tar.gz}}
```

- Create and publish a package tarball from the current directory:

```
pio pkg publish
```

- Publish the current directory and restrict public access to it:

```
pio pkg publish --private
```

- Publish a package:

```
pio pkg publish {{path/to/package.tar.gz}}
```

- Publish a package with a custom release date (UTC):

```
pio pkg publish {{path/to/package.tar.gz}} --released-at
"{{2021-04-08 21:15:38}}"
```

- Remove all versions of a published package from the registry:

```
pio pkg unpublish {{package}}
```

- Remove a specific version of a published package from the registry:

```
pio pkg unpublish {{package}}@{{version}}
```

- Undo the removal, putting all versions or a specific version of the package back into the registry:

```
pio pkg unpublish --undo {{package}}@{{version}}
```

pio platform

Manage PlatformIO development platforms.

More information: https://docs.platformio.org/en/latest/core/userguide/platforms/.

- List all installed development platforms:

```
pio platform list
```

- Search for existing development platforms:

```
pio platform search {{platform}}
```

- Show details about a development platform:

```
pio platform show {{platform}}
```

- Install a development platform:

```
pio platform install {{platform}}
```

- Update installed development platforms:

```
pio platform update
```

- Uninstall a development platform:

```
pio platform uninstall {{platform}}
```

- List all supported frameworks:

```
pio platform frameworks
```

pio project

Manage PlatformIO projects.

More information: https://docs.platformio.org/en/latest/core/userguide/project/.

- Initialize a new PlatformIO project:

```
pio project init
```

- Initialize a new PlatformIO project in a specific directory:

```
pio project init {{[-d|--project-dir]}} {{path/to/
project_directory}}
```

- Initialize a new PlatformIO project, specifying a board ID:

```
pio project init {{[-b|--board]}} {{ATmega328P|uno|...}}
```

- Initialize a new PlatformIO based project, specifying one or more project options:

```
pio project init {{[-O|--project-option]}} "{{option}}
={{value}}" {{[-O|--project-option]}} "{{option}}={{value}}"
```

- Print the configuration of a project:

```
pio project config
```

pio remote

Helper command for PlatformIO Remote Development.

`pio remote [command]` takes the same arguments as its locally executing counterpart **`pio [command]`**.

More information: https://docs.platformio.org/en/latest/core/userguide/remote/index.html.

- List all active Remote Agents:

  ```
  pio remote agent list
  ```

- Start a new Remote Agent with a specific name and share it with friends:

  ```
  pio remote agent start {{[-n|--name]}} {{agent_name}} {{[-s|--share]}} {{example1@example.com}} {{[-s|--share]}} {{example2@example.com}}
  ```

- List devices from specified Agents (omit `--agent` to specify all Agents):

  ```
  pio remote --agent {{agent_name1}} --agent {{agent_name2}} device list
  ```

- Connect to the serial port of a remote device:

  ```
  pio remote --agent {{agent_name}} device monitor
  ```

- Run all targets on a specified Agent:

  ```
  pio remote --agent {{agent_name}} run
  ```

- Update installed core packages, development platforms, and global libraries on a specific Agent:

  ```
  pio remote --agent {{agent_name}} update
  ```

- Run all tests in all environments on a specific Agent:

  ```
  pio remote --agent {{agent_name}} test
  ```

pio run

Run PlatformIO project targets.

More information: https://docs.platformio.org/en/latest/core/userguide/cmd_run.html.

- List all available project targets:

```
pio run --list-targets
```

- List all available project targets of a specific environment:

```
pio run --list-targets {{[-e|--environment]}} {{environment}}
```

- Run all targets:

```
pio run
```

- Run all targets of specified environments:

```
pio run {{[-e|--environment]}} {{environment1}} {{[-e|--environment]}} {{environment2}}
```

- Run specified targets:

```
pio run {{[-t|--target]}} {{target1}} {{[-t|--target]}} {{target2}}
```

- Run the targets of a specified configuration file:

```
pio run {{[-c|--project-conf]}} {{path/to/platformio.ini}}
```

pio settings

View and modify PlatformIO settings.

More information: https://docs.platformio.org/en/latest/core/userguide/cmd_settings.html.

- Display the names, values, and descriptions of all PlatformIO settings:

```
pio settings get
```

- Display the name, value, and description of a specific PlatformIO setting:

```
pio settings get {{setting}}
```

- Set a specific setting value:

```
pio settings set {{setting}} {{value}}
```

- Reset the values of all modified settings to their factory defaults:

```
pio settings reset
```

pio system

Miscellaneous system commands for PlatformIO.

More information: https://docs.platformio.org/en/latest/core/userguide/system/.

- Install shell completion for the current shell (supports Bash, fish, Zsh, and PowerShell):

```
pio system completion install
```

- Uninstall shell completion for the current shell:

```
pio system completion uninstall
```

- Display system-wide PlatformIO information:

```
pio system info
```

- Remove unused PlatformIO data:

```
pio system prune
```

- Remove only cached data:

```
pio system prune --cache
```

- Simulate pruning, listing unused PlatformIO data that would be removed:

```
pio system prune --dry-run
```

pio team

Manage PlatformIO teams.

More information: https://docs.platformio.org/en/latest/core/userguide/team/.

- Create a new team with the specified description:

```
pio team create --description {{description}}
{{organization_name}}:{{team_name}}
```

- Delete a team:

```
pio team destroy {{organization_name}}:{{team_name}}
```

- Add a new user to a team:

```
pio team add {{organization_name}}:{{team_name}} {{username}}
```

- Remove a user from a team:

```
pio team remove {{organization_name}}:{{team_name}}
{{username}}
```

- List all teams that the user is part of and their members:

```
pio team list
```

- List all teams in an organization:

```
pio team list {{organization_name}}
```

- Rename a team:

```
pio team update --name {{new_team_name}}
{{organization_name}}:{{team_name}}
```

- Change the description of a team:

```
pio team update --description {{new_description}}
{{organization_name}}:{{team_name}}
```

pio test

Run local tests on a PlatformIO project.

More information: https://docs.platformio.org/en/latest/core/userguide/cmd_test.html.

- Run all tests in all environments of the current PlatformIO project:

```
pio test
```

- Test only specific environments:

```
pio test {{[-e|--environment]}} {{environment1}} {{[-e|--environment]}} {{environment2}}
```

- Run only tests whose name matches a specific `glob` pattern:

```
pio test {{[-f|--filter]}} "{{pattern}}"
```

- Ignore tests whose name matches a specific `glob` pattern:

```
pio test {{[-i|--ignore]}} "{{pattern}}"
```

- Specify a port for firmware uploading:

```
pio test --upload-port {{upload_port}}
```

- Specify a custom configuration file for running the tests:

```
pio test {{[-c|--project-conf]}} {{path/to/platformio.ini}}
```

pio update

Update installed PlatformIO Core packages, development platforms, and global libraries.

More information: https://docs.platformio.org/en/latest/core/userguide/cmd_update.html.

- Perform a full update of all packages, development platforms, and global libraries:

```
pio update
```

- Update core packages only (skips platforms and libraries):

```
pio update --core-packages
```

- Simulate an update, checking for new versions of packages, platforms, and libraries without updating them:

```
pio update --dry-run
```

pio upgrade

Update PlatformIO to the latest version.

More information: https://docs.platformio.org/en/latest/core/userguide/cmd_upgrade.html.

- Update PlatformIO to the latest version:

```
pio upgrade
```

- Update PlatformIO to the latest development (unstable) version:

```
pio upgrade --dev
```

pio

Development environment for embedded boards.

Some subcommands such as **`run`** have their own usage documentation.

More information: https://docs.platformio.org/en/latest/core/userguide/.

- Display help and list subcommands:

```
pio {{[-h|--help]}}
```

- Display help for a specific subcommand:

```
pio {{subcommand}} {{[-h|--help]}}
```

- Display version:

```
pio --version
```

piodebuggdb

This command is an alias of **`pio debug --interface gdb`**.

- View documentation for the original command:

  ```
  tldr pio debug
  ```

pip cache

Inspect and manage pip's wheel cache.

More information: https://pip.pypa.io/en/stable/cli/pip_cache/.

- Show the location of the pip cache directory:

```
pip cache dir
```

- List filenames of all packages currently stored in the cache:

```
pip cache list
```

- Remove all files from the pip cache:

```
pip cache purge
```

- Remove cached files matching a specific package name:

```
pip cache remove {{package_name}}
```

pip check

Check installed packages for broken or incompatible dependencies.

More information: https://pip.pypa.io/en/stable/cli/pip_check/.

- Check for broken or missing requirements:

```
pip check
```

- Check and log output to a file:

```
pip check --log {{path/to/file}}
```

pip config

Manage local and global configuration for pip.

More information: https://pip.pypa.io/en/stable/cli/pip_config/.

- List all configuration values:

```
pip config list
```

- Show configuration files and their values:

```
pip config debug
```

- Set the value for a command option:

```
pip config set {{command.option}} {{value}} {{--global|--user|--site}}
```

- Get the value for a command option:

```
pip config get {{command.option}} {{--global|--user|--site}}
```

- Unset the value for a command option:

```
pip config unset {{command.option}} {{--global|--user|--site}}
```

- Edit the configuration file with the default editor:

```
pip config edit {{--global|--user|--site}}
```

- Edit the configuration file with a specific editor:

```
pip config edit {{--global|--user|--site}} --editor {{path/to/editor_binary}}
```

pip debug

Display debug information about the current pip environment and configuration.

Intended for debugging; options and output may change without notice.

More information: https://pip.pypa.io/en/stable/cli/pip_debug/.

- Show general debug information:

```
pip debug
```

- Show debug information for a specific platform:

```
pip debug --platform {{platform}}
```

- Show debug information for a specific Python version:

```
pip debug --python-version {{version}}
```

- Show debug information for a specific Python implementation:

```
pip debug --implementation {{implementation}}
```

- Show debug information for a specific ABI:

```
pip debug --abi {{abi}}
```

pip download

Download Python packages without installing them.

More information: https://pip.pypa.io/en/stable/cli/pip_download/.

- Download a package wheel or source archive to the current directory:

```
pip download {{package}}
```

- Download a specific version of a package:

```
pip download {{package}}=={{version}}
```

- Download a package and its dependencies to a specific directory:

```
pip download {{package}} {{[-d|--dest]}} {{path/to/
directory}}
```

- Download a package for a specific platform and Python version:

```
pip download {{package}} --only-binary :all: --platform
{{platform}} --python-version {{version}}
```

- Download a package from a specific index URL:

```
pip download {{package}} {{[-i|--index-url]}} {{url}}
```

pip freeze

List installed packages in requirements format.

More information: https://pip.pypa.io/en/stable/cli/pip_freeze/.

- List installed packages:

```
pip freeze
```

- Write installed packages to the `requirements.txt` file:

```
pip freeze > requirements.txt
```

- List installed packages in a virtual environment, excluding globally installed packages:

```
pip freeze {{[-l|--local]}}
```

- List installed packages in the user-site:

```
pip freeze --user
```

- List all packages, including `pip`, `distribute`, `setuptools`, and `wheel` (they are skipped by default):

```
pip freeze --all
```

pip hash

Compute hashes of package archives for verification.

More information: https://pip.pypa.io/en/stable/cli/pip_hash/.

- Generate hash for a package file:

```
pip hash {{path/to/package.whl}}
```

- Generate hash using a specific algorithm:

```
pip hash {{[-a|--algorithm]}} {{sha256|sha384|sha512|...}} {{path/to/package.whl}}
```

- Generate hashes for multiple files:

```
pip hash {{path/to/package1.whl path/to/package2.whl ...}}
```

- Generate hash for downloaded archive:

```
pip hash {{path/to/package.tar.gz}}
```

pip index

Inspect information available from package indexes.

More information: https://pip.pypa.io/en/stable/cli/pip_index/.

- List all available versions of a package:

```
pip index versions {{package}}
```

- List versions from a specific index:

```
pip index versions {{package}} --index-url {{https://test.pypi.org/simple/}}
```

- Include pre-release versions:

```
pip index versions {{package}} --pre
```

- Include an additional index:

```
pip index versions {{package}} --extra-index-url {{https://example.com/simple/}}
```

- List versions for a specific platform:

```
pip index versions {{package}} --platform {{linux_x86_64}}
```

pip inspect

Inspect the Python environment and produce a report in JSON format.

More information: https://pip.pypa.io/en/stable/cli/pip_inspect/.

- Inspect the current environment:

```
pip inspect
```

- Inspect and save output to a file:

```
pip inspect > {{environment_report.json}}
```

- Inspect only locally installed packages (not global):

```
pip inspect --local
```

- Inspect only user-installed packages:

```
pip inspect --user
```

- Inspect packages in a specific path:

```
pip inspect --path {{path/to/environment}}
```

- Inspect with verbose output (Note: the `-v` flag can be repeated to increase verbosity):

```
pip inspect {{[-v|--verbose]}}
```

pip install

Install Python packages.

More information: https://pip.pypa.io/en/stable/cli/pip_install/.

- Install one or more packages:

```
pip install {{package1 package2 ...}}
```

- Upgrade all specified packages to the latest version, installing any that are not already present:

```
pip install {{package1 package2 ...}} {{[-U|--upgrade]}}
```

- Install a specific version of a package:

```
pip install {{package}}=={{version}}
```

- Install packages listed in a file:

```
pip install {{[-r|--requirement]}} {{path/to/
requirements.txt}}
```

- Install a package from a local archive or directory:

```
pip install {{path/to/file.whl|path/to/file.tar.gz|path/to/
directory}}
```

- Install a package from a Git repository:

```
pip install git+https://{{example.com}}/{{user}}/
{{repository}}.git
```

- Install a package from an alternative source (URL or directory) instead of PyPI:

```
pip install {{[-f|--find-links]}} {{url|path/to/directory}}
{{package}}
```

- Install the local package in the current directory in develop (editable) mode:

```
pip install {{[-e|--editable]}} .
```

pip list

List installed Python packages.

More information: https://pip.pypa.io/en/stable/cli/pip_list/.

- List installed packages:

```
pip list
```

- List outdated packages that can be upgraded:

```
pip list {{[-o|--outdated]}}
```

- List up-to-date packages:

```
pip list {{[-u|--uptodate]}}
```

- List packages with JSON formatting:

```
pip list --format json
```

- List packages that are not required by other packages:

```
pip list --not-required
```

- List packages installed in user-site only:

```
pip list --user
```

- List packages and exclude editable packages from output:

```
pip list --exclude-editable
```

- List packages in freeze format (unlike `pip freeze`, does not show editable install information):

```
pip list --format freeze
```

pip lock

Lock Python packages and their dependencies into a reproducible file.

Experimental feature of **`pip`**.

More information: https://pip.pypa.io/en/stable/cli/pip_lock/.

- Generate a `pylock.toml` for the current project:

  ```
  pip lock {{[-e|--editable]}} .
  ```

- Lock dependencies from a requirements file:

  ```
  pip lock {{[-r|--requirement]}} {{path/to/requirements.txt}}
  ```

- Specify a custom output file for the lock:

  ```
  pip lock {{[-o|--output]}} {{path/to/lockfile.toml}}
  ```

- Lock a specific package and its dependencies:

  ```
  pip lock {{package}}
  ```

pip search

Search for Python packages by name or summary.

Doesn't work with PyPI; may work with other package indexes.

More information: https://pip.pypa.io/en/stable/cli/pip_search/.

- Search for packages using a custom package index:

```
pip search {{[-i|--index]}} {{example.com}} {{query}}
```

pip show

Show information about installed packages.

More information: https://pip.pypa.io/en/stable/cli/pip_show/.

- Show information about a package:

```
pip show {{package}}
```

- Show all information about a package:

```
pip show {{[-v|--verbose]}} {{package}}
```

- Show all installed files for a package:

```
pip show {{[-f|--files]}} {{package}}
```

pip uninstall

Uninstall Python packages.

More information: https://pip.pypa.io/en/stable/cli/pip_uninstall/.

- Uninstall a package:

```
pip uninstall {{package}}
```

- Uninstall packages listed in a specific file:

```
pip uninstall {{[-r|--requirement]}} {{path/to/
requirements.txt}}
```

- Uninstall package without asking for confirmation:

```
pip uninstall {{[-y|--yes]}} {{package}}
```

pip wheel

Build wheel archives for packages and dependencies.

More information: https://pip.pypa.io/en/stable/cli/pip_wheel/.

- Build a wheel for a package:

```
pip wheel {{package}}
```

- Build wheels for packages in requirements file:

```
pip wheel {{[-r|--requirement]}} {{path/to/requirements.txt}}
```

- Build wheel to a specific directory:

```
pip wheel {{package}} {{[-w|--wheel-dir]}} {{path/to/
directory}}
```

- Build wheel without dependencies:

```
pip wheel {{package}} --no-deps
```

- Build wheel from local project:

```
pip wheel {{path/to/project}}
```

- Build wheel from Git repository:

```
pip wheel git+{{https://github.com/user/repo.git}}
```

pip

Python package manager.

Some subcommands such as **`install`** have their own usage documentation.

More information: https://pip.pypa.io/en/stable/cli/pip/.

- Install a package (see `pip install` for more install examples):

```
pip install {{package}}
```

- Install a package to the user's directory instead of the system-wide default location:

```
pip install --user {{package}}
```

- Upgrade a package:

```
pip install {{[-U|--upgrade]}} {{package}}
```

- Uninstall a package:

```
pip uninstall {{package}}
```

- Save installed packages to file:

```
pip freeze > {{requirements.txt}}
```

- List installed packages:

```
pip list
```

- Show installed package info:

```
pip show {{package}}
```

- Install packages from a file:

```
pip install {{[-r|--requirement]}} {{requirements.txt}}
```

pip3

This command is an alias of **pip**.

- View documentation for the original command:

```
tldr pip
```

pipenv

Simple and unified Python development workflow.

Manage packages and the virtual environment for a project.

More information: https://pypi.org/project/pipenv.

- Create a new project:

  ```
  pipenv
  ```

- Create a new project using Python 3:

  ```
  pipenv --three
  ```

- Install a package:

  ```
  pipenv install {{package}}
  ```

- Install all the dependencies for a project:

  ```
  pipenv install
  ```

- Install all the dependencies for a project (including dev packages):

  ```
  pipenv install --dev
  ```

- Uninstall a package:

  ```
  pipenv uninstall {{package}}
  ```

- Start a shell within the created virtual environment:

  ```
  pipenv shell
  ```

- Generate a `requirements.txt` (list of dependencies) for a project:

  ```
  pipenv lock --requirements
  ```

piper-tts

This command is an alias of **piper**.

- View documentation for the original command:

```
tldr piper
```

piper

A fast, local neural text to speech system.

Try out and download speech models from https://rhasspy.github.io/piper-samples.

More information: https://github.com/OHF-Voice/piper1-gpl.

- Output a WAV [f]ile using a text-to-speech [m]odel (assuming a configuration file at model_path + `.json`):

```
echo {{Thing to say}} | piper -m {{path/to/model.onnx}} -f
{{outputfile.wav}}
```

- Output a WAV [f]ile using a [m]odel and specifying its JSON [c]onfig file:

```
echo {{Thing to say}} | piper -m {{path/to/model.onnx}} -c
{{path/to/model.onnx.json}} -f {{outputfile.wav}}
```

- Select a particular speaker in a voice with multiple speakers by specifying the speaker's ID number:

```
echo {{Warum?}} | piper -m {{de_DE-thorsten_emotional-
medium.onnx}} --speaker {{1}} -f {{angry.wav}}
```

- Stream the output to the mpv media player:

```
echo {{Hello world}} | piper -m {{en_GB-
northern_english_male-medium.onnx}} --output-raw -f - | mpv -
```

- Speak twice as fast, with huge gaps between sentences:

```
echo {{Speaking twice the speed. With added drama!}} | piper
-m {{file.onnx}} --length_scale {{0.5}} --sentence_silence
{{2}} -f {{drama.wav}}
```

pipes.sh

A Bash script which draws randomly pathed pipes over the terminal.

See also: **`cmatrix`**, **`cbonsai`**, **`asciiquarium`**.

More information: https://github.com/pipeseroni/pipes.sh#options.

- Change the pa[t]tern of the pipes:

```
pipes.sh -t {{0..9}}
```

- Change the [c]olor of the pipes:

```
pipes.sh -c {{0..7}}
```

- Change the [f]ramerate of the pipes:

```
pipes.sh -f {{20..100}}
```

- Disable [C]olors:

```
pipes.sh -C
```

- Display [v]ersion:

```
pipes.sh -v
```

pipx

Install and run Python applications in isolated environments.

More information: https://manned.org/pipx.

- Run an app in a temporary virtual environment:

```
pipx run {{pycowsay}} {{moo}}
```

- Install a package in a virtual environment and add entry points to path:

```
pipx install {{package}}
```

- Uninstall a package:

```
pipx uninstall {{package}}
```

- List installed packages:

```
pipx list
```

- Run an app in a temporary virtual environment with a package name different from the executable:

```
pipx run --spec {{httpx-cli}} {{httpx}} {{http://
www.github.com}}
```

- Inject dependencies into an existing virtual environment:

```
pipx inject {{package}} {{dependency1 dependency2 ...}}
```

- Install a package in a virtual environment with pip arguments:

```
pipx install --pip-args='{{pip-args}}' {{package}}
```

- Upgrade/reinstall/uninstall all installed packages:

```
pipx {{upgrade-all|uninstall-all|reinstall-all}}
```

pixi config

Manage the configuration file.

More information: https://pixi.sh/latest/reference/cli/#config.

- Edit the configuration file:

```
pixi config edit
```

- List all configurations:

```
pixi config list
```

- Prepend a value to a list configuration key:

```
pixi config prepend {{key}} {{value}}
```

- Append a value to a list configuration key:

```
pixi config append {{key}} {{value}}
```

- Set a configuration key to a value:

```
pixi config set {{key}} {{value}}
```

- Unset a configuration key:

```
pixi config unset {{key}}
```

pixi global

Manage global packages.

More information: https://pixi.sh/latest/reference/cli/#global.

- Install a package globally and add to path:

```
pixi global install {{package1 package2 ...}}
```

- Uninstall a package globally:

```
pixi global remove {{package1 package2 ...}}
```

- List all globally installed packages:

```
pixi global list
```

- Update a globally installed package:

```
pixi global upgrade {{package}}
```

- Update all globally installed packages:

```
pixi global upgrade-all
```

pixi project

Modify the project configuration file.

More information: https://pixi.sh/latest/reference/cli/#project.

- Manage project channels:

```
pixi project channel {{command}}
```

- Manage project description:

```
pixi project description {{command}}
```

- Manage project platform:

```
pixi project platform {{command}}
```

- Manage project version:

```
pixi project version {{command}}
```

- Manage project environment:

```
pixi project environment {{command}}
```

pixi task

Manage tasks in the project environment.

More information: https://pixi.sh/latest/reference/cli/#task.

- Create a new task:

```
pixi task add {{task_name}} {{task_command}}
```

- List all tasks in the project:

```
pixi task list
```

- Remove a task:

```
pixi task remove {{task_name}}
```

- Create an alias for a task:

```
pixi task alias {{alias_name}} {{task1 task2 ...}}
```

pixi

Developer Workflow and Environment Management for projects.

More information: https://pixi.prefix.dev/latest/getting_started/.

- Initialize a new project:

```
pixi init {{path/to/project}}
```

- Add project dependencies:

```
pixi add {{dependency1 dependency2 ...}}
```

- Start a pixi shell in the project environment:

```
pixi shell
```

- Run a task in the project environment:

```
pixi run {{task}}
```

- Manage tasks in the project environment:

```
pixi task {{command}}
```

- Clean environment and task cache:

```
pixi clean
```

- Display help:

```
pixi {{command}} --help
```

pixiecore

Manage the network booting of machines.

More information: https://github.com/danderson/netboot/tree/main/pixiecore.

- Start a PXE boot server which provides a `netboot.xyz` boot image:

```
pixiecore {{quick}} xyz --dhcp-no-bind
```

- Start a new PXE boot server which provides an Ubuntu boot image:

```
pixiecore {{quick}} ubuntu --dhcp-no-bind
```

- List all available boot images for quick mode:

```
pixiecore quick --help
```

pixterm

Image printing in the terminal.

See also: **`chafa`**, **`catimg`**.

More information: https://github.com/eliukblau/pixterm#cool-screenshots.

- Render a static image directly in the terminal:

```
pixterm {{path/to/file}}
```

- Use the image's original aspect ratio:

```
pixterm -s 2 {{path/to/file}}
```

- Specify a custom aspect ratio using a specific number of [t]erminal [r]ows and [c]olumns:

```
pixterm -tr {{24}} -tc {{80}} {{path/to/file}}
```

- Filter the output with a [m]atte background color and character [d]ithering:

```
pixterm -m {{000000}} -d 2 {{path/to/file}}
```

pjtoppm

Convert a HP PaintJet file to PPM.

More information: https://netpbm.sourceforge.net/doc/pjtoppm.html.

- Convert a HP PaintJet file to PPM:

```
pjtoppm {{path/to/input.pj}} > {{path/to/output.ppm}}
```

pkcs11-tool

Utility for managing and using PKCS #11 security tokens.

More information: https://github.com/OpenSC/OpenSC/wiki/Using-pkcs11-tool-and-OpenSSL.

- List slots and their potential token, using a specific module (e.g. `/usr/lib/softhsm/libsofthsm2.so`):

```
pkcs11-tool --module {{path/to/module.so}} {{[-L|--list-slots]}} {{[-T|--list-token-slots]}}
```

- List objects in a specific slot. (Note: `slot_id` is not the slot index shown as "Slot X"):

```
pkcs11-tool {{[-O|--list-objects]}} {{[-p|--pin]}} {{auth_pin}} --slot {{slot_id}}
```

- Create a new object with a specific label and type:

```
pkcs11-tool --slot {{slot_id}} {{[-p|--pin]}} {{auth_pin}} {{[-y|--type]}} {{cert|privkey|pubkey|secrkey|data|...}} {{[-a|--label]}} "{{label}}" {{[-d|--id]}} {{01}} {{[-w|--write-object]}} {{path/to/cert.crt}}
```

- Delete an object by its label and type:

```
pkcs11-tool --slot {{slot_id}} {{[-p|--pin]}} {{auth_pin}} {{[-y|--type]}} {{cert|privkey|pubkey|secrkey|data|...}} {{[-a|--label]}} "{{label}}" {{[-b|--delete-object]}}
```

pkg-config

Provide the details of installed libraries for compiling applications.

More information: https://manned.org/pkg-config.

- Get the list of libraries and their dependencies:

```
pkg-config --libs {{library1 library2 ...}}
```

- Get the list of libraries, their dependencies, and proper cflags for gcc:

```
pkg-config --cflags --libs {{library1 library2 ...}}
```

- Print the version of the linked modules:

```
pkg-config --modversion {{module1 module2 ...}}
```

- Compile your code with libgtk-3, libwebkit2gtk-4.0, and all their dependencies:

```
c++ example.cpp $(pkg-config --cflags --libs gtk+-3.0
webkit2gtk-4.0) -o example
```

pkgz

Unified package manager for multiple sources.

More information: https://github.com/roguehashrate/pkgz#-usage.

- Install a package:

```
pkgz install {{package_name}}
```

- Remove a package:

```
pkgz remove {{package_name}}
```

- Search for a package:

```
pkgz search {{package_name}}
```

- Show how many packages are installed per source:

```
pkgz info
```

- Show where a package is installed or available:

```
pkgz info {{package_name}}
```

- Update all packages in all sources:

```
pkgz update
```

- Remove cache of all supported sources:

```
pkgz clean
```

- Display version:

```
pkgz --version
```

pkill

Signal process by name.

Mostly used for stopping processes.

More information: https://manned.org/pkill.

- Kill all processes which match:

```
pkill "{{process_name}}"
```

- Kill all processes which match their full command instead of just the process name:

```
pkill {{[-f|--full]}} "{{command_name}}"
```

- Force kill matching processes (can't be blocked):

```
pkill {{[-9|-SIGKILL]}} "{{process_name}}"
```

- Send SIGUSR1 signal to processes which match:

```
pkill {{[-10|-SIGUSR1]}} "{{process_name}}"
```

- Kill the main `firefox` process to close the browser:

```
pkill {{[-o|--oldest]}} "{{firefox}}"
```

pkl

Manage, evaluate, and test Pkl configuration modules.

More information: https://pkl-lang.org/main/current/pkl-cli/.

- Evaluate the given Pkl modules and produce their rendering results:

```
pkl eval {{module.pkl}}
```

- Run as a server that communicates over `stdin` and `stdout`:

```
pkl server
```

- Evaluate Pkl modules as tests and produces a report:

```
pkl test {{module.pkl}}
```

- Start a REPL session:

```
pkl repl
```

- Prepare a Pkl project for publishing as a package:

```
pkl project package {{path/to/project_directory}}
```

- Resolve project dependencies and writes the resolved versions to a file at path `PklProject.deps.json`:

```
pkl project resolve {{path/to/project_directory}}
```

planmaker

SoftMaker Office's spreadsheet application.

More information: https://help.softmaker.com/planmaker2026/en/index.html.

- Launch the spreadsheet application with a new blank document:

```
planmaker
```

- Open an existing file with PlanMaker:

```
planmaker {{path/to/file.pmdx}}
```

- Launch PlanMaker with [N]o open documents:

```
planmaker -N
```

plantuml

Create UML diagrams from a plain text language and render them in different formats.

More information: https://plantuml.com/en/command-line.

- Render diagrams to default format (PNG):

```
plantuml {{diagram1.puml}} {{diagram2.puml}}
```

- Render a diagram in given format (e.g. `png`, `pdf`, `svg`, `txt`):

```
plantuml {{[-f|--format]}} {{format}} {{diagram.puml}}
```

- Render all diagrams of a directory:

```
plantuml {{path/to/diagrams}}
```

- Render a diagram to the output directory:

```
plantuml {{[-o|--output-dir]}} {{path/to/output}} {{diagram.puml}}
```

- Render a diagram without storing the diagram's source code (Note: It's stored by default when the `-nometadata` option isn't specified):

```
plantuml -nometadata {{diagram.png}} > {{diagram.puml}}
```

- Retrieve source from a `plantuml` diagram's metadata:

```
plantuml -metadata {{diagram.png}} > {{diagram.puml}}
```

- Render a diagram with the configuration file:

```
plantuml --config {{config.cfg}} {{diagram.puml}}
```

- Display help:

```
plantuml {{[-h|--help]}}
```

platformio

This command is an alias of **pio**.

- View documentation for the original command:

```
tldr pio
```

play

Audio player of SoX - Sound eXchange.

Plays any audio, with audio formats identified by the extension.

More information: https://manned.org/play.

- Play the given audio file:

```
play {{path/to/audio_file}}
```

- Play the given audio files:

```
play {{path/to/audio_file1 path/to/audio_file2 ...}}
```

- Play the given audio at twice the speed:

```
play {{path/to/audio_file}} speed 2.0
```

- Play the given audio in reverse:

```
play {{path/to/audio_file}} reverse
```

plenv

Switch between multiple versions of Perl.

More information: https://github.com/tokuhirom/plenv#name.

- Show the currently selected Perl version and how it was selected:

```
plenv version
```

- List all available installed Perl versions:

```
plenv versions
```

- Set the global Perl version (used unless a local or shell version takes priority):

```
plenv global {{version}}
```

- Set the local application-specific Perl version (used in the current directory and all directories below it):

```
plenv local {{version}}
```

- Set the shell-specific Perl version (used for the current session only):

```
plenv shell {{version}}
```

- Display help:

```
plenv
```

- Display help for a command:

```
plenv help {{command}}
```

plesk

Plesk hosting control panel.

More information: https://docs.plesk.com/en-US/obsidian/cli-linux/plesk-utility.75661/.

- Generate an auto login link for the admin user and print it:

```
plesk login
```

- List all hosted domains:

```
plesk bin domain --list
```

- Start watching for changes in the `panel.log` file:

```
plesk log {{panel.log}}
```

- Start the interactive MySQL console:

```
plesk db
```

- Open the Plesk main configuration file in the default editor:

```
plesk conf {{panel.ini}}
```

- Display version:

```
plesk version
```

plink

PuTTy's command line utility.

See also: **ssh**.

More information: https://manned.org/plink.

- Connect to an address:

```
plink {{ip_address}}
```

plocate

Find filenames quickly.

Make sure to run **`sudo updatedb`** to include new files.

More information: https://plocate.sesse.net/plocate.1.html.

- Look for patterns in the database (recomputed periodically):

```
plocate {{pattern}}
```

- Look for a file by its exact filename (a pattern containing no globbing characters is interpreted as `*pattern*`):

```
plocate */{{filename}}
```

pm2

Process manager for Node.js.

Used for log management, monitoring, and configuring processes.

More information: https://pm2.keymetrics.io/docs/usage/quick-start/.

- Start a process with a name that can be used for later operations:

```
pm2 start {{app.js}} --name {{application_name}}
```

- List processes:

```
pm2 list
```

- Monitor all processes:

```
pm2 monit
```

- Stop a process:

```
pm2 stop {{application_name}}
```

- Restart a process:

```
pm2 restart {{application_name}}
```

- Dump all processes for resurrecting them later:

```
pm2 save
```

- Resurrect previously dumped processes:

```
pm2 resurrect
```

pngcheck

Forensics tool for validating the integrity of PNG based (PNG, JNG, MNG) image files.

Can also extract embedded images and text from a file.

More information: https://manned.org/pngcheck.

- Verify the integrity of an image file (width, height, and color depth):

```
pngcheck {{path/to/image.png}}
```

- Print information for an image with [c]olorized output:

```
pngcheck -c {{path/to/image.png}}
```

- Print [v]erbose information for an image:

```
pngcheck -cvt {{path/to/image.png}}
```

- Receive an image from `stdin` and display detailed information:

```
cat {{path/to/image.png}} | pngcheck -cvt
```

- [s]earch for PNGs within a specific file and display information about them:

```
pngcheck -s {{path/to/image.png}}
```

- Search for PNGs within another file and e[x]tract them:

```
pngcheck -x {{path/to/image.png}}
```

pngcrush

PNG compression utility.

More information: https://pmt.sourceforge.io/pngcrush/.

- Compress a PNG file:

```
pngcrush {{in.png}} {{out.png}}
```

- Compress all PNGs and output them to the specified directory:

```
pngcrush -d {{path/to/output}} *.png
```

- Compress PNG file with all 114 available algorithms and pick the best result:

```
pngcrush -rem allb -brute -reduce {{in.png}} {{out.png}}
```

pngquant

PNG converter and lossy image compressor.

More information: https://manned.org/pngquant.

- Compress a specific PNG as much as possible and write result to a new file:

```
pngquant {{path/to/file.png}}
```

- Compress a specific PNG and override original:

```
pngquant --ext .png {{[-f|--force]}} {{path/to/file.png}}
```

- Try to compress a specific PNG with custom quality (skip if below the min value):

```
pngquant {{[-Q|--quality]}} {{0..100}} {{path/to/file.png}}
```

- Compress a specific PNG with the number of colors reduced to 64:

```
pngquant {{64}} {{path/to/file.png}}
```

- Compress a specific PNG and skip if the file is larger than the original:

```
pngquant --skip-if-larger {{path/to/file.png}}
```

- Compress a specific PNG and remove metadata:

```
pngquant --strip {{path/to/file.png}}
```

- Compress a specific PNG and save it to the given path:

```
pngquant {{path/to/file.png}} {{[-o|--output]}} {{path/to/file.png}}
```

- Compress a specific PNG and show progress:

```
pngquant {{[-v|--verbose]}} {{path/to/file.png}}
```

pngtopam

Convert a PNG image to a Netpbm image.

See also: **pamtopng**.

More information: https://netpbm.sourceforge.net/doc/pngtopam.html.

- Convert the specified PNG image to a Netpbm image:

```
pngtopam {{path/to/image.png}} > {{path/to/output.pam}}
```

- Create an output image that includes both the main image and transparency mask of the input image:

```
pngtopam -alphapam {{path/to/image.png}} > {{path/to/
output.pam}}
```

- Replace transparent pixels by the specified color:

```
pngtopam {{[-m|-mix]}} {{[-ba|-background]}} {{color}}
{{path/to/image.png}} > {{path/to/output.pam}}
```

- Write tEXt chunks found in the input image to the specified text file:

```
pngtopam {{[-te|-text]}} {{path/to/file.txt}} {{path/to/
image.png}} > {{path/to/output.pam}}
```

pngtopnm

This command has been superseded by **`pngtopam`**.

More information: https://netpbm.sourceforge.net/doc/pngtopnm.html.

- View documentation for the current command:

```
tldr pngtopam
```

pnmalias

Apply antialiasing onto a PNM image.

More information: https://netpbm.sourceforge.net/doc/pnmalias.html.

- Perform antialiasing on a PNM image, taking black pixels as background and white pixels as foreground:

```
pnmalias {{path/to/input.pnm}} > {{path/to/output.ppm}}
```

- Explicitly specify the background and foreground color:

```
pnmalias -bcolor {{background_color}} -fcolor
{{foreground_color}} {{path/to/input.pnm}} > {{path/to/
output.ppm}}
```

- Apply altialiasing to foreground pixels only:

```
pnmalias {{[-fo|-fonly]}} {{path/to/input.pnm}} > {{path/to/
output.ppm}}
```

- Apply antialiasing to all surrounding pixels of background pixels:

```
pnmalias {{[-ba|-balias]}} {{path/to/input.pnm}} > {{path/to/
output.ppm}}
```

pnmarith

This command has been superseded by **pamarith**.

More information: https://netpbm.sourceforge.net/doc/pnmarith.html.

- View documentation for the current command:

```
tldr pamarith
```

pnmcolormap

Create quantization color map for a PNM image.

More information: https://netpbm.sourceforge.net/doc/pnmcolormap.html.

- Generate an image using only `n_colors` or less colors as close as possible to the input image:

```
pnmcolormap {{n_colors}} {{path/to/input.pnm}} > {{path/to/output.ppm}}
```

- Use the splitspread strategy for determining the output colors, possibly producing a better result for images with small details:

```
pnmcolormap {{[-splits|-splitspread]}} {{n_colors}} {{path/to/input.pnm}} > {{path/to/output.ppm}}
```

- Sort the resulting colormap, which is useful for comparing colormaps:

```
pnmcolormap {{[-so|-sort]}} {{path/to/input.pnm}} > {{path/to/output.ppm}}
```

pnmcomp

This command has been superseded by **pamcomp**.

More information: https://netpbm.sourceforge.net/doc/pnmcomp.html.

- View documentation for the current command:

```
tldr pamcomp
```

pnmconvol

Convolute a PNM image.

More information: https://netpbm.sourceforge.net/doc/pnmconvol.html.

- Convolve a PNM image with the specified convolution matrix:

```
pnmconvol -matrix=-1,3,-1 {{path/to/image.pnm}} > {{path/to/output.pnm}}
```

- Convolve a PNM image with the convolution matrix in the specified files, one for each layer in the input image:

```
pnmconvol -matrixfile {{path/to/matrix1,path/to/matrix2,...}} {{path/to/image.pnm}} > {{path/to/output.pnm}}
```

- Convolve a PNM image with the convolution matrix in the specified PNM file:

```
pnmconvol {{path/to/matrix.pnm}} {{path/to/image.pnm}} > {{path/to/output.pnm}}
```

- Normalize the weights in the convolution matrix such that they add up to one:

```
pnmconvol -matrix=-1,3,-1 -normalize {{path/to/image.pnm}} > {{path/to/output.pnm}}
```

pnmcrop

Crop PNM images.

More information: https://netpbm.sourceforge.net/doc/pnmcrop.html.

- Remove white borders on a PNM image:

```
pnmcrop {{[-w|-white]}} {{path/to/image.pnm}} > {{path/to/output.pnm}}
```

- Remove borders of the specified color that are on the top and left side of the image:

```
pnmcrop -bg-color {{color}} {{[-t|-top]}} {{[-l|-left]}} {{path/to/image.pnm}} > {{path/to/output.pnm}}
```

- Determine the color of the borders to be removed by the color of the pixel in the specified corner:

```
pnmcrop -bg-corner {{topleft|topright|bottomleft|bottomright}} {{path/to/image.pnm}} > {{path/to/output.pnm}}
```

- Leave a border with a width of n pixels. Additionally, specify the behavior if the image is entirely made out of background:

```
pnmcrop {{[-m|-margin]}} {{n}} {{[-blan|-blank-image]}} {{pass|minimize|maxcrop}} {{path/to/image.pnm}} > {{path/to/output.pnm}}
```

pnmcut

This command has been superseded by **`pamcut`**.

More information: https://netpbm.sourceforge.net/doc/pnmcut.html.

- View documentation for the current command:

```
tldr pamcut
```

pnmdepth

This command is an alias of **pamdepth**.

- View documentation for the original command:

  ```
  tldr pamdepth
  ```

pnmenlarge

This command has been superseded by **`pamenlarge`**.

More information: https://netpbm.sourceforge.net/doc/pnmenlarge.html.

- View documentation for the current command:

```
tldr pamenlarge
```

pnmfile

This command has been superseded by **`pamfile`**.

More information: https://netpbm.sourceforge.net/doc/pnmfile.html.

- View documentation for the current command:

```
tldr pamfile
```

pnmflip

This command has been superseded by **`pamflip`**.

More information: https://netpbm.sourceforge.net/doc/pnmflip.html.

- View documentation for the current command:

```
tldr pamflip
```

pnmgamma

Perform gamma correction on PNM images.

More information: https://netpbm.sourceforge.net/doc/pnmgamma.html.

- Convert the image from BT.709 luminance to radiance or sRGB luminance:

```
pnmgamma -{{bt709tolinear|bt709tosrgb}} {{path/to/image.pnm}}
> {{path/to/output.pnm}}
```

- Convert the image from radiance or sRGB luminance to BT.709 luminance:

```
pnmgamma -{{lineartobt709|srgbtobt709}} {{path/to/image.pnm}}
> {{path/to/output.pnm}}
```

- Specify the gamma value used for the gamma transfer function:

```
pnmgamma {{[-ga|-gamma]}} {{value}} {{path/to/image.pnm}} >
{{path/to/output.pnm}}
```

- Specify the gamma value used for the gamma transfer function per color component:

```
pnmgamma {{[-rg|-rgamma]}} {{value}} {{[-gg|-ggamma]}}
{{value}} {{[-bg|-bgamma]}} {{value}} {{path/to/image.pnm}} >
{{path/to/output.pnm}}
```

pnmhisteq

Histogram-equalize a PNM image.

More information: https://netpbm.sourceforge.net/doc/pnmhisteq.html.

- Increase the contrast of a PNM image using histogram equalization:

```
pnmhisteq {{path/to/input.pnm}} > {{path/to/output.pnm}}
```

- Only modify grey pixels:

```
pnmhisteq {{[-g|-grey]}} {{path/to/input.pnm}} > {{path/to/output.pnm}}
```

- Do not include black or white pixels in the histogram equalization:

```
pnmhisteq -no{{black|white}} {{path/to/input.pnm}} > {{path/to/output.pnm}}
```

pnmhistmap

Draw a histogram of a PNM image.

More information: https://netpbm.sourceforge.net/doc/pnmhistmap.html.

- Draw a histogram of a PNM image:

```
pnmhistmap {{path/to/input.pnm}} > {{path/to/output.pnm}}
```

- Draw the histogram as dots instead of bars:

```
pnmhistmap {{[-d|-dots]}} {{path/to/input.pnm}} > {{path/to/
output.pnm}}
```

- Specify the range of intensity values to include:

```
pnmhistmap {{[-l|-lval]}} {{minval}} {{[-rv|-rval]}}
{{maxval}} {{path/to/input.pnm}} > {{path/to/output.pnm}}
```

pnmindex

Build a visual index of multiple PNM images.

See also: **pamundice**.

More information: https://netpbm.sourceforge.net/doc/pnmindex.html.

- Produce an image containing thumbnails of the specified images in a grid:

```
pnmindex {{path/to/input1.pnm path/to/input2.pnm ...}} > {{path/to/output.pnm}}
```

- Specify the size of the (quadratic) thumbnails:

```
pnmindex {{[-s|-size]}} {{50}} {{path/to/input1.pnm path/to/input2.pnm ...}} > {{path/to/output.pnm}}
```

- Specify the number of thumbnails per row:

```
pnmindex {{[-a|-across]}} {{10}} {{path/to/input1.pnm path/to/input2.pnm ...}} > {{path/to/output.pnm}}
```

- Specify the maximum number of colors in the output:

```
pnmindex {{[-c|-colors]}} {{512}} {{path/to/input1.pnm path/to/input2.pnm ...}} > {{path/to/output.pnm}}
```

pnminterp

This command has been superseded by **pamstretch**.

More information: https://netpbm.sourceforge.net/doc/pnminterp.html.

- View documentation for the current command:

```
tldr pamstretch
```

pnminvert

Invert a PNM image.

More information: https://netpbm.sourceforge.net/doc/pnminvert.html.

- Invert the colors or greyscale values in a PNM image:

```
pnminvert {{path/to/input.pnm}} > {{path/to/output.pnm}}
```

pnmmargin

Add a border to a PNM image.

More information: https://netpbm.sourceforge.net/doc/pnmmargin.html.

- Add a border of the specified size to a PNM image:

```
pnmmargin {{size}} {{path/to/image.pnm}} > {{path/to/
output.pnm}}
```

- Specify the color of the border:

```
pnmmargin {{[-c|-color]}} {{color}} {{size}} {{path/to/
image.pnm}} > {{path/to/output.pnm}}
```

pnmmercator

Perform Mercator transformations on Netpbm images.

More information: https://netpbm.sourceforge.net/doc/pnmmercator.html.

- Convert a rectangular projection worldmap to Mercator projection:

```
pnmmercator {{path/to/image.pnm}} > {{path/to/output.pnm}}
```

- Convert a Mercator projection worldmap to rectangular projection:

```
pnmmercator {{[-i|-inverse]}} {{path/to/image.pnm}} > {{path/to/output.pnm}}
```

pnmmontage

Create a montage from multiple PNM images.

More information: https://netpbm.sourceforge.net/doc/pnmmontage.html.

- Produce a packing of the specified images:

```
pnmmontage {{path/to/image1.pnm path/to/image2.pnm ...}} > {{path/to/output.pnm}}
```

- Specify the quality of the packing (Note: Larger values produce smaller packings but take longer to compute.):

```
pnmmontage -{{0..9}} {{path/to/image1.pnm path/to/image2.pnm ...}} > {{path/to/output.pnm}}
```

- Produce a packing that is not larger than p percent of the optimal packing:

```
pnmmontage {{[-qua|-quality]}} {{p}} {{path/to/image1.pnm path/to/image2.pnm ...}} > {{path/to/output.pnm}}
```

- Write the positions of the input files within the packed image to a machine-readable file:

```
pnmmontage {{[-d|-data]}} {{path/to/datafile}} {{path/to/image1.pnm path/to/image2.pnm ...}} > {{path/to/output.pnm}}
```

pnmnlfilt

Apply a non-linear filter onto a PNM image.

More information: https://netpbm.sourceforge.net/doc/pnmnlfilt.html.

- Apply the "alpha trimmed mean" filter with the specified alpha and radius values onto the PNM image:

```
pnmnlfilt {{0.0..0.5}} {{radius}} {{path/to/image.pnm}} > {{path/to/output.pnm}}
```

- Apply the "optimal estimation smoothing" filter with the specified noise threshold and radius onto the PNM image:

```
pnmnlfilt {{1.0..2.0}} {{radius}} {{path/to/image.pnm}} > {{path/to/output.pnm}}
```

- Apply the "edge enhancement" filter with the specified alpha and radius onto the PNM image:

```
pnmnlfilt {{-0.9..(-0.1)}} {{radius}} {{path/to/image.pnm}} > {{path/to/output.pnm}}
```

pnmnorm

Normalize the contrast in a PNM image.

See also: **pnmhisteq**.

More information: https://netpbm.sourceforge.net/doc/pnmnorm.html.

- Force the brightest pixels to be white, the darkest pixels to be black, and spread out the ones in between linearly:

```
pnmnorm {{path/to/image.pnm}} > {{path/to/output.pnm}}
```

- Force the brightest pixels to be white, the darkest pixels to be black, and spread out the ones in between quadratically such that pixels with a brightness of n become 50 % bright:

```
pnmnorm {{[-midv|-midvalue]}} {{n}} {{path/to/image.pnm}} > {{path/to/output.pnm}}
```

- Keep the pixels' hue, only modify the brightness:

```
pnmnorm {{[-k|-keephues]}} {{path/to/image.pnm}} > {{path/to/output.pnm}}
```

- Specify a method to calculate a pixel's brightness:

```
pnmnorm -{{luminosity|colorvalue|saturation}} {{path/to/image.pnm}} > {{path/to/output.pnm}}
```

pnmpad

Add borders to a PNM image.

See also: **pnmmargin**, **pamcut**, **pamcomp**.

More information: https://netpbm.sourceforge.net/doc/pnmpad.html.

- Add borders of the specified sizes to the image:

```
pnmpad {{[-l|-left]}} {{100}} {{[-ri|-right]}} {{150}} {{[-
t|-top]}} {{123}} {{[-bo|-bottom]}} {{456}} {{path/to/
image.pnm}} > {{path/to/output.pnm}}
```

- Pad the image to the specified size:

```
pnmpad {{[-wi|-width]}} {{1000}} {{[-he|-height]}} {{500}}
{{path/to/image.pnm}} > {{path/to/output.pnm}}
```

- Pad the width of the image to the specified size, controlling the ratio between right and left padding:

```
pnmpad {{[-wi|-width]}} {{1000}} {{[-ha|-halign]}} {{0.7}}
{{path/to/image.pnm}} > {{path/to/output.pnm}}
```

- Pad the width of the image using the specified color:

```
pnmpad {{[-wi|-width]}} {{1000}} {{[-c|-color]}} {{red}}
{{path/to/image.pnm}} > {{path/to/output.pnm}}
```

pnmpaste

Paste a PNM image into another PNM image.

More information: https://netpbm.sourceforge.net/doc/pnmpaste.html.

- Paste a PNM image into another PNM image at the specified coordinates:

```
pnmpaste {{x}} {{y}} {{path/to/image1.pnm}} {{path/to/
image2.pnm}} > {{path/to/output.pnm}}
```

- Paste the image read from `stdin` into the specified image:

```
{{command}} | pnmpaste {{x}} {{y}} {{path/to/image.pnm}} >
{{path/to/output.pnm}}
```

- Combine the overlapping pixels by the specified boolean operation, where white pixels represent `true` while black pixels represent `false`:

```
pnmpaste -{{and|nand|or|nor|xor|xnor}} {{x}} {{y}} {{path/to/
image1.pnm}} {{path/to/image2.pnm}} > {{path/to/output.pnm}}
```

pnmpsnr

Compute the difference between two images.

More information: https://netpbm.sourceforge.net/doc/pnmpsnr.html.

- Compute the difference, i.e. the peak signal-to-noise ratio (PSNR) between two images:

```
pnmpsnr {{path/to/file1.pnm}} {{path/to/file2.pnm}}
```

- Compare the color components rather than the luminance and chrominance components of the images:

```
pnmpsnr {{path/to/file1.pnm}} {{path/to/file2.pnm}} -rgb
```

- Run in comparison mode, i.e. only output `nomatch` or `match` depending on whether the computing PSNR exceeds `n` or not:

```
pnmpsnr {{path/to/file1.pnm}} {{path/to/file2.pnm}} -target {{n}}
```

- Run in comparison mode and compare the individual image components, i.e. Y, Cb, and Cr, to the corresponding thresholds:

```
pnmpsnr {{path/to/file1.pnm}} {{path/to/file2.pnm}} -target1 {{threshold_Y}} -target2 {{threshold_Cb}} -target3 {{threshold_Cr}}
```

- Run in comparison mode and compare the individual image components, i.e. red, green, and blue to the corresponding thresholds:

```
pnmpsnr {{path/to/file1.pnm}} {{path/to/file2.pnm}} -rgb -target1 {{threshold_red}} -target2 {{threshold_green}} -target3 {{threshold_blue}}
```

- Produce machine-readable output:

```
pnmpsnr {{path/to/file1.pnm}} {{path/to/file2.pnm}} -machine
```

pnmquant

Quantize the colors in a PNM image into a smaller set.

This command is a combination of **pnmcolormap** and **pnmremap** and accepts the union of their options, except **-mapfile**.

See also: **pnmquantall**.

More information: https://netpbm.sourceforge.net/doc/pnmquant.html.

- Generate an image using only `n_colors` or less colors as close as possible to the input image:

```
pnmquant {{n_colors}} {{path/to/input.pnm}} > {{path/to/output.pnm}}
```

pnmquantall

Run **pnmquant** on multiple files at once such that they share a common colormap.

See also: **pnmquant**.

More information: https://netpbm.sourceforge.net/doc/pnmquantall.html.

- Run pnmquant on multiple files with the specified parameters, overwriting the original files:

```
pnmquantall {{n_colors}} {{path/to/input1.pnm path/to/input2.pnm ...}}
```

- Save the quantized images to files named the same as the input files, but with the specified extension appended:

```
pnmquantall {{[-e|-ext]}} {{extension}} {{n_colors}} {{path/to/input1.pnm path/to/input2.pnm ...}}
```

pnmremap

Replace the colors in a PNM image.

More information: https://netpbm.sourceforge.net/doc/pnmremap.html.

- Replace the colors in an image with those in the specified color palette:

```
pnmremap {{[-ma|-mapfile]}} {{path/to/palette_file.ppm}} {{path/to/input.pnm}} > {{path/to/output.pnm}}
```

- Use Floyd-Steinberg dithering for representing colors missing in the color palette:

```
pnmremap {{[-ma|-mapfile]}} {{path/to/palette_file.ppm}} {{[-fs|-floyd]}} {{path/to/input.pnm}} > {{path/to/output.pnm}}
```

- Use the first color in the palette for representing colors missing in the color palette:

```
pnmremap {{[-ma|-mapfile]}} {{path/to/palette_file.ppm}} {{[-fi|-firstisdefault]}} {{path/to/input.pnm}} > {{path/to/output.pnm}}
```

- Use the specified color for representing colors missing in the color palette:

```
pnmremap {{[-ma|-mapfile]}} {{path/to/palette_file.ppm}} {{[-m|-missingcolor]}} {{color}} {{path/to/input.pnm}} > {{path/to/output.pnm}}
```

pnmrotate

Rotate a PNM image.

More information: https://netpbm.sourceforge.net/doc/pnmrotate.html.

- Rotate a PNM image by some angle (measured in degrees, counter-clockwise):

```
pnmrotate {{angle}} {{path/to/input.pnm}} > {{path/to/output.pnm}}
```

- Specify the background color exposed by rotating the input image:

```
pnmrotate {{[-b|-background]}} {{color}} {{angle}} {{path/to/input.pnm}} > {{path/to/output.pnm}}
```

- Disable anti-aliasing, improving performance but decreasing quality:

```
pnmrotate {{[-n|-noantialias]}} {{angle}} {{path/to/input.pnm}} > {{path/to/output.pnm}}
```

pnmscale

This command has been replaced by **`pamscale`**.

More information: https://netpbm.sourceforge.net/doc/pnmscale.html.

- View documentation for `pamscale`:

```
tldr pamscale
```

pnmscalefixed

Scale a PNM file quickly with possibly reduced quality.

See also: **pamscale**.

More information: https://netpbm.sourceforge.net/doc/pnmscalefixed.html.

- Scale an image such that the result has the specified dimensions:

```
pnmscalefixed {{[-w|-width]}} {{width}} {{[-h|-height]}}
{{height}} {{path/to/input.pnm}} > {{path/to/output.pnm}}
```

- Scale an image such that the result has the specified width, keeping the aspect ratio:

```
pnmscalefixed {{[-w|-width]}} {{width}} {{path/to/input.pnm}}
> {{path/to/output.pnm}}
```

- Scale an image such that its width and height is changed by the specified factors:

```
pnmscalefixed {{[-xsc|-xscale]}} {{x_factor}} {{[-ysc|-
yscale]}} {{y_factor}} {{path/to/input.pnm}} > {{path/to/
output.pnm}}
```

pnmshear

Shear a PNM image.

More information: https://netpbm.sourceforge.net/doc/pnmshear.html.

- Shear a PNM image by the specified angle:

```
pnmshear {{angle}} {{path/to/input.pnm}} > {{path/to/
output.pnm}}
```

- Specify the color of the background in the sheared image:

```
pnmshear {{[-b|-background]}} {{blue}} {{angle}} {{path/to/
input.pnm}} > {{path/to/output.pnm}}
```

- Do not perform anti-aliasing:

```
pnmshear {{[-n|-noantialias]}} {{angle}} {{path/to/
input.pnm}} > {{path/to/output.pnm}}
```

pnmsmooth

Smooth out a PNM image.

More information: https://netpbm.sourceforge.net/doc/pnmsmooth.html.

- Smooth out a PNM image using a convolution matrix of size 3x3:

```
pnmsmooth {{path/to/input.pnm}} > {{path/to/output.pnm}}
```

- Smooth out a PNM image using a convolution matrix of size width times height:

```
pnmsmooth {{[-w|-width]}} {{width}} {{[-h|-height]}} {{height}} {{path/to/input.pnm}} > {{path/to/output.pnm}}
```

pnmsplit

This command has been superseded by **pamsplit**.

More information: https://netpbm.sourceforge.net/doc/pnmsplit.html.

- View documentation for the current command:

```
tldr pamsplit
```

pnmtile

Replicate an image to fill a specified area.

More information: https://netpbm.sourceforge.net/doc/pnmtile.html.

- Replicate an image to fill an area of the specified dimensions:

```
pnmtile {{width}} {{height}} {{path/to/input.pnm}} > {{path/to/output.pnm}}
```

pnmtoddif

Convert a PNM image to a DDIF image file.

More information: https://netpbm.sourceforge.net/doc/pnmtoddif.html.

- Convert a PNM image to a DDIF image file:

```
pnmtoddif {{path/to/image.pnm}} > {{path/to/image.ddif}}
```

- Explicitly specify the horizontal and vertical resolution of the output image:

```
pnmtoddif {{[-r|-resolution]}} {{horizontal_dpi}}
{{vertical_dpi}} {{path/to/image.pnm}} > {{path/to/
image.ddif}}
```

pnmtofiasco

Convert a PNM image to a compressed FIASCO file.

More information: https://netpbm.sourceforge.net/doc/pnmtofiasco.html.

- Convert a PNM image to a compressed FIASCO file:

```
pnmtofiasco {{path/to/file.pnm}} > {{path/to/file.fiasco}}
```

- Specify the input files through a pattern:

```
pnmtofiasco {{[-i|--image-name]}} "{{img[01-09+1].pnm}}" >
{{path/to/file.fiasco}}
```

- Specify the compression quality:

```
pnmtofiasco {{[-q|--quality]}} {{quality_level}} {{path/to/
file.pnm}} > {{path/to/file.fiasco}}
```

- Load the options to be used from the specified configuration file:

```
pnmtofiasco {{[-f|--config]}} {{path/to/fiascorc}} {{path/to/
file.pnm}} > {{path/to/file.fiasco}}
```

pnmtofits

This command has been superseded by **pamtofits**.

More information: https://netpbm.sourceforge.net/doc/pnmtofits.html.

- View documentation for the current command:

```
tldr pamtofits
```

pnmtojpeg

Convert a PNM image file to the JPEG/JFIF/EXIF image format.

More information: https://netpbm.sourceforge.net/doc/pnmtojpeg.html.

- Read a PNM image as input and produce a JPEG/JFIF/EXIF image as output:

```
pnmtojpeg {{path/to/file.pnm}} > {{path/to/file.jpg}}
```

- Display version:

```
pnmtojpeg -version
```

pnmtopalm

Convert a PNM image to a Palm bitmap.

More information: https://netpbm.sourceforge.net/doc/pnmtopalm.html.

- Convert a PNM image to a Palm bitmap:

```
pnmtopalm {{path/to/file.pnm}} > {{path/to/file.palm}}
```

- Specify the color depth of the resulting bitmap:

```
pnmtopalm {{[-dep|-depth]}} {{1|2|4|8|16}} {{path/to/
file.pnm}} > {{path/to/file.palm}}
```

- Choose a compression method for the resulting bitmap:

```
pnmtopalm -{{scanline_compression|rle_compression|
packbits_compression}} {{path/to/file.pnm}} > {{path/to/
file.palm}}
```

- Build a custom colormap and include it in the resulting bitmap:

```
pnmtopalm {{[-c|-colormap]}} {{path/to/file.pnm}} > {{path/
to/file.palm}}
```

- Specify the bitmap's density:

```
pnmtopalm {{[-den|-density]}} {{72|108|144|216|288}} {{path/
to/file.pnm}} > {{path/to/file.palm}}
```

pnmtopclxl

Convert a PNM file to an HP LaserJet PCL XL printer stream.

More information: https://netpbm.sourceforge.net/doc/pnmtopclxl.html.

- Convert PNM files to an HP LaserJet PCL XL printer stream:

```
pnmtopclxl {{path/to/input1.pnm path/to/input2.pnm ...}} > {{path/to/output.pclxl}}
```

- Specify the resolution of the image as well as the location of the page from the upper left corner of each image:

```
pnmtopclxl -dpi {{resolution}} {{[-x|-xoffs]}} {{x_offset}} {{[-y|-yoffs]}} {{y_offset}} {{path/to/input1.pnm path/to/input2.pnm ...}} > {{path/to/output.pclxl}}
```

- Generate a duplex printer stream for the specified paper format:

```
pnmtopclxl {{[-du|-duplex]}} {{vertical|horizontal}} {{[-fo|-format]}} {{letter|legal|a3|a4|a5|...}} {{path/to/input1.pnm path/to/input2.pnm ...}} > {{path/to/output.pclxl}}
```

pnmtoplainpnm

This command is an alias of **`pamtopnm -plain`**.

- View documentation for the original command:

  ```
  tldr pamtopnm
  ```

pnmtopng

Convert a PNM image file to PNG image format.

More information: https://netpbm.sourceforge.net/doc/pnmtopng.html.

- Read a PNM image as input and produce a PNG image as output:

```
pnmtopng {{path/to/file.pnm}} > {{path/to/file.png}}
```

- Display version:

```
pnmtopng {{[-vers|-version]}}
```

pnmtopnm

This command is an alias of **pamtopnm**.

- View documentation for the original command:

```
tldr pamtopnm
```

pnmtops

Convert a PNM image to a PostScript file.

More information: https://netpbm.sourceforge.net/doc/pnmtops.html.

- Convert a PNM image to a PS file:

```
pnmtops {{path/to/file.pnm}} > {{path/to/file.ps}}
```

- Specify the dimensions of the output image in inches:

```
pnmtops {{[-imagew|-imagewidth]}} {{imagewidth}} {{[-imageh|-imageheight]}} {{imageheight}} {{path/to/file.pnm}} > {{path/to/file.ps}}
```

- Specify the dimensions of the page the output image resides on in inches:

```
pnmtops {{[-w|-width]}} {{width}} {{[-h|-height]}} {{height}} {{path/to/file.pnm}} > {{path/to/file.ps}}
```

pnmtorast

Convert a PNM file to a Sun rasterfile.

More information: https://netpbm.sourceforge.net/doc/pnmtorast.html.

- Convert a PNM image to a RAST image:

```
pnmtorast {{path/to/input.pnm}} > {{path/to/output.rast}}
```

- Force either `RT_STANDARD` or `RT_BYTE_ENCODED` form for the output:

```
pnmtorast -{{standard|rle}} {{path/to/input.pnm}} > {{path/
to/output.rast}}
```

pnmtorle

Convert a PNM file to an Utah Raster Tools RLE image file.

More information: https://netpbm.sourceforge.net/doc/pnmtorle.html.

- Convert a PNM image to an RLE image:

```
pnmtorle {{path/to/input.pnm}} > {{path/to/output.rle}}
```

- Print PNM header information to `stdout`:

```
pnmtorle {{[-verb|-verbose]}} {{path/to/input.pnm}} > {{path/to/output.rle}}
```

- Include a transparency channel in the output image in which every black pixel is set to fully transparent and every other pixel is set to fully opaque:

```
pnmtorle {{[-a|-alpha]}} {{path/to/input.pnm}} > {{path/to/output.rle}}
```

pnmtosgi

Convert a PNM file to an SGI image file.

More information: https://netpbm.sourceforge.net/doc/pnmtosgi.html.

- Convert a PNM image to an SGI image:

```
pnmtosgi {{path/to/input.pnm}} > {{path/to/output.sgi}}
```

- Disable or enable compression:

```
pnmtosgi -{{verbatim|rle}} {{path/to/input.pnm}} > {{path/to/output.sgi}}
```

- Write the specified string into the SGI image header's `imagename` field:

```
pnmtosgi {{[-i|-imagename]}} {{string}} {{path/to/input.pnm}} > {{path/to/output.sgi}}
```

pnmtosir

Convert a PNM file to a Solitaire Image Recorder file.

More information: https://netpbm.sourceforge.net/doc/pnmtosir.html.

- Convert a PNM image to a SIR image:

```
pnmtosir {{path/to/input.pnm}} > {{path/to/output.sir}}
```

pnmtotiff

This command has been superseded by **pamtotiff**.

More information: https://netpbm.sourceforge.net/doc/pnmtotiff.html.

- View documentation for the current command:

```
tldr pamtotiff
```

pnmtotiffcmyk

Convert a PNM image to a CMYK encoded TIFF.

More information: https://netpbm.sourceforge.net/doc/pnmtotiffcmyk.html.

- Convert a PNM image to a CMYK encoded TIFF:

```
pnmtotiffcmyk {{path/to/input_file.pnm}} > {{path/to/
output_file.tiff}}
```

- Specify the TIFF compression method:

```
pnmtotiffcmyk -{{none|packbits|lzw}} {{path/to/
input_file.pnm}} > {{path/to/output_file.tiff}}
```

- Control the fill order:

```
pnmtotiffcmyk -{{msb2lsb|lsb2msb}} {{path/to/input_file.pnm}}
> {{path/to/output_file.tiff}}
```

pnmtoxwd

Convert a PNM file into an X11 window dump file.

More information: https://netpbm.sourceforge.net/doc/pnmtoxwd.html.

- Convert a PNM image file to XWD:

```
pnmtoxwd {{path/to/input_file.pnm}} > {{path/to/
output_file.xwd}}
```

- Produce the output in the DirectColor format:

```
pnmtoxwd {{[-d|-directcolor]}} {{path/to/input_file.pnm}} >
{{path/to/output_file.xwd}}
```

- Set the color depth of the output to b bits:

```
pnmtoxwd {{[-ps|-pseudodepth]}} {{b}} {{path/to/
input_file.pnm}} > {{path/to/output_file.xwd}}
```

pnpm audit

Scan project dependencies.

Check for known security issues with the installed packages.

More information: https://pnpm.io/cli/audit.

- Identify vulnerabilities in the project:

```
pnpm audit
```

- Automatically fix vulnerabilities:

```
pnpm audit fix
```

- Generate a security report in JSON format:

```
pnpm audit --json > {{path/to/audit-report.json}}
```

- Audit only dev dependencies:

```
pnpm audit {{[-D|--dev]}}
```

- Audit only production dependencies:

```
pnpm audit {{[-P|--prod]}}
```

- Exclude optional dependencies from the audit:

```
pnpm audit --no-optional
```

- Ignore registry errors during the audit process:

```
pnpm audit --ignore-registry-errors
```

- Filter advisories by severity (low, moderate, high, critical):

```
pnpm audit --audit-level {{severity}}
```

pnpm outdated

Check for outdated packages.

The check can be limited to a subset of the installed packages by providing arguments (patterns are supported).

More information: https://pnpm.io/cli/outdated.

- Check for outdated packages:

  ```
  pnpm outdated
  ```

- Check for outdated dependencies found in every workspace package:

  ```
  pnpm outdated {{[-r|--recursive]}}
  ```

- Filter outdated packages using a package selector:

  ```
  pnpm outdated --filter {{package_selector}}
  ```

- List outdated packages globally:

  ```
  pnpm outdated {{[-g|--global]}}
  ```

- Print details of outdated packages:

  ```
  pnpm outdated --long
  ```

- Print outdated dependencies in a specific format:

  ```
  pnpm outdated --format {{format}}
  ```

- Print only versions that satisfy specifications in `package.json`:

  ```
  pnpm outdated --compatible
  ```

- Check only outdated dev dependencies:

  ```
  pnpm outdated {{[-D|--dev]}}
  ```

pnpm

Fast, disk space efficient package manager for Node.js.

Manage Node.js projects and their module dependencies.

More information: https://pnpm.io/pnpm-cli.

- Create a `package.json` file:

```
pnpm init
```

- Download all the packages listed as dependencies in `package.json`:

```
pnpm {{[i|install]}}
```

- Download a specific version of a package and add it to the list of dependencies in `package.json`:

```
pnpm add {{module_name}}@{{version}}
```

- Download a package and add it to the list of dev dependencies in `package.json`:

```
pnpm add {{module_name}} {{[-D|--save-dev]}}
```

- Download a package and install it globally:

```
pnpm add {{module_name}} {{[-g|--global]}}
```

- Uninstall a package and remove it from the list of dependencies in `package.json`:

```
pnpm {{[rm|remove]}} {{module_name}}
```

- Print a tree of locally installed modules:

```
pnpm {{[ls|list]}}
```

- List top-level globally installed modules:

```
pnpm {{[ls|list]}} {{[-g|--global]}} --depth {{0}}
```

pnpx

Directly execute binaries from npm packages, using **`pnpm`** instead of **`npm`**.

Note: This command is deprecated, use **`pnpm exec`** and **`pnpm dlx`** instead.

More information: https://cuyl.github.io/pnpm.github.io/pnpx-cli/.

- Execute the binary from a given `npm` module:

  ```
  pnpx {{module_name}}
  ```

- Execute a specific binary from a given `npm` module, in case the module has multiple binaries:

  ```
  pnpx --package {{package_name}} {{module_name}}
  ```

- Display help:

  ```
  pnpx --help
  ```

pocount

Translate Toolkit utility to get translation progress from file, supporting several formats.

More information: https://docs.translatehouse.org/projects/translate-toolkit/en/latest/commands/pocount.html.

- Print a colorful table with the translation progress of a file:

```
pocount {{path/to/file.po}}
```

- Print translation progress of various files, one line per file:

```
pocount --short {{translation_*.ts}}
```

- Generate a CSV file with the translation progress of various files:

```
pocount --csv {{translation_*.ts}} > {{path/to/
translation_progress.csv}}
```

podman build

Daemonless tool for building container images.

More information: https://docs.podman.io/en/latest/markdown/podman-build.1.html.

- Create an image using a `Dockerfile` or `Containerfile` in the specified directory:

```
podman build {{path/to/directory}}
```

- Create an image with a specified tag:

```
podman build {{[-t|--tag]}} {{image_name:version}} {{path/to/directory}}
```

- Create an image from a non-standard file:

```
podman build {{[-f|--file]}} {{Containerfile.different}} .
```

- Create an image without using any previously cached images:

```
podman build --no-cache {{path/to/directory}}
```

- Create an image suppressing all output:

```
podman build {{[-q|--quiet]}} {{path/to/directory}}
```

podman commit

Create a new image based on the changed container.

More information: https://docs.podman.io/en/latest/markdown/podman-commit.1.html.

- Create an image from a specific container:

```
podman commit {{container}} {{image}}:{{tag}}
```

- Apply an `ENV` instruction to the created image:

```
podman commit {{[-c|--change]}} "ENV {{name}}
={{value}}" {{container}} {{image}}:{{tag}}
```

- Apply `LABEL`, `ENTRYPOINT`, and `CMD` instruction to the created image:

```
podman commit {{[-c|--change]}} CMD={{command}} {{[-c|--
change]}} ENTRYPOINT={{command}} {{[-c|--change]}} "LABEL
{{key}}={{value}}" {{container}} {{image}}:{{tag}}
```

- Create an image with a specific author and comment in the metadata:

```
podman commit {{[-a|--author]}} "{{author}}" {{[-m|--
message]}} "{{comment}}" {{container}} {{image}}:{{tag}}
```

- Create an image without pausing the container during commit:

```
podman commit {{[-p|--pause]}} false {{container}} {{image}}:
{{tag}}
```

- Display help:

```
podman commit --help
```

podman-compose

Run and manage Compose Specification container definition.

More information: https://github.com/containers/podman-compose.

- List all running containers:

  ```
  podman-compose ps
  ```

- Create and start all containers in the background using a local `docker-compose.yml`:

  ```
  podman-compose up {{[-d|--detach]}}
  ```

- Start all containers, building if needed:

  ```
  podman-compose up --build
  ```

- Start all containers using an alternate compose file:

  ```
  podman-compose {{[-f|--file]}} {{path/to/file.yaml}} up
  ```

- Stop all running containers:

  ```
  podman-compose stop
  ```

- Remove all containers, networks, and volumes:

  ```
  podman-compose down {{[-v|--volumes]}}
  ```

- Follow logs for a container (omit all container names):

  ```
  podman-compose logs {{[-f|--follow]}} {{container_name}}
  ```

- Run a one-time command in a service with no ports mapped:

  ```
  podman-compose run {{service_name}} {{command}}
  ```

podman container commit

This command is an alias of **`podman commit`**.

- View documentation for the original command:

```
tldr podman commit
```

podman export

Export the filesystem of a container and save it as a tarball on the local machine.

See also: **`podman import`**, **`podman save`**.

More information: https://docs.podman.io/en/latest/markdown/podman-export.1.html.

- Export a container's filesystem to a `.tar` file:

```
podman export {{[-o|--output]}} {{path/to/file.tar}} {{container_name_or_id}}
```

- Export a container's filesystem to `stdout`:

```
podman export {{container_name_or_id}} > {{path/to/file.tar}}
```

podman image load

This command is an alias of **`podman load`**.

- View documentation for the original command:

```
tldr podman load
```

podman image pull

This command is an alias of **`podman pull`**.

- View documentation for the original command:

```
tldr podman pull
```

podman image

Manage OCI/Docker container images.

See also: **`podman build`**, **`podman import`**, **`podman pull`**.

More information: https://docs.podman.io/en/latest/markdown/podman-image.1.html.

- List local container images:

  ```
  podman image {{[ls|list]}}
  ```

- Delete unused local container images:

  ```
  podman image prune
  ```

- Delete all unused images (not just those without a tag):

  ```
  podman image prune {{[-a|--all]}}
  ```

- Show the history of a local container image:

  ```
  podman image history {{image}}
  ```

podman images

Manage OCI/Docker container images.

More information: https://docs.podman.io/en/latest/markdown/podman-images.1.html.

- List all container images:

```
podman images
```

- List all container images including intermediates:

```
podman images {{[-a|--all]}}
```

- List the output in quiet mode (only numeric IDs):

```
podman images {{[-q|--quiet]}}
```

- List all images not used by any container:

```
podman images {{[-f|--filter]}} dangling=true
```

- List images that contain a substring in their name:

```
podman images "{{*image|image*}}"
```

podman import

Import a tarball and save it as a filesystem image.

See also: **`podman export`**, **`podman save`**.

More information: https://docs.podman.io/en/latest/markdown/podman-import.1.html.

- Import a tarball from a local file and create an image:

```
podman import {{path/to/tarball.tar}} {{image:tag}}
```

- Import a tarball from a URL:

```
podman import {{https://example.com/image.tar}} {{image:tag}}
```

- Import a tarball and add a commit message:

```
podman import {{[-m|--message]}} "{{commit_message}}" {{path/to/tarball.tar}} {{image:tag}}
```

- Import a tarball and set a default command (required for running the container):

```
podman import {{[-c|--change]}} CMD={{/bin/bash}} {{path/to/tarball.tar}} {{image:tag}}
```

podman load

Load an image from an oci-archive or a docker-archive created using **`podman save`**.

See also: **`podman save`**, **`podman import`**.

More information: https://docs.podman.io/en/latest/markdown/podman-load.1.html.

- Load an image from a `.tar` file:

```
podman load {{[-i|--input]}} {{path/to/file.tar}}
```

- Load an image from a compressed `.tar` file:

```
podman load {{[-i|--input]}} {{path/to/file.tar.ext}}
```

- Load an image and display quiet output (only show the image ID):

```
podman load {{[-q|--quiet]}} {{[-i|--input]}} {{path/to/file.tar}}
```

- Load an image from `stdin`:

```
podman < {{path/to/file.tar}} load
```

podman login

Log in to a container registry.

Note: The default authfile path on Linux is **`$XDG_RUNTIME_DIR/containers/auth.json`**, which is usually stored in a **`tmpfs`** (in RAM).

More information: https://docs.podman.io/en/latest/markdown/podman-login.1.html.

- Log in to a registry (non-persistent on Linux; persistent on Windows/macOS):

```
podman login {{registry.example.org}}
```

- Log in to a registry persistently on Linux:

```
podman login --authfile $HOME/.config/containers/auth.json {{registry.example.org}}
```

- Log in to an insecure (HTTP) registry:

```
podman login --tls-verify false {{registry.example.org}}
```

podman machine

Create and manage virtual machines running Podman.

Included with Podman version 4 or greater.

More information: https://docs.podman.io/en/latest/markdown/podman-machine.1.html.

- List existing machines:

```
podman machine {{[ls|list]}}
```

- Create a new default machine:

```
podman machine init
```

- Create a new machine with a specific name:

```
podman machine init {{name}}
```

- Create a new machine with different resources:

```
podman machine init --cpus {{4}} --memory {{4096}} --disk-size {{50}}
```

- Start or stop a machine:

```
podman machine {{start|stop}} {{name}}
```

- Connect to a running machine via SSH:

```
podman machine ssh {{name}}
```

- Inspect information about a machine:

```
podman machine inspect {{name}}
```

podman ps

List Podman containers.

More information: https://docs.podman.io/en/latest/markdown/podman-ps.1.html.

- List currently running Podman containers:

```
podman ps
```

- List all Podman containers (running and stopped):

```
podman ps {{[-a|--all]}}
```

- Show the latest created container (includes all states):

```
podman ps {{[-l|--latest]}}
```

- Filter containers that contain a substring in their name:

```
podman ps {{[-f|--filter]}} "name={{name}}"
```

- Filter containers that share a given image as an ancestor:

```
podman ps {{[-f|--filter]}} "ancestor={{image}}:{{tag}}"
```

- Filter containers by exit status code:

```
podman ps {{[-a|--all]}} {{[-f|--filter]}} "exited={{code}}"
```

- Filter containers by status:

```
podman ps {{[-f|--filter]}} "status={{created|running|
removing|paused|exited|dead}}"
```

- Filter containers that mount a specific volume or have a volume mounted in a specific path:

```
podman ps {{[-f|--filter]}} "volume={{path/to/directory}}" --
format "table \{\{.ID\}\}\t\{\{.Image\}\}\t\{\{.Names\}\}\t\
{\{.Mounts\}\}"
```

podman pull

Pull images from a container registry.

More information: https://docs.podman.io/en/latest/markdown/podman-pull.1.html.

- Pull a specific container image:

```
podman pull {{image}}:{{tag}}
```

- Pull a container image in quiet mode:

```
podman pull {{[-q|--quiet]}} {{image}}:{{tag}}
```

- Pull all tags of a container image:

```
podman pull {{[-a|--all-tags]}} {{image}}
```

- Pull a container image for a specific platform:

```
podman pull --platform {{linux/arm64}} {{image}}:{{tag}}
```

- Pull a container image without TLS verification:

```
podman pull --tls-verify=false {{image}}:{{tag}}
```

- Display help:

```
podman pull {{[-h|--help]}}
```

podman rmi

Remove OCI/Docker images.

More information: https://docs.podman.io/en/latest/markdown/podman-rmi.1.html.

- Remove one or more images given their names:

```
podman rmi {{image1:tag image2:tag ...}}
```

- Force remove an image:

```
podman rmi {{[-f|--force]}} {{image}}
```

- Remove an image without deleting untagged parents:

```
podman rmi --no-prune {{image}}
```

- Display help:

```
podman rmi {{[-h|--help]}}
```

podman run

Run a command in a new Podman container.

More information: https://docs.podman.io/en/latest/markdown/podman-run.1.html.

- Run command in a new container from a tagged image:

```
podman run {{image:tag}} {{command}}
```

- Run command in a new container in background and display its ID:

```
podman run {{[-d|--detach]}} {{image:tag}} {{command}}
```

- Run command in a one-off container in interactive mode and pseudo-TTY:

```
podman run --rm {{[-it|--interactive --tty]}} {{image:tag}}
{{command}}
```

- Run command in a new container with passed environment variables:

```
podman run {{[-e|--env]}} '{{variable}}={{value}}' {{[-e|--
env]}} {{variable}} {{image:tag}} {{command}}
```

- Run command in a new container with bind mounted volumes:

```
podman run {{[-v|--volume]}} /{{path/to/host_path}}:/{{path/
to/container_path}} {{image:tag}} {{command}}
```

- Run command in a new container with published ports:

```
podman run {{[-p|--publish]}} {{host_port}}:
{{container_port}} {{image:tag}} {{command}}
```

- Run command in a new container overwriting the entrypoint of the image:

```
podman run --entrypoint {{command}} {{image:tag}}
```

- Run command in a new container connecting it to a network:

```
podman run --network {{network}} {{image:tag}}
```

podman save

Save an image to a local file or directory.

See also: **`podman load`**, **`podman export`**.

More information: https://docs.podman.io/en/latest/markdown/podman-save.1.html.

- Save an image to a `.tar` file:

```
podman save {{[-o|--output]}} {{path/to/file.tar}} {{image:tag}}
```

- Save an image to `stdout`:

```
podman save {{image:tag}} > {{path/to/file.tar}}
```

- Save an image with compression:

```
podman save {{image:tag}} | {{gzip|bzip2|xz|zstd|zstdchunked}} > {{path/to/file.tar.ext}}
```

- Transfer an image to remote system with on-the-fly compression and progress bar:

```
podman save {{image:tag}} | zstd {{[-T|--threads]}} 0 --ultra | pv | ssh {{username}}@{{remote_host}} podman load
```

podman

Simple management tool for pods, containers, and images.

Provides a Docker-CLI comparable command-line. Simply put: **`alias docker=podman`**.

More information: https://docs.podman.io/en/latest/Commands.html.

- List all containers (both running and stopped):

```
podman ps {{[-a|--all]}}
```

- Create a container from an image, with a custom name:

```
podman run --name {{container_name}} {{image}}
```

- Start or stop an existing container:

```
podman {{start|stop}} {{container_name}}
```

- Pull an image from a registry (defaults to Docker Hub):

```
podman pull {{image}}
```

- Display the list of already downloaded images:

```
podman images
```

- Open a shell inside an already running container:

```
podman exec {{[-it|--interactive --tty]}} {{container_name}} {{sh}}
```

- Remove a stopped container:

```
podman rm {{container_name}}
```

- Display the logs of one or more containers and follow log output:

```
podman logs {{[-f|--follow]}} {{container_name_or_id1 container_name_or_id2 ...}}
```

poetry about

Get information about Poetry, an application to manage Python packages and dependencies.

See also: **`asdf`**.

More information: https://python-poetry.org/docs/cli/#about.

- Display global information about Poetry, including the current version:

```
poetry about
```

poetry add

Add required packages to the **`pyproject.toml`** file in Poetry.

See also: **`asdf`**.

More information: https://python-poetry.org/docs/cli/#add.

- Add required packages:

```
poetry add {{package_name}}
```

- Add required packages to a specific group of dependencies:

```
poetry add {{package_name}} --group {{group_name}}
```

- Add a specific version of a package:

```
poetry add {{package_name}}=={{version}}
```

- Add a specific version of a package equal to or earlier than a given version:

```
poetry add {{package_name}}<={{version}}
```

- Add a specific version of a package equal to or later than a given version:

```
poetry add {{package_name}}>={{version}}
```

poetry build

Build a Poetry package as a tarball and a wheel.

More information: https://python-poetry.org/docs/cli/#build.

- Build a tarball and a wheel for the project:

```
poetry build
```

- Build a wheel package:

```
poetry build {{[-f|--format]}} wheel
```

- Build a source distribution (sdist):

```
poetry build {{[-f|--format]}} sdist
```

- Clean the output directory before building:

```
poetry build --clean
```

- Set the output directory:

```
poetry build {{[-o|--output]}} {{path/to/directory}}
```

poetry cache

Manage Poetry's cache.

See also: **`asdf`**.

More information: https://python-poetry.org/docs/cli/#cache.

- Display Poetry's available caches:

```
poetry cache list
```

- Remove all packages from a cache (e.g. PyPI):

```
poetry cache clear PyPI --all
```

- Remove a specific package from a cache (Note: must be in format `cache:package:version`):

```
poetry cache clear {{pypi}}:{{requests}}:{{2.24.0}}
```

poetry check

Manage Poetry file validation and consistency.

See also: **`asdf`**.

More information: https://python-poetry.org/docs/cli/#check.

- Check validation and consistency between `pyproject.toml` and `poetry.lock` for Poetry:

```
poetry check
```

- Verify that `poetry.lock` exists:

```
poetry check --lock
```

- Fail if warnings are reported:

```
poetry check --strict
```

poetry config

Edit poetry config settings and repositories.

More information: https://python-poetry.org/docs/cli/#config.

- List current configuration:

```
poetry config --list
```

- Remove the a previously set setting:

```
poetry config {{config_key}} --unset
```

- See the value of a specific setting:

```
poetry config {{config_key}}
```

- Change or add a new configuration setting by passing a value after the setting's name:

```
poetry config {{config_key}} {{config_value}}
```

- Migrate outdated configuration settings:

```
poetry config --migrate
```

- Set/Get settings that are specific to a project:

```
poetry config --local
```

poetry-debug

Debug issues with your Poetry project.

See also: **asdf**.

More information: https://python-poetry.org/docs/cli/#debug.

- Show debug info about Poetry and your project's virtual environment:

```
poetry debug info
```

- Attempt to resolve your project dependencies:

```
poetry debug resolve
```

- Show supported packaging tags for your project's active virtual environment:

```
poetry debug tags
```

poetry-env

Manage virtual environments associated with a Poetry project.

See also: **`asdf`**.

More information: https://python-poetry.org/docs/cli/#env.

- Print the command to activate a virtual environment:

```
poetry env activate
```

- Display information about the current environment:

```
poetry env info
```

- Display the path of the current environment:

```
poetry env info {{[-p|--path]}}
```

- Display the path of the current environment's Python executable:

```
poetry env info {{[-e|--executable]}}
```

- List all virtual environments associated with the current project (optionally showing the full path):

```
poetry env list --full-path
```

- Remove specific or all virtual environments associated with the current project:

```
poetry env remove python {{path/to/executable|
environment_name}} | poetry env remove --all
```

- Activate or create a virtual environment for the project using the specified Python executable:

```
poetry env use python {{path/to/executable}}
```

poetry export

Export Poetry's lock file to other formats.

Provided by the Export Poetry Plugin.

More information: https://github.com/python-poetry/poetry-plugin-export#usage.

- Export dependencies to a `requirements.txt` file:

```
poetry export {{[-o|--output]}} {{requirements.txt}}
```

- Export dependencies including development dependencies:

```
poetry export {{[-o|--output]}} {{requirements-dev.txt}} --dev
```

- Export dependencies without hashes:

```
poetry export {{[-o|--output]}} {{requirements.txt}} --without-hashes
```

- Export dependencies for a specific format:

```
poetry export {{[-o|--output]}} {{requirements.txt}} {{[-f|--format]}} {{requirements.txt}}
```

- Export only specific dependency groups:

```
poetry export {{[-o|--output]}} {{requirements.txt}} --only {{main}}
```

- Display help:

```
poetry export {{[-h|--help]}}
```

poetry help

Display global help, or help for a specific **`poetry`** command.

More information: https://python-poetry.org/docs/cli/#help.

- Display global help:

```
poetry help
```

- Display help for a specific command:

```
poetry help {{config|show|...}}
```

poetry init

Create a basic **`pyproject.toml`** file interactively.

More information: https://python-poetry.org/docs/cli/#init.

- Create a `pyproject.toml` file interactively:

```
poetry init
```

- Create a `pyproject.toml` file with prefilled values:

```
poetry init --name {{package_name}} --author "{{author_name <email@example.com>}}"
```

- Create a `pyproject.toml` file without interaction (using defaults):

```
poetry init {{[-n|--no-interaction]}}
```

- Create a `pyproject.toml` file and add a dependency:

```
poetry init --dependency {{package_name}}
```

- Create a `pyproject.toml` file and add a development dependency:

```
poetry init --dev-dependency {{package_name}}
```

- Display help:

```
poetry init {{[-h|--help]}}
```

poetry install

Install all dependencies for a Python project as defined in the pyproject.toml file.

More information: https://python-poetry.org/docs/cli/#install.

- Install dependencies:

```
poetry install
```

- Skip installing the project itself as a dependency:

```
poetry install --no-root
```

- Install only production dependencies:

```
poetry install --without dev
```

- Install optional dependency groups:

```
poetry install --with test,docs
```

poetry list

List available Poetry commands.

See also: **`asdf`**.

More information: https://python-poetry.org/docs/cli/#list.

- List all available Poetry commands:

```
poetry list
```

- List commands for a specific namespace:

```
poetry list {{namespace}}
```

poetry lock

Lock dependencies in **`pyproject.toml`** (without installing them).

See also: **`asdf`**.

More information: https://python-poetry.org/docs/cli/#lock.

- Lock dependencies from the current directory's `pyproject.toml` file:

  ```
  poetry lock
  ```

- Regenerate the existing lock file:

  ```
  poetry lock --regenerate
  ```

poetry new

Create a new Poetry project in a specific directory.

More information: https://python-poetry.org/docs/cli/#new.

- Create a new project (defaults to `src` layout):

```
poetry new {{path/to/directory}}
```

- Create a new project asking for configuration details interactively:

```
poetry new {{path/to/directory}} {{[-i|--interactive]}}
```

- Create a new project with a specific package name:

```
poetry new {{path/to/directory}} --name {{package_name}}
```

- Create a new project using the flat layout (without the `src` directory):

```
poetry new {{path/to/directory}} --flat
```

- Create a new project with a specific author:

```
poetry new {{path/to/directory}} --author "{{Name
<email@example.com>}}"
```

- Create a new project with a specific README format:

```
poetry new {{path/to/directory}} --readme {{md|rst|txt|...}}
```

poetry publish

Publish a package to a remote repository.

More information: https://python-poetry.org/docs/cli/#publish.

- Publish the current package to PyPI:

```
poetry publish
```

- Build the package before publishing:

```
poetry publish --build
```

- Publish to a specific repository:

```
poetry publish {{[-r|--repository]}} {{repository_name}}
```

- Publish with specific credentials:

```
poetry publish {{[-u|--username]}} {{username}} {{[-p|--password]}} {{password}}
```

- Simulate publishing the current package without actually publishing it:

```
poetry publish --dry-run
```

- Skip files that already exist in the repository:

```
poetry publish --skip-existing
```

poetry-python

Manage Python versions through Poetry.

See also: **`asdf`**.

More information: https://python-poetry.org/docs/cli/#python.

- Install the specified Python version:

```
poetry python install {{3.13.1}}
```

- List all Python versions managed by System or Poetry:

```
poetry python list
```

- List all Python versions managed by Poetry:

```
poetry python list --managed
```

- Remove the specified Python version (if managed by Poetry):

```
poetry python remove {{3.13.1}}
```

poetry remove

Remove a package from the project dependencies.

More information: https://python-poetry.org/docs/cli/#remove.

- Remove one or more packages from the project's dependencies:

  ```
  poetry remove {{package1 package2 ...}}
  ```

- Remove a package from the development dependencies:

  ```
  poetry remove {{package}} {{[-D|--dev]}}
  ```

- Remove a package from a specific dependency group:

  ```
  poetry remove {{package}} {{[-G|--group]}} {{group_name}}
  ```

- Simulate removing a package without making any changes:

  ```
  poetry remove {{package}} --dry-run
  ```

- Update the lock file only, without removing the package from the environment:

  ```
  poetry remove {{package}} --lock
  ```

poetry run

Run a command in the project's virtual environment.

More information: https://python-poetry.org/docs/cli/#run.

- Run a command inside the virtual environment:

```
poetry run {{command}}
```

- Run a command with arguments:

```
poetry run {{command}} {{argument1 argument2 ...}}
```

- Run a script defined in `pyproject.toml`:

```
poetry run {{script_name}}
```

- Run a Python script:

```
poetry run python {{path/to/script.py}}
```

poetry search

Search for packages on a remote index.

Note: PyPI no longer supports searching via the command-line, so this command may fail on the default repository.

More information: https://python-poetry.org/docs/cli/#search.

- Search for a package:

```
poetry search {{package_name}}
```

- Search for multiple packages:

```
poetry search {{package1 package2 ...}}
```

poetry-self

Manage the Poetry installation/runtime environment itself.

These commands reference **`pyproject.toml`** and **`poetry.lock`** files in your Poetry configuration directory.

See also: **`asdf`**.

More information: https://python-poetry.org/docs/cli/#self.

- Install a package:

```
poetry self add {{package_name}}
```

- Install dependencies from the Poetry installation's `pyproject.toml` file:

```
poetry self install
```

- Lock dependencies from the Poetry installation's `pyproject.toml` file:

```
poetry self lock
```

- Remove a package:

```
poetry self remove {{package_name}}
```

- List all installed packages:

```
poetry self show
```

- List all installed plugins:

```
poetry self show plugins
```

- Sync the runtime environment with the Poetry installation's `poetry.lock` file:

```
poetry self sync
```

- Update dependencies from the Poetry installation's `pyproject.toml` file:

```
poetry self update
```

poetry shell

Spawn a shell within the virtual environment.

Note: The **`shell`** command was moved to a plugin: **`poetry-plugin-shell`**.

More information: https://python-poetry.org/docs/cli/#shell.

- Spawn a shell within the virtual environment:

  ```
  poetry shell
  ```

poetry show

Show details of packages in your Poetry project.

See also: **`asdf`**.

More information: https://python-poetry.org/docs/cli/#show.

- Display all packages:

```
poetry show
```

- Show details of a specific package:

```
poetry show {{package_name}}
```

- Show details as a dependency tree:

```
poetry show {{[-t|--tree]}}
```

- Only show top-level packages (those explicitly defined in `pyproject.toml`):

```
poetry show {{[-T|--top-level]}}
```

- Show outdated packages:

```
poetry show {{[-o|--outdated]}}
```

- Show the latest versions for all packages:

```
poetry show {{[-l|--latest]}}
```

- Exclude a specific dependency group/s:

```
poetry show --without {{group1,group2,...}}
```

- Only show a specific dependency group/s:

```
poetry show --only {{group1,group2,...}}
```

poetry source

Add source configurations to your Poetry project.

See also: **`asdf`**.

More information: https://python-poetry.org/docs/cli/#source.

- Add a source configuration:

```
poetry source add {{source_name}} {{source_url}}
```

- Set the priority of a source:

```
poetry source add --priority {{primary|supplemental|
explicit}} {{source_name}} {{source_url}}
```

- Display info for all sources:

```
poetry source show
```

- Display info for a specific source:

```
poetry source show {{source_name}}
```

- Remove a source from your `pyproject.toml` file:

```
poetry source remove {{source_name}}
```

poetry sync

Sync your project's environment with the **`poetry.lock`** file.

More information: https://python-poetry.org/docs/cli/#sync.

- Sync your project's environment with the `poetry.lock` file:

  ```
  poetry sync
  ```

- Exclude one or more dependency groups for the installation:

  ```
  poetry sync --without {{test|docs|...}}
  ```

- Select optional dependency groups:

  ```
  poetry sync --with {{test|docs|...}}
  ```

- Install all dependency groups including optional groups:

  ```
  poetry sync --all-groups
  ```

- Install specific dependency groups:

  ```
  poetry sync --only {{test|docs|...}}
  ```

- Install project without dependencies:

  ```
  poetry sync --only-root
  ```

- Specify extras to install:

  ```
  poetry sync {{[-E|--extras]}}
  ```

- Skip the defaulted package installation for your project:

  ```
  poetry sync --no-root
  ```

poetry update

Update the dependencies as according to the **`pyproject.toml`** file.

More information: https://python-poetry.org/docs/cli/#update.

- Update all dependencies:

  ```
  poetry update
  ```

- Update one or more specific packages:

  ```
  poetry update {{package1 package2 ...}}
  ```

- Update the lock file only, without installing the packages:

  ```
  poetry update --lock
  ```

- Synchronize the environment with the locked packages:

  ```
  poetry update --sync
  ```

- Update dependencies only for a specific group:

  ```
  poetry update --only {{group_name}}
  ```

- Simulate the update process without making changes:

  ```
  poetry update --dry-run
  ```

poetry version

Manage Poetry project version.

Assumes the following project stages: **`patch`**, **`minor`**, **`major`**, **`prepatch`**, **`preminor`**, **`premajor`**, **`prerelease`**.

See also: **`asdf`**.

More information: https://python-poetry.org/docs/cli/#version.

- Output the current version:

```
poetry version {{[-s|--short]}}
```

- Set project to a specific phase:

```
poetry version {{stage}}
```

- Increment the project to the next prerelease phase:

```
poetry version --next-phase
```

- Simulate bumping the version to a given stage without writing to `pyproject.toml`:

```
poetry version {{stage}} --dry-run
```

poetry

Manage Python packages and dependencies.

Some subcommands such as **`about`**, **`check`**, **`env`**, etc. have their own usage documentation.

See also: **`asdf`**, **`pipenv`**, **`hatch`**.

More information: https://python-poetry.org/docs/cli/.

- Create a new Poetry project in the directory with a specific name:

```
poetry new {{project_name}}
```

- Install and add a dependency and its sub-dependencies to the `pyproject.toml` file in the current directory:

```
poetry add {{dependency}}
```

- Install the project dependencies using the `pyproject.toml` file in the current directory:

```
poetry install
```

- Interactively (append `-n` for non-interactively) initialize the current directory as a new Poetry project:

```
poetry init
```

- Get the latest version of all dependencies and update `poetry.lock`:

```
poetry update
```

- Execute a command inside the project's virtual environment:

```
poetry run {{command}}
```

- Bump the version of the project in `pyproject.toml`:

```
poetry version {{patch|minor|major|prepatch|preminor|
premajor|prerelease}}
```

- Spawn a shell within the project's virtual environment (for versions below 2.0, use `poetry shell`):

```
eval "$(poetry env activate)"
```

pokeget

Display sprites of Pokemon in your terminal.

More information: https://github.com/talwat/pokeget-rs.

- Print a sprite of a given pokemon:

```
pokeget {{pokemon_name}}
```

- Print Mr. Mime (note the use of `-` instead of spaces):

```
pokeget mr-mime
```

- Print Mega Gengar:

```
pokeget gengar {{[-m|--mega]}}
```

- Print a random shiny Pokemon:

```
pokeget random {{[-s|--shiny]}}
```

- Print Alolan Meowth, without printing the Pokemon's name:

```
pokeget meowth {{[-a|--alolan]}} --hide-name
```

- Print a random Pokemon with 1/4096 chance to be shiny:

```
((RANDOM%4096 == 0)) && pokeget random --shiny || pokeget
random
```

polybar-msg

Control **`polybar`** using inter-process-messaging (IPC).

Note: IPC is disabled by default and can be enabled by setting **`enable-ipc = true`** in the Polybar config.

More information: https://polybar.readthedocs.io/en/stable/user/ipc.html.

- Quit the bar:

  ```
  polybar-msg cmd quit
  ```

- Restart the bar in-place:

  ```
  polybar-msg cmd restart
  ```

- Hide the bar (does nothing if the bar is already hidden):

  ```
  polybar-msg cmd hide
  ```

- Show the bar again (does nothing if the bar is not hidden):

  ```
  polybar-msg cmd show
  ```

- Toggle between hidden/visible:

  ```
  polybar-msg cmd toggle
  ```

- Execute a module action (the data string is optional):

  ```
  polybar-msg action "#{{module_name}}.{{action_name}}.
  {{data_string}}"
  ```

- Only send messages to a specific Polybar instance (all instances by default):

  ```
  polybar-msg -p {{process_id}} {{cmd|action}} {{payload}}
  ```

polybar

A fast and easy-to-use status bar.

More information: https://github.com/polybar/polybar/wiki.

- Start Polybar (the bar name is optional if only one bar is defined in the config):

```
polybar {{bar_name}}
```

- Start Polybar with the specified config:

```
polybar --config={{path/to/config.ini}} {{bar_name}}
```

- Start Polybar and reload the bar when the configuration file is modified:

```
polybar --reload {{bar_name}}
```

pomo

Utility for the Pomodoro technique.

More information: https://codeberg.org/kevinschoon/pomo.

- Initialize pomo's database:

```
pomo init
```

- Start a pomodoro session:

```
pomo start {{message}}
```

- Start a pomodoro session with three intervals that last three seconds:

```
pomo start --duration 3s --pomodoros 3 {{message}}
```

- List previous tasks:

```
pomo list
```

- Display help:

```
pomo --help
```

pop

Send emails from your terminal.

More information: https://github.com/charmbracelet/pop.

- Launch the Text-based User Interface:

```
pop
```

- Send an email using the content of a Markdown file as body:

```
pop < {{path/to/message.md}} --from {{me@example.com}} --to
{{you@example.com}} --subject "{{On the Subject of
Ducks...}}" --attach {{path/to/attachment}}
```

- Display help:

```
pop --help
```

popd

Remove a directory placed on the directory stack via the **`pushd`** shell built-in.

See also: **`pushd`**, **`dirs`**.

More information: https://www.gnu.org/software/bash/manual/bash.html#index-popd.

- Remove the top directory from the stack and cd to it:

```
popd
```

- Remove the Nth directory (starting from zero to the left from the list printed with `dirs`):

```
popd +N
```

- Remove the Nth directory (starting from zero to the right from the list printed with `dirs`):

```
popd -N
```

- Remove the 1st directory (starting from zero to the left from the list printed with `dirs`):

```
popd -n
```

popeye

Report potential issues with Kubernetes deployment manifests.

More information: https://github.com/derailed/popeye.

- Scan the current Kubernetes cluster:

  ```
  popeye
  ```

- Scan a specific namespace:

  ```
  popeye {{[-n|--namespace]}} {{namespace}}
  ```

- Scan specific Kubernetes context:

  ```
  popeye --context {{context}}
  ```

- Use a spinach configuration file for scanning:

  ```
  popeye {{[-f|--file]}} {{spinach.yaml}}
  ```

posh

Gems documentation browser for Ruby developers.

More information: https://poshtui.com/docs.

- Download documentation to your machine (run inside a Ruby project):

```
posh sync
```

- Start the interactive documentation browser for the current project:

```
posh
```

- Open a specific project:

```
posh --project {{path/to/project}}
```

- Clear all docsets from your machine:

```
posh clear
```

- Generate the autocompletion script for your shell:

```
posh completion {{bash|fish|powershell|zsh}}
```

- Display help:

```
posh {{[-h|--help]}}
```

- Display help for a specific subcommand:

```
posh {{subcommand}} {{[-h|--help]}}
```

postcss

Transform styles with JS plugins.

More information: https://github.com/postcss/postcss-cli#usage.

- Parse and transform a CSS file:

```
postcss {{path/to/file}}
```

- Parse and transform a CSS file and output to a specific file:

```
postcss {{path/to/file}} {{[-o|--output]}} {{path/to/file}}
```

- Parse and transform a CSS file and output to a specific directory:

```
postcss {{path/to/file}} {{[-d|--dir]}} {{path/to/directory}}
```

- Parse and transform a CSS file in-place:

```
postcss {{path/to/file}} {{[-r|--replace]}}
```

- Specify a custom PostCSS parser:

```
postcss {{path/to/file}} --parser {{parser}}
```

- Specify a custom PostCSS syntax:

```
postcss {{path/to/file}} --syntax {{syntax}}
```

- Watch for changes to a CSS file:

```
postcss {{path/to/file}} {{[-w|--watch]}}
```

- Display help:

```
postcss {{[-h|--help]}}
```

postgres

Run the PostgreSQL database server.

More information: https://www.postgresql.org/docs/current/app-postgres.html.

- Start the server on a specific port (defaults to 5432):

```
postgres -p {{5433}}
```

- Set a runtime parameter (short form):

```
postgres -c {{shared_buffers=128MB}}
```

- Set a runtime parameter (long form):

```
postgres --{{shared-buffers}}={{128MB}}
```

- Start in single-user mode for a specific database (defaults to the user name):

```
postgres --single -D {{path/to/datadir}} {{my_database}}
```

powershell

This command may be mistaken as the cross-platform version of PowerShell (formerly known as PowerShell Core), which uses **`pwsh`** instead of **`powershell`**.

The original **`powershell`** command in Windows is still available to use the legacy Windows version of PowerShell (version 5.1 and below).

More information: https://learn.microsoft.com/powershell/module/microsoft.powershell.core/about/about_pwsh.

- View the documentation for the command referring to the latest, cross-platform version of PowerShell (version 6 and above):

  ```
  tldr pwsh
  ```

- View the documentation for the command referring to the legacy Windows PowerShell (version 5.1 and below):

  ```
  tldr powershell {{[-p|--platform]}} windows
  ```

ppmbrighten

This command has been superseded by **pambrighten**.

More information: https://netpbm.sourceforge.net/doc/ppmbrighten.html.

- View documentation for the current command:

```
tldr pambrighten
```

ppmchange

Change all pixels of one color in a PPM image to another color.

More information: https://netpbm.sourceforge.net/doc/ppmchange.html.

- Exchange the first color in each `oldcolor` - `newcolor` pair with the second color:

```
ppmchange {{oldcolor1 newcolor1 oldcolor2 newcolor2 ...}}
{{path/to/input.ppm}} > {{path/to/output.ppm}}
```

- Specify how similar colors must be in order to be considered the same:

```
ppmchange -closeness {{percentage}} {{oldcolor1 newcolor1
oldcolor2 newcolor2 ...}} {{path/to/input.ppm}} > {{path/to/
output.ppm}}
```

- Replace all pixels not specified in the arguments by a color:

```
ppmchange {{[-r|-remainder]}} {{color}} {{oldcolor1 newcolor1
oldcolor2 newcolor2 ...}} {{path/to/input.ppm}} > {{path/to/
output.ppm}}
```

ppmcie

Draw a CIE color chart as a PPM image.

More information: https://netpbm.sourceforge.net/doc/ppmcie.html.

- Draw a CIE color chart using the REC709 color system as a PPM image:

```
ppmcie > {{path/to/output.ppm}}
```

- Specify the color system to be used:

```
ppmcie -{{cie|ebu|hdtv|ntsc|smpte}} > {{path/to/output.ppm}}
```

- Specify the location of the individual illuminants:

```
ppmcie -{{red|green|blue}} {{xpos}} {{ypos}} > {{path/to/
output.ppm}}
```

- Do not dim the area outside the Maxwell triangle:

```
ppmcie {{[-f|-full]}} > {{path/to/output.ppm}}
```

ppmcolormask

Produce a mask of areas of a certain color in a PPM image.

More information: https://netpbm.sourceforge.net/doc/ppmcolormask.html.

- Produce a mask of areas of a certain color in the specified PPM image:

```
ppmcolormask {{[-c|-color]}} {{red,blue}} {{path/to/
input.ppm}} > {{path/to/output.pbm}}
```

ppmdim

Dim a PPM image.

Partly superseded by **`pamfunc -multiplier`**.

More information: https://netpbm.sourceforge.net/doc/ppmdim.html.

- Dim the specified PPM image by dimfactor:

```
ppmdim {{0.6}} {{path/to/input.ppm}} > {{path/to/output.ppm}}
```

ppmdist

Produce a grayscale version of a PPM image.

More information: https://netpbm.sourceforge.net/doc/ppmdist.html.

- Produce a grayscale version of the specified PPM image:

```
ppmdist {{path/to/input.ppm}} > {{path/to/output.pgm}}
```

- Use the specified method to map colors to graylevels:

```
ppmdist -{{frequency|intensity}} {{path/to/input.ppm}} >
{{path/to/output.pgm}}
```

ppmdither

Reduce the number of colors in an image by applying dithering.

More information: https://netpbm.sourceforge.net/doc/ppmdither.html.

- Read a PPM image, apply dithering, and save it to a file:

```
ppmdither {{path/to/image.ppm}} > {{path/to/file.ppm}}
```

- Specify the desired number of shades for each primary color:

```
ppmdither {{[-r|-red]}} {{2}} {{[-g|-green]}} {{3}} {{[-b|-blue]}} {{2}} {{path/to/image.ppm}} > {{path/to/file.ppm}}
```

- Specify the dimensions of the dithering matrix:

```
ppmdither {{[-d|-dim]}} {{2}} {{path/to/image.ppm}} > {{path/to/file.ppm}}
```

ppmdraw

Draw lines, text, and more on a PPM image by executing a script.

Documentation on the utilized scripting language can be found by following the link below.

More information: https://netpbm.sourceforge.net/doc/ppmdraw.html.

- Draw on the specified PPM image by executing the supplied script:

```
ppmdraw -script '{{setpos 50 50; text_here
"hello!"; }}' {{path/to/image.pnm}} > {{path/to/output.pnm}}
```

- Draw on the specified PPM image by executing the script in the specified file:

```
ppmdraw -scriptfile {{path/to/script}} {{path/to/image.pnm}}
> {{path/to/output.pnm}}
```

ppmfade

Generate a transition between two PPM images.

More information: https://netpbm.sourceforge.net/doc/ppmfade.html.

- Generate a transition between two PPM images ([f]irst and [l]ast) using the specified effect:

```
ppmfade -f {{path/to/image1.ppm}} -l {{path/to/image2.ppm}} -{{mix|spread|shift|relief|oil|...}}
```

- Generate a transition starting with the specified image and ending in a solid black image:

```
ppmfade -f {{path/to/image.ppm}} -{{mix|spread|shift|relief|oil|...}}
```

- Generate a transition starting with a solid black image and ending with the specified image:

```
ppmfade -l {{path/to/image.ppm}} -{{mix|spread|shift|relief|oil|...}}
```

- Store the resulting images in files named `base.NNNN.ppm` where `NNNN` is an increasing number:

```
ppmfade -f {{path/to/image1.ppm}} -l {{path/to/image2.ppm}} -{{mix|spread|shift|relief|oil|...}} -base {{base}}
```

ppmflash

Brighten a PPM image file.

More information: https://netpbm.sourceforge.net/doc/ppmflash.html.

- Generate a PPM image as output that is `flashfactor` times brighter than the input PPM image:

```
ppmflash {{flashfactor}} {{path/to/file.ppm}} > {{path/to/file.ppm}}
```

- Display version:

```
ppmflash {{[-v|-version]}}
```

ppmforge

Generate fractals resembling clouds, planets, and starry skies.

More information: https://netpbm.sourceforge.net/doc/ppmforge.html.

- Generate an image of a planet:

```
ppmforge > {{path/to/image.ppm}}
```

- Generate an image of clouds or the night sky:

```
ppmforge -{{night|clouds}} > {{path/to/image.ppm}}
```

- Use a custom mesh size and dimension for fractal generation and specify the dimensions of the output:

```
ppmforge {{[-m|-mesh]}} {{512}} {{[-d|-dimension]}} {{2.5}} {{[-x|-xsize]}} {{1000}} {{[-y|-ysize]}} {{1000}} > {{path/to/image.ppm}}
```

- Control the tilt and the angle from which the generated planet is illuminated:

```
ppmforge {{[-t|-tilt]}} {{-15}} {{[-ho|-hour]}} {{12}} > {{path/to/image.ppm}}
```

ppmglobe

Generate strips of an image suitable to be glued onto a sphere.

See also: **pnmmercator**.

More information: https://netpbm.sourceforge.net/doc/ppmglobe.html.

- Transform an image to strips that can be cut out and glues onto a sphere:

```
ppmglobe {{number_of_strips}} {{path/to/image.ppm}} > {{path/to/output.ppm}}
```

- Use the specified color for the areas between the strips:

```
ppmglobe {{[-b|-background]}} {{red}} {{number_of_strips}} {{path/to/image.ppm}} > {{path/to/output.ppm}}
```

ppmhist

Print a histogram of the colors present in a PPM image.

See also: **`pgmhist`**.

More information: https://netpbm.sourceforge.net/doc/ppmhist.html.

- Generate the histogram for human reading:

```
ppmhist {{[-nom|-nomap]}} {{path/to/image.ppm}}
```

- Generate a PPM file of the colormap for the image, with the color histogram as comments:

```
ppmhist {{[-m|-map]}} {{path/to/image.ppm}}
```

- Display version:

```
ppmhist {{[-v|-version]}}
```

ppmlabel

Add text to a PPM image.

More information: https://netpbm.sourceforge.net/doc/ppmlabel.html.

- Add text to a PPM image at the specified location:

```
ppmlabel -x {{pos_x}} -y {{pos_y}} {{[-t|-text]}} {{text}}
{{path/to/input_file.ppm}} > {{path/to/output_file.ppm}}
```

- Add multiple texts at different locations:

```
ppmlabel -x {{pos_x1}} -y {{pos_y1}} {{[-t|-text]}} {{text1}}
-x {{pos_x2}} -y {{pos_y2}} {{[-t|-text]}} {{text2}} {{path/
to/input_file.ppm}} > {{path/to/output_file.ppm}}
```

- Specify the line color, the background color, the tilt, and the size of the added text:

```
ppmlabel -x {{pos_x}} -y {{pos_y}} {{[-c|-color]}}
{{line_color}} {{[-b|-background]}} {{background_color}} {{[-
a|-angle]}} {{tilt}} {{[-s|-size]}} {{size}} {{[-t|-text]}}
{{text}} {{path/to/input_file.ppm}} > {{path/to/
output_file.ppm}}
```

ppmmake

Create a PPM image of a specified color and dimensions.

More information: https://netpbm.sourceforge.net/doc/ppmmake.html.

- Create a PPM image of the specified color and dimensions:

```
ppmmake {{color}} {{width}} {{height}} > {{path/to/
output_file.ppm}}
```

ppmmix

Blend together two PPM images.

More information: https://netpbm.sourceforge.net/doc/ppmmix.html.

- Blend the specified PPM images using fadefactor to control the weight of each image:

```
ppmmix {{fadefactor}} {{path/to/input_file1.ppm path/to/
input_file2.ppm ...}} > {{path/to/output_file.ppm}}
```

ppmnorm

This command has been superseded by **`pnmnorm`**.

More information: https://netpbm.sourceforge.net/doc/ppmnorm.html.

- View documentation for the current command:

```
tldr pnmnorm
```

ppmntsc

Make the RGB colors in a PPM image compatible with NTSC or PAL color systems.

More information: https://netpbm.sourceforge.net/doc/ppmntsc.html.

- Make the RGB colors in a PPM image compatible with NTSC color systems:

```
ppmntsc {{path/to/input_file.ppm}} > {{path/to/
output_file.ppm}}
```

- Make the RGB colors in a PPM image compatible with PAL color systems:

```
ppmntsc --pal {{path/to/input_file.ppm}} > {{path/to/
output_file.ppm}}
```

- Print the number of illegal pixels in the input image to `stderr`:

```
ppmntsc {{[--verb|--verbose]}} {{path/to/input_file.ppm}} >
{{path/to/output_file.ppm}}
```

- Output only legal/illegal/corrected pixels, set other pixels to black:

```
ppmntsc --{{legalonly|illegalonly|correctedonly}} {{path/to/
input_file.ppm}} > {{path/to/output_file.ppm}}
```

ppmpat

Produce a PPM image with a pattern.

More information: https://netpbm.sourceforge.net/doc/ppmpat.html.

- Produce a PPM file of the specified pattern with the specified dimensions:

```
ppmpat -{{gingham2|gingham3|madras|tartan|poles|...}}
{{width}} {{height}} > {{path/to/file.ppm}}
```

- Produce a PPM file of a camo pattern using the specified colors:

```
ppmpat {{[-ca|-camo]}} {{[-co|-color]}} {{color1,color2,...}}
{{width}} {{height}} > {{path/to/file.ppm}}
```

ppmquant

This command has been replaced by **`pnmquant`** and **`pnmremap`**.

More information: https://netpbm.sourceforge.net/doc/ppmquant.html.

- View documentation for `pnmquant`:

```
tldr pnmquant
```

- View documentation for `pnmremap`:

```
tldr pnmremap
```

ppmquantall

This command has been superseded by **`pnmquantall`**.

More information: https://netpbm.sourceforge.net/doc/ppmquantall.html.

- View documentation for the current command:

```
tldr pnmquantall
```

ppmrainbow

Generate a rainbow.

More information: https://netpbm.sourceforge.net/doc/ppmrainbow.html.

- Generate a rainbow consisting of the specified colors:

```
ppmrainbow {{color1 color2 ...}} > {{path/to/
output_file.ppm}}
```

- Specify the size of the output in pixels:

```
ppmrainbow {{[-w|-width]}} {{width}} {{[-h|-height]}}
{{height}} {{color1 color2 ...}} > {{path/to/
output_file.ppm}}
```

- End the rainbow with the last color specified, do not repeat the first color:

```
ppmrainbow {{[-n|-norepeat]}} {{color1 color2 ...}} > {{path/
to/output_file.ppm}}
```

ppmrelief

Produce a relief of a PPM image.

More information: https://netpbm.sourceforge.net/doc/ppmrelief.html.

- Produce a relief of the specified PPM image:

```
ppmrelief {{path/to/input_file.ppm}} > {{path/to/
output_file.ppm}}
```

ppmshadow

Add simulated shadows to a PPM image.

More information: https://netpbm.sourceforge.net/doc/ppmshadow.html.

- Add simulated shadows to a PPM image:

```
ppmshadow {{path/to/input_file.ppm}} > {{path/to/
output_file.ppm}}
```

- [b]lur the image by the specified number of pixels:

```
ppmshadow -b {{n}} {{path/to/input_file.ppm}} > {{path/to/
output_file.ppm}}
```

- Specify the displacement of the simulated light source to the left and the top of the image:

```
ppmshadow -x {{left_offset}} -y {{top_offset}} {{path/to/
input_file.ppm}} > {{path/to/output_file.ppm}}
```

ppmshift

Shift the lines in a PPM image by a randomized amount.

More information: https://netpbm.sourceforge.net/doc/ppmshift.html.

- Shift the lines in the input image by a randomized amount not exceeding s to the left or to the right:

```
ppmshift {{s}} {{path/to/input_file.ppm}} > {{path/to/output_file.ppm}}
```

ppmspread

Displace the pixels in a PPM image by a randomized amount.

More information: https://netpbm.sourceforge.net/doc/ppmspread.html.

- Displace the pixels in a PPM image by a randomized amount that is at most a:

```
ppmspread {{a}} {{path/to/input_file.ppm}} > {{path/to/
output_file.ppm}}
```

- Specify a seed to a the pseudo-random number generator:

```
ppmspread {{a}} {{path/to/input_file.ppm}} {{[-r|-
randomseed]}} {{seed}} > {{path/to/output_file.ppm}}
```

ppmtoacad

Convert a PPM image to an AutoCAD database or slide.

More information: https://netpbm.sourceforge.net/doc/ppmtoacad.html.

- Convert a PPM image to an AutoCAD slide:

```
ppmtoacad {{path/to/file.ppm}} > {{path/to/file.acad}}
```

- Convert a PPM image to an AutoCAD binary database import file:

```
ppmtoacad {{[-d|-dxb]}} {{path/to/file.ppm}} > {{path/to/file.dxb}}
```

- Restrict the colors in the output to 8 RGB shades:

```
ppmtoacad -8 {{path/to/file.ppm}} > {{path/to/file.dxb}}
```

ppmtoapplevol

Convert a PPM image into an Apple volume label image.

More information: https://netpbm.sourceforge.net/doc/ppmtoapplevol.html.

- Convert a PPM image into an Apple volume label image:

```
ppmtoapplevol {{path/to/image.ppm}} > {{path/to/output}}
```

ppmtoarbtxt

Convert a PPM image to an arbitrary text format according to a template.

More information: https://netpbm.sourceforge.net/doc/ppmtoarbtxt.html.

- Convert a PPM image to text as specified by the given template:

```
ppmtoarbtxt {{path/to/template}} {{path/to/image.ppm}} >
{{path/to/output_file.txt}}
```

- Convert a PPM image to text as specified by the given template, prepend the contents of the specified head template:

```
ppmtoarbtxt {{path/to/template}} -hd {{path/to/
head_template}} {{path/to/image.ppm}} > {{path/to/
output_file.txt}}
```

- Convert a PPM image to text as specified by the given template, append the contents of the specified tail template:

```
ppmtoarbtxt {{path/to/template}} -hd {{path/to/
tail_template}} {{path/to/image.ppm}} > {{path/to/
output_file.txt}}
```

- Display version:

```
ppmtoarbtxt {{[-v|-version]}}
```

ppmtoascii

Convert a PPM image to an ASCII image using ANSI terminal color codes.

See also: **ppmtoterm**, **pbmtoascii**, **pbmto4425**.

More information: https://netpbm.sourceforge.net/doc/ppmtoascii.html.

- Convert a PPM image to an ASCII image, combining an area of 1x2 pixels into a character:

```
ppmtoascii {{path/to/input.ppm}} > {{path/to/output.txt}}
```

- Convert a PPM image to an ASCII image, combining an area of 2x4 pixels into a character:

```
ppmtoascii -2x4 {{path/to/input.ppm}} > {{path/to/
output.txt}}
```

ppmtobmp

Convert a PPM image to a BMP file.

More information: https://netpbm.sourceforge.net/doc/ppmtobmp.html.

- Convert a PPM image to a BMP file:

```
ppmtobmp {{path/to/file.ppm}} > {{path/to/file.bmp}}
```

- Explicitly specify whether or not a Windows BMP file or an OS/2 BMP file should be created:

```
ppmtobmp -{{windows|os2}} {{path/to/file.ppm}} > {{path/to/file.bmp}}
```

- Use a specific number of bits for each pixel:

```
ppmtobmp {{[-b|-bbp]}} {{1|4|8|24}} {{path/to/file.ppm}} > {{path/to/file.bmp}}
```

ppmtoeyuv

Convert a PPM image to an Berkeley YUV file.

More information: https://netpbm.sourceforge.net/doc/ppmtoeyuv.html.

- Read a PPM image from the input file, convert it to a Berkeley YUV image, and store it in the specified output file:

```
ppmtoeyuv {{path/to/input_file.ppm}} > {{path/to/
output_file.eyuv}}
```

ppmtogif

This command has been superseded by **pamtogif**.

More information: https://netpbm.sourceforge.net/doc/ppmtogif.html.

- View documentation for the current command:

```
tldr pamtogif
```

ppmtoicr

Convert a PPM image to NCSA ICR format.

More information: https://netpbm.sourceforge.net/doc/ppmtoicr.html.

- Convert a PPM image to an ICR file:

```
ppmtoicr {{path/to/file.ppm}} > {{path/to/file.icr}}
```

- Display the output in name:

```
ppmtoicr {{[-w|-windowname]}} {{name}} {{path/to/file.ppm}} >
{{path/to/file.icr}}
```

- Expand the image by the specified factor:

```
ppmtoicr {{[-e|-expand]}} {{factor}} {{path/to/file.ppm}} >
{{path/to/file.icr}}
```

- Display the output on the screen with the specified number:

```
ppmtoicr {{[-d|-display]}} {{number}} {{path/to/file.ppm}} >
{{path/to/file.icr}}
```

ppmtoilbm

Convert a PPM image to an ILBM file.

More information: https://netpbm.sourceforge.net/doc/ppmtoilbm.html.

- Convert a PPM image to an ILBM file:

```
ppmtoilbm {{path/to/file.ppm}} > {{path/to/file.ilbm}}
```

- Write a maximum of n planes to the ILBM file and produce a HAM/24bit/direct color file if this number is exceeded:

```
ppmtoilbm {{[-mp|-maxplanes]}} {{n}} -{{hamif|24if|dcif}}
{{path/to/file.ppm}} > {{path/to/file.ilbm}}
```

- Produce an ILBM file with exactly n planes:

```
ppmtoilbm {{[-fp|-fixplanes]}} {{n}} {{path/to/file.ppm}} >
{{path/to/file.ilbm}}
```

- Select the compression method to be used:

```
ppmtoilbm -{{compress|nocompress|savemem}} {{path/to/
file.ppm}} > {{path/to/file.ilbm}}
```

ppmtojpeg

This command has been superseded by **pnmtojpeg**.

More information: https://netpbm.sourceforge.net/doc/ppmtojpeg.html.

- View documentation for the current command:

```
tldr pnmtojpeg
```

ppmtoleaf

Convert a PPM image to the Interleaf image format.

More information: https://netpbm.sourceforge.net/doc/ppmtoleaf.html.

- Convert a PPM image to a LEAF file:

```
ppmtoleaf {{path/to/file.ppm}} > {{path/to/file.leaf}}
```

ppmtolj

Convert a PPM file to an HP LaserJet PCL 5 Color file.

More information: https://netpbm.sourceforge.net/doc/ppmtolj.html.

- Convert a PPM file to an HP LaserJet PCL 5 Color file:

```
ppmtolj {{path/to/input.ppm}} > {{path/to/output.lj}}
```

- Apply a gamma correction using the specified gamma value:

```
ppmtolj {{[-g|-gamma]}} {{gamma}} {{path/to/input.ppm}} > {{path/to/output.lj}}
```

- Specify the required resolution:

```
ppmtolj {{[-r|-resolution]}} {{75|100|150|300|600}} {{path/to/input.ppm}} > {{path/to/output.lj}}
```

ppmtomap

This command has been superseded by **pnmcolormap**.

More information: https://netpbm.sourceforge.net/doc/ppmtomap.html.

- View documentation for the current command:

```
tldr pnmcolormap
```

ppmtomitsu

Convert a PPM image to a Mitsubishi S340-10 file.

More information: https://netpbm.sourceforge.net/doc/ppmtomitsu.html.

- Convert a PPM image to a MITSU file:

```
ppmtomitsu {{path/to/file.ppm}} > {{path/to/file.mitsu}}
```

- Enlarge the image by the specified factor, use the specified sharpness, and produce n copies:

```
ppmtomitsu {{[-e|-enlarge]}} {{1|2|3}} {{[-s|-sharpness]}}
{{1|2|3|4}} {{[-c|-copy]}} {{n}} {{path/to/file.ppm}} >
{{path/to/file.mitsu}}
```

- Use the given medium for the printing process:

```
ppmtomitsu {{[-m|-media]}} {{A|A4|AS|A4S}} {{path/to/
file.ppm}} > {{path/to/file.mitsu}}
```

ppmtompeg

Encode an MPEG-1 stream.

More information: https://netpbm.sourceforge.net/doc/ppmtompeg.html.

- Produce an MPEG-1 stream using the parameter file to specify inputs and outputs:

```
ppmtompeg {{path/to/parameter_file}}
```

- Encode the GOP with the specified number only:

```
ppmtompeg {{[-g|-gop]}} {{gop_num}} {{path/to/
parameter_file}}
```

- Specify the first and last frame to encode:

```
ppmtompeg {{[-fr|-frames]}} {{first_frame}} {{last_frame}}
{{path/to/parameter_file}}
```

- Combine multiple MPEG frames into a single MPEG-1 stream:

```
ppmtompeg -combine_frames {{path/to/parameter_file}}
```

ppmtoneo

Convert a PPM image to an Atari Neochrome file.

More information: https://netpbm.sourceforge.net/doc/ppmtoneo.html.

- Convert a PPM image to a NEO file:

```
ppmtoneo {{path/to/file.ppm}} > {{path/to/file.neo}}
```

ppmtopcx

Convert a PPM image to a PCX file.

More information: https://netpbm.sourceforge.net/doc/ppmtopcx.html.

- Convert a PPM image to a PCX file:

```
ppmtopcx {{path/to/file.ppm}} > {{path/to/file.pcx}}
```

- Produce a PCX file with the specified color depth:

```
ppmtopcx -{{8bit|24bit}} {{path/to/file.ppm}} > {{path/to/file.pcx}}
```

ppmtopgm

Convert a PPM image to a PGM image.

More information: https://netpbm.sourceforge.net/doc/ppmtopgm.html.

- Convert PPM image to PGM image:

```
ppmtopgm {{path/to/file.ppm}} > {{path/to/file.pgm}}
```

- Display version:

```
ppmtopgm {{[-v|-version]}}
```

ppmtopi1

Convert a PPM image to an Atari Degas PI1 image.

See also: **`pi1toppm`**.

More information: https://netpbm.sourceforge.net/doc/ppmtopi1.html.

- Convert a PPM image into an Atari Degas PI1 image:

```
ppmtopi1 {{path/to/image.ppm}} > {{path/to/output_image.pi1}}
```

ppmtopict

Convert a PPM image to a Macintosh PICT file.

More information: https://netpbm.sourceforge.net/doc/ppmtopict.html.

- Convert a PPM image to a PICT file:

```
ppmtopict {{path/to/file.ppm}} > {{path/to/file.pict}}
```

ppmtopj

Convert a PPM file to an HP PaintJet file.

More information: https://netpbm.sourceforge.net/doc/ppmtopj.html.

- Convert a PPM file to an HP PaintJet file:

```
ppmtopj {{path/to/input.ppm}} > {{path/to/output.pj}}
```

- Move the image in the x and y direction:

```
ppmtopj {{[-x|-xpos]}} {{dx}} {{[-y|-ypos]}} {{dy}} {{path/to/input.ppm}} > {{path/to/output.pj}}
```

- Explicitly specify a gamma value:

```
ppmtopj {{[-g|-gamma]}} {{gamma}} {{path/to/input.ppm}} > {{path/to/output.pj}}
```

ppmtopjxl

Convert a PPM image into an HP PaintJet XL PCL file.

More information: https://netpbm.sourceforge.net/doc/ppmtopjxl.html.

- Convert a PPM image into an PJXL file:

```
ppmtopjxl {{path/to/image.ppm}} > {{path/to/output.pjxl}}
```

- Resize the input image:

```
ppmtopjxl {{[-xsi|-xsize]}} {{10cm}} {{[-ysi|-ysize]}}
{{5cm}} {{path/to/image.ppm}} > {{path/to/output.pjxl}}
```

- Shift the input image:

```
ppmtopjxl {{[-xsh|-xshift]}} {{10pt}} {{[-ysh|-yshift]}}
{{5pt}} {{path/to/image.ppm}} > {{path/to/output.pjxl}}
```

- Do not use the normal TIFF 4.0 compression method:

```
ppmtopjxl {{[-n|-nopack]}} {{path/to/image.ppm}} > {{path/to/
output.pjxl}}
```

ppmtoppm

Copy a PPM image.

More information: https://netpbm.sourceforge.net/doc/ppmtoppm.html.

- Copy a PPM image (i.e. a PBM, PGM, or PPM image) from `stdin` to `stdout`:

```
ppmtoppm < {{path/to/image.ppm}} > {{path/to/output.ppm}}
```

- Display version:

```
ppmtoppm {{[-v|-version]}}
```

ppmtopuzz

Convert a PPM image to an X11 puzzle file.

More information: https://netpbm.sourceforge.net/doc/ppmtopuzz.html.

- Convert a PPM image to an X11 puzzle file:

```
ppmtopuzz {{path/to/file.ppm}} > {{path/to/file.puzz}}
```

ppmtorgb3

Separate the color components of a PPM file into three separate PGM files.

See also: **`rgb3toppm`**.

More information: https://netpbm.sourceforge.net/doc/ppmtorgb3.html.

- Separate the color components of a PPM file, saving the outputs to `file.red`, `file.grn`, and `file.blu`:

```
ppmtorgb3 {{path/to/file.ppm}}
```

ppmtosixel

Convert a PPM image to DEC sixel format.

More information: https://netpbm.sourceforge.net/doc/ppmtosixel.html.

- Convert a PPM image to DEC sixel format:

```
ppmtosixel {{path/to/file.ppm}} > {{path/to/file.sixel}}
```

- Produce an uncompressed SIXEL file that is much slower to print:

```
ppmtosixel {{[-r|-raw]}} {{path/to/file.ppm}} > {{path/to/
file.sixel}}
```

- Add a left margin of 1.5 inches:

```
ppmtosixel {{[-m|-margin]}} {{path/to/file.ppm}} > {{path/to/
file.sixel}}
```

- Encode control codes in a more portable (although less space-efficient) way:

```
ppmtosixel -7bit {{path/to/file.ppm}} > {{path/to/
file.sixel}}
```

ppmtospu

Convert a PPM file to an Atari Spectrum 512 image.

More information: https://netpbm.sourceforge.net/doc/ppmtospu.html.

- Convert a PPM file to an Atari Spectrum 512 image:

```
ppmtospu {{path/to/input.ppm}} > {{path/to/output.spu}}
```

- Use a dithering matrix of the specified size (0 means no dithering):

```
ppmtospu -d{{0|2|4}} {{path/to/input.ppm}} > {{path/to/
output.spu}}
```

ppmtoterm

Convert a PPM image to an ANSI ISO 6429 ASCII image.

See also: **`ppmtoascii`**, **`pbmtoascii`**, **`pbmto4425`**.

More information: https://netpbm.sourceforge.net/doc/ppmtoterm.html.

- Convert a PPM image to an ANSI ISO 6429 ASCII image, mapping each pixel to an individual character:

```
ppmtoterm {{path/to/input.ppm}} > {{path/to/output.txt}}
```

ppmtotga

This command has been superseded by **pamtotga**.

More information: https://netpbm.sourceforge.net/doc/ppmtotga.html.

- View documentation for the current command:

```
tldr pamtotga
```

ppmtouil

This command has been superseded by **pamtouil**.

More information: https://netpbm.sourceforge.net/doc/ppmtouil.html.

- View documentation for the current command:

```
tldr pamtouil
```

ppmtowinicon

This command has been superseded by **pamtowinicon**.

More information: https://netpbm.sourceforge.net/doc/ppmtowinicon.html.

- View documentation for the current command:

```
tldr pamtowinicon
```

ppmtoxpm

Convert a PPM image to an X11 version 3 pixmap.

More information: https://netpbm.sourceforge.net/doc/ppmtoxpm.html.

- Convert a PPM image to a XPM image:

```
ppmtoxpm {{path/to/input_file.ppm}} > {{path/to/
output_file.xpm}}
```

- Specify the prefix string in the output XPM image:

```
ppmtoxpm {{[-n|-name]}} {{prefix_string}} {{path/to/
input_file.ppm}} > {{path/to/output_file.xpm}}
```

- In the output XPM file, specify colors by their hexadecimal code instead of their name:

```
ppmtoxpm {{[-h|-hexonly]}} {{path/to/input_file.ppm}} >
{{path/to/output_file.xpm}}
```

- Use the specified PGM file as a transparency mask:

```
ppmtoxpm {{[-a|-alphamask]}} {{path/to/alpha_file.pgm}}
{{path/to/input_file.ppm}} > {{path/to/output_file.xpm}}
```

ppmtoyuv

Convert a PPM image to an Abekas YUV file.

More information: https://netpbm.sourceforge.net/doc/ppmtoyuv.html.

- Read a PPM image from the input file, convert it to an Abekas YUV image, and store it in the specified output file:

```
ppmtoyuv {{path/to/input_file.ppm}} > {{path/to/
output_file.yuv}}
```

ppmtoyuvsplit

Convert a PPM image to three subsampled Abekas YUV files.

More information: https://netpbm.sourceforge.net/doc/ppmtoyuvsplit.html.

- Read a PPM image from the input file, convert it to three subsampled Abekas YUV image, and store these images to output files starting with the specified basename:

```
ppmtoyuvsplit {{basename}} {{path/to/input_file.ppm}}
```

ppmtv

Make a PPM Image look like taken from an American TV.

Dim every other row of image data down by the specified dim factor (a number between 0 and 1).

More information: https://netpbm.sourceforge.net/doc/ppmtv.html.

- Give the PPM image an American TV appearance:

```
ppmtv {{dim_factor}} {{path/to/file.ppm}} > {{path/to/output.ppm}}
```

- Suppress all informational messages:

```
ppmtv {{[-q|-quiet]}}
```

- Display version:

```
ppmtv {{[-v|-version]}}
```

ppmwheel

Generate a PPM image of a color wheel.

More information: https://netpbm.sourceforge.net/doc/ppmwheel.html.

- Generate a color wheel of type `Ppmcirc`:

```
ppmwheel {{diameter}} > {{path/to/output.ppm}}
```

- Generate a color wheel of type `Hue-value`:

```
ppmwheel {{[-huev|-huevalue]}} {{diameter}} > {{path/to/
output.ppm}}
```

- Generate a color wheel of type `Hue-saturation`:

```
ppmwheel {{[-hues|-huesaturation]}} {{diameter}} > {{path/to/
output.ppm}}
```

pppd

Establish Point-to-Point connection to another computer.

Note: It should not be invoked manually.

More information: https://ppp.samba.org/pppd.html.

- Start the daemon:

```
pppd
```

pprof

Visualize and analyze profiling data.

More information: https://github.com/google/pprof/tree/main/doc#pprof.

- Generate a text report from a specific profiling file, on fibbo binary:

```
pprof -top {{./fibbo}} {{./fibbo-profile.pb.gz}}
```

- Generate a graph and open it on a web browser:

```
pprof -svg {{./fibbo}} {{./fibbo-profile.pb.gz}}
```

- Run pprof in interactive mode to be able to manually launch `pprof` on a file:

```
pprof {{./fibbo}} {{./fibbo-profile.pb.gz}}
```

- Run a web server that serves a web interface on top of `pprof`:

```
pprof -http={{localhost:8080}} {{./fibbo}} {{./fibbo-
profile.pb.gz}}
```

- Fetch a profile from an HTTP server and generate a report:

```
pprof {{http://localhost:8080/debug/pprof}}
```

pr

Paginate or columnate files for printing.

More information: https://www.gnu.org/software/coreutils/manual/html_node/pr-invocation.html.

- Print multiple files with a default header and footer:

```
pr {{path/to/file1 path/to/file2 ...}}
```

- Print with a custom centered header:

```
pr {{[-h|--header]}} "{{header}}" {{path/to/file1 path/to/file2 ...}}
```

- Print with numbered lines and a custom date format:

```
pr {{[-n|--number-lines]}} {{[-D|--date-format]}} "{{format}}" {{path/to/file1 path/to/file2 ...}}
```

- Print all files together, one in each column, without a header or footer:

```
pr {{[-m|--merge]}} {{[-T|--omit-pagination]}} {{path/to/file1 path/to/file2 ...}}
```

- Print, beginning at page 2 up to page 5, with a given page length (including header and footer):

```
pr +2:5 {{[-l|--length]}} {{page_length}} {{path/to/file1 path/to/file2 ...}}
```

- Print with an offset for each line and a truncating custom page width:

```
pr {{[-o|--indent]}} {{offset}} {{[-W|--page_width]}} {{width}} {{path/to/file1 path/to/file2 ...}}
```

pre-commit

Create Git hooks that run before commits.

More information: https://pre-commit.com/#command-line-interface.

- Install pre-commit into your Git hooks:

```
pre-commit install
```

- Run pre-commit hooks on all staged files:

```
pre-commit run
```

- Run pre-commit hooks on all files, staged or unstaged:

```
pre-commit run --all-files
```

- Clean pre-commit cache:

```
pre-commit clean
```

- Update pre-commit configuration file to the latest repos' versions:

```
pre-commit autoupdate
```

prek

Create Git hooks that run before commits.

More information: https://prek.j178.dev/reference/cli/.

- Install prek into your Git hooks:

```
prek install
```

- Run prek hooks on all staged files:

```
prek run
```

- Run prek hooks on all files, staged or unstaged:

```
prek run {{[-a|--all-files]}}
```

- Clean prek cache:

```
prek cache clean
```

- Update prek configuration file to the latest repos' versions:

```
prek auto-update
```

prename

This command is an alias of **`rename`**.

- View documentation for the original command:

```
tldr {{[-p|--platform]}} common rename
```

presenterm

A terminal-based slideshow tool that renders markdown presentations.

More information: https://mfontanini.github.io/presenterm/.

- Display a presentation:

```
presenterm {{path/to/slides.md}}
```

- Display a presentation with a specific theme:

```
presenterm --theme {{dark|light|tokyonight-storm|...}} {{path/to/slides.md}}
```

- List all available themes:

```
presenterm --list-themes
```

- Export a presentation to PDF:

```
presenterm --export-pdf --output {{path/to/output.pdf}} {{path/to/slides.md}}
```

- Display a presentation with code snippet execution enabled:

```
presenterm --enable-snippet-execution {{path/to/slides.md}}
```

- Validate that presentation content fits within the terminal:

```
presenterm --validate-overflows {{path/to/slides.md}}
```

prettier

An opinionated code formatter for JavaScript, JSON, CSS, YAML, and more.

More information: https://prettier.io/docs/cli.

- Format a file and print the result to `stdout`:

  ```
  prettier {{path/to/file}}
  ```

- Check if a specific file has been formatted:

  ```
  prettier --check {{path/to/file}}
  ```

- Run with a specific configuration file:

  ```
  prettier --config {{path/to/config_file}} {{path/to/file}}
  ```

- Format a file or directory, replacing the original:

  ```
  prettier --write {{path/to/file_or_directory}}
  ```

- Format files or directories recursively using single quotes and no trailing commas:

  ```
  prettier --single-quote --trailing-comma {{none}} --write {{path/to/file_or_directory}}
  ```

- Format JavaScript and TypeScript files recursively, replacing the original:

  ```
  prettier --write "**/*.{js,jsx,ts,tsx}"
  ```

pretty-bytes

Convert bytes to a human-readable string.

More information: https://github.com/sindresorhus/pretty-bytes-cli.

- Convert numeric bytes value to a human-readable string:

```
pretty-bytes {{1337}}
```

- Convert numeric bytes value from `stdin` to a human-readable string:

```
echo {{1337}} | pretty-bytes
```

- Display help:

```
pretty-bytes --help
```

print

`print` can refer to multiple commands with the same name.

- View documentation for the Zsh builtin:

  `tldr print.zsh`

- View documentation for the `print` alias of `run-mailcap --action=print`:

  `tldr {{[-p|--platform]}} linux run-mailcap`

- View documentation for printing text files on Windows:

  `tldr {{[-p|--platform]}} windows print.win`

print

Z Shell (**zsh**) builtin. Print arguments, similar to **echo**.

See also: **echo**, **printf**, **zsh**.

More information: https://zsh.sourceforge.io/Doc/Release/Shell-Builtin-Commands.html.

- Print input:

```
print "Hello" "World"
```

- Print separated by newline(s):

```
print -l "Line1" "Line 2" "Line3"
```

- Print without trailing newline:

```
print -n "Hello"; print "World"
```

- Enable backslash escapes:

```
print -e "Line 1\nLine2"
```

- Print arguments as described by `printf` (for greater portability across shells, consider using the `printf` command instead):

```
print -f "%s is %d years old.\n" "Alice" 30
```

printenv

Print values of environment variables.

More information: https://www.gnu.org/software/coreutils/manual/html_node/printenv-invocation.html.

- Display key-value pairs of all environment variables:

```
printenv
```

- Display the value of a specific variable:

```
printenv {{HOME}}
```

- Display the value of a variable and end with NUL instead of newline:

```
printenv {{[-0|--null]}} {{HOME}}
```

printf

Format and print text.

See also: **echo**.

More information: https://www.gnu.org/software/coreutils/manual/html_node/printf-invocation.html.

- Print a text message:

```
printf "{{%s\n}}" "{{Hello world}}"
```

- Print formatted message multiple times with different strings:

```
printf "%s\n" {{string1 string2 ...}}
```

- Print an integer in bold blue:

```
printf "{{\e[1;34m%.3d\e[0m\n}}" {{42}}
```

- Print a float number with the Unicode Euro sign:

```
printf "{{\u20AC %.2f\n}}" {{123.4}}
```

- Print a text message composed with environment variables:

```
printf "{{var1: %s\tvar2: %s\n}}" "{{$VAR1}}" "{{$VAR2}}"
```

- Store a formatted message in a variable (does not work on Zsh):

```
printf -v {{myvar}} {{"This is %s = %d\n" "a year" 2016}}
```

- Print a hexadecimal, octal, and scientific number:

```
printf "{{hex=%x octal=%o scientific=%e\n}}" 0x{{FF}}
0{{377}} {{100000}}
```

procs

Display information about the active processes.

More information: https://github.com/dalance/procs/blob/master/man/procs.1.adoc.

- List all processes showing the PID, user, CPU usage, memory usage, and the command which started them:

```
procs
```

- List all processes as a tree:

```
procs --tree
```

- List information about processes, if the commands which started them contain `zsh`:

```
procs {{zsh}}
```

- List information about all processes sorted by CPU time in [a]scending or [d]escending order:

```
procs {{--sorta|--sortd}} cpu
```

- List information about processes with either a PID, command, or user containing `41` or `firefox`:

```
procs --or {{PID|command|user}} {{41}} {{firefox}}
```

- List information about processes with both PID `41` and a command or user containing `zsh`:

```
procs --and {{41}} {{zsh}}
```

progpilot

A PHP static analysis tool for detecting security vulnerabilities.

More information: https://github.com/designsecurity/progpilot.

- Analyze the current directory:

```
progpilot
```

- Analyze a specific file or directory:

```
progpilot {{path/to/file_or_directory}}
```

- Specify a custom configuration file:

```
progpilot --configuration {{path/to/configuration.yml}}
```

progress

Display/Monitor the progress of running coreutils.

More information: https://github.com/Xfennec/progress.

- Show the progress of running coreutils:

```
progress
```

- Monitor all running coreutils:

```
progress {{[-m|--monitor]}}
```

- Show the progress of running coreutils in quiet mode:

```
progress {{[-q|--quiet]}}
```

- Launch and monitor a single long-running command:

```
{{command}} & progress {{[-m|--monitor]}} {{[-p|--pid]}} $!
```

- Include an estimate of time remaining for completion:

```
progress {{[-w|--wait]}} {{[-c|--command]}} {{firefox}}
```

Projucer

A project manager for JUCE framework applications.

More information: https://docs.juce.com/master/projucer_manual.html#projucer_manual_tools_command_line_tools.

- Display information about a project:

```
Projucer --status {{path/to/project_file}}
```

- Resave all files and resources in a project:

```
Projucer --resave {{path/to/project_file}}
```

- Update the version number in a project:

```
Projucer --set-version {{version_number}} {{path/to/project_file}}
```

- Generate a JUCE project from a PIP file:

```
Projucer --create-project-from-pip {{path/to/PIP}} {{path/to/output}}
```

- Remove all JUCE-style comments (`//=====`, `//-----`, or `///////`):

```
Projucer --tidy-divider-comments {{path/to/target_folder}}
```

- Display help:

```
Projucer --help
```

promtool

Tooling for the Prometheus monitoring system.

More information: https://prometheus.io/docs/prometheus/latest/getting_started/.

- Check if the configuration files are valid or not (if present report errors):

  ```
  promtool check config {{config_file.yml}}
  ```

- Check if the rule files are valid or not (if present report errors):

  ```
  promtool check rules {{rules_file.yml}}
  ```

- Pass Prometheus metrics over `stdin` to check them for consistency and correctness:

  ```
  curl --silent {{http://example.com:9090/metrics/}} | promtool check metrics
  ```

- Run unit tests for rules config:

  ```
  promtool test rules {{test_file.yml}}
  ```

propelauth

Set up PropelAuth authentication as quickly and easily as possible.

More information: https://docs.propelauth.com/reference/api/cli.

- Log in to PropelAuth using an API Key generated from https://auth.propelauth.com/api_keys/personal:

  ```
  propelauth login
  ```

- Set the default PropelAuth Project for the CLI. If no default project is set, the system will prompt for selecting a Project each time certain commands are run:

  ```
  propelauth set-default-project
  ```

- Install PropelAuth authentication in an application. If no directory is provided, the current directory is used:

  ```
  propelauth setup {{[-f|--framework]}} {{path/to/directory}}
  ```

- Log the CLI out of PropelAuth:

  ```
  propelauth logout
  ```

prosodyctl

The control tool for the Prosody XMPP server.

Note: Process management through **`prosodyctl`** is discouraged. Instead, use the tools provided by your system (e.g. **`systemctl`**).

More information: https://prosody.im/doc/prosodyctl.

- Show the status of the Prosody server:

  ```
  sudo prosodyctl status
  ```

- Reload the server's configuration files:

  ```
  sudo prosodyctl reload
  ```

- Add a user to the Prosody XMPP server:

  ```
  sudo prosodyctl adduser {{user@example.com}}
  ```

- Set a user's password:

  ```
  sudo prosodyctl passwd {{user@example.com}}
  ```

- Permanently delete a user:

  ```
  sudo prosodyctl deluser {{user@example.com}}
  ```

protector

Protect or unprotect branches on GitHub repositories.

More information: https://github.com/jcgay/protector#usage.

- Protect branches of a GitHub repository (create branch protection rules):

```
protector {{branches_regex}} -repos {{organization/repository}}
```

- Simulate what would be protected without actually doing it:

```
protector -dry-run {{branches_regex}} -repos {{organization/repository}}
```

- Free branches of a GitHub repository (delete branch protection rules):

```
protector -free {{branches_regex}} -repos {{organization/repository}}
```

protoc

Parse Google Protobuf **`.proto`** files and generate output in the specified language.

More information: https://manned.org/protoc.

- Generate Python code from a `.proto` file:

```
protoc --python_out={{path/to/output_directory}}
{{input_file.proto}}
```

- Generate Java code from a `.proto` file that imports other `.proto` files:

```
protoc --java_out={{path/to/output_directory}} --
proto_path={{path/to/import_search_path}}
{{input_file.proto}}
```

- Generate code for multiple languages:

```
protoc --csharp_out={{path/to/c#_output_directory}} --
js_out={{path/to/js_output_directory}} {{input_file.proto}}
```

- Encode a text-format message into a protocol message from a `.proto` file:

```
protoc < {{message.txt}} --encode={{TypeName}}
{{input_file.proto}}
```

- Decode a protocol message into text-format from a `.proto` file:

```
protoc < {{message.bin}} --decode={{TypeName}}
{{input_file.proto}}
```

- Decode a protocol message into raw tag/value pairs:

```
protoc < {{message.bin}} --decode_raw
```

prowler aws

Assess AWS security best practices, perform audits, compliance checks, and generate reports.

See also: **`prowler azure`**, **`prowler gcp`**, **`prowler kubernetes`**, **`prowler m365`**, **`prowler github`**.

More information: https://docs.prowler.com/user-guide/cli/tutorials/misc.

- Run the default set of checks on the AWS account:

```
prowler aws
```

- Use a custom AWS profile and filter audited regions:

```
prowler aws {{[-p|--profile]}} {{custom_profile}} {{[-f|--filter-region]}} {{us-east-1 eu-south-2 ...}}
```

- Run checks for selected AWS services:

```
prowler aws {{[-s|--services]}} {{s3|ec2|...}}
```

- Run a specific AWS check:

```
prowler aws {{[-c|--checks]}} {{s3_bucket_public_access}}
```

- Exclude specific checks or services:

```
prowler aws {{[-e|--excluded-checks]}} {{s3_bucket_public_access}} --exclude-services {{s3|ec2|...}}
```

prowler azure

Assess Azure security best practices, perform audits, compliance checks, and generate reports.

See also: **`prowler aws`**, **`prowler gcp`**, **`prowler kubernetes`**, **`prowler m365`**, **`prowler github`**.

More information: https://docs.prowler.com/user-guide/cli/tutorials/misc.

- Run the default set of checks on the current Azure account using Azure CLI authentication:

```
prowler azure --az-cli-auth
```

- Run checks for specific Azure subscriptions:

```
prowler azure --az-cli-auth --subscription-ids
{{subscription_id1 subscription_id2 ...}}
```

- Authenticate using a service principal via environment variables:

```
prowler azure --sp-env-auth
```

- Authenticate using browser login and specify a tenant ID:

```
prowler azure --browser-auth --tenant-id "{{XXXXXXXX}}"
```

- Authenticate using a managed identity (e.g. for Azure VM):

```
prowler azure --managed-identity-auth
```

- Run checks for selected Azure services:

```
prowler azure {{[-s|--services]}} {{defender|iam|...}}
```

- Run a specific Azure check:

```
prowler azure {{[-c|--checks]}}
{{storage_blob_public_access_level_is_disabled}}
```

- Exclude specific checks or services:

```
prowler azure {{[-e|--excluded-checks]}}
{{storage_blob_public_access_level_is_disabled}} --exclude-
services {{defender|iam|...}}
```

prowler gcp

Assess Google Cloud Platform (GCP) security best practices, audits, and compliance checks.

See also: **`prowler aws`**, **`prowler azure`**, **`prowler kubernetes`**, **`prowler m365`**, **`prowler github`**.

More information: https://docs.prowler.com/user-guide/cli/tutorials/misc.

- Run the default set of checks on all accessible GCP projects using default user credentials:

```
prowler gcp
```

- Authenticate using a service account credentials file:

```
prowler gcp --credentials-file {{path/to/credentials.json}}
```

- Scan specific GCP projects by ID:

```
prowler gcp --project-ids {{project_id1 project_id2 ...}}
```

- Run checks for selected GCP services:

```
prowler gcp {{[-s|--services]}} {{iam|compute|...}}
```

- Run a specific GCP check:

```
prowler gcp {{[-c|--checks]}}
{{gcp_storage_bucket_logging_enabled}}
```

- Exclude specific checks or services:

```
prowler gcp {{[-e|--excluded-checks]}}
{{gcp_storage_bucket_logging_enabled}} --exclude-services
{{iam|compute|...}}
```

prowler github

Assess GitHub account, repository, and organization security best practices.

See also: **`prowler aws`**, **`prowler azure`**, **`prowler gcp`**, **`prowler kubernetes`**, **`prowler m365`**.

More information: https://docs.prowler.com/user-guide/cli/tutorials/misc.

- Run all default GitHub security checks:

```
prowler github
```

- Authenticate using a GitHub Personal Access Token:

```
prowler github --personal-access-token {{pat}}
```

- Authenticate using a GitHub OAuth App Token:

```
prowler github --oauth-app-token {{oauth_token}}
```

- Authenticate using a GitHub App ID and private key:

```
prowler github --github-app-id {{app_id}} --github-app-key
{{app_key}}
```

prowler kubernetes

Assess Kubernetes cluster security best practices and configurations.

See also: **`prowler aws`**, **`prowler azure`**, **`prowler gcp`**, **`prowler m365`**, **`prowler github`**.

More information: https://docs.prowler.com/user-guide/cli/tutorials/misc.

- Run the default checks using the default kubeconfig location:

```
prowler kubernetes
```

- Specify a custom kubeconfig file for scanning:

```
prowler kubernetes --kubeconfig-file {{path/to/kubeconfig}}
```

- Specify a specific Kubernetes context to scan:

```
prowler kubernetes --context {{my-context}}
```

- Scan specific namespaces only:

```
prowler kubernetes --namespaces {{default}} {{kube-system}}
```

- Run checks for selected Kubernetes services:

```
prowler kubernetes {{[-s|--services]}} {{ietcd|
apiserver|...}}
```

- Run a specific Kubernetes check:

```
prowler kubernetes {{[-c|--checks]}} {{etcd_encryption}}
```

- Exclude specific checks or services:

```
prowler kubernetes {{[-e|--excluded-checks]}}
{{etcd_encryption}} --exclude-services {{ietcd|
apiserver|...}}
```

prowler m365

Assess Microsoft 365 (M365) security configurations and best practices.

See also: **`prowler aws`**, **`prowler azure`**, **`prowler gcp`**, **`prowler kubernetes`**, **`prowler github`**.

More information: https://docs.prowler.com/user-guide/cli/tutorials/misc.

- Run Prowler with combined service principal and user credentials:

```
prowler m365 --env-auth
```

- Authenticate using a service principal:

```
prowler m365 --sp-env-auth
```

- Authenticate using the Azure CLI:

```
prowler m365 --az-cli-auth
```

- Authenticate using a browser and specify the tenant ID:

```
prowler m365 --browser-auth --tenant-id "{{XXXXXXXX}}"
```

- Run a specific Microsoft 365 check:

```
prowler m365 {{[-c|--checks]}}
{{etcd_enm365_onedrive_sharing_enabledcryption}}
```

- Exclude specific checks:

```
prowler m365 {{[-e|--excluded-checks]}}
{{m365_onedrive_sharing_enabled}}
```

prowler

Perform security best practices assessments, audits, and compliance checks across AWS, Azure, Google Cloud, and Kubernetes.

See also: **`prowler aws`**, **`prowler azure`**, **`prowler gcp`**, **`prowler kubernetes`**, **`prowler m365`**, **`prowler github`**.

More information: https://docs.prowler.com/user-guide/cli/tutorials/misc.

- Run an AWS, Azure, GCP, Kubernetes - as provider - audit with default checks:

```
prowler {{provider}}
```

- Show all available checks for a specific provider:

```
prowler {{provider}} {{[-l|--list-checks]}}
```

- Show all available services for a specific provider:

```
prowler {{provider}} --list-services
```

- Generate output in multiple formats, including JSON-ASFF for AWS Security Hub:

```
prowler {{provider}} --output-modes {{csv,json-asff,html,...}}
```

- Execute in verbose mode:

```
prowler {{provider}} --verbose
```

- Filter findings by status:

```
prowler {{provider}} --status {{PASS,FAIL,MANUAL}}
```

- Display help:

```
prowler --help
```

- Display version:

```
prowler {{[-v|--version]}}
```

proxify

A versatile and portable proxy for capturing, manipulating, and replaying HTTP/HTTPS traffic on the go.

See also: **`mitmproxy`**.

More information: https://github.com/projectdiscovery/proxify#usage.

- Start a HTTP proxy (on the loopback network interface `127.0.0.1` and port `8888`):

```
proxify
```

- Start a HTTP proxy on a custom network interface and port (may require `sudo` for a port number lower than `1024`):

```
proxify {{[-ha|-http-addr]}} "{{ip_address}}:{{port_number}}"
```

- Specify output format and output file:

```
proxify {{[-of|-output-format]}} {{jsonl|yaml}} {{[-o|-output]}} {{path/to/file}}
```

- Display help:

```
proxify -h
```

prqlc

PRQL compiler.

PRQL is a modern language for transforming data - a simple, powerful, pipelined SQL replacement.

More information: https://prql-lang.org/book/project/integrations/prqlc-cli.html.

- Run the compiler interactively:

```
prqlc compile
```

- Compile a specific `.prql` file to `stdout`:

```
prqlc compile {{path/to/file.prql}}
```

- Compile a `.prql` file to a `.sql` file:

```
prqlc compile {{path/to/source.prql}} {{path/to/target.sql}}
```

- Compile a query:

```
echo "{{from employees | filter has_dog | select salary}}" |
prqlc compile
```

- Watch a directory and compile on file modification:

```
prqlc watch {{path/to/directory}}
```

ps-nvm

PowerShell-based utility to manage multiple Node.js versions, inspired by **`nvm`**.

This tool provides multiple commands that all can only be run through PowerShell.

More information: https://github.com/aaronpowell/ps-nvm.

- View documentation for `Get-NodeInstallLocation`, a tool to get the current Node.js install location:

  ```
  tldr get-nodeinstalllocation
  ```

- View documentation for `Get-NodeVersions`, a tool to list all available and currently-installed Node.js versions:

  ```
  tldr get-nodeversions
  ```

- View documentation for `Install-NodeVersion`, a tool to install Node.js runtime versions:

  ```
  tldr install-nodeversion
  ```

- View documentation for `Remove-NodeVersion`, a tool to uninstall an existing Node.js version:

  ```
  tldr remove-nodeversion
  ```

- View documentation for `Set-NodeInstallLocation`, a tool to set the Node.js install location:

  ```
  tldr set-nodeinstalllocation
  ```

- View documentation for `Set-NodeVersion`, a tool to set the default version of Node.js:

  ```
  tldr set-nodeversion
  ```

ps

Information about running processes.

More information: https://manned.org/ps.

- List all running processes:

```
ps aux
```

- List all running processes including the full command string:

```
ps auxww
```

- Search for a process that matches a string (the brackets will prevent `grep` from matching itself):

```
ps aux | grep {{[s]tring}}
```

- List all processes of the current user in extra full format:

```
ps {{[-u|--user]}} $(id {{[-u|--user]}}) -F
```

- List all processes of the current user as a tree:

```
ps {{[-u|--user]}} $(id {{[-u|--user]}}) f
```

- Get the parent PID of a process:

```
ps {{[-o|--format]}} ppid= {{[-p|--pid]}} {{process_id}}
```

- Sort processes by memory consumption:

```
ps {{[k|--sort]}} size
```

- Display threads for a specific process:

```
ps -L {{[-p|--pid]}} {{process_id}}
```

psalm

A static analysis tool for finding errors in PHP applications.

More information: https://psalm.dev/docs/running_psalm/command_line_usage/#command-line-options.

- Generate a Psalm configuration:

```
psalm --init
```

- Analyze the current working directory:

```
psalm
```

- Analyze a specific directory or file:

```
psalm {{path/to/file_or_directory}}
```

- Analyze a project with a specific configuration file:

```
psalm --config {{path/to/psalm.xml}}
```

- Include informational findings in the output:

```
psalm --show-info
```

- Analyze a project and display statistics:

```
psalm --stats
```

- Analyze a project in parallel with 4 threads:

```
psalm --threads {{4}}
```

psexec.py

Execute commands on a remote Windows machine using **`RemComSvc`**, providing PsExec-like functionality.

Part of the Impacket suite.

More information: https://github.com/fortra/impacket.

- Spawn an interactive shell on a remote target:

```
psexec.py {{domain}}/{{username}}:{{password}}@{{target}}
```

- Execute a specific command on a remote target:

```
psexec.py {{domain}}/{{username}}:{{password}}@{{target}}
{{command}}
```

- Copy the filename for later execution, arguments are passed in the command:

```
psexec.py -c {{filename}} {{domain}}/{{username}}:
{{password}}@{{target}} {{command}}
```

- Execute a command from a specific path on a remote target:

```
psexec.py -path {{path}} {{domain}}/{{username}}:{{password}}
@{{target}} {{command}}
```

- Authenticate using pass-the-hash authentication instead of a password:

```
psexec.py -hashes {{LM_Hash}}:{{NT_Hash}} {{domain}}/
{{username}}@{{target}}
```

- Use Kerberos authentication for the target:

```
psexec.py -k -no-pass {{domain}}/{{username}}@{{target}}
```

- Specify the IP address of the domain controller:

```
psexec.py -dc-ip {{domain_controller_ip}} {{domain}}/
{{username}}:{{password}}@{{target}}
```

psgrep

Search running processes with **`grep`**.

More information: https://jvz.github.io/psgrep/.

- Find process lines containing a specific string:

```
psgrep {{process_name}}
```

- Find process lines containing a specific string, excluding headers:

```
psgrep -n {{process_name}}
```

- Search using a simplified format (PID, user, command):

```
psgrep -s {{process_name}}
```

psidtopgm

Convert PostScript image data to a PGM image.

More information: https://netpbm.sourceforge.net/doc/psidtopgm.html.

- Convert the image data in a PS file to a PGM image of the specified dimensions and quality:

```
psidtopgm {{width}} {{height}} {{bits_per_sample}} {{path/to/file.ps}} > {{path/to/image.pgm}}
```

psql

PostgreSQL client.

More information: https://www.postgresql.org/docs/current/app-psql.html.

- Connect to the database. By default, it connects to the local socket using port 5432 with the currently logged in user:

```
psql {{database}}
```

- Connect to the database on given server host running on given port with given username, without a password prompt:

```
psql {{[-h|--host]}} {{host}} {{[-p|--port]}} {{port}} {{[-U|--username]}} {{username}} {{database}}
```

- Connect to the database; user will be prompted for password:

```
psql {{[-h|--host]}} {{host}} {{[-p|--port]}} {{port}} {{[-U|--username]}} {{username}} {{[-W|--password]}} {{database}}
```

- Execute a single SQL query or PostgreSQL command on the given database (useful in shell scripts):

```
psql {{[-c|--command]}} '{{query}}' {{database}}
```

- Execute commands from a file on the given database:

```
psql {{database}} {{[-f|--file]}} {{path/to/file.sql}}
```

pssh

Parallel SSH program.

More information: https://manned.org/pssh.

- Run a command on two hosts, and print its output on each server inline:

```
pssh {{[-i|--inline]}} {{[-H|--host]}} "{{host1}}
{{host2}}" {{hostname --ip-addresses}}
```

- Run a command and save the output to separate files:

```
pssh {{[-H|--host]}} {{host1}} {{[-H|--host]}} {{host2}} {{[-
o|--outdir]}} {{path/to/output_directory}} {{hostname --ip-
addresses}}
```

- Run a command on multiple hosts, specified in a new-line separated file:

```
pssh {{[-i|--inline]}} {{[-h|--hosts]}} {{path/to/
hosts_file}} {{hostname --ip-addresses}}
```

- Run a command as root (this asks for the root password):

```
pssh {{[-i|--inline]}} {{[-h|--hosts]}} {{path/to/
hosts_file}} {{[-A|--askpass]}} {{[-l|--user]}}
{{root_username}} {{hostname --ip-addresses}}
```

- Run a command with extra SSH arguments:

```
pssh {{[-i|--inline]}} {{[-h|--hosts]}} {{path/to/
hosts_file}} {{[-x|--extra-arg]}} "{{-O
VisualHostKey=yes}}" {{hostname --ip-addresses}}
```

- Run a command limiting the number of parallel connections to 10:

```
pssh {{[-i|--inline]}} {{[-h|--hosts]}} {{path/to/
hosts_file}} {{[-p|-par]}} {{10}} '{{cd dir; ./script.sh;
exit}}'
```

pstopnm

Convert a PostScript file to a PNM image.

More information: https://netpbm.sourceforge.net/doc/pstopnm.html.

- Convert a PS file to PNM images, storing page N of the input to `path/to/fileN.ppm`:

```
pstopnm {{path/to/file.ps}}
```

- Explicitly specify the output format:

```
pstopnm -{{pbm|pgm|ppm}} {{path/to/file.ps}}
```

- Specify the resolution of the output in dots per inch:

```
pstopnm -dpi {{n}} {{path/to/file.ps}}
```

psysh

A runtime developer console, interactive debugger, and REPL for PHP.

More information: https://github.com/bobthecow/psysh/wiki/CLI-options.

- Open a shell in the current directory:

```
psysh
```

- Open a shell in a specific directory:

```
psysh --cwd {{path/to/directory}}
```

- Use a specific configuration file:

```
psysh {{[-c|--config]}} {{path/to/file}}
```

pt

Platinum Searcher.

A code search tool similar to **ag**.

More information: https://github.com/monochromegane/the_platinum_searcher.

- Find files containing a pattern and print the files with highlighted matches:

```
pt {{pattern}}
```

- Find files containing a pattern and display count of matches in each file:

```
pt {{[-c|--count]}} {{pattern}}
```

- Find files containing a pattern as a whole word and ignore its case:

```
pt {{[-wi|--word-regexp --ignore-case]}} {{pattern}}
```

- Find a pattern in files with a given extension using a `regex`:

```
pt {{[-G|--file-search-regexp]}}='{{\.ext$}}' {{pattern}}
```

- Find files whose contents match the `regex`, up to 2 directories deep:

```
pt --depth={{2}} -e '{{^ba[rz]*$}}'
```

ptargrep

Find **`regex`** patterns in **`.tar`** archive files.

More information: https://manned.org/ptargrep.

- Search for a pattern within one or more `.tar` archives:

```
ptargrep "{{search_pattern}}" {{path/to/file1 path/to/file2 ...}}
```

- Extract to the current directory using the basename of the file from the archive:

```
ptargrep {{[-b|--basename]}} "{{search_pattern}}" {{path/to/file}}
```

- Search for a case-insensitive pattern matching within a `.tar` archive:

```
ptargrep {{[-i|--ignore-case]}} "{{search_pattern}}" {{path/to/file}}
```

ptghci

Interactive Haskell REPL with syntax highlighting, multiline editing, and real-time type display.

See also: **`ghci`**.

More information: https://github.com/litxio/ptghci.

- Start an interactive session:

```
ptghci
```

- Start an interactive session and load a Haskell file:

```
ptghci {{path/to/file.hs}}
```

- [Interactive] List past commands from the current session:

```
%past
```

- [Interactive] List past commands including previous sessions:

```
%past -n {{number}}
```

- [Interactive] Re-run specific commands from history:

```
%rerun {{3,4-5,p8}}
```

- [Interactive] Search Hoogle for an identifier:

```
%hoogle {{identifier}}
```

- [Interactive] Change the syntax highlighting style:

```
%style {{style_name}}
```

ptpython

A better Python REPL.

More information: https://github.com/prompt-toolkit/ptpython.

- Start a REPL (interactive shell):

```
ptpython
```

- Execute a specific Python file:

```
ptpython {{path/to/file.py}}
```

- Execute a specific Python file and start a REPL:

```
ptpython {{[-i|--interactive]}} {{path/to/file.py}}
```

- Open the menu:

```
<F2>
```

- Open the history page:

```
<F3>
```

- Toggle paste mode:

```
<F6>
```

- Quit:

```
<Ctrl d>
```

ptpython3

This command is an alias of **ptpython**.

- View documentation for the original command:

```
tldr ptpython
```

pueue add

Enqueue a task for execution.

More information: https://github.com/Nukesor/pueue#how-to-use-it.

- Add any command to the default queue:

```
pueue add {{command}}
```

- Pass a list of flags or arguments to a command when enqueuing:

```
pueue add -- {{command --arg -f}}
```

- Add a command but do not start it if it's the first in a queue:

```
pueue add {{[-s|--stashed]}} -- {{rsync --archive --
compress /local/directory /remote/directory}}
```

- Add a command to a group and start it immediately, see `pueue group` to manage groups:

```
pueue add {{[-i|--immediate]}} {{[-g|--group]}}
"{{cpu_intensive}}" -- {{ffmpeg -i input.mp4 frame_%d.png}}
```

- Add a command and start it after commands 9 and 12 finish successfully:

```
pueue add {{[-a|--after]}} {{9}} {{12}} {{[-g|--group]}}
"{{torrents}}" -- {{transmission-cli torrent_file.torrent}}
```

- Add a command with a label after some delay has passed, see `pueue enqueue` for valid datetime formats:

```
pueue add {{[-l|--label]}} "{{compressing large file}}" {{[-
d|--delay]}} "{{wednesday 10:30pm}}" -- "{{7z a
compressed_file.7z large_file.xml}}"
```

pueue clean

Remove all finished tasks from the list and clear logs.

More information: https://github.com/Nukesor/pueue#how-to-use-it.

- Remove finished tasks and clear logs:

```
pueue clean
```

- Only clean commands that finished successfully:

```
pueue clean {{[-s|--successful-only]}}
```

pueue completions

Generate shell completion files for Bash, Elvish, fish, PowerShell, and Zsh.

More information: https://github.com/Nukesor/pueue#how-to-use-it.

- Generate completions for Bash:

```
sudo pueue completions bash {{/usr/share/bash-completion/completions/pueue.bash}}
```

- Generate completions for Zsh:

```
sudo pueue completions zsh {{/usr/share/zsh/site-functions}}
```

- Generate completions for fish:

```
sudo pueue completions fish {{/usr/share/fish/completions}}
```

pueue edit

Edit the command or path of a stashed or queued task.

More information: https://github.com/Nukesor/pueue#how-to-use-it.

- Edit a task, see `pueue status` to get the task ID:

```
pueue edit {{task_id}}
```

- Edit the path from which a task is executed:

```
pueue edit {{task_id}} --path
```

- Edit a command with the specified editor:

```
EDITOR={{nano}} pueue edit {{task_id}}
```

pueue enqueue

Enqueue stashed tasks.

See also: **`pueue stash`**.

More information: https://github.com/Nukesor/pueue#how-to-use-it.

- Enqueue multiple stashed tasks at once:

```
pueue enqueue {{task_id}} {{task_id}}
```

- Enqueue a stashed task after 60 seconds:

```
pueue enqueue {{[-d|--delay]}} {{60}} {{task_id}}
```

- Enqueue a stashed task next Wednesday:

```
pueue enqueue {{[-d|--delay]}} {{wednesday}} {{task_id}}
```

- Enqueue a stashed task after four months:

```
pueue enqueue {{[-d|--delay]}} "4 months" {{task_id}}
```

- Enqueue a stashed task on 2021-02-19:

```
pueue enqueue {{[-d|--delay]}} {{2021-02-19}} {{task_id}}
```

- List all available date/time formats:

```
pueue enqueue {{[-h|--help]}}
```

pueue follow

Follow the output of a currently running task.

See also: **`pueue log`**.

More information: https://github.com/Nukesor/pueue#how-to-use-it.

- Follow the output of a task (`stdout` + `stderr`):

```
pueue follow {{task_id}}
```

- Follow `stderr` of a task:

```
pueue follow --err {{task_id}}
```

pueue group

Display, add, or remove groups.

More information: https://github.com/Nukesor/pueue#how-to-use-it.

- Show all groups with their statuses and number of parallel jobs:

```
pueue group
```

- Add a custom group:

```
pueue group add "{{group_name}}"
```

- Remove a group and move its tasks to the default group:

```
pueue group remove "{{group_name}}"
```

pueue help

Display help for subcommands.

More information: https://github.com/Nukesor/pueue#how-to-use-it.

- Show all available subcommands and flags:

```
pueue help
```

- Display help for a specific subcommand:

```
pueue help {{subcommand}}
```

pueue kill

Kill running tasks or whole groups.

More information: https://github.com/Nukesor/pueue#how-to-use-it.

- Kill all tasks in the default group:

```
pueue kill
```

- Kill a specific task:

```
pueue kill {{task_id}}
```

- Kill a task and terminate all its child processes:

```
pueue kill --children {{task_id}}
```

- Kill all tasks in a group and pause the group:

```
pueue kill {{[-g|--group]}} {{group_name}}
```

- Kill all tasks across all groups and pause all groups:

```
pueue kill {{[-a|--all]}}
```

pueue log

Display the log output of 1 or more tasks.

See also: **`pueue status`**.

More information: https://github.com/Nukesor/pueue#how-to-use-it.

- Show the last few lines of output from all tasks:

```
pueue log
```

- Show the full output of a task:

```
pueue log {{task_id}}
```

- Show the last few lines of output from several tasks:

```
pueue log {{task_id}} {{task_id}}
```

- Print a specific number of lines from the tail of output:

```
pueue log {{[-l|--lines]}} {{number_of_lines}} {{task_id}}
```

pueue parallel

Set the amount of allowed parallel tasks.

More information: https://github.com/Nukesor/pueue#how-to-use-it.

- Set the maximum number of tasks allowed to run in parallel, in the default group:

```
pueue parallel {{max_number_of_parallel_tasks}}
```

- Set the maximum number of tasks allowed to run in parallel, in a specific group:

```
pueue parallel {{[-g|--group]}} {{group_name}} {{maximum_number_of_parallel_tasks}}
```

pueue pause

Pause running tasks or groups.

See also: **`pueue start`**.

More information: https://github.com/Nukesor/pueue#how-to-use-it.

- Pause all tasks in the default group:

```
pueue pause
```

- Pause a running task:

```
pueue pause {{task_id}}
```

- Pause a running task and stop all its direct children:

```
pueue pause --children {{task_id}}
```

- Pause all tasks in a group and prevent it from starting new tasks:

```
pueue pause {{[-g|--group]}} {{group_name}}
```

- Pause all tasks and prevent all groups from starting new tasks:

```
pueue pause {{[-a|--all]}}
```

pueue remove

Remove tasks from the list. Running or paused tasks need to be killed first.

More information: https://github.com/Nukesor/pueue#how-to-use-it.

- Remove a killed or finished task:

```
pueue remove {{task_id}}
```

- Remove multiple tasks at once:

```
pueue remove {{task_id}} {{task_id}}
```

pueue reset

Kill everything and reset.

More information: https://github.com/Nukesor/pueue#how-to-use-it.

- Kill all tasks and remove everything (logs, status, groups, task IDs):

```
pueue reset
```

- Kill all tasks, terminate their children, and reset everything:

```
pueue reset --children
```

- Reset without asking for confirmation:

```
pueue reset {{[-f|--force]}}
```

pueue restart

Restart tasks.

More information: https://github.com/Nukesor/pueue#how-to-use-it.

- Restart a specific task:

```
pueue restart {{task_id}}
```

- Restart multiple tasks at once, and start them immediately (do not enqueue):

```
pueue restart {{[-k|--immediately]}} {{task_id}} {{task_id}}
```

- Restart a specific task from a different path:

```
pueue restart --edit-path {{task_id}}
```

- Edit a command before restarting:

```
pueue restart {{[-e|--edit]}} {{task_id}}
```

- Restart a task in-place (without enqueuing as a separate task):

```
pueue restart {{[-i|--in-place]}} {{task_id}}
```

- Restart all failed tasks and stash them:

```
pueue restart {{[-a|--all-failed]}} --stashed
```

pueue send

Send input to a task.

More information: https://github.com/Nukesor/pueue#how-to-use-it.

- Send input to a running command:

```
pueue send {{task_id}} "{{input}}"
```

- Send confirmation to a task expecting y/N (e.g. APT, cp):

```
pueue send {{task_id}} {{y}}
```

pueue shutdown

Remotely shut down the daemon.

Only use this subcommand if the daemon isn't started by a service manager.

More information: https://github.com/Nukesor/pueue#how-to-use-it.

- Shut down the daemon without a service manager:

```
pueue shutdown
```

pueue start

Resume operation of tasks or groups of tasks.

See also: **pueue pause**.

More information: https://github.com/Nukesor/pueue#how-to-use-it.

- Resume all tasks in the default group:

```
pueue start
```

- Resume a specific task:

```
pueue start {{task_id}}
```

- Resume multiple tasks at once:

```
pueue start {{task_id}} {{task_id}}
```

- Resume all tasks and start their children:

```
pueue start {{[-a|--all]}} --children
```

- Resume all tasks in a specific group:

```
pueue start group {{group_name}}
```

pueue stash

Stash tasks to prevent them starting automatically.

See also: **`pueue start`**, **`pueue enqueue`**.

More information: https://github.com/Nukesor/pueue#how-to-use-it.

- Stash an enqueued task:

```
pueue stash {{task_id}}
```

- Stash multiple tasks at once:

```
pueue stash {{task_id}} {{task_id}}
```

- Start a stashed task immediately:

```
pueue start {{task_id}}
```

- Enqueue a task to be executed when preceding tasks finish:

```
pueue enqueue {{task_id}}
```

pueue status

Display the current status of all tasks.

More information: https://github.com/Nukesor/pueue#how-to-use-it.

- Show the status of all tasks:

```
pueue status
```

- Show the status of a specific group:

```
pueue status {{[-g|--group]}} {{group_name}}
```

pueue switch

Switch the queue position of two enqueued or stashed commands.

More information: https://github.com/Nukesor/pueue#how-to-use-it.

- Switch the priority of two tasks:

```
pueue switch {{task_id1}} {{task_id2}}
```

pueue

A task management tool for sequential and parallel execution of long-running tasks.

Some subcommands such as **add** have their own usage documentation.

More information: https://github.com/Nukesor/pueue#how-to-use-it.

- Add a command to the task list:

```
pueue add -- "{{command}}"
```

- List tasks in the task list:

```
pueue status
```

- Send data to a task's `stdin`:

```
pueue send {{task_id}} "{{hello}}"
```

- View a task's `stdout` and `stderr`, as well as basic information about that task:

```
pueue log {{task_id}}
```

- Create a task group:

```
pueue group --add {{group_name}}
```

- Kill a task:

```
pueue kill {{task_id}}
```

- Set maximum amount of parallel tasks (queued tasks are started as needed to meet this limit):

```
pueue parallel {{number_of_parallel_tasks}}
```

- Edit the command line of a stopped task in the default editor (as specified by `$EDITOR`):

```
pueue edit {{task_id}}
```

pulumi about

Print information about the Pulumi environment.

More information: https://www.pulumi.com/docs/iac/cli/commands/pulumi_about/.

- Print information about the Pulumi environment:

```
pulumi about
```

- Print information about the Pulumi environment in JSON format:

```
pulumi about {{[-j|--json]}}
```

- Print information about the Pulumi environment of a specific stack:

```
pulumi about {{[-s|--stack]}} {{stack_name}}
```

- Display help:

```
pulumi about {{[-h|--help]}}
```

pulumi cancel

Cancel a stack's currently running update, if any.

More information: https://www.pulumi.com/docs/iac/cli/commands/pulumi_cancel/.

- Cancel a stack's currently running update, if any:

```
pulumi cancel {{stack_name}}
```

- Skip confirmation prompts, and proceed with cancellation anyway:

```
pulumi cancel {{[-y|--yes]}}
```

- Display help:

```
pulumi cancel {{[-h|--help]}}
```

pulumi config

Manage configuration of a Pulumi stack.

More information: https://www.pulumi.com/docs/iac/cli/commands/pulumi_config/.

- View current configuration in JSON format:

```
pulumi config {{[-j|--json]}}
```

- View configuration for a specified stack:

```
pulumi config {{[-s|--stack]}} {{stack_name}}
```

- Get the value of a configuration key:

```
pulumi config get {{key}}
```

- Remove a configuration value:

```
pulumi config rm {{key}}
```

- Set a value for a configuration key from a file:

```
cat {{path/to/file}} | pulumi config set {{key}}
```

- Set a secret value (e.g. API key) for a configuration key and store/display as ciphertext:

```
pulumi config set --secret {{key}} {{S3cr37_value}}
```

- Remove multiple configuration values from a specified configuration file:

```
pulumi config --config-file {{path/to/file}} rm-all {{key1 key2 ...}}
```

pulumi console

Open a stack in the Pulumi Console (cloud or self-hosted).

It gives you instructions to migrate if not available for your backend.

More information: https://www.pulumi.com/docs/iac/cli/commands/pulumi_console/.

- Open the current stack:

```
pulumi console
```

- Open the console for a specific stack:

```
pulumi console {{[-s|--stack]}} {{stack_name}}
```

- Display help:

```
pulumi console {{[-h|--help]}}
```

pulumi destroy

Destroy all existing resources in a stack.

More information: https://www.pulumi.com/docs/iac/cli/commands/pulumi_destroy/.

- Destroy all resources in the current stack:

  ```
  pulumi destroy
  ```

- Destroy all resources in a specific stack:

  ```
  pulumi destroy {{[-s|--stack]}} {{stack}}
  ```

- Automatically approve and destroy resources after previewing:

  ```
  pulumi destroy {{[-y|--yes]}}
  ```

- Exclude protected resources from being destroyed:

  ```
  pulumi destroy --exclude-protected
  ```

- Remove the stack and its configuration file after all resources in the stack are deleted:

  ```
  pulumi destroy --remove
  ```

- Continue destroying the resources, even if an error is encountered:

  ```
  pulumi destroy --continue-on-error
  ```

pulumi down

This command is an alias of **`pulumi destroy`**.

- View documentation for the original command:

```
tldr pulumi destroy
```

pulumi env

Manage Pulumi environments.

More information: https://www.pulumi.com/docs/iac/cli/commands/pulumi_env/.

- List all environments:

```
pulumi env ls
```

- Create an environment:

```
pulumi env init {{environment_name}}
```

- Set a value in an environment:

```
pulumi env set {{environment_name}} {{key}} {{value}}
```

- Edit an environment definition:

```
pulumi env edit {{environment_name}}
```

- Delete a value from an environment:

```
pulumi env rm {{environment_name}} {{key}}
```

- Delete an environment entirely:

```
pulumi env rm {{environment_name}}
```

- Display help:

```
pulumi env {{[-h|--help]}}
```

pulumi gen-completion

Generate completion scripts for the Pulumi CLI.

Supported shells are Bash, Zsh, fish.

More information: https://www.pulumi.com/docs/iac/cli/commands/pulumi_gen-completion/.

- Generate completion scripts:

```
pulumi gen-completion {{bash|zsh|fish}}
```

pulumi import

Import resources into an existing stack.

Read syntax for your cloud provider: https://www.pulumi.com/registry/.

More information: https://www.pulumi.com/docs/iac/cli/commands/pulumi_import/.

- Generate the resource definition with a given name for an existing provider resource:

```
pulumi import {{type_token}} {{name}} {{resource_id}}
```

- Import an existing AWS user as a `pulumi` resource:

```
pulumi import aws:iam/user:User {{my_user_resource}} {{resouce_id}}
```

- Import an existing Cloudflare worker:

```
pulumi import cloudflare:index/workersScript:WorkersScript {{my_worker_script}} {{account_id/script_name}}
```

- Import from a JSON file for bulk import operations and output to a file instead of `stdout`:

```
pulumi import --file {{path/to/file.json}} --out {{path/to/file}}
```

pulumi install

Install packages and plugins for the current program or policy pack.

More information: https://www.pulumi.com/docs/iac/cli/commands/pulumi_install/.

- Install packages and plugins:

  ```
  pulumi install
  ```

- Install packages and plugins but skip dependencies:

  ```
  pulumi install --no-dependencies
  ```

- Install packages and reinstall existing plugins:

  ```
  pulumi install --reinstall
  ```

pulumi login

Log in to the Pulumi cloud.

More information: https://www.pulumi.com/docs/iac/cli/commands/pulumi_login/.

- Log in to the managed Pulumi Cloud backend, defaults to https://api.pulumi.com:

  ```
  pulumi login
  ```

- Log in to a self-hosted Pulumi Cloud backend on a specified URL:

  ```
  pulumi login {{url}}
  ```

- Use Pulumi locally, independent of a cloud backend:

  ```
  pulumi login {{[-l|--local]}}
  ```

- Display help:

  ```
  pulumi login {{[-h|--help]}}
  ```

pulumi logout

Log out of the Pulumi cloud.

More information: https://www.pulumi.com/docs/iac/cli/commands/pulumi_logout/.

- Log out of a specific cloud backend:

```
pulumi logout {{url}}
```

- Log out of all backends simultaneously:

```
pulumi logout --all
```

- Log out of using local mode:

```
pulumi logout {{[-l|--local]}}
```

- Display help:

```
pulumi logout {{[-h|--help]}}
```

pulumi new

Create a new Pulumi project.

More information: https://www.pulumi.com/docs/iac/cli/commands/pulumi_new/.

- Choose a template interactively:

  ```
  pulumi new
  ```

- Create a project from a specific template (e.g. `azure-python`):

  ```
  pulumi new {{provided_template}}
  ```

- Create a project from a local file:

  ```
  pulumi new {{path/to/templates/aws-typescript}}
  ```

- Create a project from a Git repository:

  ```
  pulumi new {{url}}
  ```

- Use the specified secrets provider with the backend:

  ```
  pulumi new --secrets-provider {{passphrase}}
  ```

pulumi org

Manage Pulumi Organization configuration.

More information: https://www.pulumi.com/docs/iac/cli/commands/pulumi_org/.

- Display the default organization and current backend:

  ```
  pulumi org
  ```

- Display the default organization:

  ```
  pulumi org get-default
  ```

- Set the default organization:

  ```
  pulumi org set-default {{organization_name}}
  ```

- Search for resources in Pulumi Cloud using Pulumi AI with a plaintext natural language query:

  ```
  pulumi org search ai {{[-q|--query]}} "{{show me all load balancers in my organization}}"
  ```

- Display help:

  ```
  pulumi org {{[-h|--help]}}
  ```

pulumi plugin

Manage language and resource provider plugins manually.

Other commands manage these automatically.

More information: https://www.pulumi.com/docs/iac/cli/commands/pulumi_plugin/.

- List all plugins on the downloaded cache:

  ```
  pulumi plugin ls
  ```

- List plugins being used by the current project in JSON format:

  ```
  pulumi plugin {{[-p|--project]}} {{[-j|--json]}}
  ```

- Install a plugin kind (e.g. resource) with the latest version or a specific one:

  ```
  pulumi plugin install {{kind}} {{name}} {{version}}
  ```

- Remove a plugin kind (e.g. resource) and interactively pick a version or provide a specific one:

  ```
  pulumi plugin rm {{kind}} {{name}} {{version}}
  ```

- Display help:

  ```
  pulumi plugin {{[-h|--help]}}
  ```

pulumi policy

Manage resource policies on Pulumi Cloud (Business Critical) or locally (no organization sub-commands).

More information: https://www.pulumi.com/docs/iac/cli/commands/pulumi_policy/.

- Create a new Pulumi Policy Pack from a template or URL:

```
pulumi policy new --dir {{path/to/directory}} {{template|
url}}
```

- Validate syntax of a policy. To check a policy against a project use `pulumi preview`:

```
pulumi policy validate-config {{organization_name}}/
{{policy_pack_name}} {{version}}
```

- List all policies for an organization:

```
pulumi policy ls {{[-j|--json]}} {{organization_name}}
```

- Publish a policy to the Pulumi Cloud:

```
pulumi policy publish {{organization_name}}
```

- Enable a policy with a specific version:

```
pulumi policy enable {{organization_name}}/
{{policy_pack_name}} {{latest|version}}
```

- Disable a policy with a specific version (defaults to all versions):

```
pulumi policy disable {{organization_name}}/
{{policy_pack_name}} --version {{version}}
```

- Display help:

```
pulumi policy {{[-h|--help]}}
```

pulumi preview

Show a preview of updates to a stack's resources.

More information: https://www.pulumi.com/docs/iac/cli/commands/pulumi_preview/.

- Show a preview of updates to a stack's resources:

```
pulumi preview
```

- Show a preview of updates to a stack's resources in JSON format:

```
pulumi preview {{[-j|--json]}}
```

- Preview updates as a rich diff showing overall changes:

```
pulumi preview --diff
```

- Preview updates using a Policy Pack (without Pulumi Cloud, best on CI/CD):

```
pulumi preview --policy-pack {{path/to/directory}}
```

- Display help:

```
pulumi preview {{[-h|--help]}}
```

pulumi refresh

Refresh the resources in a stack.

More information: https://www.pulumi.com/docs/iac/cli/commands/pulumi_refresh/.

- Compare the current stack's state with the state in the cloud provider and adopt any changes into the current stack:

```
pulumi refresh
```

- Refresh resources in the current stack and show the operation as a rich diff:

```
pulumi refresh --diff
```

- Refresh resources in the current stack and return an error if any changes occur during the refresh:

```
pulumi refresh --expect-no-changes
```

- Only show a preview of the refresh, but don't perform the refresh itself:

```
pulumi refresh --preview-only
```

- Specify the name of the stack to operate on (defaults to the current stack):

```
pulumi refresh {{[-s|--stack]}} {{stack_name}}
```

- Display help:

```
pulumi refresh {{[-h|--help]}}
```

pulumi schema

Check a Pulumi package schema for errors.

Schema reference: https://www.pulumi.com/docs/iac/extending-pulumi/schema/.

More information: https://www.pulumi.com/docs/iac/cli/commands/pulumi_schema/.

- Check a package schema:

  ```
  pulumi schema check {{path/to/file}}
  ```

- Check a package schema without failing if the reference to a type is missing:

  ```
  pulumi schema check --allow-dangling-references {{path/to/file}}
  ```

- Display help:

  ```
  pulumi schema check {{[-h|--help]}}
  ```

pulumi stack hist

This command is an alias of **`pulumi stack history`**.

- View documentation for the original command:

```
tldr pulumi stack history
```

pulumi stack history

Display history for a stack.

More information: https://www.pulumi.com/docs/iac/cli/commands/pulumi_stack_history/.

- Display history for the current stack:

```
pulumi stack {{[hist|history]}}
```

- Display history for the current stack showing full dates instead of relative dates:

```
pulumi stack {{[hist|history]}} --full-dates
```

- Display history for the current stack in JSON format:

```
pulumi stack {{[hist|history]}} {{[-j|--json]}}
```

- Display history for a specific stack:

```
pulumi stack {{[hist|history]}} {{[-s|--stack]}} {{stack_name}}
```

- Display help:

```
pulumi stack {{[hist|history]}} {{[-h|--help]}}
```

pulumi stack

Manage stacks and view stack state.

More information: https://www.pulumi.com/docs/iac/cli/commands/pulumi_stack/.

- Create a new stack:

```
pulumi stack init {{stack_name}}
```

- Show the stack state along with resource URNs:

```
pulumi stack {{[-u|--show-urns]}}
```

- List stacks in the current project:

```
pulumi stack ls
```

- List stacks across all projects:

```
pulumi stack ls {{[-a|--all]}}
```

- Select an active stack:

```
pulumi stack select {{stack_name}}
```

- Delete a stack:

```
pulumi stack rm {{stack_name}}
```

- Show stack outputs, including secrets, in plaintext:

```
pulumi stack output --show-secrets
```

- Export the stack state to a JSON file:

```
pulumi stack export --file {{path/to/file.json}}
```

pulumi state

Edit the current stack's state.

More information: https://www.pulumi.com/docs/iac/cli/commands/pulumi_state/.

- Delete a resource from the current stack's state:

  ```
  pulumi state delete
  ```

- Move a resource from the current stack to another:

  ```
  pulumi state move {{resource_urn}} --dest {{stack_name}}
  ```

- Rename a resource in the current stack's state:

  ```
  pulumi state rename
  ```

- Repair an invalid state:

  ```
  pulumi state repair
  ```

- Edit a stack's state in the editor specified by the `$EDITOR` environment variable:

  ```
  pulumi state edit --stack {{stack_name}}
  ```

- Display help:

  ```
  pulumi state {{[-h|--help]}}
  ```

pulumi up

Create or update the resources in a stack.

More information: https://www.pulumi.com/docs/iac/cli/commands/pulumi_up/.

- Preview and deploy changes to a program and/or infrastructure:

  ```
  pulumi up
  ```

- Automatically approve and perform the update after previewing it:

  ```
  pulumi up {{[-y|--yes]}}
  ```

- Preview and deploy changes in a specific stack:

  ```
  pulumi up {{[-s|--stack]}} {{stack}}
  ```

- Refresh the state of the stack's resources before updating:

  ```
  pulumi up {{[-r|--refresh]}}
  ```

- Don't display stack outputs:

  ```
  pulumi up --suppress-outputs
  ```

- Continue updating the resources, even if an error is encountered:

  ```
  pulumi up --continue-on-error
  ```

- Display help:

  ```
  pulumi up {{[-h|--help]}}
  ```

pulumi update

This command is an alias of **`pulumi up`**.

- View documentation for the original command:

```
tldr pulumi up
```

pulumi version

Display Pulumi's version number.

More information: https://www.pulumi.com/docs/iac/cli/commands/pulumi_version/.

- Display version:

```
pulumi version
```

- Display help:

```
pulumi version {{[-h|--help]}}
```

pulumi whoami

Print information about the currently logged in user.

More information: https://www.pulumi.com/docs/iac/cli/commands/pulumi_whoami/.

- Print the username of the currently logged in user:

```
pulumi whoami
```

- Print detailed information about the currently logged in user:

```
pulumi whoami {{[-v|--verbose]}}
```

- Print detailed information about the currently logged in user as JSON:

```
pulumi whoami {{[-j|--json]}}
```

- Display help:

```
pulumi whoami {{[-h|--help]}}
```

pulumi

Define infrastructure on any cloud using familiar programming languages.

Some subcommands such as **up** have their own usage documentation.

More information: https://www.pulumi.com/docs/iac/cli/.

- Create a new project using a template:

  `pulumi new`

- Create a new stack using an isolated deployment target:

  `pulumi stack init`

- Configure variables (e.g. keys, regions, etc.) interactively:

  `pulumi config`

- Preview and deploy changes to a program and/or infrastructure:

  `pulumi up`

- Simulate deployment changes without performing them:

  `pulumi preview`

- Destroy a program and its infrastructure:

  `pulumi destroy`

- Use Pulumi locally, independent of a Pulumi Cloud:

  `pulumi login {{[-l|--local]}}`

pup

HTML parsing tool.

More information: https://github.com/ericchiang/pup.

- Transform a raw HTML file into a cleaned, indented, and colored format:

```
cat {{index.html}} | pup --color
```

- Filter HTML by element tag name:

```
cat {{index.html}} | pup '{{tag}}'
```

- Filter HTML by ID:

```
cat {{index.html}} | pup '{{div#id}}'
```

- Filter HTML by attribute value:

```
cat {{index.html}} | pup '{{input[type="text"]}}'
```

- Print all text from the filtered HTML elements and their children:

```
cat {{index.html}} | pup '{{div}} text{}'
```

- Print HTML as JSON:

```
cat {{index.html}} | pup '{{div}} json{}'
```

puppet agent

Retrieve the client configuration from a Puppet server and apply it to the local host.

More information: https://github.com/puppetlabs/puppet/blob/main/references/man/agent.md.

- Register a node at a Puppet server and apply the received catalog:

```
puppet agent --test --server {{puppetserver_fqdn}} --serverport {{port}} --waitforcert {{poll_time}}
```

- Run the agent in the background (uses settings from `puppet.conf`):

```
puppet agent
```

- Run the agent once in the foreground, then exit:

```
puppet agent --test
```

- Simulate running the agent without applying any changes:

```
puppet agent --test --noop
```

- Log every resource being evaluated (even if nothing is being changed):

```
puppet agent --test --evaltrace
```

- Disable the agent:

```
puppet agent --disable "{{message}}"
```

- Enable the agent:

```
puppet agent --enable
```

puppet apply

Apply Puppet manifests locally.

More information: https://github.com/puppetlabs/puppet/blob/main/references/man/apply.md.

- Apply a manifest:

```
puppet apply {{path/to/manifest}}
```

- Execute puppet code:

```
puppet apply --execute {{code}}
```

- Use a specific module and hiera configuration file:

```
puppet apply --modulepath {{path/to/directory}} --
hiera_config {{path/to/file}} {{path/to/manifest}}
```

puppet

Manage and automate the configuration of servers.

Puppet uses a declarative language to define system configurations and apply them automatically.

Some subcommands such as **`agent`**, **`apply`** have their own usage documentation.

More information: https://github.com/puppetlabs/puppet/blob/main/references/man/overview.md.

- Apply a Puppet manifest file to configure the system:

  ```
  puppet apply {{path/to/file.pp}}
  ```

- Simulate applying a manifest to preview changes:

  ```
  puppet apply --noop {{path/to/file.pp}}
  ```

- Validate the syntax of a Puppet manifest:

  ```
  puppet parser validate {{path/to/file.pp}}
  ```

- Run the Puppet agent to fetch and apply configurations from the master:

  ```
  puppet agent {{[-t|--test]}}
  ```

- Display help for a specific subcommand:

  ```
  puppet help {{subcommand}}
  ```

- Display general help:

  ```
  puppet {{[-h|--help]}}
  ```

- Display version:

  ```
  puppet {{[-V|--version]}}
  ```

pushd

Place a directory on a stack so it can be accessed later.

See also: **`popd`**, **`dirs`**.

More information: https://www.gnu.org/software/bash/manual/bash.html#index-pushd.

- Switch to directory and push it on the stack:

```
pushd {{path/to/directory}}
```

- Switch first and second directories on the stack:

```
pushd
```

- Rotate stack by making the 5th element the top of the stack:

```
pushd +4
```

- Rotate the stack 4 times to the left (the current directory stays at the top by replacing the 5th element):

```
pushd -n +4
```

pushln

This command is an alias of **`print -nz`**.

- View documentation for the original command:

  `tldr print`

putty

SSH, Telnet, and Rlogin client for connecting to remote servers.

Note: On Linux, the native **ssh** client is often more convenient. PuTTY is more commonly used on Windows.

More information: https://the.earth.li/~sgtatham/putty/latest/htmldoc/Chapter3.html#using-cmdline.

- Connect to a remote host via SSH:

```
putty -ssh {{username}}@{{hostname_or_ip}}
```

- Connect to a remote host on a specific [P]ort:

```
putty -ssh {{username}}@{{hostname_or_ip}} -P {{port}}
```

- Load a saved session:

```
putty -load {{session_name}}
```

- Connect with a private key for authentication:

```
putty -ssh {{username}}@{{hostname_or_ip}} -i {{path/to/private_key.ppk}}
```

- Connect via Telnet:

```
putty -telnet {{hostname_or_ip}}
```

- Enable [X]11 forwarding:

```
putty -ssh {{username}}@{{hostname_or_ip}} -X
```

- Set up [L]ocal port forwarding:

```
putty -ssh {{username}}@{{hostname_or_ip}} -L {{local_port}}:{{destination_host}}:{{destination_port}}
```

- Display help:

```
putty -help
```

pv

Monitor the progress of data through a pipe.

More information: https://manned.org/pv.

- Print the contents of the file and display a progress bar:

```
pv {{path/to/file}}
```

- Measure the speed and amount of data flow between pipes (`--size` is optional):

```
{{command1}} | pv {{[-s|--size]}}
{{expected_amount_of_data_for_eta}} | {{command2}}
```

- Filter a file, see both progress and amount of output data:

```
pv {{[-cN|--cursor --name]}} in {{path/to/file.txt}} | grep
{{pattern}} | pv {{[-cN|--cursor --name]}} out > {{path/to/
filtered_file.txt}}
```

- Attach to an already running process and see its file reading progress:

```
pv {{[-d|--watchfd]}} {{process_id}}
```

- Read an erroneous file, skip errors as `dd conv=sync,noerror` would:

```
pv {{[-EE|--skip-errors --skip-errors]}} {{path/to/
faulty_media}} > {{path/to/image.img}}
```

- Stop reading after reading specified amount of data, rate limit to 1K/s:

```
pv {{[-L|--rate-limit]}} {{1K}} {{[-S|--stop-at-size]}}
{{maximum_file_size_to_be_read}}
```

- Calculate hash (MD5, SHA1, SHA256, etc.) of a large file and show progress:

```
pv {{path/to/file}} | {{sha256sum}}
```

- Only display a timer for how long a command has taken to run:

```
{{command}} | pv {{[-t|--timer]}}
```

pwd

Print the name of current/working directory.

More information: https://www.gnu.org/software/coreutils/manual/html_node/pwd-invocation.html.

- Print the current directory:

```
pwd
```

- Print the current directory, and resolve all symlinks (i.e. show the "physical" path):

```
pwd {{[-P|--physical]}}
```

- Display help:

```
pwd --help
```

pwgen

Generate pronounceable passwords.

More information: https://manned.org/pwgen.

- Generate 160 random passwords with character length of 8:

```
pwgen
```

- Generate passwords with character length of 20:

```
pwgen 20
```

- Generate 10 passwords with character length of 20:

```
pwgen 20 10
```

- Generate random passwords with symbols:

```
pwgen {{[-y|--symbols]}}
```

- Generate secure, hard-to-memorize passwords:

```
pwgen {{[-s|--secure]}}
```

- Generate password with at least one capital letter in them, specify their length, and how many to generate:

```
pwgen {{[-c|--capitalize]}} {{length}} {{count}}
```

pwqgen

Generate a random passphrase.

More information: https://manned.org/pwqgen.

- Generate a passphrase:

```
pwqgen
```

- Generate a passphrase with a specific bit size between 24 and 136:

```
pwqgen random={{bitsize}}
```

- Use a config file to control password generation:

```
pwqgen config={{path/to/config_file}}
```

- Display help:

```
pwqgen {{[-h|--help]}}
```

- Display version:

```
pwqgen --version
```

pwsh

Shell and scripting language designed especially for system administration.

This command refers to PowerShell version 6 and above (also known as PowerShell Core and cross-platform PowerShell).

To use the original Windows version (5.1 and below, also known as the legacy Windows PowerShell), use **`powershell`** instead of **`pwsh`**.

More information: https://learn.microsoft.com/powershell/module/microsoft.powershell.core/about/about_pwsh.

- Start an interactive shell session:

```
pwsh
```

- Start an interactive shell session without loading startup configs:

```
pwsh -NoProfile
```

- Execute specific commands:

```
pwsh -Command "{{echo 'powershell is executed'}}"
```

- Execute a specific script:

```
pwsh -File {{path/to/script.ps1}}
```

- Start a session with a specific version of PowerShell:

```
pwsh -Version {{version}}
```

- Prevent a shell from exit after running startup commands:

```
pwsh -NoExit
```

- Describe the format of data sent to PowerShell:

```
pwsh -InputFormat {{Text|XML}}
```

- Determine how an output from PowerShell is formatted:

```
pwsh -OutputFormat {{Text|XML}}
```

py-spy

A sampling profiler for Python programs.

More information: https://github.com/benfred/py-spy.

- Show a live view of the functions that take the most execution time of a running process:

```
py-spy top {{[-p|--pid]}} {{process_id}}
```

- Start a program and show a live view of the functions that take the most execution time:

```
py-spy top -- python {{path/to/file.py}}
```

- Produce an SVG flame graph of the function call execution time:

```
py-spy record {{[-o|--output]}} {{path/to/profile.svg}} {{[-p|--pid]}} {{process_id}}
```

- Dump the call stack of a running process:

```
py-spy dump {{[-p|--pid]}} {{process_id}}
```

pyats shell

Start a pre-loaded pyATS interactive Python Shell to save time in prototyping.

More information: https://pubhub.devnetcloud.com/media/genie-docs/docs/cli/genie_shell.html.

- Open pyATS shell with a defined Testbed file:

  ```
  pyats shell --testbed-file {{path/to/testbed.yaml}}
  ```

- Open pyATS shell with a defined Pickle file:

  ```
  pyats shell --pickle-file {{path/to/pickle.file}}
  ```

- Open pyATS with IPython disabled:

  ```
  pyats shell --no-ipython
  ```

pyats version

View and upgrade the pyATS installation.

More information: https://developer.cisco.com/pyats/.

- Display version of all packages:

```
pyats version check
```

- Display outdated packages:

```
pyats version check --outdated
```

- Update packages to the most recent version:

```
pyats version update
```

- Update or downgrade packages to a specific version:

```
pyats version update {{version}}
```

pyats

A vendor agnostic test automation framework by Cisco Systems, used for network and systems testing.

More information: https://developer.cisco.com/pyats/.

- Run a pyATS subcommand:

```
pyats {{subcommand}}
```

- Display help:

```
pyats --help
```

- Display help about a specific subcommand:

```
pyats {{subcommand}} --help
```

- Display version:

```
pyats version check
```

pycodestyle

Check Python code against PEP 8 style conventions.

More information: https://pycodestyle.pycqa.org/en/latest/intro.html#example-usage-and-output.

- Check the style of a single file:

```
pycodestyle {{file.py}}
```

- Check the style of multiple files:

```
pycodestyle {{file1.py file2.py ...}}
```

- Show only the first occurrence of an error:

```
pycodestyle --first {{file.py}}
```

- Show the source code for each error:

```
pycodestyle --show-source {{file.py}}
```

- Show the specific PEP 8 text for each error:

```
pycodestyle --show-pep8 {{file.py}}
```

pydoc

Display offline Python documentation.

More information: https://docs.python.org/library/pydoc.html.

- Print documentation on a subject (Python keyword, topic, function, module, package, etc.):

```
pydoc {{subject}}
```

- Start an HTTP server on an arbitrary unused port and open a [b]rowser to see the documentation:

```
pydoc -b
```

- Display help:

```
pydoc
```

pydocstyle

Statically check Python scripts for compliance with Python docstring conventions.

More information: https://pydocstyle.readthedocs.io/en/latest/usage.html.

- Analyze a Python script or all the Python scripts in a specific directory:

```
pydocstyle {{file.py|path/to/directory}}
```

- Show an explanation of each error:

```
pydocstyle {{[-e|--explain]}} {{file.py|path/to/directory}}
```

- Show debug information:

```
pydocstyle {{[-d|--debug]}} {{file.py|path/to/directory}}
```

- Display the total number of errors:

```
pydocstyle --count {{file.py|path/to/directory}}
```

- Use a specific configuration file:

```
pydocstyle --config {{path/to/config_file}} {{file.py|path/
to/directory}}
```

- Ignore one or more errors:

```
pydocstyle --ignore {{D101,D2,D107,...}} {{file.py|path/to/
directory}}
```

- Check for errors from a specific convention:

```
pydocstyle --convention {{pep257|numpy|google}} {{file.py|
path/to/directory}}
```

pyenv virtualenv

Create virtual environments based on one's installed Python distributions.

More information: https://github.com/pyenv/pyenv-virtualenv#usage.

- Create a new Python 3.6.6 virtual environment:

```
pyenv virtualenv 3.6.6 {{virtualenv_name}}
```

- List all existing virtual environments:

```
pyenv virtualenvs
```

- Activate a virtual environment:

```
pyenv activate {{virtualenv_name}}
```

- Deactivate the virtual environment:

```
pyenv deactivate
```

pyenv

Switch between multiple versions of Python easily.

See also: **`asdf`**.

More information: https://manned.org/pyenv.

- List all available commands:

  `pyenv commands`

- List all Python versions under the `${PYENV_ROOT}/versions` directory:

  `pyenv versions`

- List all Python versions that can be installed from upstream:

  `pyenv install --list`

- Install a Python version under the `${PYENV_ROOT}/versions` directory:

  `pyenv install {{2.7.10}}`

- Uninstall a Python version under the `${PYENV_ROOT}/versions` directory:

  `pyenv uninstall {{2.7.10}}`

- Set Python version to be used globally in the current machine:

  `pyenv global {{2.7.10}}`

- Set Python version to be used in the current directory and all directories below it:

  `pyenv local {{2.7.10}}`

pyflakes

Check Python source code files for errors.

More information: https://pypi.org/project/pyflakes.

- Check a single Python file:

```
pyflakes check {{path/to/file.py}}
```

- Check Python files in a specific directory:

```
pyflakes checkPath {{path/to/directory}}
```

- Check Python files in a directory recursively:

```
pyflakes checkRecursive {{path/to/directory}}
```

- Check all Python files found in multiple directories:

```
pyflakes iterSourceCode {{path/to/directory_1 path/to/
directory_2 ...}}
```

pygbag

Package Pygame projects as WebAssembly to run in web browsers.

More information: https://github.com/pygame-web/pygbag#pygbag.

- Package a Pygame project and start a local test server:

```
pygbag {{path/to/project_folder}}
```

- Package using Python module syntax:

```
python -m pygbag {{path/to/project_folder}}
```

- Package and build without starting the test server:

```
pygbag {{path/to/project_folder}} --build
```

- Package with a specific template:

```
pygbag {{path/to/project_folder}} --template
{{template_name.tmpl}}
```

- Package and create a ZIP archive for https://itch.io:

```
pygbag {{path/to/project_folder}} --archive
```

- Package with optimization turned off:

```
pygbag {{path/to/project_folder}} --no_opt
```

- Specify a custom port for the test server:

```
pygbag {{path/to/project_folder}} --port {{8080}}
```

- Display help:

```
pygbag {{[-h|--help]}}
```

pygmentize

Python-based syntax highlighter.

More information: https://pygments.org/docs/cmdline/.

- Highlight file syntax and print to `stdout` (language is inferred from the file extension):

```
pygmentize {{file.py}}
```

- Explicitly set the language for syntax highlighting:

```
pygmentize -l {{javascript}} {{input_file}}
```

- List available lexers (processors for input languages):

```
pygmentize -L lexers
```

- Save output to a file in HTML format:

```
pygmentize -f html -o {{output_file.html}} {{input_file.py}}
```

- List available output formats:

```
pygmentize -L formatters
```

- Output an HTML file, with additional formatter options (full page, with line numbers):

```
pygmentize -f html -O "full,linenos=True" -o
{{output_file.html}} {{input_file}}
```

pyinfra

Automates infrastructure at a large scale.

More information: https://docs.pyinfra.com/en/3.x/cli.html.

- Execute a command over SSH:

```
pyinfra {{target_ip_address}} exec --
{{command_name_and_arguments}}
```

- Execute contents of a deploy file on a list of targets:

```
pyinfra {{path/to/target_list.py}} {{path/to/deploy.py}}
```

- Execute commands on locally:

```
pyinfra @local {{path/to/deploy.py}}
```

- Execute commands over Docker:

```
pyinfra @docker/{{container}} {{path/to/deploy.py}}
```

pyinstaller

Bundle a Python application and its dependencies into a single package.

More information: https://pyinstaller.org/en/stable/man/pyinstaller.html.

- Bundle a Python script into a one-folder bundle (output goes to `dist/`):

```
pyinstaller {{path/to/script.py}}
```

- Bundle a Python script into a single executable file:

```
pyinstaller {{[-F|--onefile]}} {{path/to/script.py}}
```

- Bundle a GUI application without opening a console window:

```
pyinstaller {{[-w|--windowed]}} {{path/to/script.py}}
```

- Set the name of the bundled executable:

```
pyinstaller {{[-n|--name]}} {{app_name}} {{path/to/
script.py}}
```

- Set a custom icon for the executable:

```
pyinstaller {{[-i|--icon]}} {{path/to/icon.ico}} {{path/to/
script.py}}
```

- Include additional data files or directories in the bundle:

```
pyinstaller --add-data "{{path/to/source}}:
{{destination}}" {{path/to/script.py}}
```

- Display help:

```
pyinstaller {{[-h|--help]}}
```

- Display version:

```
pyinstaller {{[-v|--version]}}
```

pylint

A Python code linter.

More information: https://pylint.pycqa.org/en/latest/.

- Show lint errors in a file:

```
pylint {{path/to/file.py}}
```

- Lint a package or module (must be importable; no `.py` suffix):

```
pylint {{package_or_module}}
```

- Lint a package from a directory path (must contain an `__init__.py` file):

```
pylint {{path/to/directory}}
```

- Lint a file and use a configuration file (usually named `pylintrc`):

```
pylint --rcfile {{path/to/pylintrc}} {{path/to/file.py}}
```

- Lint a file and disable a specific error code:

```
pylint --disable {{C,W,no-error,design}} {{path/to/file}}
```

pypy

Fast and compliant alternative implementation of the Python language.

More information: https://manned.org/pypy.

- Start a REPL (interactive shell):

```
pypy
```

- Execute script in a given Python file:

```
pypy {{path/to/file.py}}
```

- Execute script as part of an interactive shell:

```
pypy -i {{path/to/file.py}}
```

- Execute a Python expression:

```
pypy -c "{{expression}}"
```

- Run library module as a script (terminates option list):

```
pypy -m {{module}} {{arguments}}
```

- Install a package using pip:

```
pypy -m pip install {{package}}
```

- Interactively debug a Python script:

```
pypy -m pdb {{path/to/file.py}}
```

pystun3

Classic STUN client written in Python.

More information: https://github.com/talkiq/pystun3.

- Make a STUN request:

  ```
  pystun3
  ```

- Make a STUN request and specify the stun server:

  ```
  pystun3 --stun-host {{stun.1und1.de}}
  ```

- Make a STUN request and specify the source port:

  ```
  pystun3 --source-port {{7932}}
  ```

pytest

Run Python tests.

More information: https://docs.pytest.org/en/latest/how-to/usage.html.

- Run tests from specific files:

```
pytest {{path/to/test_file1.py path/to/test_file2.py ...}}
```

- Run tests with names matching a specific [k]eyword expression:

```
pytest -k {{expression}}
```

- Exit as soon as a test fails or encounters an error:

```
pytest {{[-x|--exitfirst]}}
```

- Run tests matching or excluding markers:

```
pytest -m {{marker_name1 and not marker_name2}}
```

- Run until a test failure, continuing from the last failing test:

```
pytest {{[--sw|--stepwise]}}
```

- Run tests without capturing output:

```
pytest {{[-s|--capture=no]}}
```

- Run tests with increased verbosity, displaying individual test names:

```
pytest {{[-v|--verbose]}}
```

python -m json.tool

Validate and pretty-print JSON data.

Part of Python's standard library.

More information: https://docs.python.org/library/json.html#module-json.tool.

- Pretty-print JSON from a file:

```
python -m json.tool {{path/to/file.json}}
```

- Validate and pretty-print JSON from `stdin`:

```
echo '{{{"key": "value"}}}' | python -m json.tool
```

python

Python language interpreter.

More information: https://docs.python.org/using/cmdline.html.

- Start a REPL (interactive shell):

```
python
```

- Execute a specific Python file:

```
python {{path/to/file.py}}
```

- Execute a specific Python file and start a REPL:

```
python -i {{path/to/file.py}}
```

- Execute a Python expression:

```
python -c "{{expression}}"
```

- Run the script of the specified library module:

```
python -m {{module}} {{arguments}}
```

- Install a package using `pip`:

```
python -m pip install {{package}}
```

- Interactively debug a Python script:

```
python -m pdb {{path/to/file.py}}
```

- Start the built-in HTTP server on port 8000 in the current directory:

```
python -m http.server
```

python3

This command is an alias of **`python`**.

- View documentation for the original command:

  ```
  tldr python
  ```

q

Execute SQL-like queries on CSV and TSV files.

More information: https://harelba.github.io/q/.

- Query a CSV file by specifying the delimiter as ',':

```
q {{[-d|--delimiter]}} ',' "SELECT * from {{path/to/file}}"
```

- Query a TSV file:

```
q {{[-t|--tab-delimited]}} "SELECT * from {{path/to/file}}"
```

- Query file with header row:

```
q {{[-d|--delimiter]}} {{delimiter}} {{[-H|--skip-header]}}
"SELECT * from {{path/to/file}}"
```

- Read data from `stdin`; '-' in the query represents the data from `stdin`:

```
{{output}} | q "select * from -"
```

- Join two files (aliased as `f1` and `f2` in the example) on column `c1`, a common column:

```
q "SELECT * FROM {{path/to/file}} f1 JOIN {{path/to/
other_file}} f2 ON (f1.c1 = f2.c1)"
```

- Format output using an output delimiter with an output header line (Note: Command will output column names based on the input file header or the column aliases overridden in the query):

```
q {{[-D|--output-delimiter]}} {{delimiter}} {{[-O|--output-
header]}} "SELECT {{column}} as {{alias}} from {{path/to/
file}}"
```

qalc

Powerful and easy to use calculator.

See also: **bc**.

More information: https://qalculate.github.io/manual/qalc.html.

- Launch in interactive mode:

```
qalc {{[-i|--interactive]}}
```

- Launch in terse mode (print the results only):

```
qalc {{[-t|--terse]}}
```

- Update currency exchange rates:

```
qalc {{[-e|--exrates]}}
```

- Perform calculations non-interactively:

```
qalc {{66+99|2^4|6 feet to cm|1 bitcoin to USD|20 kmph to mph|...}}
```

- List all supported functions/prefixes/units/variables:

```
qalc --{{list-functions|list-prefixes|list-units|list-variables}}
```

- Execute commands from a file:

```
qalc {{[-f|--file]}} {{path/to/file}}
```

qc

Manage and execute command snippets stored in QOwnNotes notes.

See also: **`qownnotes`**.

More information: https://www.qownnotes.org/getting-started/command-line-snippet-manager.html.

- Configure the snippet manager, e.g. to set the security token from QOwnNotes:

  ```
  qc configure
  ```

- Search and print command snippets stored in your `Commands.md` note and all your notes tagged with `commands`:

  ```
  qc search
  ```

- Execute a snippet and show the command before executing:

  ```
  qc exec --command
  ```

- Execute the last snippet and show the command before executing:

  ```
  qc exec --command --last
  ```

- Switch between note folders in QOwnNotes:

  ```
  qc switch
  ```

qcp

Copy files using the default text editor to define the filenames.

More information: https://manned.org/qcp.

- Copy a single file (open an editor with the source filename on the left and the target filename on the right):

```
qcp {{source_file}}
```

- Copy multiple JPEG files:

```
qcp {{*.jpg}}
```

- Copy files, but swap the positions of the source and the target filenames in the editor:

```
qcp {{[-o|--option]}} swap {{*.jpg}}
```

qdbus

Inter-Process Communication (IPC) and Remote Procedure Calling (RPC) mechanism originally developed for Linux.

More information: https://doc.qt.io/qt-6/qtdbus-index.html.

- List available service names:

```
qdbus
```

- List object paths for a specific service:

```
qdbus {{service_name}}
```

- List methods, signals, and properties available on a specific object:

```
qdbus {{service_name}} /{{path/to/object}}
```

- Execute a specific method passing arguments and display the returned value:

```
qdbus {{service_name}} /{{path/to/object}} {{method_name}}
{{argument1 argument2 ...}}
```

- Display the current brightness value in a KDE Plasma session:

```
qdbus {{org.kde.Solid.PowerManagement}} {{/org/kde/Solid/
PowerManagement/Actions/BrightnessControl}}
{{org.kde.Solid.PowerManagement.Actions.BrightnessControl.brightness}}
```

- Set a specific brightness to a KDE Plasma session:

```
qdbus {{org.kde.Solid.PowerManagement}} {{/org/kde/Solid/
PowerManagement/Actions/BrightnessControl}}
{{org.kde.Solid.PowerManagement.Actions.BrightnessControl.setBrightnes
{{5000}}
```

- Invoke volume up shortcut in a KDE Plasma session:

```
qdbus {{org.kde.kglobalaccel}} {{/component/kmix}}
{{invokeShortcut}} "{{increase_volume}}"
```

- Gracefully log out and then do nothing, reboot, or shut down:

```
qdbus {{org.kde.Shutdown}} {{/Shutdown}} {{logout|
logoutAndReboot|logoutAndShutdown}}
```

qemu-img

Create and manipulate Quick Emulator Virtual HDD images.

More information: https://qemu.readthedocs.io/en/master/tools/qemu-img.html.

- Create disk image with a specific size (in gigabytes):

```
qemu-img create {{path/to/image_file.img}} {{gigabytes}}G
```

- Show information about a disk image:

```
qemu-img info {{path/to/image_file.img}}
```

- Increase or decrease image size:

```
qemu-img resize {{path/to/image_file.img}} {{gigabytes}}G
```

- Dump the allocation state of every sector of the specified disk image:

```
qemu-img map {{path/to/image_file.img}}
```

- Convert a VMware `.vmdk` disk image to a KVM `.qcow2` disk image and display [p]rogress:

```
qemu-img convert -f vmdk -O qcow2 -p {{path/to/
image_file.vmdk}} {{path/to/image_file.qcow2}}
```

- [c]reate an internal snapshot of a KVM `.qcow2` disk image:

```
qemu-img snapshot -c {{snapshot_tag_name}} {{path/to/
image_file.qcow2}}
```

- [a]pply an internal snapshot to a KVM `.qcow2` disk image:

```
qemu-img snapshot -a {{snapshot_tag_name}} {{path/to/
image_file.qcow2}}
```

qemu-system-i386

Emulate the **i386** architecture.

More information: https://www.qemu.org/docs/master/system/target-i386.html.

- Boot from an image emulating the i386 architecture:

```
qemu-system-i386 -hda {{image_name.img}} -m {{4096}}
```

- Boot a QEMU instance from a live ISO image:

```
qemu-system-i386 -hda {{image_name.img}} -m {{4096}} -cdrom
{{os_image.iso}} -boot d
```

- Boot from a physical device (e.g. from USB to test a bootable medium):

```
qemu-system-i386 -hda {{/dev/storage_device}} -m {{4096}}
```

- Do not launch a VNC server:

```
qemu-system-i386 -hda {{image_name.img}} -m {{4096}} -
nographic
```

- Exit non-graphical QEMU:

```
<Ctrl a><x>
```

- List the supported machine types:

```
qemu-system-i386 {{[-M|-machine]}} help
```

qemu-system-riscv64

Emulate **`riscv64`** architecture.

More information: https://www.qemu.org/docs/master/system/target-riscv.html.

- Boot a kernel emulating `riscv64` architecture:

```
qemu-system-riscv64 {{[-M|-machine]}} virt -bios none -kernel {{kernel.elf}} -nographic
```

- List supported machine types:

```
qemu-system-riscv64 {{[-M|-machine]}} help
```

- Exit non-graphical QEMU:

```
<Ctrl a><x>
```

qemu-system-x86_64

Emulate the **x86_64** architecture.

More information: https://www.qemu.org/docs/master/system/target-i386.html.

- Boot from an image emulating the x86_64 architecture:

```
qemu-system-x86_64 -hda {{image_name.img}} -m {{4096}}
```

- Boot a QEMU instance from a live ISO image:

```
qemu-system-x86_64 -hda {{image_name.img}} -m {{4096}} -cdrom
{{os_image.iso}} -boot d
```

- Boot from a physical device (e.g. from USB to test a bootable medium):

```
qemu-system-x86_64 -hda {{/dev/storage_device}} -m {{4096}}
```

- Do not launch a VNC server:

```
qemu-system-x86_64 -hda {{image_name.img}} -m {{4096}} -
nographic
```

- Exit non-graphical QEMU:

```
<Ctrl a><x>
```

- List the supported machine types:

```
qemu-system-x86_64 {{[-M|-machine]}} help
```

qgis

View, create, and analyze geographic data in a Geographic Information System.

Supports rasters, vectors, and project files (**`.qgs`**, **`.qgz`**, **`.qlr`**).

More information: https://docs.qgis.org/latest/en/docs/user_manual/introduction/qgis_configuration.html#running-qgis-with-advanced-settings.

- Launch QGIS:

```
qgis
```

- Open a specific project file:

```
qgis {{[-p|--project]}} {{path/to/project.qgz}}
```

- Open one or more raster or vector files directly:

```
qgis {{path/to/file1.tif path/to/file2.shp ...}}
```

- Hide the splash screen on startup:

```
qgis {{[-n|--nologo]}}
```

- Set the initial map extent:

```
qgis {{[-e|--extent]}} {{xmin,ymin,xmax,ymax}}
```

- Run a Python script on load:

```
qgis {{[-f|--code]}} {{path/to/script.py}}
```

- Launch QGIS without restoring plugins:

```
qgis {{[-P|--noplugins]}}
```

- Skip prompts for missing layers when opening a project:

```
qgis {{[-B|--skipbadlayers]}} {{[-p|--project]}} {{path/to/project.qgz}}
```

qgis_process

Run QGIS processing algorithms from the command line without opening the GUI.

See also: **`qgis`**.

More information: https://docs.qgis.org/latest/en/docs/user_manual/processing/standalone.html.

- List all available processing algorithms:

  ```
  qgis_process list
  ```

- Display help for a specific algorithm:

  ```
  qgis_process help {{algorithm_id}}
  ```

- Run a processing algorithm with parameters:

  ```
  qgis_process run {{algorithm_id}} {{--PARAMETER1=value1 --PARAMETER2=value2 ...}}
  ```

- Run an algorithm and output results as JSON:

  ```
  qgis_process --json run {{algorithm_id}} {{--PARAMETER1=value1 --PARAMETER2=value2 ...}}
  ```

- Run without loading plugins for faster startup:

  ```
  qgis_process --skip-loading-plugins run {{algorithm_id}} {{--PARAMETER1=value1 --PARAMETER2=value2 ...}}
  ```

- Run on a headless server without a display:

  ```
  QT_QPA_PLATFORM=offscreen qgis_process run {{algorithm_id}} {{--PARAMETER1=value1 --PARAMETER2=value2 ...}}
  ```

- List available and active plugins:

  ```
  qgis_process plugins
  ```

- Enable or disable an installed plugin:

  ```
  qgis_process plugins {{enable|disable}} {{plugin_name}}
  ```

qmake

Generate Makefiles from Qt project files.

More information: https://doc.qt.io/qt-6/qmake-running.html.

- Generate a `Makefile` from a project file in the current directory:

```
qmake
```

- Specify `Makefile` and project file locations:

```
qmake -o {{path/to/Makefile}} {{path/to/project_file.pro}}
```

- Generate a default project file:

```
qmake -project
```

- Compile a project:

```
qmake && make
```

- Enable debug mode:

```
qmake -d
```

- Display help:

```
qmake -help
```

qmmp

An audio player with an interface similar to Winamp or XMMS.

See also: **`clementine`**, **`ncmpcpp`**, **`cmus`**.

More information: https://manned.org/qmmp.

- Launch the GUI:

```
qmmp
```

- Start or stop the currently playing audio:

```
qmmp {{[-t|--play-pause]}}
```

- Seek [f]or[w]ar[d]s or [b]ack[w]ar[d]s a specific amount of time in seconds:

```
qmmp --seek-{{fwd|bwd}} {{time_in_seconds}}
```

- Play the next audio file:

```
qmmp --next
```

- Play the previous audio file:

```
qmmp --previous
```

- Display the current volume:

```
qmmp --volume-status
```

- [inc]rease or [dec]rease the volume of the currently playing audio by 5%:

```
qmmp --volume-{{inc|dec}}
```

qmv

Move files and directories using the default text editor to define the filenames.

More information: https://manned.org/qmv.

- Move a single file (open an editor with the source filename on the left and the target filename on the right):

```
qmv {{source_file}}
```

- Move multiple JPEG files:

```
qmv {{*.jpg}}
```

- Move multiple directories:

```
qmv {{[-d|--directory]}} {{path/to/directory1 path/to/
directory2 path/to/directory3 ...}}
```

- Move all files and directories inside a directory:

```
qmv {{[-R|--recursive]}} {{path/to/directory}}
```

- Move files, but swap the positions of the source and the target filenames in the editor:

```
qmv {{[-o|--option]}} swap {{*.jpg}}
```

- Rename all files and folders in the current directory, but show only target filenames in the editor (you can think of it as a kind of simple mode):

```
qmv {{[-f|--format]}} do .
```

qoitopam

Convert a QOI image (Quite OK Image format) to Netpbm.

More information: https://netpbm.sourceforge.net/doc/qoitopam.html.

- Convert a QOI image to Netpbm:

```
qoitopam {{path/to/image.qoi}} > {{path/to/output.pnm}}
```

QOwnNotes

Markdown note-taking application.

Optionally integrates with the note-taking applications of Nextcloud and ownCloud.

See also: **qc**.

More information: https://www.qownnotes.org/getting-started/cli-parameters.html.

- Run in portable mode:

  ```
  QOwnNotes --portable
  ```

- Dump settings and other information about the app and environment in GitHub Markdown:

  ```
  QOwnNotes --dump-settings
  ```

- Specify a different context for settings and internal files:

  ```
  QOwnNotes --session {{test}}
  ```

- Trigger a menu action after the application was started:

  ```
  QOwnNotes --action {{actionShow_Todo_List}}
  ```

qpdf

Versatile PDF transformation software.

More information: https://manned.org/qpdf.

- Extract pages 1-3, 5, and 6-10 from a PDF file and save them as another one:

```
qpdf --empty --pages {{path/to/input.pdf}} {{1-3,5,6-10}} --
{{path/to/output.pdf}}
```

- Merge (concatenate) all the pages of multiple PDF files and save the result as a new PDF:

```
qpdf --empty --pages {{path/to/file1.pdf file2.pdf ...}} --
{{path/to/output.pdf}}
```

- Merge (concatenate) given pages from a list of PDF files and save the result as a new PDF:

```
qpdf --empty --pages {{path/to/file1.pdf}} {{1,6-8}} {{path/
to/file2.pdf}} {{3,4,5}} -- {{path/to/output.pdf}}
```

- Write each group of n pages to a separate output file with a given filename pattern:

```
qpdf --split-pages={{n}} {{path/to/input.pdf}} {{path/to/
out_%d.pdf}}
```

- Rotate certain pages of a PDF with a given angle:

```
qpdf --rotate={{90:2,4,6}} --rotate={{180:7-8}} {{path/to/
input.pdf}} {{path/to/output.pdf}}
```

- Remove the password from a password-protected file:

```
qpdf --password={{password}} --decrypt {{path/to/input.pdf}}
{{path/to/output.pdf}}
```

qr

Generate QR codes in the terminal with ANSI VT-100 escape codes.

See also: **`qrencode`**.

More information: https://manned.org/qr.

- Generate a QR code:

```
qr "{{data}}"
```

- Specify the error correction level (defaults to `M`):

```
qr --error-correction {{L|M|Q|H}} "{{data}}"
```

- Generate a QR code from the output of another command:

```
{{command}} | qr
```

- Save the QR code as a PNG image:

```
qr "{{data}}" > {{path/to/file.png}}
```

qrencode

QR Code generator. Supports PNG and EPS.

See also: **`qr`**.

More information: https://manned.org/qrencode.

- Convert a string to a QR code and save to an output file:

```
qrencode {{[-o|--output]}} {{path/to/output_file.png}} {{string}}
```

- Convert a string to a micro QR code and save to an output file:

```
qrencode {{[-o|--output]}} {{path/to/output_file.png}} {{[-M|--micro]}} {{string}}
```

- Convert an input file to a QR code and save to an output file:

```
qrencode {{[-o|--output]}} {{path/to/output_file.png}} {{[-r|--read-from]}} {{path/to/input_file}}
```

- Convert a string to a QR code and print it in terminal:

```
qrencode {{[-t|--type]}} ansiutf8 {{string}}
```

- Convert a string to a QR code with a specific error correction level and save to an output file:

```
qrencode {{[-o|--output]}} {{path/to/output_file.png}} {{[-l|--level]}} {{l|m|q|h}} {{string}}
```

- Convert input from pipe to a QR code and print it in terminal:

```
echo {{string}} | qrencode {{[-t|--type]}} utf8
```

qrttoppm

Convert a QRT ray tracer file to a PPM image.

More information: https://netpbm.sourceforge.net/doc/qrttoppm.html.

- Convert a QRT file to a PPM image:

```
qrttoppm {{path/to/file.qrt}} > {{path/to/image.ppm}}
```

qsv

Blazing-fast toolkit for querying, slicing, sorting, analyzing, filtering, transforming, and validating tabular data.

More information: https://qsv.dathere.com/.

- Count the rows in a CSV file:

```
qsv count {{path/to/file.csv}}
```

- Select specific columns from a CSV file:

```
qsv select {{column1,column2,...}} {{path/to/file.csv}}
```

- Filter rows containing a `regex` or literal text:

```
qsv search {{regex_or_text}} {{path/to/file.csv}}
```

- Sort a CSV file by one or more columns:

```
qsv sort {{[-s|--select]}} {{column1,column2,...}} {{path/to/file.csv}}
```

- Compute summary statistics and infer data types for each column:

```
qsv stats {{path/to/file.csv}}
```

- Display help:

```
qsv --help
```

- Display version:

```
qsv --version
```

qtcreator

Cross-platform IDE for Qt applications.

More information: https://doc.qt.io/qtcreator/creator-cli.html.

- Start Qt Creator:

```
qtcreator
```

- Start Qt Creator and restore the last session:

```
qtcreator -lastsession
```

- Start Qt Creator but don't load the specified plugin:

```
qtcreator -noload {{plugin}}
```

- Start Qt Creator but don't load any plugins:

```
qtcreator -noload {{all}}
```

- Start Qt Creator in presentation mode with pop-ups for keyboard shortcuts:

```
qtcreator -presentationMode
```

- Start Qt Creator and show the diff from a specific commit:

```
qtcreator -git-show {{commit}}
```

quarkus

Create Quarkus projects, manage extensions, and perform essential build and development tasks.

More information: https://quarkus.io/guides/cli-tooling.

- Create a new application project in a new directory:

  ```
  quarkus create app {{project_name}}
  ```

- Run the current project in live coding mode:

  ```
  quarkus dev
  ```

- Run the application:

  ```
  quarkus run
  ```

- Run the current project in continuous testing mode:

  ```
  quarkus test
  ```

- Add one or more extensions to the current project:

  ```
  quarkus extension add {{extension_name1 extension_name2 ...}}
  ```

- Build a container image using Docker:

  ```
  quarkus image build docker
  ```

- Deploy the application to Kubernetes:

  ```
  quarkus deploy kubernetes
  ```

- Update project:

  ```
  quarkus update
  ```

quarto

An open-source scientific and technical publishing system built on Pandoc.

More information: https://quarto.org/docs/reference/projects/options.html.

- Create a new project:

```
quarto create-project {{path/to/destination_directory}} --
type {{book|default|website}}
```

- Create a new blog website:

```
quarto create-project {{path/to/destination_directory}} --
type {{website}} --template {{blog}}
```

- Render input file(s) to different formats:

```
quarto render {{path/to/file.ext}} --to {{html|pdf|docx}}
```

- Render and preview a document or a website:

```
quarto preview {{path/to/destination_directory|path/to/file}}
```

- Publish a document or project to Quarto Pub, GitHub Pages, RStudio Connect, or Netlify:

```
quarto publish {{quarto-pub|gh-pages|connect|netlify}}
```

quilt

Manage a series of patches.

More information: https://manned.org/quilt.

- Import an existing patch from a file:

```
quilt import {{path/to/file.patch}}
```

- Create a new patch:

```
quilt new {{filename.patch}}
```

- Add a file to the current patch:

```
quilt add {{path/to/file}}
```

- After editing the file, refresh the current patch with the changes:

```
quilt refresh
```

- Apply all the patches in the series file:

```
quilt push -a
```

- Remove all applied patches:

```
quilt pop -a
```

quota

Display users' disk space usage and allocated limits.

More information: https://manned.org/quota.

- Show disk quotas in human-readable units for the current user:

```
quota {{[-s|--human-readable]}}
```

- Display disk quotas verbosely (also display quotas on filesystems where no storage is allocated):

```
quota {{[-v|--verbose]}}
```

- Display disk quotas quietly (only display quotas on filesystems where usage is over quota):

```
quota {{[-q|--quiet]}}
```

- Print quotas for the groups of which the current user is a member:

```
quota {{[-g|--group]}}
```

- Show disk quotas for another user:

```
sudo quota {{[-u|--user]}} {{username}}
```

qutebrowser

A keyboard-driven, vim-like browser based on PyQt5.

More information: https://qutebrowser.org/doc/qutebrowser.1.html.

- Open qutebrowser with a specified storage directory:

```
qutebrowser --basedir {{path/to/directory}}
```

- Open a qutebrowser instance with temporary settings:

```
qutebrowser --set {{content.geolocation}} {{true|false}}
```

- Restore a named session of a qutebrowser instance:

```
qutebrowser --restore {{session_name}}
```

- Launch qutebrowser, opening all URLs using the specified method:

```
qutebrowser --target {{auto|tab|tab-bg|tab-silent|tab-bg-silent|window|private-window}}
```

- Open qutebrowser with a temporary base directory and print logs to `stdout` as JSON:

```
qutebrowser --temp-basedir --json-logging
```

qwen

Launch an interactive prompt with Qwen3-Coder.

See also: **`gemini`**.

More information: https://github.com/QwenLM/qwen-code.

- Start a REPL session to chat interactively:

```
qwen
```

- Send the output of another command to Qwen and exit immediately:

```
{{echo "Summarize the history of Rome"}} | qwen {{[-p|--prompt]}}
```

- Override the default model (default: qwen3-coder-max):

```
qwen {{[-m|--model]}} {{model_name}}
```

- Run inside a sandbox container:

```
qwen {{[-s|--sandbox]}}
```

- Execute a prompt then stay in interactive mode:

```
qwen {{[-i|--prompt-interactive]}} "{{Give me an example of recursion in Python}}"
```

- Include all files in context:

```
qwen {{[-a|--all-files]}}
```

- Show memory usage in status bar:

```
qwen --show-memory-usage
```

R

R language interpreter.

More information: https://manned.org/R.

- Start a REPL (interactive shell):

```
R
```

- Start R in vanilla mode (i.e. a blank session that doesn't save the workspace at the end):

```
R --vanilla
```

- Execute a file:

```
R {{[-f|--file]}} {{path/to/file.R}}
```

- Execute an R expression and then exit:

```
R -e {{expr}}
```

- Run R with a debugger:

```
R {{[-d|--debugger]}} {{debugger}}
```

- Check R packages from package sources:

```
R CMD check {{path/to/package_source}}
```

- Display version:

```
R --version
```

r

r can refer to multiple commands with the same name.

- View documentation for the R language interpreter:

  `tldr r.lang`

- View documentation for the Zsh command:

  `tldr r.zsh`

r

This command is an alias of **`fc -e -`**.

- View documentation for the original command:

```
tldr fc
```

r2

This command is an alias of **radare2**.

- View documentation for the original command:

  `tldr radare2`

r2e

Forward RSS feeds to an email address.

Requires a configured **`sendmail`** or SMTP setup.

More information: https://manned.org/r2e.

- Create a new feed database that sends email to an email address:

```
r2e new {{email_address}}
```

- Subscribe to a feed:

```
r2e add {{feed_name}} {{feed_uri}}
```

- Send new stories to an email address:

```
r2e run
```

- List all feeds:

```
r2e list
```

- Delete a feed at a specified index:

```
r2e delete {{index}}
```

- Display help:

```
r2e {{[-h|--help]}}
```

rabbitmq-diagnostics

Diagnose, monitor, and run health checks on RabbitMQ nodes.

Many subcommands are delegated to **`rabbitmqctl`**.

More information: https://www.rabbitmq.com/docs/man/rabbitmq-diagnostics.8.

- List resource alarms:

  ```
  rabbitmq-diagnostics alarms
  ```

- List node certificates:

  ```
  rabbitmq-diagnostics certificates
  ```

- Check if RabbitMQ is running on the specified node:

  ```
  rabbitmq-diagnostics check_running --node {{node}}
  ```

- Run peer discovery:

  ```
  rabbitmq-diagnostics discover_peers
  ```

- List listeners (bound sockets):

  ```
  rabbitmq-diagnostics listeners
  ```

- Print the last n log lines on the specified node:

  ```
  rabbitmq-diagnostics log_tail --number {{n}} --node {{node}}
  ```

rabbitmq-plugins

Manage RabbitMQ plugins.

More information: https://www.rabbitmq.com/docs/man/rabbitmq-plugins.8.

- List plugins:

```
rabbitmq-plugins list
```

- Enable a plugin:

```
rabbitmq-plugins enable {{plugin}}
```

- Disable a plugin:

```
rabbitmq-plugins disable {{plugin}}
```

- Enable a plugin and disable the rest:

```
rabbitmq-plugins set {{plugin}}
```

rabbitmq-queues

Manage RabbitMQ queues.

More information: https://www.rabbitmq.com/docs/man/rabbitmq-queues.8.

- Grow quorum queue clusters by adding a member on the specified node:

```
rabbitmq-queues grow {{node}} {{all|even}}
```

- Rebalance leaders of replicated queues across nodes:

```
rabbitmq-queues rebalance {{all|quorum|stream}}
```

- Shrink quorum queue clusters by removing any members on the specified node:

```
rabbitmq-queues shrink {{node}}
```

- Add a quorum queue member on the specified node:

```
rabbitmq-queues add_member {{queue}} {{node}}
```

- Delete a quorum queue member on the specified node:

```
rabbitmq-queues delete_member {{queue}} {{node}}
```

- Display quorum status of a quorum queue:

```
rabbitmq-queues quorum_status {{queue}}
```

rabbitmq-streams

Manage RabbitMQ streams.

More information: https://www.rabbitmq.com/docs/man/rabbitmq-streams.8.

- Add a stream replica on the specified node:

```
rabbitmq-streams add_replica {{stream}} {{node}}
```

- Delete a stream replica on the specified node:

```
rabbitmq-streams delete_replica {{stream}} {{node}}
```

- Display the status of a stream:

```
rabbitmq-streams stream_status {{stream}}
```

- Restart a stream:

```
rabbitmq-streams restart_stream {{stream}}
```

- List stream connections:

```
rabbitmq-streams list_stream_connections
```

- List all stream consumers:

```
rabbitmq-streams list_stream_consumers
```

- List all stream publishers:

```
rabbitmq-streams list_stream_publishers
```

- List tracking information for a stream:

```
rabbitmq-streams list_stream_tracking {{stream}}
```

rabbitmq-upgrade

Manage the upgrade of a RabbitMQ node.

More information: https://www.rabbitmq.com/docs/man/rabbitmq-upgrade.8.

- Wait for all quorum queues to have an above minimum online quorum:

```
rabbitmq-upgrade await_online_quorum_plus_one
```

- Put the node in maintenance mode:

```
rabbitmq-upgrade drain
```

- Put the node out of maintenance and into regular operating mode:

```
rabbitmq-upgrade revive
```

- Run post-upgrade tasks:

```
rabbitmq-upgrade post_upgrade
```

- Display help:

```
rabbitmq-upgrade help
```

rabbitmqctl-cluster

Manage RabbitMQ nodes in a cluster.

More information: https://www.rabbitmq.com/docs/man/rabbitmqctl.8.

- Display the status of the cluster:

```
rabbitmqctl cluster_status
```

- Display the status of the current node:

```
rabbitmqctl status
```

- Start the RabbitMQ application on a specific node:

```
rabbitmqctl {{[-n|--node]}} {{nodename}} start_app
```

- Stop the RabbitMQ application on a specific node:

```
rabbitmqctl {{[-n|--node]}} {{nodename}} stop_app
```

- Stop a specific RabbitMQ node:

```
rabbitmqctl {{[-n|--node]}} {{nodename}} stop
```

- Reset a specific RabbitMQ node to a clean state:

```
rabbitmqctl {{[-n|--node]}} {{nodename}} reset
```

- Make the current node join an existing cluster:

```
rabbitmqctl join_cluster {{nodename}}
```

rabbitmqctl-users

Manage RabbitMQ users, their permissions, and tags.

More information: https://www.rabbitmq.com/docs/management.

- List all users:

```
rabbitmqctl list_users
```

- Add a new user with a password:

```
rabbitmqctl add_user {{username}} {{password}}
```

- Delete an existing user:

```
rabbitmqctl delete_user {{username}}
```

- Change the password for a user:

```
rabbitmqctl change_password {{username}} {{new_password}}
```

- Set permissions for a user on a specific virtual host:

```
rabbitmqctl set_permissions {{[-p|--vhost]}} {{vhost}}
{{username}} {{read}} {{write}} {{configure}}
```

- Clear all permissions for a user on a specific virtual host:

```
rabbitmqctl clear_permissions {{[-p|--vhost]}} {{vhost}}
{{username}}
```

- Assign one or more tags (e.g., administrator) to a user:

```
rabbitmqctl set_user_tags {{username}} {{tag1 tag2 ...}}
```

rabbitmqctl-vhosts

Manage virtual hosts (vhosts) in RabbitMQ.

Vhosts are used to separate multiple logical brokers on the same RabbitMQ server.

More information: https://www.rabbitmq.com/docs/vhosts.

- List all virtual hosts:

```
rabbitmqctl list_vhosts
```

- Add a new virtual host:

```
rabbitmqctl add_vhost {{vhost_name}}
```

- Delete a virtual host:

```
rabbitmqctl delete_vhost {{vhost_name}}
```

- Set permissions for a user on a specific virtual host:

```
rabbitmqctl set_permissions {{[-p|--vhost]}} {{vhost_name}}
{{username}} {{read}} {{write}} {{configure}}
```

- Clear permissions for a user on a specific virtual host:

```
rabbitmqctl clear_permissions {{[-p|--vhost]}} {{vhost_name}}
{{username}}
```

rabbitmqctl

Manage, configure, and inspect RabbitMQ servers.

More information: https://www.rabbitmq.com/docs/man/rabbitmqctl.8.

- Display the status of the current node:

```
rabbitmqctl status
```

- View documentation for RabbitMQ cluster commands:

```
tldr rabbitmqctl cluster
```

- View documentation for RabbitMQ user commands:

```
tldr rabbitmqctl users
```

- View documentation for RabbitMQ vhosts commands:

```
tldr rabbitmqctl vhosts
```

- Learn more about a specific command:

```
rabbitmqctl help {{command}}
```

rabin2

Get information about binary files (ELF, PE, Java CLASS, Mach-O) - symbols, sections, linked libraries, etc.

Comes bundled with **`radare2`**.

More information: https://manned.org/rabin2.

- Display general information about a binary (architecture, type, endianness):

```
rabin2 -I {{path/to/binary}}
```

- Display linked libraries:

```
rabin2 -l {{path/to/binary}}
```

- Display symbols imported from libraries:

```
rabin2 -i {{path/to/binary}}
```

- Display strings contained in the binary:

```
rabin2 -z {{path/to/binary}}
```

- Display the output in JSON:

```
rabin2 -j -I {{path/to/binary}}
```

racket

Racket language interpreter.

More information: https://docs.racket-lang.org/reference/running-sa.html#%28part._mz-cmdline%29.

- Start a REPL (interactive shell):

```
racket
```

- Execute a Racket script:

```
racket {{path/to/script.rkt}}
```

- Execute a Racket expression:

```
racket {{[-e|--eval]}} "{{expression}}"
```

- Run module as a script (terminates option list):

```
racket {{[-l|--lib]}} {{module_name}} {{[-m|--main]}} {{arguments}}
```

- Start a REPL (interactive shell) for the `typed/racket` hashlang:

```
racket -I typed/racket
```

raco

Racket tools.

More information: https://docs.racket-lang.org/raco/.

- Install a package, automatically installing dependencies:

```
raco pkg install --auto {{package_source}}
```

- Install the current directory as a package:

```
raco pkg install
```

- Build (or rebuild) bytecode, documentation, executables, and metadata indexes for collections:

```
raco setup {{collection1 collection2 ...}}
```

- Run tests in files:

```
raco test {{path/to/tests1.rkt path/to/tests2.rkt ...}}
```

- Search local documentation:

```
raco docs {{search_terms}}
```

- Display help:

```
raco help
```

radare2

A set of reverse engineering tools.

More information: https://book.rada.re/first_steps/commandline_flags.html.

- Open a file in write mode without parsing the file format headers:

```
radare2 -nw {{path/to/binary}}
```

- Debug a program:

```
radare2 -d {{path/to/binary}}
```

- Run a script before entering the interactive CLI:

```
radare2 -i {{path/to/script.r2}} {{path/to/binary}}
```

- [Interactive] Display help text for any command:

```
{{radare2_command}}?
```

- [Interactive] Run a shell command from the interactive CLI:

```
!{{shell_command}}
```

- [Interactive] Dump raw bytes of current block to a file:

```
pr > {{path/to/file.bin}}
```

rage

A simple, secure, and modern file encryption tool (and Rust library) with small explicit keys, no configuration options, and UNIX-style composability.

Rust implementation of **age**.

More information: https://github.com/str4d/rage.

- Encrypt a file for `user` and save it to `message.age`:

```
echo "{{Your secret message}}" | rage --encrypt --recipient {{user}} --output {{path/to/message.age}}
```

- Decrypt a file with `identity_file` and save it to `message`:

```
rage --decrypt --identity {{path/to/identity_file}} --output {{message}}
```

rails console

Interact with a Rails application.

More information: https://guides.rubyonrails.org/command_line.html#bin-rails-console.

- Start the Rails console:

```
rails console
```

- Start the Rails console and roll back all data modifications on exit:

```
rails console {{[-s|--sandbox]}}
```

- Start the Rails console on a specified environment:

```
rails console {{[-e|--environment]}} {{dev|test|
production|...}}
```

- Display help:

```
rails console {{[-h|--help]}}
```

rails db

Various database-related subcommands for Ruby on Rails.

More information: https://guides.rubyonrails.org/active_record_migrations.html.

- Create databases, load the schema, and initialize with seed data:

```
rails db:setup
```

- Access the database console:

```
rails db
```

- Create the databases defined in the current environment:

```
rails db:create
```

- Destroy the databases defined in the current environment:

```
rails db:drop
```

- Run pending migrations:

```
rails db:migrate
```

- View the status of each migration file:

```
rails db:migrate:status
```

- Roll back the last migration:

```
rails db:rollback
```

- Fill the current database with data defined in `db/seeds.rb`:

```
rails db:seed
```

rails destroy

Destroy Rails resources.

More information: https://guides.rubyonrails.org/command_line.html#bin-rails-destroy.

- List all available generators to destroy:

  ```
  rails destroy
  ```

- Destroy a model named Post:

  ```
  rails destroy model {{Post}}
  ```

- Destroy a controller named Posts:

  ```
  rails destroy controller {{Posts}}
  ```

- Destroy a migration that creates Posts:

  ```
  rails destroy migration {{CreatePosts}}
  ```

- Destroy a scaffold for a model named Post:

  ```
  rails destroy scaffold {{Post}}
  ```

rails generate

Generate new Rails templates in an existing project.

More information: https://guides.rubyonrails.org/command_line.html#bin-rails-generate.

- List all available generators:

```
rails generate
```

- Generate a new model named Post with attributes title and body:

```
rails generate model {{Post}} {{title:string}} {{body:text}}
```

- Generate a new controller named Posts with actions index, show, new, and create:

```
rails generate controller {{Posts}} {{index}} {{show}} {{new}} {{create}}
```

- Generate a new migration that adds a category attribute to an existing model called Post:

```
rails generate migration {{AddCategoryToPost}} {{category:string}}
```

- Generate a scaffold for a model named Post, predefining the attributes title and body:

```
rails generate scaffold {{Post}} {{title:string}} {{body:text}}
```

rails new

Create a new Rails application.

More information: https://guides.rubyonrails.org/command_line.html#rails-new.

- Create a Rails app named `blog` in the current directory:

  ```
  rails new blog
  ```

- Create a Rails app with API-only configuration:

  ```
  rails new {{app_name}} --api
  ```

- Create a Rails app with `postgresql` as the database:

  ```
  rails new {{app_name}} {{[-d|--database]}} postgresql
  ```

- Create a Rails app without generating JavaScript files:

  ```
  rails new {{app_name}} {{[-J|--skip-javascript]}}
  ```

- Display help:

  ```
  rails new {{[-h|--help]}}
  ```

rails routes

List routes in a Rails application.

More information: https://guides.rubyonrails.org/routing.html.

- List all routes:

```
rails routes
```

- List all routes in an expanded format:

```
rails routes {{[-E|--expanded]}}
```

- List routes partially matching URL helper method name, HTTP verb, or URL path:

```
rails routes {{[-g|--grep]}} {{posts_path|GET|/posts}}
```

- List routes that map to a specified controller:

```
rails routes {{[-c|--controller]}} {{posts|Posts|
Blogs::PostsController}}
```

rails server

Serve the Rails app in the current directory using the Puma web server, which comes bundled with Rails.

More information: https://guides.rubyonrails.org/command_line.html#bin-rails-server.

- Run the web server:

```
rails server
```

- Run the web server on a specified port:

```
rails server {{[-p|--port]}} {{port_number}}
```

- Run the web server on a specified IP address:

```
rails server {{[-b|--binding]}} {{ip_address}}
```

- Run the web server on a specified environment:

```
rails server {{[-e|--environment]}} {{environment}}
```

- Display help:

```
rails server {{[-h|--help]}}
```

rails

A server-side MVC framework written in Ruby.

Some subcommands such as **`generate`** have their own usage documentation.

More information: https://guides.rubyonrails.org/command_line.html.

- Create a new rails project:

```
rails new "{{project_name}}"
```

- Generate a scaffold for a model named Post, predefining the attributes title and body:

```
rails generate scaffold Post title:string body:text
```

- Run migrations:

```
rails db:migrate
```

- List all routes:

```
rails routes
```

- Start local server for current project on port 3000:

```
rails server
```

- Start local server for current project on a specified port:

```
rails server {{[-p|--port]}} "{{port}}"
```

- Open console to interact with application from command-line:

```
rails console
```

- Display version:

```
rails {{[-v|--version]}}
```

railway

Connect code to a Railway project.

More information: https://docs.railway.com/reference/cli-api.

- Log in to a Railway account:

  ```
  railway login
  ```

- Link to an existing Project under a Railway account or team:

  ```
  railway link {{project_id}}
  ```

- Create a new project:

  ```
  railway init
  ```

- Run a local command using variables from the active environment:

  ```
  railway run {{cmd}}
  ```

- Deploy the linked project directory (if running from a subdirectory, the project root is still deployed):

  ```
  railway up
  ```

- Open an interactive shell to a database:

  ```
  railway connect
  ```

rainbowstream

Interactive Twitter client supporting realtime tweetstream, trends, sending, search, favorites, and user management.

Online help with **<h>**, **<ArrowUp>** and **<ArrowDown>** for history, **<Tab>** to auto-complete, and 2-**<Tab>** for suggestion.

More information: https://github.com/orakaro/rainbowstream.

- Open RainbowStream:

  ```
  rainbowstream
  ```

- [Interactive] Show your timeline (optional number of tweets to display, default is 5):

  ```
  home {{number_of_tweets}}
  ```

- [Interactive] Show profile of a given user:

  ```
  whois @{{user}}
  ```

- [Interactive] Tweet the message as-is:

  ```
  t {{message}}
  ```

- [Interactive] Retweet the tweet with given ID (ID is beside the time):

  ```
  rt {{tweet_id}}
  ```

- [Interactive] Favorite the tweet with given ID:

  ```
  fav {{tweet_id}}
  ```

- [Interactive] Perform a search for a given word (with or without hashtag):

  ```
  s {{word}}
  ```

rake

A Make-like program for Ruby.

Tasks for **rake** are specified in a Rakefile.

More information: https://ruby.github.io/rake/.

- Run the `default` Rakefile task:

  ```
  rake
  ```

- Run a specific task:

  ```
  rake {{task}}
  ```

- Execute `n` jobs at a time in parallel (number of CPU cores + 4 by default):

  ```
  rake --jobs {{n}}
  ```

- Use a specific Rakefile:

  ```
  rake --rakefile {{path/to/Rakefile}}
  ```

- Execute `rake` from another directory:

  ```
  rake --directory {{path/to/directory}}
  ```

raku

Rakudo Raku (formerly Perl 6) programming language interpreter.

See also: **`perl`**.

More information: https://manned.org/raku.

- Execute a Raku script:

```
raku {{path/to/script.raku}}
```

- Execute a single Raku command:

```
raku -e "{{command}}"
```

- Check syntax only (runs BEGIN and CHECK blocks):

```
raku -c {{path/to/script.raku}}
```

- Start a REPL (interactive shell):

```
raku
```

- Load a module before running the program:

```
raku -M {{module_name}} {{path/to/script.raku}}
```

- Add a path to the module search path:

```
raku -I {{path/to/module_directory}} {{path/to/script.raku}}
```

- Extract and display documentation from a script:

```
raku --doc {{path/to/script.raku}}
```

ranger

Console file manager with VI key bindings.

See also: **`clifm`**, **`vifm`**, **`mc`**, **`dolphin`**.

More information: https://github.com/ranger/ranger/blob/master/doc/ranger.pod.

- Launch ranger:

```
ranger
```

- Show only directories:

```
ranger --show-only-dirs
```

- Change the configuration directory:

```
ranger {{[-r|--confdir]}} {{path/to/directory}}
```

- Change the data directory:

```
ranger --datadir {{path/to/directory}}
```

- Print CPU usage statistics on exit:

```
ranger --profile
```

rapper

The Raptor RDF parsing utility.

Part of the Raptor RDF Syntax Library.

More information: https://librdf.org/raptor/rapper.html.

- Convert an RDF/XML document to Turtle:

```
rapper {{[-i|--input]}} rdfxml {{[-o|--output]}} turtle
{{path/to/file}}
```

- Count the number of triples in a Turtle file:

```
rapper {{[-i|--input]}} turtle {{[-c|--count]}} {{path/to/
file}}
```

rar

The RAR archiver. Supports multi-volume archives that can be optionally self-extracting.

More information: https://manned.org/rar.

- Archive 1 or more files:

```
rar a {{path/to/archive_name.rar}} {{path/to/file1 path/to/file2 path/to/file3 ...}}
```

- Archive a directory:

```
rar a {{path/to/archive_name.rar}} {{path/to/directory}}
```

- Split the archive into parts of equal size (50M):

```
rar a -v{{50M}} -R {{path/to/archive_name.rar}} {{path/to/file_or_directory}}
```

- Password protect the resulting archive:

```
rar a -p{{password}} {{path/to/archive_name.rar}} {{path/to/file_or_directory}}
```

- Encrypt file data and headers with password:

```
rar a -hp{{password}} {{path/to/archive_name.rar}} {{path/to/file_or_directory}}
```

- Use a specific compression level (0-5):

```
rar a -m{{compression_level}} {{path/to/archive_name.rar}} {{path/to/file_or_directory}}
```

rarcrack

Password cracker for RAR, Zip, and 7z archives.

- Brute force the password for an archive (tries to guess the archive type):

```
rarcrack {{path/to/file.zip}}
```

- Specify the archive type:

```
rarcrack --type {{rar|zip|7z}} {{path/to/file.zip}}
```

- Use multiple threads:

```
rarcrack --threads {{6}} {{path/to/file.zip}}
```

rasttopnm

Convert a Sun rasterfile to a PNM file.

More information: https://netpbm.sourceforge.net/doc/rasttopnm.html.

- Convert a RAST image to a PNM file:

```
rasttopnm {{path/to/input.rast}} > {{path/to/output.pnm}}
```

- Use the color map indices in the raster if they are color values:

```
rasttopnm {{[-i|-index]}} {{path/to/input.rast}} > {{path/to/
output.pnm}}
```

rawtopgm

Convert a raw greyscale image to a PGM image.

More information: https://netpbm.sourceforge.net/doc/rawtopgm.html.

- Convert a raw greyscale image to a PGM image:

```
rawtopgm {{width}} {{height}} {{path/to/image.raw}} > {{path/to/output.pgm}}
```

- Convert a raw greyscale image to a PGM image, assume the image to be a square:

```
rawtopgm {{path/to/image.raw}} > {{path/to/output.pgm}}
```

- Convert a raw greyscale image in which the pixels come bottom-first instead of top-first to a PGM image:

```
rawtopgm {{width}} {{height}} {{[-bt|-bottomfirst]}} {{path/to/image.raw}} > {{path/to/output.pgm}}
```

- Ignore the first `n` bytes of the specified file:

```
rawtopgm {{width}} {{height}} {{[-h|-headerskip]}} {{n}} {{path/to/image.raw}} > {{path/to/output.pgm}}
```

- Ignore the last `m` bytes of each row in the specified file:

```
rawtopgm {{width}} {{height}} {{[-r|-rowskip]}} {{m}} {{path/to/image.raw}} > {{path/to/output.pgm}}
```

- Specify the maxval for the grey values in the input to be equal to `n`:

```
rawtopgm {{width}} {{height}} {{[-m|-maxval]}} {{n}} {{path/to/image.raw}} > {{path/to/output.pgm}}
```

- Specify the number of bytes that represent each sample in the input and that the byte-sequence is to be interpreted as little-endian:

```
rawtopgm {{width}} {{height}} -bpp {{1|2}} {{[-l|-littleendian]}} {{path/to/image.raw}} > {{path/to/output.pgm}}
```

rawtoppm

Convert a raw RGB stream to a PPM image.

More information: https://netpbm.sourceforge.net/doc/rawtoppm.html.

- Convert a raw RGB stream to a PPM image:

```
rawtoppm {{width}} {{height}} {{path/to/image.raw}} > {{path/to/output.ppm}}
```

- Convert a raw RGB stream in which the pixels come bottom-first instead of top-first to a PPM image:

```
rawtoppm {{width}} {{height}} {{path/to/image.raw}} | pamflip {{[-tb|-topbottom]}} > {{path/to/output.ppm}}
```

- Ignore the first n bytes of the specified file:

```
rawtoppm {{width}} {{height}} {{[-h|-headerskip]}} {{n}} {{path/to/image.raw}} > {{path/to/output.ppm}}
```

- Ignore the last m bytes of each row in the specified file:

```
rawtoppm {{width}} {{height}} {{[-ro|-rowskip]}} {{m}} {{path/to/image.raw}} > {{path/to/output.ppm}}
```

- Specify the order of color components for each pixel:

```
rawtoppm {{width}} {{height}} -{{rgb|rbg|grb|gbr|brg|bgr}} {{path/to/image.raw}} > {{path/to/output.ppm}}
```

rbac-lookup

Find roles and cluster roles attached to any user, service account, or group name in your Kubernetes cluster.

More information: https://github.com/FairwindsOps/rbac-lookup.

- View all RBAC bindings:

  ```
  rbac-lookup
  ```

- View RBAC bindings that match a given expression:

  ```
  rbac-lookup {{search_term}}
  ```

- View all RBAC bindings along with the source role binding:

  ```
  rbac-lookup {{[-o|--output]}} wide
  ```

- View all RBAC bindings filtered by subject:

  ```
  rbac-lookup {{[-k|--kind]}} {{user|group|serviceaccount}}
  ```

- View all RBAC bindings along with IAM roles (if you are using GKE):

  ```
  rbac-lookup --gke
  ```

rbash

This command is an alias of **`bash --restricted`**.

- View documentation for the original command:

  `tldr bash`

rbenv

Easily install Ruby versions and manage application environments.

See also: **`asdf`**.

More information: https://manned.org/rbenv.

- Install a Ruby version:

```
rbenv install {{version}}
```

- Display a list of the latest stable versions for each Ruby:

```
rbenv install --list
```

- Display a list of installed Ruby versions:

```
rbenv versions
```

- Use a specific Ruby version across the whole system:

```
rbenv global {{version}}
```

- Use a specific Ruby version for an application/project directory:

```
rbenv local {{version}}
```

- Display the currently selected Ruby version:

```
rbenv version
```

- Uninstall a Ruby version:

```
rbenv uninstall {{version}}
```

- Display all Ruby versions that contain the specified executable:

```
rbenv whence {{executable}}
```

rbt

RBTools, a set of tools for working with Review Board and RBCommons.

More information: https://www.reviewboard.org/docs/rbtools/dev/.

- Post changes to Review Board:

  `rbt post {{change_number}}`

- Display the diff that will be sent to Review Board:

  `rbt diff`

- Land a change in a local branch or on a review request:

  `rbt land {{branch_name}}`

- Patch your tree with a change on a review request:

  `rbt patch {{review_request_id}}`

- Set up RBTool to talk to a repository:

  `rbt setup-repo`

rbw

Unofficial Bitwarden-compatible password manager.

More information: https://github.com/doy/rbw#configuration.

- Log in to the vault:

```
rbw login
```

- Unlock the vault:

```
rbw unlock
```

- List all items in the vault:

```
rbw list
```

- Get a password for an entry:

```
rbw get "{{entry_name}}"
```

- Get a username for an entry:

```
rbw get {{[-f|--field]}} username "{{entry_name}}"
```

- Copy a password to the clipboard:

```
rbw get {{[-c|--clipboard]}} "{{entry_name}}"
```

- Generate a new password with the specified number of characters:

```
rbw generate {{password_length}}
```

- Lock the vault:

```
rbw lock
```

rc

A modern simplistic port listener & reverse shell.

Similar to **nc**.

More information: https://github.com/robiot/rustcat/wiki/Basic-Usage.

- Start listening on a specific port:

```
rc -lp {{port}}
```

- Start a reverse shell:

```
rc {{host}} {{port}} -r {{shell}}
```

rcat

This command is an alias of **rc**.

- View documentation for the original command:

```
tldr rc
```

rclone

Copy, synchronize, or move files and directories to and from many cloud services.

More information: https://rclone.org/commands/rclone/.

- Launch an interactive menu to setup rclone:

```
rclone config
```

- List contents of a directory on an rclone remote:

```
rclone lsf {{remote_name}}:{{path/to/directory}}
```

- Copy a file or directory from the local machine to the remote destination:

```
rclone copy {{path/to/source_file_or_directory}}
{{remote_name}}:{{path/to/directory}}
```

- Copy files changed within the past 24 hours to a remote from the local machine, asking the user to confirm each file:

```
rclone copy {{[-i|--interactive]}} --max-age 24h
{{remote_name}}:{{path/to/directory}} {{path/to/
local_directory}}
```

- Mirror a specific file or directory (Note: Unlike copy, sync removes files from the remote if it does not exist locally):

```
rclone sync {{path/to/file_or_directory}} {{remote_name}}:
{{path/to/directory}}
```

- Simulate deleting a remote file or directory (remove `--dry-run` from the command to actually delete):

```
rclone {{[-n|--dry-run]}} delete {{remote_name}}:{{path/to/
file_or_directory}}
```

- Mount rclone remote (experimental):

```
rclone mount {{remote_name}}:{{path/to/directory}} {{path/to/
mount_point}}
```

- Unmount rclone remote if `<Ctrl c>` fails (experimental):

```
fusermount {{[-u|--update]}} {{path/to/mount_point}}
```

rcs

Revision Control System - manage RCS file attributes.

See also: **`ci`**, **`co`**, **`rcsdiff`**, **`rlog`**.

More information: https://manned.org/rcs.

- Unlock a revision locked by another user (requires access):

```
rcs -u {{path/to/file}}
```

- Lock a specific revision of a file:

```
rcs -l{{revision}} {{path/to/file}}
```

- Set the strict locking mode (require lock for check-in):

```
rcs -L {{path/to/file}}
```

- Add or replace a log message for a specific revision:

```
rcs -m{{revision}}:"{{new_message}}" {{path/to/file}}
```

- Delete a specific revision from the RCS file:

```
rcs -o{{revision}} {{path/to/file}}
```

rcsdiff

Compare RCS revisions (show differences between revisions in RCS files).

See also: **`ci`**, **`co`**, **`rcs`**, **`rlog`**.

More information: https://manned.org/rcsdiff.

- Compare the working file with the latest revision:

```
rcsdiff {{path/to/file}}
```

- Compare the working file with a specific revision:

```
rcsdiff -r{{revision}} {{path/to/file}}
```

- Compare two specific revisions of a file:

```
rcsdiff -r{{revision1}} -r{{revision2}} {{path/to/file}}
```

- Show differences in unified format:

```
rcsdiff -u {{path/to/file}}
```

- Show differences with context lines:

```
rcsdiff -c {{path/to/file}}
```

rcsmerge

Merge RCS revisions into the working file.

See also: **`ci`**, **`co`**, **`rcs`**, **`rcsdiff`**, **`rlog`**.

More information: https://manned.org/rcsmerge.

- Merge differences between two revisions into the working file:

```
rcsmerge -r{{revision1}} -r{{revision2}} {{path/to/file}}
```

- Merge changes from a branch revision into the working file:

```
rcsmerge -r{{branch_revision}} {{path/to/file}}
```

- Perform a quiet merge (suppress diagnostics):

```
rcsmerge -q -r{{revision1}} -r{{revision2}} {{path/to/file}}
```

- Print the result to `stdout` instead of overwriting the working file:

```
rcsmerge -p -r{{revision1}} -r{{revision2}} {{path/to/file}}
```

rdfind

Find files with duplicate content and get rid of them.

More information: https://rdfind.pauldreik.se/rdfind.1.html.

- Identify all duplicates in a given directory and output a summary:

```
rdfind -dryrun true {{path/to/directory}}
```

- Replace all duplicates with hardlinks:

```
rdfind -makehardlinks true {{path/to/directory}}
```

- Replace all duplicates with symlinks/soft links:

```
rdfind -makesymlinks true {{path/to/directory}}
```

- Delete all duplicates and do not ignore empty files:

```
rdfind -deleteduplicates true -ignoreempty false {{path/to/
directory}}
```

rdiff-backup

Local/remote mirror and incremental backup tool.

More information: https://rdiff-backup.net/rdiff-backup.1.html.

- Back up `path/to/source` to `path/to/backup`:

```
rdiff-backup backup {{path/to/source}} {{path/to/backup}}
```

- List incremental backups in repository (location path, local, or remote):

```
rdiff-backup list increments {{repository}}
```

- Restore from most recent backup:

```
rdiff-backup restore {{path/to/backup}} {{path/to/
destination}}
```

- Restore backed up files as they were 3 days ago:

```
rdiff-backup restore --at 3D {{path/to/backup}} {{path/to/
destination}}
```

rdp_check.py

Test whether an account is valid on the target host using the RDP protocol (no full login, just authentication check).

Part of the Impacket suite.

More information: https://github.com/fortra/impacket.

- Check if credentials are valid on a target (password prompted if omitted):

```
rdp_check.py {{domain}}/{{username}}@{{target}}
```

- Check credentials using NTLM hashes:

```
rdp_check.py -hashes {{LM_Hash}}:{{NT_Hash}} {{domain}}/
{{username}}@{{target}}
```

- Check credentials with explicit password:

```
rdp_check.py {{domain}}/{{username}}:{{password}}@{{target}}
```

- Check credentials for a local account on the target (no domain):

```
rdp_check.py {{username}}:{{password}}@{{target}}
```

react-native start

Start the React Native server.

More information: https://github.com/facebook/react-native/tree/main/packages/community-cli-plugin#start.

- Start the server that communicates with connected devices:

  ```
  react-native start
  ```

- Start the metro bundler with a clean cache:

  ```
  react-native start --reset-cache
  ```

- Start the server in a custom port (defaults to 8081):

  ```
  react-native start --port {{3000}}
  ```

- Start the server in verbose mode:

  ```
  react-native start --verbose
  ```

- Specify the maximum number of workers for transforming files (default is the number of CPU cores):

  ```
  react-native start --max-workers {{count}}
  ```

- Disable interactive mode:

  ```
  react-native start --no-interactive
  ```

react-native

A framework for building native apps with React.

More information: https://github.com/react-native-community/cli/blob/main/docs/commands.md.

- Initialize a new React Native project in a directory of the same name:

```
react-native init {{project_name}}
```

- Start the metro bundler:

```
react-native start
```

- Start the metro bundler with a clean cache:

```
react-native start --reset-cache
```

- Build the current application and start it on a connected Android device or emulator:

```
react-native run-android
```

- Build the current application and start it on an iOS simulator:

```
react-native run-ios
```

- Build the current application in `release` mode and start it on a connected Android device or emulator:

```
react-native run-android --variant={{release}}
```

- Start `logkitty` and print logs to `stdout`:

```
react-native log-android
```

- Start `tail system.log` for an iOS simulator and print logs to `stdout`:

```
react-native log-ios
```

read

Shell builtin for retrieving data from **`stdin`**.

More information: https://www.gnu.org/software/bash/manual/bash.html#index-read.

- Store data that you type from the keyboard to one or more variable:

```
read {{variable1 variable2 ...}}
```

- Store each of the next lines you enter as values of an array:

```
read -a {{array}}
```

- Specify the number of maximum characters to be read:

```
read -n {{character_count}} {{variable}}
```

- Assign multiple values to multiple variables:

```
read <<< "{{The surname is Bond}}" {{_ variable1 _ variable2}}
```

- Do not let backslash (\) act as an escape character:

```
read -r {{variable}}
```

- Display a prompt before the input:

```
read -p "{{Enter your input here: }}" {{variable}}
```

- Do not echo typed characters (silent mode):

```
read -s {{variable}}
```

- Perform an action on each line of a command's output:

```
{{command}} | while IFS= read -r line; do {{echo|ls|rm|...}} "$line"; done
```

readarray

Read lines from **`stdin`** into an array.

More information: https://www.gnu.org/software/bash/manual/bash.html#index-readarray.

- Interactively input lines into an array:

```
readarray {{array_name}}
```

- Read lines from a file and insert them in an array:

```
readarray < {{path/to/file.txt}} {{array_name}}
```

- Remove [t]railing delimiters (newline by default):

```
readarray < {{path/to/file.txt}} -t {{array_name}}
```

- Copy at most `n` lines:

```
readarray < {{path/to/file.txt}} -n {{n}} {{array_name}}
```

- [s]kip the first `n` lines:

```
readarray < {{path/to/file.txt}} -s {{n}} {{array_name}}
```

- Define a custom [d]elimiter:

```
readarray < {{path/to/file.txt}} -d {{delimiter}}
{{array_name}}
```

- Display help:

```
help mapfile
```

readlink

Follow symlinks and get symlink information.

More information: https://www.gnu.org/software/coreutils/manual/html_node/readlink-invocation.html.

- Print the target of a symbolic link to a file or directory:

```
readlink {{path/to/symlink}}
```

- Get the absolute path to a file or directory:

```
readlink {{[-f|--canonicalize]}} {{path/to/file_or_directory}}
```

readonly

Set read-only shell variables.

More information: https://www.gnu.org/software/bash/manual/bash.html#index-readonly.

- Set a read-only variable:

```
readonly {{variable_name}}={{value}}
```

- Mark a variable as read-only:

```
readonly {{existing_variable}}
```

- [p]rint the names and values of all read-only variables to `stdout`:

```
readonly -p
```

realpath

Display the resolved absolute path for a file or directory.

More information: https://www.gnu.org/software/coreutils/manual/html_node/realpath-invocation.html.

- Display the absolute path for a file or directory:

```
realpath {{path/to/file_or_directory}}
```

- Require all path components to exist:

```
realpath {{[-e|--canonicalize-existing]}} {{path/to/file_or_directory}}
```

- Resolve `..` components before symlinks:

```
realpath {{[-L|--logical]}} {{path/to/file_or_directory}}
```

- Disable symlink expansion:

```
realpath {{[-s|--no-symlinks]}} {{path/to/file_or_directory}}
```

- Suppress error messages:

```
realpath {{[-q|--quiet]}} {{path/to/file_or_directory}}
```

recon-ng

Automated reconnaissance and information gathering tool.

More information: https://github.com/lanmaster53/recon-ng/wiki.

- Start the tool in interactive mode:

```
recon-ng
```

- [Interactive] Create a workspace:

```
workspaces create {{workspace_name}}
```

- [Interactive] Search the marketplace for modules used to accomplish different reconnaissance tasks:

```
marketplace search
```

- [Interactive] Install all available modules (some may need API keys to function completely):

```
marketplace install all
```

- [Interactive] Load the profiler module. It is used to scan the web for profiles matching the target, scrape them, and store them:

```
modules load profiler
```

- [Interactive] Insert the target's username. After entering this command, enter the desired username of the search and leave the rest of the options blank:

```
db insert profiles
```

- [Interactive] Run the current module:

```
run
```

recsel

Print records from a recfile: a human-editable, plain text database.

More information: https://www.gnu.org/software/recutils/manual/recutils.html#Invoking-recsel.

- Extract name and version field:

```
recsel {{[-p|--print]}} name,version {{data.rec}}
```

- Use "~" to match a string with a given regex:

```
recsel {{[-e|--expression]}} "{{field_name}} ~
'{{regex}}' {{data.rec}}"
```

- Use a predicate to match a name and a version:

```
recsel {{[-e|--expression]}} "name ~ '{{regex}}' && version ~
'{{regex}}'" {{data.rec}}
```

rector

An automated tool for updating and refactoring PHP 5.3+ code.

More information: https://github.com/rectorphp/rector.

- Process a specific directory:

```
rector process {{path/to/directory}}
```

- Simulate processing a directory without applying changes:

```
rector process {{path/to/directory}} --dry-run
```

- Process a directory and apply coding standards:

```
rector process {{path/to/directory}} --with-style
```

- Display a list of available levels:

```
rector levels
```

- Process a directory with a specific level:

```
rector process {{path/to/directory}} --level {{level_name}}
```

redis-benchmark

Benchmark a Redis server.

More information: https://redis.io/docs/latest/operate/oss_and_stack/management/optimization/benchmarks/.

- Run full benchmark:

```
redis-benchmark
```

- Run benchmark on a specific Redis server:

```
redis-benchmark -h {{host}} -p {{port}} -a {{password}}
```

- Run a subset of tests with default 100000 requests:

```
redis-benchmark -h {{host}} -p {{port}} -t {{set,lpush}} -n {{100000}}
```

- Run with a specific script:

```
redis-benchmark -n {{100000}} script load "{{redis.call('set', 'foo', 'bar')}}"
```

- Run benchmark by using 100000 [r]andom keys:

```
redis-benchmark -t {{set}} -r {{100000}}
```

- Run benchmark by using a [P]ipelining of 16 commands:

```
redis-benchmark -n {{1000000}} -t {{set,get}} -P {{16}}
```

- Run benchmark [q]uietly and only show query per seconds result:

```
redis-benchmark -q
```

redis-cli

Open a connection to a Redis server.

More information: https://redis.io/docs/latest/develop/.

- Connect to the local server:

```
redis-cli
```

- Connect to a remote server on the default port (6379):

```
redis-cli -h {{host}}
```

- Connect to a remote server specifying a port number:

```
redis-cli -h {{host}} -p {{port}}
```

- Connect to a remote server specifying a URI:

```
redis-cli -u {{uri}}
```

- Specify a password:

```
redis-cli -a {{password}}
```

- Execute Redis command:

```
redis-cli {{redis_command}}
```

- Connect to the local cluster:

```
redis-cli -c
```

redis-server

Persistent key-value database.

More information: https://redis.io/tutorials/operate/redis-at-scale/talking-to-redis/configuring-a-redis-server/.

- Start Redis server, using the default port (6379), and write logs to `stdout`:

```
redis-server
```

- Start Redis server, using the default port, as a background process:

```
redis-server --daemonize yes
```

- Start Redis server, using the specified port, as a background process:

```
redis-server --port {{port}} --daemonize yes
```

- Start Redis server with a custom configuration file:

```
redis-server {{path/to/redis.conf}}
```

- Start Redis server with verbose logging:

```
redis-server --loglevel {{warning|notice|verbose|debug}}
```

redshift

Adjust the color temperature of a screen according to its surroundings.

Note: Redshift does not support Wayland.

See also: **`gammastep`**.

More information: https://manned.org/redshift.

- Turn on Redshift with [t]emperature set to 5700k during the day and 3600k at night:

```
redshift -t 5700:3600
```

- Turn on Redshift with a manually specified custom [l]ocation:

```
redshift -l {{latitude}}:{{longitude}}
```

- Turn on Redshift with screen [b]rightness set to 70% during the day and 40% at night:

```
redshift -b 0.7:0.4
```

- Turn on Redshift with custom [g]amma levels (between 0 and 1):

```
redshift -g {{red}}:{{green}}:{{blue}}
```

- [P]urge existing temperature changes and set a constant unchanging color temperature in [O]ne-shot mode:

```
redshift -PO {{temperature}}
```

reflac

Recompress FLAC files in-place while preserving metadata.

More information: https://github.com/chungy/reflac#running.

- Recompress a directory of FLAC files:

```
reflac {{path/to/directory}}
```

- Enable maximum compression (very slow):

```
reflac {{[-8|--best]}} {{path/to/directory}}
```

- Display filenames as they are processed:

```
reflac {{[-v|--verbose]}} {{path/to/directory}}
```

- Recurse into subdirectories:

```
reflac {{[-r|--recursive]}} {{path/to/directory}}
```

- Preserve file modification times:

```
reflac --preserve {{path/to/directory}}
```

reflex

Watch a directory and rerun a command when certain files change.

More information: https://github.com/cespare/reflex#usage.

- Rebuild with `make` if any file changes:

```
reflex make
```

- Compile and run Go application if any `.go` file changes:

```
reflex {{[-r|--regex]}} '{{\.go$}}' {{go run .}}
```

- Ignore a directory when watching for changes:

```
reflex {{[-G|--inverse-regex]}} '{{^dir/}}' {{command}}
```

- Run command when reflex starts and restarts on file changes:

```
reflex {{[-s|--start-service]}} true {{command}}
```

- Substitute the filename that changed in:

```
reflex -- echo {}
```

reg.py

Query, add, delete, save, or back up registry keys/values on a remote Windows machine over SMB/RPC.

Part of the Impacket suite.

More information: https://github.com/fortra/impacket.

- Query subkeys and values under a registry path:

```
reg.py {{domain}}/{{username}}:{{password}}@{{target}} query
-keyName '{{HKLM\SOFTWARE\Microsoft\Windows}}'
```

- Query all subkeys and values under a registry path recursively:

```
reg.py {{domain}}/{{username}}:{{password}}@{{target}} query
-keyName '{{HKLM\SOFTWARE\Microsoft\Windows}}' -s
```

- Add a new registry key or value (default value type is REG_SZ):

```
reg.py {{domain}}/{{username}}:{{password}}@{{target}} add -
keyName '{{HKLM\SOFTWARE\Microsoft\Windows}}' -v
{{value_name}} -vt {{REG_SZ|REG_NONE|REG_EXPAND_SZ|
REG_BINARY|REG_DWORD|REG_DWORD_BIG_ENDIAN|REG_LINK|
REG_MULTI_SZ|REG_QWORD}} -vd {{value_data}}
```

- Delete a registry key or value:

```
reg.py {{domain}}/{{username}}:{{password}}@{{target}} delete
-keyName '{{HKLM\SOFTWARE\Example}}' -v {{value_name}}
```

- Save a registry key (and subkeys) to a file on the target via UNC path:

```
reg.py {{domain}}/{{username}}:{{password}}@{{target}} save -
keyName '{{HKLM\SOFTWARE\Example}}' -o '\\{{target}}\
{{share}}\{{output_file.reg}}'
```

- Back up SAM, SYSTEM, and SECURITY hives to a file on a target via UNC path (requires SYSTEM privileges):

```
reg.py {{domain}}/{{username}}:{{password}}@{{target}} backup
-o '\\{{target}}\{{share}}'
```

regedit

Wine registry counterpart of the Microsoft Windows **regedit** service.

More information: https://manned.org/regedit.

- Export a specific registry key and contents to a file:

```
regedit -E {{path/to/file}} {{path/to/registry_key}}
```

- Delete a specified registry key:

```
regedit -D {{path/to/registry_key}}
```

- Open the graphical registry manager:

```
regedit
```

- Display help:

```
regedit -?
```

regex

Regular expressions (**regex**) are patterns used to match, search, and manipulate text.

Note: **regex** isn't a command, but syntax to be used with other commands.

See also: **egrep**, **glob**.

More information: https://cheatography.com/davechild/cheat-sheets/regular-expressions/.

- Match any single character:

```
.
```

- Match the start of a line:

```
^{{hello}}
```

- Match the end of a line:

```
{{world}}$
```

- Match zero or more repeated characters:

```
{{a}}*
```

- Match one character in a set of characters:

```
[{{abc}}]
```

- Match ranges of characters:

```
[{{a-z}}][{{3-9}}]
```

- Match anything but the specified character:

```
[^{{a}}]
```

- Match a boundary around a word:

```
"\b{{text}}\b"
```

rehash

This command is an alias of **`hash -r`**.

- View documentation for the original command:

  ```
  tldr hash
  ```

reindexdb

Rebuild indexes in a PostgreSQL database.

More information: https://www.postgresql.org/docs/current/app-reindexdb.html.

- Reindex a specific database:

```
reindexdb {{database_name}}
```

- Reindex a specific database using connection options:

```
reindexdb {{database_name}} {{[-h|--host]}} {{hostname}} {{[-p|--port]}} {{port}} {{[-U|--username]}} {{username}}
```

- Reindex all databases:

```
reindexdb {{[-a|--all]}}
```

- Reindex a specific table in a database:

```
reindexdb {{database_name}} {{[-t|--table]}} {{table_name}}
```

- Reindex a specific index in a database:

```
reindexdb {{database_name}} {{[-i|--index]}} {{index_name}}
```

- Reindex a specific schema in a database:

```
reindexdb {{database_name}} {{[-S|--schema]}} {{schema_name}}
```

- Reindex with verbose output:

```
reindexdb {{database_name}} {{[-v|--verbose]}}
```

- Reindex a database using multiple parallel jobs:

```
reindexdb {{database_name}} {{[-j|--jobs]}} {{number_of_jobs}}
```

rekor-cli

Immutable tamper resistant ledger of metadata generated within a software projects supply chain.

More information: https://github.com/sigstore/rekor.

- Upload an artifact to Rekor:

```
rekor-cli upload --artifact {{path/to/file.ext}} --signature {{path/to/file.ext.sig}} --pki-format={{x509}} --public-key={{path/to/key.pub}}
```

- Get information regarding entries in the Transparency Log:

```
rekor-cli get --uuid={{0e81b4d9299e2609e45b5c453a4c0e7820ac74e02c4935a8b830d104632fd2c
```

- Search the Rekor index to find entries by Artifact:

```
rekor-cli search --artifact {{path/to/file.ext}}
```

- Search the Rekor index to find entries by a specific hash:

```
rekor-cli search --sha {{6b86b273ff34fce19d6b804eff5a3f5747ada4eaa22f1d49c01e52ddb7875b4b}}
```

Remove-NodeVersion

Uninstall Node.js runtime versions for **`ps-nvm`**.

This command is part of **`ps-nvm`** and can only be run under PowerShell.

More information: https://github.com/aaronpowell/ps-nvm.

- Uninstall a given Node.js version:

```
Remove-NodeVersion {{node_version}}
```

- Uninstall multiple Node.js versions:

```
Remove-NodeVersion {{node_version1 , node_version2 , ...}}
```

- Uninstall all currently-installed versions of Node.js 20.x:

```
Get-NodeVersions -Filter ">=20.0.0 <21.0.0" | Remove-
NodeVersion
```

- Uninstall all currently-installed versions of Node.js:

```
Get-NodeVersions | Remove-NodeVersion
```

rename

Rename a file or group of files with a **regex**.

WARNING: This command will overwrite files without prompting unless the **-n** option is used.

Note: This page refers to the Perl version, also known as **file-rename**.

More information: https://manned.org/prename.

- Replace `from` with `to` in the filenames of the specified files:

```
rename 's/{{from}}/{{to}}/' {{*.txt}}
```

- Simulate running the program without doing anything:

```
rename -n 's/{{from}}/{{to}}/' {{*.txt}}
```

- Change the extension:

```
rename 's/\.{{old}}$/\.{{new}}/' {{*.txt}}
```

- Change to lowercase (use `-f` in case-insensitive filesystems):

```
rename {{[-f|--force]}} 'y/A-Z/a-z/' {{*.txt}}
```

- Capitalize first letter of every word in the name:

```
rename {{[-f|--force]}} 's/\b(\w)/\U$1/g' {{*.txt}}
```

- Replace spaces with underscores:

```
rename 's/\s+/_/g' {{*.txt}}
```

renice

Alter the scheduling priority/niceness of running processes.

Niceness values range from -20 (most favorable to the process) to 19 (least favorable to the process).

See also: **nice**.

More information: https://manned.org/renice.1p.

- Increase/decrease the priority of a running [p]rocess:

```
renice -n {{3}} -p {{process_id}}
```

- Increase/decrease the priority of all processes owned by a [u]ser:

```
renice -n {{-4}} -u {{user_id|username}}
```

- Increase/decrease the priority of all processes that belong to a process [g]roup:

```
renice -n {{5}} -g {{process_group}}
```

repomix

Pack a GitHub repository into an AI-friendly file.

More information: https://github.com/yamadashy/repomix.

- Output custom format:

```
repomix {{[-o|--output]}} {{path/to/file}} --style {{xml|markdown|plain}}
```

- Send output to `stdout`:

```
repomix --stdout > {{path/to/file}}
```

- Send output to `stdout`, then pipe into another program:

```
repomix --stdout | {{less}}
```

- Output with compression:

```
repomix --compress
```

- Process specific files:

```
repomix --include "{{src/**/*.ts}}" --ignore "{{**/*.test.ts}}"
```

- Pack a repository from a branch:

```
repomix --remote {{https://github.com/user/repo/tree/main}}
```

- Pack a repository at a specific commit:

```
repomix --remote {{https://github.com/user/repo/commit/836abcd7335137228ad77feb28655d85712680f1}}
```

- Pack repository using shorthand:

```
repomix --remote {{user/repo}}
```

repren

Multi-pattern string replacement and file renaming tool.

More information: https://github.com/jlevy/repren.

- Simulate renaming a directory of PNGs with a literal string replacement:

```
repren {{[-n|--dry-run]}} --rename --literal --from '{{find_string}}' --to '{{replacement_string}}' {{*.png}}
```

- Simulate renaming a directory of JPEGs with a regex:

```
repren --rename {{[-n|--dry-run]}} --from '{{regex}}' --to '{{replacement_string}}' {{*.jpg}} {{*.jpeg}}
```

- Do a find-and-replace on the contents of a directory of CSV files:

```
repren --from '{{([0-9]+) example_string}}' --to '{{replacement_string \1}}' {{*.csv}}
```

- Do both a find-and-replace and a rename operation at the same time, using a pattern file:

```
repren {{[-p|--patterns]}} {{path/to/patfile.ext}} --full {{*.txt}}
```

- Do a case-insensitive rename:

```
repren --rename {{[-i|--insensitive]}} {{[-p|--patterns]}} {{path/to/patfile.ext}} *
```

resend

Send and manage emails from the command-line.

More information: https://github.com/resend/resend-cli#commands.

- Log in to Resend (opens browser for authentication):

```
resend login
```

- Log in with an API key directly (for CI/agents):

```
resend login --key {{re_xxxxxxxxx}}
```

- Send an email:

```
resend emails send --from {{email@example.com}} --to
{{recipient@example.com}} --subject "{{subject}}" --text
"{{message}}"
```

- Create a template:

```
resend templates create --name "{{Welcome}}" --subject
"{{subject}}" --html "{{<h1>Hello</h1>}}"
```

- Send an email using a template:

```
resend emails send --to {{recipient@example.com}} --template
{{template_id}}
```

- List verified domains:

```
resend domains {{[ls|list]}}
```

- Show current authentication status:

```
resend whoami
```

- Check CLI version, API key, and domain status:

```
resend doctor
```

resolvconf

Manage nameserver information.

Acts as an intermediary between programs that supply nameserver information and applications that use this information.

This page documents Debian's implementation of **`resolvconf`**.

More information: https://manned.org/resolvconf.

- Add or override the IFACE.PROG record and run the update scripts if updating is enabled:

```
resolvconf -a {{IFACE.PROG}}
```

- Delete the IFACE.PROG record and run the update scripts if updating is enabled:

```
resolvconf -d {{IFACR.PROG}}
```

- Just run the update scripts if updating is enabled:

```
resolvconf -u
```

- Set the flag indicating whether `resolvconf` should run update scripts when invoked with `-a`, `-d`, or `-u`:

```
resolvconf --enable-updates
```

- Clear the flag indicating whether to run updates:

```
resolvconf --disable-updates
```

- Check whether updates are enabled:

```
resolvconf --updates-are-enabled
```

restic

A fast and secure backup program.

More information: https://restic.readthedocs.io/en/stable/manual_rest.html#usage-help.

- Initialize a backup repository in the specified local directory:

```
restic init {{[-r|--repo]}} {{path/to/repository}}
```

- Back up a directory to the repository:

```
restic {{[-r|--repo]}} {{path/to/repository}} backup {{path/to/directory}}
```

- Show backup snapshots currently stored in the repository:

```
restic {{[-r|--repo]}} {{path/to/repository}} snapshots
```

- Restore a specific backup snapshot to a target directory:

```
restic {{[-r|--repo]}} {{path/to/repository}} restore {{latest|snapshot_id}} --target {{path/to/target}}
```

- Restore a specific path from a specific backup to a target directory:

```
restic {{[-r|--repo]}} {{path/to/repository}} restore {{snapshot_id}} --target {{path/to/target}} --include {{path/to/restore}}
```

- Clean up the repository and keep only the most recent snapshot of each unique backup:

```
restic forget --keep-last 1 --prune
```

resticprofile schedule

Schedule backups and run them in the background.

See also: **`restic`**, **`resticprofile unschedule`**.

More information: https://creativeprojects.github.io/resticprofile/schedules/configuration/index.html.

- Schedule default profile:

```
resticprofile schedule
```

- Schedule a profile (default profile is "default"):

```
resticprofile --name "{{group_name}}" schedule
```

- Schedule all profiles:

```
resticprofile schedule --all
```

- Don't start the job after installing:

```
resticprofile schedule --no-start
```

- Display status of scheduled jobs for a profile:

```
resticprofile status {{[-n|--name]}} {{profile_name}}
```

- Run a scheduled job manually (used by system scheduler):

```
resticprofile run-schedule "backup@{{profile_name}}"
```

resticprofile unschedule

The command removes jobs for schedules declared in the selected profile or group (or of all profiles and groups).

See also: **`restic`**, **`resticprofile schedule`**.

More information: https://creativeprojects.github.io/resticprofile/schedules/configuration/index.html.

- Unschedule a backup for a specific profile:

```
resticprofile unschedule {{[-n|--name]}} "{{profile_name}}"
```

- Unschedule all backups:

```
resticprofile unschedule --all
```

resticprofile

Configuration profiles manager for restic backup.

See also: **`restic`**, **`resticprofile schedule`**, **`resticprofile unschedule`**.

More information: https://creativeprojects.github.io/resticprofile/configuration/getting_started/index.html#write-your-first-configuration-file.

- List all saved snapshots:

```
resticprofile
```

- Run a backup on the default profile:

```
resticprofile backup
```

- Run a backup with a specific profile (default profile is "default"):

```
resticprofile {{[-n|--name]}} "{{profile_name}}" backup
```

- Simulate a backup and show the underlying restic commands:

```
resticprofile --dry-run backup
```

- Display the names of all profiles from the configuration file:

```
resticprofile profiles
```

- Generate shell completions:

```
resticprofile generate {{--bash-completion|--zsh-completion}}
```

- Show all details of a profile:

```
resticprofile show {{[-n|--name]}} "{{profile_name}}"
```

resume

Easily setup a new resume.

More information: https://github.com/jsonresume/resume-cli.

- Create a new `resume.json` file in the current working directory:

  ```
  resume init
  ```

- Validate a `resume.json` against schema tests to ensure it complies with the standard:

  ```
  resume validate
  ```

- Export a resume locally in a stylized HTML or PDF format:

  ```
  resume export {{path/to/html_or_pdf}}
  ```

- Start a web server that serves a local `resume.json`:

  ```
  resume serve
  ```

retry

Repeat command until it succeeds or a criterion is met.

More information: https://manned.org/retry.

- Retry a command until it succeeds:

```
retry {{command}}
```

- Retry a command every n seconds until it succeeds:

```
retry {{[-d|--delay]}} {{n}} {{command}}
```

- Give up after n attempts:

```
retry {{[-t|--times]}} {{n}} {{command}}
```

return

Exit a function.

Can exit out of a script if run with **`source`**.

See also: **`exit`**.

More information: https://www.gnu.org/software/bash/manual/bash.html#index-return.

- Exit a function prematurely:

```
{{func_name}}() { {{echo "This is reached"}}; return; {{echo "This is not"}}; }
```

- Specify the function's return value:

```
{{func_name}}() { return {{exit_code}}; }
```

reuse

Tool for compliance with the REUSE recommendations.

More information: https://reuse.readthedocs.io/en/stable/man/index.html.

- Lint for REUSE compliance for the current project (version control aware):

```
reuse lint
```

- Lint for REUSE compliance from the specified directory:

```
reuse --root {{path/to/directory}} lint
```

- Add copyright statement to file:

```
reuse annotate {{[-c|--copyright]}} "{{your_name}}
<{{your_email}}>" --fallback-dot-license {{path/to/file}}
```

- Add license information to file:

```
reuse annotate {{[-l|--license]}} {{spdx_identifier}} --
fallback-dot-license {{path/to/file}}
```

- Download a license by its SPDX identifier and place it in the LICENSES directory:

```
reuse download {{spdx_identifier}}
```

- Download all missing licenses detected in the project:

```
reuse download --all
```

rfetch

A configurable fetch program to output system information.

More information: https://github.com/kamui-fin/rfetch.

- Display system information:

```
rfetch
```

- Display system [a]rchitecture:

```
rfetch -a
```

- Display system up[t]ime:

```
rfetch -t
```

- Display system [k]ernel:

```
rfetch -k
```

- Display system [c]PU:

```
rfetch -c
```

- Display Linux [D]istro:

```
rfetch -D
```

- View [d]esktop environment:

```
rfetch -d
```

rg

Ripgrep, a recursive line-oriented search tool.

Aims to be a faster alternative to **`grep`**.

More information: https://github.com/BurntSushi/ripgrep/blob/master/GUIDE.md.

- Recursively search current directory for a pattern (`regex`):

```
rg {{pattern}}
```

- Recursively search for a pattern in a file or directory:

```
rg {{pattern}} {{path/to/file_or_directory}}
```

- Search for a literal string pattern:

```
rg {{[-F|--fixed-strings]}} -- {{string}}
```

- Include hidden files and entries listed in `.gitignore`:

```
rg {{[-.|--hidden]}} --no-ignore {{pattern}}
```

- Only search the files matching the `glob` pattern(s) (e.g. `README.*`, use `!filename_pattern` to exclude instead):

```
rg {{pattern}} {{[-g|--glob]}} '{{filename_glob_pattern}}'
```

- Recursively list filenames in the current directory and highlight ones that match a pattern:

```
rg --files | rg {{[--passthru|--passthrough]}} {{pattern}}
```

- Only list matched files (useful when piping to other commands):

```
rg {{[-l|--files-with-matches]}} {{pattern}}
```

- Show lines that do not match the pattern:

```
rg {{[-v|--invert-match]}} {{pattern}}
```

rga

Ripgrep wrapper with rich file type searching capabilities.

More information: https://github.com/phiresky/ripgrep-all.

- Search recursively for a pattern in all files in the current directory:

```
rga {{regex}}
```

- List available adapters:

```
rga --rga-list-adapters
```

- Change which adapters to use (e.g. `ffmpeg`, `pandoc`, `poppler` etc.):

```
rga --rga-adapters={{adapter1,adapter2}} {{regex}}
```

- Search for a pattern using the mime type instead of the file extension (slower):

```
rga --rga-accurate {{regex}}
```

- Display help:

```
rga --help
```

rgb3toppm

Combine three PGM images into one PPM image.

See also: **ppmtorgb3**.

More information: https://netpbm.sourceforge.net/doc/rgb3toppm.html.

- Combine three PGM images (representing red, green, and blue color components) into one PPM image:

```
rgb3toppm {{path/to/red_file.ppm}} {{path/to/green_file.ppm}} {{path/to/blue_file.ppm}} > {{path/to/output.ppm}}
```

rgpt

An automated code review tool that uses GPT you can use straight from your terminal.

More information: https://github.com/vaibhav-venkat/review-gpt.

- Ask GPT to improve the code with no extra options:

```
rgpt --i "$(git diff {{path/to/file}})"
```

- Get a more detailed verbose output from `rgpt` while reviewing the code:

```
rgpt --v --i "$(git diff {{path/to/file}})"
```

- Ask GPT to improve the code and limit it to a certain amount of GPT3 tokens:

```
rgpt --max {{300}} --i "$(git diff {{path/to/file}})"
```

- Ask GPT for a more unique result using a float value between 0 and 2. (higher = more unique):

```
rgpt --pres {{1.2}} --i "$(git diff {{path/to/file}})"
```

- Ask GPT to review your code using a specific model:

```
rgpt --model {{davinci}} --i "$(git diff {{path/to/file}})"
```

- Make `rgpt` use a JSON output:

```
rgpt --json --i "$(git diff {{path/to/file}})"
```

rgrep

This command is an alias of **`grep --recursive`**.

- View documentation for the original command:

```
tldr grep
```

rhash

Calculate or check common message digests.

More information: https://rhash.sourceforge.io/manpage.php.

- Calculate default CRC32 digests of a file:

```
rhash {{path/to/file}}
```

- Recursively process a directory to generate an SFV file using SHA1:

```
rhash --sha1 --recursive {{path/to/folder}} > {{path/to/output.sfv}}
```

- Verify the integrity of files based on an SFV file:

```
rhash --check {{path/to/file.sfv}}
```

- Calculate the SHA3 digest of a text message:

```
rhash --sha3-256 --message '{{message}}'
```

- Calculate CRC32 digest of a file and output digest encoded in Base64 using BSD format:

```
rhash --base64 --bsd {{path/to/file}}
```

- Use custom output template:

```
rhash --printf '{{%p\t%s\t%{mtime}\t%m\n}}' {{path/to/file}}
```

ri

Browse structured API documentation for Ruby.

See also: **ruby**.

More information: https://ruby.github.io/rdoc/RI_md.html.

- Start interactive shell:

```
ri
```

- View documentation for a particular name:

```
ri {{File#read}}
```

- List classes and modules for which `ri` has documentation:

```
ri {{[-l|--list]}}
```

rich

A toolbox for fancy output in the terminal.

More information: https://github.com/Textualize/rich-cli.

- Display a file with syntax highlighting:

```
rich {{path/to/file.py}}
```

- Add line numbers, and indentation guides:

```
rich {{path/to/file.py}} --line-numbers --guides
```

- Apply a theme:

```
rich {{path/to/file.py}} --theme {{monokai}}
```

- Display a file in an interactive pager:

```
rich {{path/to/file.py}} --pager
```

- Display contents from a URL:

```
rich {{https://raw.githubusercontent.com/Textualize/rich-cli/main/README.md}} --markdown --pager
```

- Export a file as HTML:

```
rich {{path/to/file.md}} --export-html {{path/to/file.html}}
```

- Display text with formatting tags, custom alignment, and line width:

```
rich --print "{{Hello [green on black]Stylized[/green on black] [bold]World[/bold]}}" --{{left|center|right}} --width {{10}}
```

rip

Remove files or directories by sending them to the graveyard, allowing for them to be recovered.

More information: https://github.com/nivekuil/rip#-usage.

- Remove files or directories from specified locations and place them in the graveyard:

```
rip {{path/to/file_or_directory1 path/to/
file_or_directory2 ...}}
```

- Interactively remove files or directories, with a prompt before every removal:

```
rip {{[-i|--inspect]}} {{path/to/file_or_directory1 path/to/
file_or_directory2 ...}}
```

- List all files and directories in the graveyard that were originally within the current directory:

```
rip {{[-s|--seance]}}
```

- Permanently delete every file and directory in the graveyard:

```
rip {{[-d|--decompose]}}
```

- Put back the files and directories which were affected by the most recent removal:

```
rip {{[-u|--unbury]}}
```

- Put back every file and directory that is listed by `rip --seance`:

```
rip {{[-s|--seance]}} {{[-u|--unbury]}}
```

rkdeveloptool

Flash, dump, and manage boot firmware for Rockchip-based computer devices.

You will need to turn on the device into Maskrom/Bootrom mode before connecting it through USB.

Some subcommands may require to run as root.

More information: https://github.com/rockchip-linux/rkdeveloptool.

- [l]ist all connected Rockchip-based flash [d]evices:

```
rkdeveloptool ld
```

- Initialize the device by forcing it to [d]ownload and install the [b]ootloader from the specified file:

```
rkdeveloptool db {{path/to/bootloader.bin}}
```

- [u]pdate the boot[l]oader software with a new one:

```
rkdeveloptool ul {{path/to/bootloader.bin}}
```

- Write an image to a GPT-formatted flash partition, specifying the initial storage sector (usually `0x0` alias `0`):

```
rkdeveloptool wl {{initial_sector}} {{path/to/image.img}}
```

- Write to the flash partition by its user-friendly name:

```
rkdeveloptool wlx {{partition_name}} {{path/to/image.img}}
```

- [r]eset/reboot the [d]evice, exit from the Maskrom/Bootrom mode to boot into the selected flash partition:

```
rkdeveloptool rd
```

rlatopam

Convert Alias/Wavefront RLA and RPF image files to Netpbm format.

More information: https://netpbm.sourceforge.net/doc/rlatopam.html.

- Convert the specified SPOT image to PGM format:

```
rlatopam {{path/to/file}} > {{path/to/output.pam}}
```

rletopnm

Convert a Utah Raster Tools RLE image file to a PNM file.

More information: https://netpbm.sourceforge.net/doc/rletopnm.html.

- Convert an RLE image to a PNM file:

```
rletopnm {{path/to/input.rle}} > {{path/to/output.pnm}}
```

- Create a PGM image containing the RLE file's alpha channel:

```
rletopnm {{[--a|--alphaout]}} {{path/to/alpha_file.pgm}}
{{path/to/input.rle}} > {{path/to/output.pnm}}
```

- Operate in verbose mode and print the contents of the RLE header to `stdout`:

```
rletopnm {{[--verb|--verbose]}} {{path/to/input.rle}} >
{{path/to/output.pnm}}
```

rlog

Print the revision log of RCS files.

See also: **`ci`**, **`co`**, **`rcs`**, **`rcsdiff`**.

More information: https://manned.org/rlog.

- Display the complete revision history of a file:

```
rlog {{path/to/file}}
```

- Display only the header information (no revision details):

```
rlog -h {{path/to/file}}
```

- Display information for a specific revision:

```
rlog -r{{revision}} {{path/to/file}}
```

- Display revisions within a date range:

```
rlog -d"{{start_date}}<{{end_date}}" {{path/to/file}}
```

- Display revisions by a specific author:

```
rlog -w{{author}} {{path/to/file}}
```

rlwrap

Add line editing, persistent history, and prompt completion to a REPL command.

More information: https://manned.org/rlwrap.

- Run a REPL command with line editing, persistent history, and prompt completion:

```
rlwrap {{command}}
```

- Use all words seen on input and output for prompt completion:

```
rlwrap {{[-r|--remember]}} {{command}}
```

- Improve prompt completion if prompts contain ANSI colour codes:

```
rlwrap {{[-A|--ansi-colour-aware]}} {{command}}
```

- Enable filename completion (case sensitive):

```
rlwrap {{[-c|--complete-filenames]}} {{command}}
```

- Add coloured prompts, use colour name or an ANSI-conformant colour specification. Use an uppercase colour name for bold styling:

```
rlwrap {{[-p|--prompt-colour=]}}{{black|red|green|yellow|
blue|cyan|purple|white|colour_spec}} {{command}}
```

rm

Remove files or directories.

See also: **`rmdir`**, **`trash`**.

More information: https://www.gnu.org/software/coreutils/manual/html_node/rm-invocation.html.

- Remove specific files:

```
rm {{path/to/file1 path/to/file2 ...}}
```

- Remove specific files ignoring nonexistent ones:

```
rm {{[-f|--force]}} {{path/to/file1 path/to/file2 ...}}
```

- Remove specific files interactively prompting before each removal:

```
rm {{[-i|--interactive]}} {{path/to/file1 path/to/file2 ...}}
```

- Remove specific files printing info about each removal:

```
rm {{[-v|--verbose]}} {{path/to/file1 path/to/file2 ...}}
```

- Remove specific files and directories recursively:

```
rm {{[-r|--recursive]}} {{path/to/file_or_directory1 path/to/file_or_directory2 ...}}
```

- Remove empty directories (this is considered the safe method):

```
rm {{[-d|--dir]}} {{path/to/directory}}
```

rmdir

Remove directories without files.

See also: **rm**.

More information: https://www.gnu.org/software/coreutils/manual/html_node/rmdir-invocation.html.

- Remove specific directories:

```
rmdir {{path/to/directory1 path/to/directory2 ...}}
```

- Remove specific nested directories recursively:

```
rmdir {{[-p|--parents]}} {{path/to/directory1 path/to/directory2 ...}}
```

- Clean a directory of empty directories:

```
rmdir *
```

rmlint

Find space waste and other broken things on your filesystem.

More information: https://rmlint.readthedocs.io/en/latest/rmlint.1.html.

- Check directories for duplicated, empty, and broken files:

```
rmlint {{path/to/directory1 path/to/directory2 ...}}
```

- Check for duplicates bigger than a specific size, preferably keeping files in tagged directories (after the double slash):

```
rmlint {{[-s|--size]}} {{1MB}} {{path/to/directory}} //
{{path/to/original_directory}}
```

- Check for space wasters, keeping everything in the untagged directories:

```
rmlint {{[-k|--keep-all-untagged]}} {{path/to/directory}} //
{{path/to/original_directory}}
```

- Delete duplicate files found by an execution of `rmlint`:

```
./rmlint.sh
```

- Find duplicate directory trees based on data, ignoring names:

```
rmlint {{[-D|--merge-directories]}} {{path/to/directory}}
```

- Mark files at lower path [d]epth as originals, on tie choose shorter [l]ength:

```
rmlint {{[-S|--rank-by]}} {{dl}} {{path/to/directory}}
```

- Find files with identical filename and contents, and link rather than delete the duplicates:

```
rmlint {{[-c|--config]}} sh:link {{[-b|--match-basename]}}
{{path/to/directory}}
```

- Use `data` as master directory. Find only duplicates in backup that are also in `data`. Do not delete any files in `data`:

```
rmlint {{path/to/backup}} // {{path/to/data}} {{[-k|--keep-
all-tagged]}} {{[-m|--must-match-tagged]}}
```

rnano

This command is an alias of **`nano --restricted`**.

More information: https://manned.org/rnano.

- View documentation for the original command:

```
tldr nano
```

roave-backward-compatibility-check

Verify backward compatibility breaks between two versions of a PHP library.

More information: https://github.com/Roave/BackwardCompatibilityCheck.

- Check for breaking changes since the last tag:

  ```
  roave-backward-compatibility-check
  ```

- Check for breaking changes since a specific tag:

  ```
  roave-backward-compatibility-check --from={{git_reference}}
  ```

- Check for breaking changes between the last tag and a specific reference:

  ```
  roave-backward-compatibility-check --to={{git_reference}}
  ```

- Check for breaking changes and output to Markdown:

  ```
  roave-backward-compatibility-check --format=markdown >
  {{results.md}}
  ```

robo

PHP task runner.

More information: https://robo.li/getting-started.html.

- List available commands:

```
robo list
```

- Run a specific command:

```
robo {{command}}
```

- Simulate running a specific command:

```
robo --simulate {{command}}
```

roll

Roll a user-defined dice sequence.

More information: https://manned.org/roll.

- Roll 3 6-sided dice and sums the results:

```
roll {{3d}}
```

- Roll 1 8-sided die, add 3, and sum the results:

```
roll {{d8 + 3}}
```

- Roll 4 6-sided dice, keep the 3 highest results, and sum the results:

```
roll {{4d6h3}}
```

- Roll 2 12-sided dice 2 times and show every roll:

```
roll --verbose {{2{2d12}}}
```

- Roll 2 20-sided dice until the result is bigger than 10:

```
roll "{{2d20>10}}"
```

- Roll 2 5-sided dice 3 times and show the total sum:

```
roll --sum-series {{3{2d5}}}
```

ROPgadget

Find ROP gadgets in binary files.

More information: https://github.com/JonathanSalwan/ROPgadget#usage.

- List gadgets in the binary file:

```
ROPgadget --binary {{path/to/binary}}
```

- Filter gadgets in the binary file by a `regex`:

```
ROPgadget --binary {{path/to/binary}} --re {{regex}}
```

- List gadgets in the binary file, excluding specified type:

```
ROPgadget --binary {{path/to/binary}} --{{norop|nojob|nosys}}
```

- Exclude bad byte gadgets in the binary file:

```
ROPgadget --binary {{path/to/binary}} --badbytes
{{byte_string}}
```

- List gadgets up to the specified number of bytes in the binary file:

```
ROPgadget --binary {{path/to/binary}} --depth {{nbyte}}
```

ropper

Find ROP gadgets in binary files.

More information: https://scoding.de/ropper/.

- List gadgets in the binary file:

```
ropper --file {{path/to/binary}}
```

- Filter gadgets in the binary file by a `regex`:

```
ropper --file {{path/to/binary}} --search {{regex}}
```

- List gadgets of specified type in the binary file:

```
ropper --file {{path/to/binary}} --type {{rop|job|sys|all}}
```

- Exclude bad byte gadgets in the binary file:

```
ropper --file {{path/to/binary}} --badbytes {{byte_string}}
```

- List gadgets up to the specified instruction count in the binary file:

```
ropper --file {{path/to/binary}} --inst-count {{count}}
```

route

Show and manipulate the route table.

More information: https://manned.org/route.

- Display the information of route table:

```
route -n
```

- Add route rule:

```
sudo route add -net {{ip_address}} netmask
{{netmask_address}} gw {{gw_address}}
```

- Delete route rule:

```
sudo route del -net {{ip_address}} netmask
{{netmask_address}} dev {{gw_address}}
```

rpcdump.py

Dump remote RPC endpoints information via the Endpoint Mapper.

Part of the Impacket suite.

More information: https://github.com/fortra/impacket.

- Dump RPC endpoints using username and password:

```
rpcdump.py {{domain}}/{{username}}:{{password}}@{{target}}
```

- Dump RPC endpoints using NTLM hashes:

```
rpcdump.py -hashes {{LMHASH}}:{{NTHASH}} {{domain}}/
{{username}}:{{password}}@{{target}}
```

- Specify a target IP address explicitly (useful if the target name is a NetBIOS name):

```
rpcdump.py -target-ip {{target_ip}} {{domain}}/{{username}}:
{{password}}@{{target}}
```

- Connect to a specific port (default is 135 for RPC Endpoint Mapper):

```
rpcdump.py -port {{port_number}} {{domain}}/{{username}}:
{{password}}@{{target}}
```

- Enable debug output:

```
rpcdump.py -debug {{domain}}/{{username}}:{{password}}
@{{target}}
```

rpcmap.py

Look up listening MSRPC interfaces using a string binding (e.g., **`ncacn_ip_tcp:host[port]`**).

Part of the Impacket suite.

More information: https://github.com/fortra/impacket.

- Connect to an MSRPC interface using a string binding (e.g., `ncacn_ip_tcp:host[port]`):

```
rpcmap.py {{stringbinding}}
```

- Bruteforce UUIDs even if the MGMT interface is available:

```
rpcmap.py -brute-uuids {{stringbinding}}
```

- Bruteforce operation numbers (opnums) for discovered UUIDs:

```
rpcmap.py -brute-opnums {{stringbinding}}
```

- Bruteforce major versions of found UUIDs:

```
rpcmap.py -brute-versions {{stringbinding}}
```

- Specify a target IP address manually:

```
rpcmap.py -target-ip {{ip_address}} {{stringbinding}}
```

- Authenticate to the RPC interface with username and password:

```
rpcmap.py -auth-rpc {{domain}}/{{username}}:{{password}}
{{stringbinding}}
```

- Authenticate using NTLM hashes for RPC:

```
rpcmap.py -hashes-rpc {{LMHASH:NTHASH}} {{stringbinding}}
```

- Enable debug output for verbose information:

```
rpcmap.py -debug {{stringbinding}}
```

rpi-imager

Flash images onto storage devices.

More information: https://github.com/raspberrypi/rpi-imager.

- Write a specific image to a specific block device:

```
rpi-imager --cli {{path/to/image.zip}} {{/dev/sdX}}
```

- Write a specific image to a block device, disabling the checksum verification:

```
rpi-imager --cli --disable-verify {{path/to/image.zip}} {{/dev/sdX}}
```

- Write a specific image to a block device, which will expect a specific checksum when running the verification:

```
rpi-imager --cli --sha256 {{expected_hash}} {{path/to/image.zip}} {{/dev/sdX}}
```

rpk

Manage Redpanda topics, clusters, groups, security, and more via a single binary.

More information: https://docs.redpanda.com/current/reference/rpk/.

- Create a new topic:

  ```
  rpk topic create {{topic_name}}
  ```

- Produce a message to a topic:

  ```
  rpk topic produce {{topic_name}}
  ```

- Consume messages from multiple topics:

  ```
  rpk topic consume {{topic_name1 topic_name2 ...}}
  ```

- List all topics:

  ```
  rpk topic list
  ```

- Display cluster information:

  ```
  rpk cluster info
  ```

- List all consumer groups:

  ```
  rpk group list
  ```

- Describe a consumer group with lag information:

  ```
  rpk group describe {{group_name}}
  ```

- Display version:

  ```
  rpk version
  ```

rr

Debugging tool designed to record and replay program execution.

More information: https://github.com/rr-debugger/rr/wiki/Usage.

- Record an application:

```
rr record {{path/to/binary --arg1 --arg2}}
```

- Replay latest recorded execution:

```
rr replay
```

RsaCtfTool.py

RSA attack tool for CTF challenges - recover private keys from weak public keys and/or decrypt data.

More information: https://github.com/RsaCtfTool/RsaCtfTool#usage.

- Recover a private key from a public key file:

```
RsaCtfTool.py --publickey {{path/to/key.pub}} --private
```

- Decrypt a file using a public key:

```
RsaCtfTool.py --publickey {{path/to/key.pub}} --decryptfile
{{path/to/ciphered_file}}
```

- Decrypt a specific ciphertext string:

```
RsaCtfTool.py --publickey {{path/to/key.pub}} --decrypt
"{{ciphertext}}"
```

- Dump RSA key components (e.g., modulus, exponent) from a key file:

```
RsaCtfTool.py --dumpkey --key {{path/to/key.pub}}
```

- Run a specific attack (e.g., Fermat factorization) to recover the private key:

```
RsaCtfTool.py --publickey {{path/to/key.pub}} --private --
attack fermat
```

- Generate a public key from modulus (n) and exponent (e):

```
RsaCtfTool.py --createpub -n {{modulus}} -e {{exponent}}
```

- Attempt all available attacks to recover the private key:

```
RsaCtfTool.py --publickey {{path/to/key.pub}} --private --
attack all
```

Rscript

Run a script with the R programming language.

More information: https://manned.org/Rscript.

- Run a script:

```
Rscript {{path/to/file.R}}
```

- Run a script in vanilla mode (i.e. a blank session that doesn't save the workspace at the end):

```
Rscript --vanilla {{path/to/file.R}}
```

- Execute one or more R expressions:

```
Rscript -e {{expression1}} -e {{expression2}}
```

- Display version:

```
Rscript --version
```

rspec

Behavior-driven development testing framework written in Ruby to test Ruby code.

More information: https://rspec.info/features/3-13/rspec-core/command-line/.

- Initialize an `.rspec` configuration and a spec helper file:

  ```
  rspec --init
  ```

- Run all tests:

  ```
  rspec
  ```

- Run a specific directory of tests:

  ```
  rspec {{path/to/directory}}
  ```

- Run one or more test files:

  ```
  rspec {{path/to/file1 path/to/file2 ...}}
  ```

- Run a specific test in a file (e.g. the test starts on line 83):

  ```
  rspec {{path/to/file}}:{{83}}
  ```

- Run specs with a specific seed:

  ```
  rspec --seed {{seed_number}}
  ```

rsql

SQL client to interface with databases and other data sources inside the terminal.

More information: https://github.com/theseus-rs/rsql.

- Enter interactive mode:

```
rsql
```

- Connect to a database (e.g. PostgreSQL):

```
rsql --url "{{postgresql://user:pass@localhost/mydb}}"
```

- Connect to a PostgreSQL database with SSL:

```
rsql --url "{{postgresql://user:pass@localhost/db?
sslmode=require}}"
```

- Connect to a MySQL database with a specified charset:

```
rsql --url "{{mysql://user:pass@localhost/db?
charset=utf8mb4}}"
```

- Run a query and exit:

```
rsql --url "{{sqlite://database.db}}" -- "{{SELECT * FROM
users LIMIT 10}}"
```

- Set default format:

```
rsql --url "{{sqlite://db.sqlite}}" --format json
```

- Connect to file and use custom line separator:

```
rsql --url "{{delimited://data.txt?separator=|
&has_header=true}}"
```

rsstail

`tail` for RSS feeds.

More information: https://manned.org/rsstail.

- Show the feed of a given URL and wait for new entries appearing at the bottom:

```
rsstail -u {{url}}
```

- Show the feed in reverse chronological order (newer at the bottom):

```
rsstail -r -u {{url}}
```

- Include publication date and link:

```
rsstail -pl -u {{url}}
```

- Set update interval:

```
rsstail -u {{url}} -i {{interval_in_seconds}}
```

- Show feed and exit:

```
rsstail -1 -u {{url}}
```

rsync

Transfer files either to or from a remote host (but not between two remote hosts), by default using SSH.

To specify a remote path, use **`user@host:path/to/file_or_directory`**.

More information: https://download.samba.org/pub/rsync/rsync.1.

- Transfer a file (use `--dry-run` to simulate the transfer):

```
rsync {{path/to/source}} {{path/to/destination}}
```

- Use archive mode (recursively copy directories, copy symlinks without resolving, and preserve permissions, ownership, and modification times):

```
rsync {{[-a|--archive]}} {{path/to/source}} {{path/to/destination}}
```

- Compress the data as it is sent to the destination, display verbose and human-readable progress, and keep partially transferred files if interrupted:

```
rsync {{[-zvhP|--compress --verbose --human-readable --partial --progress]}} {{path/to/source}} {{path/to/destination}}
```

- Recursively copy directories and ensure each file is fully committed to disk rather than remaining in RAM:

```
rsync {{[-r|--recursive]}} --fsync {{path/to/source}} {{path/to/destination}}
```

- Transfer directory contents, but not the directory itself:

```
rsync {{[-r|--recursive]}} {{path/to/source}}/ {{path/to/destination}}
```

- Use archive mode, resolve symlinks, and skip files that are newer on the destination:

```
rsync {{[-auL|--archive --update --copy-links]}} {{path/to/source}} {{path/to/destination}}
```

- Transfer a directory from a remote host running `rsyncd` and delete files on the destination that do not exist on the source:

```
rsync {{[-r|--recursive]}} --delete rsync://{{host}}:{{path/
to/source}} {{path/to/destination}}
```

- Transfer a file over SSH using a different port than the default (22) and show global progress:

```
rsync {{[-e|--rsh]}} 'ssh -p {{port}}' --info=progress2
{{host}}:{{path/to/source}} {{path/to/destination}}
```

rtl_sdr

Raw data recorder for RTL-SDR receivers.

Data is encoded using I/Q sampling (aka quadrature sampling).

More information: https://osmocom.org/projects/rtl-sdr/wiki/Rtl-sdr.

- Save RAW data from a frequency (specified in Hz) to a file:

```
rtl_sdr -f {{100000000}} {{path/to/file}}
```

- Pipe data to another program:

```
rtl_sdr -f {{100000000}} - | {{aplay}}
```

- Read a specified number of samples:

```
rtl_sdr -f {{100000000}} -n {{20}} -
```

- Specify the sample rate in Hz (ranges 225001-300000 and 900001-3200000):

```
rtl_sdr -f {{100000000}} -s {{2400000}} -
```

- Specify the device by its index:

```
rtl_sdr -f {{100000000}} -d {{0}} -
```

- Specify the gain:

```
rtl_sdr -f {{100000000}} -g {{20}} -
```

- Specify the output block size:

```
rtl_sdr -f {{100000000}} -b {{9999999}} -
```

- Use synchronous output:

```
rtl_sdr -f {{100000000}} -S -
```

rtmpdump

Dump media content streamed over the RTMP protocol.

More information: https://rtmpdump.mplayerhq.hu/rtmpdump.1.html.

- Download a file:

```
rtmpdump {{[-r|--rtmp]}} {{rtmp://example.com/path/to/video}}
{{[-o|--flv]}} {{file.ext}}
```

- Download a file from a Flash player:

```
rtmpdump {{[-r|--rtmp]}} {{rtmp://example.com/path/to/video}}
{{[-W|--swfVfy]}} {{http://example.com/player}} {{[-f|--
flashVer]}} "{{LNX 10,0,32,18}}" {{[-o|--flv]}} {{file.ext}}
```

- Specify connection parameters if they are not detected correctly:

```
rtmpdump {{[-r|--rtmp]}} {{rtmp://example.com/path/to/video}}
{{[-a|--app]}} {{app_name}} {{[-y|--playpath]}} {{path/to/
video}} {{[-o|--flv]}} {{file.ext}}
```

- Download a file from a server that requires a referrer:

```
rtmpdump {{[-r|--rtmp]}} {{rtmp://example.com/path/to/video}}
{{[-p|--pageUrl]}} {{http://example.com/webpage}} {{[-o|--
flv]}} {{file.ext}}
```

rtv

Reddit Terminal Viewer.

Use **<ArrowKeys>** to navigate. **<ArrowRight>** and **<ArrowLeft>** to view and return from a submission, respectively.

More information: https://github.com/michael-lazar/rtv.

- Start an interactive session:

  `rtv`

- [Interactive] Open the front page:

  `/front`

- [Interactive] Open a subreddit:

  `/r/{{subreddit_name}}`

- Expand/collapse comments:

  `<Space>`

- Open link:

  `<o>`

- Log in:

  `<u>`

- Display help:

  `<?>`

rubocop

Lint Ruby files.

More information: https://docs.rubocop.org/rubocop/latest/usage/cli_reference.html.

- Check all files in the current directory (including subdirectories):

```
rubocop
```

- Check one or more specific files or directories:

```
rubocop {{path/to/file_or_directory1 path/to/file_or_directory2 ...}}
```

- Write output to file:

```
rubocop --out {{path/to/file}}
```

- View list of cops (linter rules):

```
rubocop --show-cops
```

- Exclude a cop:

```
rubocop --except {{cop1 cop2 ...}}
```

- Run only specified cops:

```
rubocop --only {{cop1 cop2 ...}}
```

- Auto-correct files (experimental):

```
rubocop --auto-correct
```

ruby

Ruby programming language interpreter.

See also: **`gem`**, **`bundler`**, **`rake`**, **`irb`**, **`ri`**.

More information: https://manned.org/ruby.

- Execute a Ruby script:

```
ruby {{path/to/script.rb}}
```

- Execute a single Ruby command in the command-line:

```
ruby -e "{{command}}"
```

- Check for syntax errors on a given Ruby script:

```
ruby -c {{path/to/script.rb}}
```

- Start the built-in HTTP server on port 8080 in the current directory:

```
ruby -run -e httpd
```

- Locally execute a Ruby binary without installing the required library it depends on:

```
ruby -I {{path/to/library_folder}} -r
{{library_require_name}} {{path/to/bin_folder/bin_name}}
```

- Display version:

```
ruby {{[-v|--version]}}
```

ruff check

An extremely fast Python linter. **check** is the default command - it can be omitted everywhere.

If no files or directories are specified, the current working directory is used by default.

More information: https://docs.astral.sh/ruff/linter/.

- Run the linter on the given files or directories:

```
ruff check {{path/to/file_or_directory1 path/to/
file_or_directory2 ...}}
```

- Apply the suggested fixes, modifying the files in-place:

```
ruff check --fix
```

- Run the linter and re-lint on change:

```
ruff check --watch
```

- Only enable the specified rules (or all rules), ignoring the configuration file:

```
ruff check --select {{ALL|rule_code1,rule_code2,...}}
```

- Additionally enable the specified rules:

```
ruff check --extend-select {{rule_code1,rule_code2,...}}
```

- Disable the specified rules:

```
ruff check --ignore {{rule_code1,rule_code2,...}}
```

- Ignore all existing violations of a rule by adding `# noqa` directives to all lines that violate it:

```
ruff check --select {{rule_code}} --add-noqa
```

ruff format

An extremely fast Python code formatter.

If no files or directories are specified, the current working directory is used by default.

More information: https://docs.astral.sh/ruff/formatter/.

- Format given files or directories in-place:

```
ruff format {{path/to/file_or_directory1 path/to/
file_or_directory2 ...}}
```

- Print which files would have been modified and return a non-zero exit code if there are files to reformat, and zero otherwise:

```
ruff format --check
```

- Print what changes would be made without modifying the files:

```
ruff format --diff
```

ruff

An extremely fast Python linter and code formatter, written in Rust.

See also: **`black`**.

More information: https://docs.astral.sh/ruff/tutorial/.

- View documentation for the Ruff linter:

```
tldr ruff check
```

- View documentation for the Ruff code formatter:

```
tldr ruff format
```

rumdl

A fast Markdown linter and formatter written in Rust.

More information: https://rumdl.dev/usage/cli.

- Lint the specified files or directories:

```
rumdl check {{path/to/file_or_directory1 path/to/
file_or_directory2 ...}}
```

- Lint and automatically fix issues where possible:

```
rumdl check {{[-f|--fix]}} {{path/to/file_or_directory}}
```

- Lint with specific rules disabled:

```
rumdl check {{[-d|--disable]}} {{rule_id1,rule_id2,...}}
{{path/to/file_or_directory}}
```

- Re-run the linter whenever files change:

```
rumdl check {{[-w|--watch]}} {{path/to/file_or_directory}}
```

- Format files in place:

```
rumdl fmt {{path/to/file_or_directory}}
```

- Create a default configuration file (`.rumdl.toml`) in the current directory:

```
rumdl init
```

- Show information about a specific rule (list all rules if omitted):

```
rumdl rule {{MD013}}
```

- Display version:

```
rumdl version
```

run-help

Get instructions for Zsh commands.

Note: This command is an alias of **`man`** by default.

More information: https://manned.org/zshcontrib.

- Activate Zsh's `run-help`, which adds instructions for Zsh built-ins:

```
unalias run-help && autoload run-help
```

- Display all Zsh-specific topics:

```
run-help
```

- Display help for a command:

```
run-help {{command}}
```

runit

3-stage init system.

More information: https://smarden.org/runit/runit.8.

- Start runit's 3-stage init scheme:

```
runit
```

- Shut down runit:

```
kill --CONT {{runit_process_id}}
```

runsv

Start and manage a runit service.

More information: https://manned.org/runsv.

- Start a runit service as the current user:

```
runsv {{path/to/service}}
```

- Start a runit service as root:

```
sudo runsv {{path/to/service}}
```

runsvchdir

Change the directory **`runsvdir`** uses by default.

More information: https://manned.org/runsvchdir.

- Switch `runsvdir` directories:

```
sudo runsvchdir {{path/to/directory}}
```

runsvdir

Run an entire directory of services.

More information: https://manned.org/runsvdir.

- Start and manage all services in a directory as the current user:

```
runsvdir {{path/to/services}}
```

- Start and manage all services in a directory as root:

```
sudo runsvdir {{path/to/services}}
```

- Start services in separate sessions:

```
runsvdir -P {{path/to/services}}
```

rustc

The Rust compiler.

Rust projects usually use **`cargo`** instead of invoking **`rustc`** directly.

More information: https://doc.rust-lang.org/stable/rustc/.

- Compile a binary crate:

```
rustc {{path/to/main.rs}}
```

- Compile with optimizations (`s` means optimize for binary size; `z` is the same with even more optimizations):

```
rustc {{[-C|--codegen]}} lto {{[-C|--codegen]}} opt-level={{0|1|2|3|s|z}} {{path/to/main.rs}}
```

- Compile with debugging information:

```
rustc {{[-g|--codegen debuginfo=2]}} {{path/to/main.rs}}
```

- Explain an error message:

```
rustc --explain {{error_code}}
```

- Compile with architecture-specific optimizations for the current CPU:

```
rustc {{[-C|--codegen]}} target-cpu={{native}} {{path/to/main.rs}}
```

- Display the target list (Note: You have to add a target using `rustup` first to be able to compile for it):

```
rustc --print target-list
```

- Compile for a specific target:

```
rustc --target {{target_triple}} {{path/to/main.rs}}
```

- Display help:

```
rustc {{[-h|--help]}}
```

rustdoc

Generate documentation for a Rust crate.

More information: https://doc.rust-lang.org/stable/rustdoc/.

- Generate documentation from the crate's root:

```
rustdoc {{src/lib.rs}}
```

- Pass a name for the project:

```
rustdoc {{src/lib.rs}} --crate-name {{name}}
```

- Generate documentation from Markdown files:

```
rustdoc {{path/to/file.md}}
```

- Specify the output directory:

```
rustdoc {{src/lib.rs}} {{[-o|--out-dir]}} {{path/to/output_directory}}
```

- Display help:

```
rustdoc {{[-h|--help]}}
```

rustfmt

Format Rust source code.

More information: https://github.com/rust-lang/rustfmt.

- Format a file, overwriting the original file in-place:

```
rustfmt {{path/to/source.rs}}
```

- Check a file for formatting and display any changes on the console:

```
rustfmt --check {{path/to/source.rs}}
```

- Back up any modified files before formatting (the original file is renamed with a `.bk` extension):

```
rustfmt --backup {{path/to/source.rs}}
```

- Format code using a specific Rust style edition (formatting rules) verbosely:

```
rustfmt --style-edition {{2015|2018|2021|2024}} {{[-v|--verbose]}} {{path/to/source1.rs path/to/source2.rs ...}}
```

- Format code using a specific Rust edition (language features and parsing):

```
rustfmt --edition {{2015|2018|2021|2024}} {{path/to/source1.rs path/to/source2.rs ...}}
```

rustic

Create fast, encrypted, deduplicated backups powered by Rust.

More information: https://github.com/rustic-rs/rustic.

- Initialize a new repository:

```
rustic init --repository {{/srv/rustic-repo}}
```

- Create a new backup of a file/directory to a repository:

```
rustic backup --repository {{/srv/rustic-repo}} {{path/to/file_or_directory}}
```

rustscan

Modern Port Scanner written in Rust.

Note: **`nmap`** must be installed for some of the examples below to work.

See also: **`hping3`**, **`masscan`**, **`naabu`**, **`nmap`**, **`zmap`**.

More information: https://github.com/bee-san/RustScan/wiki.

- Scan all ports of one or more comma-delimited addresses using the default values:

```
rustscan {{[-a|--addresses]}}
{{ip_or_hostname1,ip_or_hostname2,...}}
```

- Scan the top 1000 ports with service and version detection:

```
rustscan --top {{[-a|--addresses]}} {{address}}
```

- Scan a specific list of ports:

```
rustscan {{[-p|--ports]}} {{port1,port2,...}} {{[-a|--
addresses]}} {{address}}
```

- Scan a specific range of ports:

```
rustscan {{[-r|--range]}} {{start}}-{{end}} {{[-a|--
addresses]}} {{address}}
```

- Invoke `nmap` functionalities (Nmap's OS detection and default scripts):

```
rustscan {{[-a|--addresses]}} {{address}} -- -O {{[-sC|--
script=default]}}
```

- Scan with custom batch size (default: 4500) and timeout (default: 1500ms):

```
rustscan {{[-b|--batch-size]}} {{batch_size}} {{[-t|--
timeout]}} {{timeout}} {{[-a|--addresses]}} {{address}}
```

- Scan with specific port order:

```
rustscan --scan-order {{serial|random}} {{[-a|--addresses]}}
{{address}}
```

- Scan in greppable mode (only output of the ports, no `nmap`):

```
rustscan {{[-g|--greppable]}} {{[-a|--addresses]}}
{{address}}
```

rustup check

Check for updates to Rust toolchains and **`rustup`**.

More information: https://rust-lang.github.io/rustup/.

- Check for all updates:

```
rustup check
```

rustup completions

Generate shell completions for **`rustup`** and **`cargo`**.

More information: https://rust-lang.github.io/rustup/.

- Print the completion script to `stdout`:

```
rustup completions {{bash|elvish|fish|powershell|zsh}}
{{rustup|cargo}}
```

rustup component

Modify a toolchain's installed components.

Without the **`--toolchain`** option **`rustup`** will use the default toolchain. See **`rustup help toolchain`** for more information about toolchains.

More information: https://rust-lang.github.io/rustup/.

- Add a component to a toolchain:

```
rustup component add --toolchain {{toolchain}} {{component}}
```

- Remove a component from a toolchain:

```
rustup component remove --toolchain {{toolchain}}
{{component}}
```

- List installed and available components for a toolchain:

```
rustup component list --toolchain {{toolchain}}
```

- List installed components for a toolchain:

```
rustup component list --toolchain {{toolchain}} --installed
```

rustup default

Set the default Rust toolchain.

More information: https://rust-lang.github.io/rustup/.

- Switch the default Rust toolchain (see `rustup help toolchain` for more information):

```
rustup default {{toolchain}}
```

rustup doc

Open the offline Rust documentation for the current toolchain.

There are a lot more documentation pages not mentioned here. See **`rustup help doc`** for more information.

More information: https://rust-lang.github.io/rustup/.

- Open the main page:

  ```
  rustup doc
  ```

- Open the documentation for a specific topic (a module in the standard library, a type, a keyword, etc.):

  ```
  rustup doc {{std::fs|usize|fn|...}}
  ```

- Open the Rust Programming Language book:

  ```
  rustup doc --book
  ```

- Open the Cargo book:

  ```
  rustup doc --cargo
  ```

- Open the Rust Reference:

  ```
  rustup doc --reference
  ```

rustup help

Display help on **`rustup`** and its subcommands.

More information: https://rust-lang.github.io/rustup/.

- Display help:

```
rustup help
```

- Display help for a subcommand:

```
rustup help {{subcommand}}
```

rustup-init.sh

Script to install **`rustup`** and the Rust toolchain.

More information: https://forge.rust-lang.org/infra/other-installation-methods.html#rustup.

- Download and run `rustup-init` to install `rustup` and the default Rust toolchain:

```
curl https://sh.rustup.rs {{[-sSf|--silent --show-error --fail]}} | sh -s
```

- Download and run `rustup-init` and pass arguments to it:

```
curl https://sh.rustup.rs {{[-sSf|--silent --show-error --fail]}} | sh -s -- {{arguments}}
```

- Run `rustup-init` and specify additional components or targets to install:

```
rustup-init.sh --target {{target}} --component {{component}}
```

- Run `rustup-init` and specify the default toolchain to install:

```
rustup-init.sh --default-toolchain {{toolchain}}
```

- Run `rustup-init` and do not install any toolchain:

```
rustup-init.sh --default-toolchain {{none}}
```

- Run `rustup-init` and specify an installation profile:

```
rustup-init.sh --profile {{minimal|default|complete}}
```

- Run `rustup-init` without asking for confirmation:

```
rustup-init.sh -y
```

rustup install

This command is an alias of **`rustup toolchain install`**.

- View documentation for the original command:

  ```
  tldr rustup toolchain
  ```

rustup man

View the man page for a command managed by **`rustup`**.

More information: https://rust-lang.github.io/rustup/examples.html.

- View the man page for a given command from the default toolchain:

```
rustup man {{command}}
```

- View the man page for a given command from the specified toolchain:

```
rustup man --toolchain {{toolchain}} {{command}}
```

rustup override

Modify directory toolchain overrides.

See **`rustup help toolchain`** for more information about toolchains.

More information: https://rust-lang.github.io/rustup/.

- List directory toolchain overrides:

  ```
  rustup override list
  ```

- Set the override toolchain for the current directory (i.e. tell `rustup` to run `cargo`, `rustc`, etc. from a specific toolchain when in that directory):

  ```
  rustup override set {{toolchain}}
  ```

- Remove the toolchain override for the current directory:

  ```
  rustup override unset
  ```

- Remove all toolchain overrides for directories that no longer exist:

  ```
  rustup override unset --nonexistent
  ```

rustup run

Run a command with an environment configured for a Rust toolchain.

Note: All commands managed by **`rustup`** have a shorthand for this: for example, **`cargo +nightly build`** is equivalent to **`rustup run nightly cargo build`**.

More information: https://rust-lang.github.io/rustup/.

- Run a command using a given Rust toolchain (see `rustup help toolchain` for more information):

  ```
  rustup run {{toolchain}} {{command}}
  ```

rustup self

Modify the **`rustup`** installation.

More information: https://rust-lang.github.io/rustup/.

- Update `rustup`:

```
rustup self update
```

- Uninstall `rustup`:

```
rustup self uninstall
```

rustup set

Alter **`rustup`** settings.

More information: https://rust-lang.github.io/rustup/.

- Set the default host triple:

```
rustup set default-host {{host_triple}}
```

- Set the default profile (`minimal` includes only `rustc`, `rust-std`, and `cargo`, whereas `default` adds `rust-docs`, `rustfmt`, and `clippy`):

```
rustup set profile {{minimal|default}}
```

- Set whether `rustup` should update itself when running `rustup update`:

```
rustup set auto-self-update {{enable|disable|check-only}}
```

rustup show

Show installed toolchains, targets, and the version of **`rustc`**.

More information: https://rust-lang.github.io/rustup/.

- Show all information:

```
rustup show
```

- Show the active toolchain:

```
rustup show active-toolchain
```

- Show the rustup data directory:

```
rustup show home
```

rustup target

Modify a toolchain's supported targets.

Without the **`--toolchain`** option **`rustup`** will use the default toolchain. See **`rustup help toolchain`** for more information about toolchains.

More information: https://rust-lang.github.io/rustup/.

- Add a target to a toolchain:

```
rustup target add --toolchain {{toolchain}} {{target}}
```

- Remove a target from a toolchain:

```
rustup target remove --toolchain {{toolchain}} {{target}}
```

- List available and installed targets for a toolchain:

```
rustup target list --toolchain {{toolchain}}
```

- List installed targets for a toolchain:

```
rustup target list --toolchain {{toolchain}} --installed
```

rustup toolchain

Manage Rust toolchains.

See **`rustup help toolchain`** for more information about toolchains.

More information: https://rust-lang.github.io/rustup/.

- Install or update a given toolchain:

```
rustup toolchain install {{toolchain}}
```

- Uninstall a toolchain:

```
rustup toolchain uninstall {{toolchain}}
```

- List installed toolchains:

```
rustup toolchain list
```

- Create a custom toolchain by symlinking to a directory:

```
rustup toolchain link {{custom_toolchain_name}} {{path/to/
directory}}
```

rustup uninstall

This command is an alias of **`rustup toolchain uninstall`**.

- View documentation for the original command:

```
tldr rustup toolchain
```

rustup update

Update Rust toolchains and **`rustup`** itself (if not installed using a package manager).

More information: https://rust-lang.github.io/rustup/.

- Update all installed toolchains and `rustup`:

  ```
  rustup update
  ```

- Install or update a specific toolchain (see `rustup help toolchain` for more information):

  ```
  rustup update {{toolchain}}
  ```

rustup which

Display which binary will be run for a command managed by **`rustup`**.

Like **`which`**, but searches a Rust toolchain instead of **`$PATH`**.

More information: https://rust-lang.github.io/rustup/.

- Display the path to the binary in the default toolchain:

  ```
  rustup which {{command}}
  ```

- Display the path to the binary in the specified toolchain (see `rustup help toolchain` for more information):

  ```
  rustup which --toolchain {{toolchain}} {{command}}
  ```

rustup

Install, manage, and update Rust toolchains.

Some subcommands such as **`toolchain`**, **`target`**, **`update`**, etc. have their own usage documentation.

More information: https://rust-lang.github.io/rustup/.

- Install the nightly toolchain for your system:

```
rustup install nightly
```

- Switch the default toolchain to nightly so that the `cargo` and `rustc` commands will use it:

```
rustup default nightly
```

- Use the nightly toolchain when inside the current project but leave global settings unchanged:

```
rustup override set nightly
```

- Update all toolchains:

```
rustup update
```

- List installed toolchains:

```
rustup show
```

- Run `cargo build` with a certain toolchain:

```
rustup run {{toolchain}} cargo build
```

- Open the local Rust documentation in the default web browser:

```
rustup doc
```

rvm

Easily installing, managing, and working with multiple ruby environments.

More information: https://rvm.io/rvm/cli.

- Install one or more versions of Ruby:

```
rvm install {{version1 version2 ...}}
```

- Display a list of installed versions:

```
rvm list
```

- Use a specific version of Ruby:

```
rvm use {{version}}
```

- Set the default Ruby version:

```
rvm --default use {{version}}
```

- Upgrade a version of Ruby to a new version:

```
rvm upgrade {{current_version}} {{new_version}}
```

- Uninstall a version of Ruby and keep its sources:

```
rvm uninstall {{version}}
```

- Remove a version of Ruby and its sources:

```
rvm remove {{version}}
```

- Show specific dependencies for your OS:

```
rvm requirements
```

s

Web search from the terminal.

More information: https://github.com/zquestz/s#s.

- Search for a query on Google (default provider):

```
s {{query}}
```

- List all providers:

```
s {{[-l|--list-providers]}}
```

- Search for a query with a given provider:

```
s {{[-p|--provider]}} {{provider}} {{query}}
```

- Use a specified binary to perform the search query:

```
s {{[-b|--binary]}} "{{binary}} {{arguments}}" {{query}}
```

s3cmd

Upload, retrieve, and manage data in S3 compatible object storage.

More information: https://s3tools.org/s3cmd.

- Invoke configuration/reconfiguration tool:

```
s3cmd --configure
```

- List Buckets/Folders/Objects:

```
s3cmd ls s3://{{bucket|path/to/file}}
```

- Create Bucket/Folder:

```
s3cmd mb s3://{{bucket}}
```

- Download a specific file from a bucket:

```
s3cmd get s3://{{bucket_name}}/{{path/to/file}} {{path/to/
local_file}}
```

- Upload a file to a bucket:

```
s3cmd put {{local_file}} s3://{{bucket}}/{{file}}
```

- Move an object to a specific bucket location:

```
s3cmd mv s3://{{src_bucket}}/{{src_object}} s3://
{{dst_bucket}}/{{dst_object}}
```

- Delete a specific object:

```
s3cmd rm s3://{{bucket}}/{{object}}
```

safe

Interact with HashiCorp Vault.

More information: https://github.com/egen/safe.

- Add a safe target:

```
safe target {{vault_addr}} {{target_name}}
```

- Authenticate the CLI client against the Vault server, using an authentication token:

```
safe auth {{authentication_token}}
```

- Print the environment variables describing the current target:

```
safe env
```

- Display a tree hierarchy of all reachable keys for a given path:

```
safe tree {{path}}
```

- Move a secret from one path to another:

```
safe move {{path/to/old_secret}} {{path/to/new_secret}}
```

- Generate a new 2048-bit SSH key-pair and store it:

```
safe ssh {{2048}} {{path/to/secret}}
```

- Set non-sensitive keys for a secret:

```
safe set {{path/to/secret}} {{key}}={{value}}
```

- Set auto-generated password in a secret:

```
safe gen {{path/to/secret}} {{key}}
```

sails

A realtime enterprise level MVC framework built on top of Node.js.

More information: https://sailsjs.com/documentation/reference/command-line-interface.

- Start Sails:

  ```
  sails lift
  ```

- Create new Sails project:

  ```
  sails new {{project_name}}
  ```

- Generate Sails API:

  ```
  sails generate {{name}}
  ```

- Generate Sails Controller:

  ```
  sails generate controller {{name}}
  ```

- Generate Sails Model:

  ```
  sails generate model {{name}}
  ```

salt-call

Invoke salt locally on a salt minion.

More information: https://docs.saltproject.io/en/latest/ref/cli/salt-call.html.

- Perform a highstate on this minion:

```
salt-call state.highstate
```

- Simulate a highstate, computing all changes without actually performing them:

```
salt-call state.highstate test=true
```

- Perform a highstate with verbose debugging output:

```
salt-call {{[-l|--log-level]}} debug state.highstate
```

- List this minion's grains:

```
salt-call grains.items
```

salt-key

Manage salt minion keys on the salt master.

Needs to be run on the salt master, likely as root or with sudo.

More information: https://docs.saltproject.io/en/latest/ref/cli/salt-key.html.

- List all accepted, unaccepted, and rejected minion keys:

  ```
  salt-key {{[-L|--list-all]}}
  ```

- Accept a minion key by name:

  ```
  salt-key {{[-a|--accept-all]}} {{minion_id}}
  ```

- Reject a minion key by name:

  ```
  salt-key {{[-r|--reject]}} {{minion_id}}
  ```

- Print fingerprints of all public keys:

  ```
  salt-key {{[-F|--finger-all]}}
  ```

salt-run

Frontend for executing salt-runners on minions.

More information: https://docs.saltproject.io/en/latest/ref/cli/salt-run.html.

- Show status of all minions:

```
salt-run manage.status
```

- Show all minions which are disconnected:

```
salt-run manage.up
```

salt

Execute commands and assert state on remote salt minions.

More information: https://docs.saltproject.io/en/latest/ref/cli/index.html.

- List connected minions:

  ```
  salt '*' test.ping
  ```

- Execute a highstate on all connected minions:

  ```
  salt '*' state.highstate
  ```

- Upgrade packages using the OS package manager (apt, yum, brew) on a subset of minions:

  ```
  salt '*.example.com' pkg.upgrade
  ```

- Execute an arbitrary command on a particular minion:

  ```
  salt '{{minion_id}}' cmd.run "ls "
  ```

sam2p

Raster (bitmap) image converter with smart PDF and PostScript (EPS) output.

More information: https://github.com/pts/sam2p.

- Concatenate all PDF files into one:

```
sam2p *.pdf {{path/to/output.pdf}}
```

sambaPipe.py

Exploit CVE-2017-7494 (SambaCry) to upload and load a shared object (SO) file on a vulnerable Samba server for remote code execution.

Part of the Impacket suite.

More information: https://github.com/fortra/impacket.

- Upload and load a shared object file on a vulnerable Samba server:

```
sambaPipe.py -so {{path/to/file.so}} {{domain}}/{{username}}:
{{password}}@{{target}}
```

- Authenticate using NTLM hashes instead of a password:

```
sambaPipe.py -so {{path/to/file.so}} -hashes
{{LM_HASH:NT_HASH}} {{domain}}/{{username}}:{{password}}
@{{target}}
```

- Use Kerberos authentication for the target:

```
sambaPipe.py -so {{path/to/file.so}} -k -no-pass {{domain}}/
{{username}}:{{password}}@{{target}}
```

- Specify a domain controller IP for authentication:

```
sambaPipe.py -so {{path/to/file.so}} -dc-ip {{dc_ip}}
{{domain}}/{{username}}:{{password}}@{{target}}
```

- Use a custom port for the SMB connection:

```
sambaPipe.py -so {{path/to/file.so}} -port {{port}}
{{domain}}/{{username}}:{{password}}@{{target}}
```

samply

Sample and record CPU profiles for analysis.

More information: https://github.com/mstange/samply.

- Record a profile of a command and open it in the browser:

```
samply record {{path/to/command arg1 arg2 ...}}
```

- Adjust sampling rate:

```
samply record --rate {{rate_in_hz}} {{path/to/command arg1 arg2 ...}}
```

- Record a profile to a file without opening the browser:

```
samply record --save-only --output {{path/to/profile.json}} -- {{path/to/command arg1 arg2 ...}}
```

- Load a previously saved profile in the browser:

```
samply load {{path/to/profile.json}}
```

samtools

Tools for handling high-throughput sequencing (genomics) data.

Used for reading/writing/editing/indexing/viewing of data in SAM/BAM/CRAM format.

More information: https://www.htslib.org/doc/samtools.html.

- Convert a SAM input file to BAM stream and save to file:

```
samtools view -S {{[-b|--bam]}} {{input.sam}} > {{output.bam}}
```

- Take input from `stdin` (-) and print the SAM header and any reads overlapping a specific region to `stdout`:

```
{{other_command}} | samtools view {{[-h|--with-header]}} - chromosome:start-end
```

- Sort file and save to BAM (the output format is automatically determined from the output file's extension):

```
samtools sort {{input}} {{[-o|--output]}} {{output.bam}}
```

- Index a sorted BAM file (creates `sorted_input.bam.bai`):

```
samtools index {{sorted_input.bam}}
```

- Print alignment statistics about a file:

```
samtools flagstat {{sorted_input}}
```

- Count alignments to each index (chromosome/contig):

```
samtools idxstats {{sorted_indexed_input}}
```

- Merge multiple files:

```
samtools merge {{output}} {{input1 input2 ...}}
```

- Split input file according to read groups:

```
samtools split {{merged_input}}
```

sass

Convert SCSS or Sass files to CSS.

More information: https://sass-lang.com/documentation/cli/dart-sass/.

- Convert a SCSS or Sass file to CSS and print out the result:

```
sass {{inputfile.scss|inputfile.sass}}
```

- Convert a SCSS or Sass file to CSS and save the result to a file:

```
sass {{inputfile.scss|inputfile.sass}} {{outputfile.css}}
```

- Watch a SCSS or Sass file for changes and output or update the CSS file with same filename:

```
sass --watch {{inputfile.scss|inputfile.sass}}
```

- Watch a SCSS or Sass file for changes and output or update the CSS file with the given filename:

```
sass --watch {{inputfile.scss|inputfile.sass}}:
{{outputfile.css}}
```

satis

The utility for the Satis static Composer repository.

More information: https://github.com/composer/satis.

- Initialize a Satis configuration:

```
satis init {{satis.json}}
```

- Add a VCS repository to the Satis configuration:

```
satis add {{repository_url}}
```

- Build the static output from the configuration:

```
satis build {{satis.json}} {{path/to/output_directory}}
```

- Build the static output by updating only the specified repository:

```
satis build --repository-url {{repository_url}}
{{satis.json}} {{path/to/output_directory}}
```

- Remove useless archive files:

```
satis purge {{satis.json}} {{path/to/output_directory}}
```

sbcl

High performance Common Lisp compiler.

More information: https://www.sbcl.org/manual/#Command-Line-Options.

- Start a REPL (interactive shell):

```
sbcl
```

- Execute a Lisp script:

```
sbcl --script {{path/to/script.lisp}}
```

sbigtopgm

Convert an SBIG CCDOPS file to PGM.

More information: https://netpbm.sourceforge.net/doc/sbigtopgm.html.

- Convert an SBIG CCDOPS image file to PGM:

```
sbigtopgm {{path/to/input_file.sbig}} > {{path/to/
output.pgm}}
```

sbt

Build tool for Scala and Java projects.

More information: https://www.scala-sbt.org/1.x/docs/.

- Start a REPL (interactive shell):

```
sbt
```

- Create a new Scala project from an existing Giter8 template hosted on GitHub:

```
sbt new {{scala/hello-world.g8}}
```

- Compile and run all tests:

```
sbt test
```

- Delete all generated files in the `target` directory:

```
sbt clean
```

- Compile the main sources in `src/main/scala` and `src/main/java` directories:

```
sbt compile
```

- Use the specified version of sbt:

```
sbt -sbt-version {{version}}
```

- Use a specific jar file as the sbt launcher:

```
sbt -sbt-jar {{path}}
```

- Display help:

```
sbt -h
```

sbuild

Build a Debian binary package in a clean **`chroot`** environment.

More information: https://wiki.debian.org/sbuild.

- Build the package in the current directory:

```
sbuild
```

- Build the given package:

```
sbuild {{package}}
```

- Build for a certain distribution:

```
sbuild --dist {{distribution}}
```

- Build using custom dependencies (if a directory is passed, all files ending with `.deb` are used):

```
sbuild --extra-package {{path/to/file_or_directory}}
```

- Run a shell in case of build failure to further investigate:

```
sbuild --build-failed-commands=%SBUILD_SHELL
```

- Cross build for a certain architecture:

```
sbuild --host {{architecture}}
```

- Build for the given native architecture:

```
sbuild --arch {{architecture}}
```

sc_analysis_dump

Dump of traceroute data in an easily parsed format.

More information: https://www.caida.org/catalog/software/scamper/.

- Output the traceroute of `.warts` files one after the other in an easy-to-parse format:

```
sc_analysis_dump {{path/to/file1.warts path/to/
file2.warts ...}}
```

sc_tracediff

Display traceroute paths where the path has changed.

More information: https://www.caida.org/catalog/software/scamper/.

- Show the difference between traceroutes in two `.warts` files:

```
sc_tracediff {{path/to/file1.warts}} {{path/to/file2.warts}}
```

- Show the difference between the traceroutes in two `.warts` files, including those that have not changed:

```
sc_tracediff -a {{path/to/file1.warts}} {{path/to/
file2.warts}}
```

- Show the difference between the traceroutes in two `.warts` files and try to show DNS names and not IP addresses if possible:

```
sc_tracediff -n {{path/to/file1.warts}} {{path/to/
file2.warts}}
```

sc_ttlexp

Dump source addresses from ICMP TTL expired messages in **`.warts`** files.

More information: https://www.caida.org/catalog/software/scamper/.

- Output the source address of ICMP TTL expire messages in `.warts` files one after the other:

```
sc_ttlexp {{path/to/file1.warts path/to/file2.warts ...}}
```

sc_warts2csv

Dump traceroutes collected by **`scamper`** in CSV format.

More information: https://www.caida.org/catalog/software/scamper/.

- Convert traceroute data in `.warts` files to CSV and output it:

```
sc_warts2csv {{path/to/file1.warts path/to/file2.warts ...}}
```

sc_warts2json

JSON dump of information contained in a **`.warts`** file.

More information: https://www.caida.org/catalog/software/scamper/.

- Convert `.warts` files to JSON and output the result:

```
sc_warts2json {{path/to/file1.warts path/to/file2.warts ...}}
```

sc_warts2pcap

Write packets included in **`.warts`** files to a PCAP file.

This is only possible for packets of type **`tbit`**, **`sting`**, or **`sniff`**.

More information: https://www.caida.org/catalog/software/scamper/.

- Convert the data from several `.warts` files into one PCAP file:

```
sc_warts2pcap -o {{path/to/output.pcap}} {{path/to/
file1.warts path/to/file2.warts ...}}
```

- Convert the data from a `.warts` file into a PCAP file and sort the packets by timestamp:

```
sc_warts2pcap -s -o {{path/to/output.pcap}} {{path/to/
file.warts}}
```

sc_warts2text

Simple dump of information contained in a **`.warts`** file.

More information: https://www.caida.org/catalog/software/scamper/.

- Output the information in `.warts` files as text:

```
sc_warts2text {{path/to/file1.warts path/to/file2.warts ...}}
```

sc_wartscat

Concatenate **`.warts`** files.

More information: https://www.caida.org/catalog/software/scamper/.

- Concatenate `.warts` files into one:

```
sc_wartscat -o {{path/to/output.warts}} {{path/to/file1.warts
path/to/file2.warts ...}}
```

sc_wartsdump

Verbose dump of information contained in a **`.warts`** file.

More information: https://www.caida.org/catalog/software/scamper/.

- Output the content of `.warts` files verbose:

```
sc_wartsdump {{path/to/file1.warts path/to/file2.warts ...}}
```

sc_wartsfilter

Select specific records from a **`.warts`** file.

More information: https://www.caida.org/catalog/software/scamper/.

- Filter all data records that had specific destinations and write them to a separate file:

```
sc_wartsfilter -i {{path/to/input.warts}} -o {{path/to/
output.warts}} -a {{192.0.2.5}} -a {{192.0.2.6}}
```

- Filter all records that had certain destinations in a prefix and write them to a separate file:

```
sc_wartsfilter -i {{path/to/input.warts}} -o {{path/to/
output.warts}} -a {{2001:db8::/32}}
```

- Filter all records that using a specific action and output them as JSON:

```
sc_wartsfilter -i {{path/to/input.warts}} -t {{ping}} |
sc_warts2json
```

sc_wartsfix

Truncate damaged **`.warts`** files.

More information: https://www.caida.org/catalog/software/scamper/.

- Save all records (in a separate file) up to the last intact one:

```
sc_wartsfix {{path/to/file1.warts path/to/file2.warts ...}}
```

scala-cli

Interact with the Scala programming language.

More information: https://scala-cli.virtuslab.org/docs/overview/.

- Start a REPL (interactive shell) using a specific Scala and JVM version:

```
scala-cli --scala {{3.1.0}} --jvm {{temurin:17}}
```

- Compile and run a Scala script:

```
scala-cli run {{path/to/script.scala}}
```

- Compile and test a Scala script:

```
scala-cli test {{path/to/script.scala}}
```

- Format a Scala script, updating the file in-place:

```
scala-cli fmt {{path/to/script.scala}}
```

- Generate files for IDE (VSCode and IntelliJ) support:

```
scala-cli setup-ide {{path/to/script.scala}}
```

scala

Scala application launcher and interactive interpreter.

More information: https://scala-cli.virtuslab.org/docs/reference/cli-options/.

- Start a REPL (interactive shell):

```
scala
```

- Start the interpreter with a dependency in the [c]lass[p]ath:

```
scala {{[-cp|--extra-jars]}} {{filename.jar}} {{command}}
```

- Execute a Scala script:

```
scala {{script.scala}}
```

- Execute a `.jar` program:

```
scala {{filename.jar}}
```

- Execute a single Scala command:

```
scala {{[-e|--execute-script]}} {{command}}
```

scalafmt

Code formatter for Scala.

Configurations are stored in the **`.scalafmt.conf`** file.

More information: https://scalameta.org/scalafmt/.

- Reformat all `.scala` files in the current directory recursively:

  ```
  scalafmt
  ```

- Reformat specific files or directories with a custom formatting configuration:

  ```
  scalafmt --config {{path/to/.scalafmt.conf}} {{path/to/file_or_directory1 path/to/file_or_directory2 ...}}
  ```

- Check if files are correctly formatted, returning `0` if all files respect the formatting style:

  ```
  scalafmt --config {{path/to/.scalafmt.conf}} --test
  ```

- Exclude files or directories:

  ```
  scalafmt --exclude {{path/to/file_or_directory1 path/to/file_or_directory2 ...}}
  ```

- Format only files that were edited against the current Git branch:

  ```
  scalafmt --config {{path/to/.scalafmt.conf}} --mode diff
  ```

scamper

Actively probes the Internet in order to analyze topology and performance.

Includes some tools that start with **`sc_`**, for example **`sc_warts2text`** or **`sc_ttlexp`**.

More information: https://www.caida.org/catalog/software/scamper/.

- Execute the standard option (traceroute) to a destination:

```
scamper -i {{192.0.2.1}}
```

- Execute two actions (ping and traceroute) on two different targets:

```
scamper -I "{{ping}} {{192.0.2.1}}" -I "{{trace}}
{{192.0.2.2}}"
```

- Ping several hosts with UDP, use a specific port number for the first ping, and increase it for each subsequent ping:

```
scamper -c "{{ping}} -P {{UDP-dport}} -d {{33434}}" -i
{{192.0.2.1}} -i {{192.0.2.2}}
```

- Use the Multipath Discovery Algorithm (MDA) to determine the presence of load-balanced paths to the destination and use ICMP echo packets to sample with a maximum of three attempts, write the result to a `.warts` file:

```
scamper -O {{warts}} -o {{path/to/output.warts}} -I
"{{tracelb}} -P {{ICMP-echo}} -q {{3}} {{192.0.2.1}}"
```

- Execute a Paris traceroute with ICMP to a destination and save the result in a compressed `.warts` file:

```
scamper -O {{warts.gz}} -o {{path/to/output.warts}} -I
"{{trace}} -P {{icmp-paris}} {{2001:db8:dead:beaf::4}}"
```

- Record all ICMP packets that arrive at a specific IP address and have a specific ICMP ID in a `.warts` file:

```
scamper -O {{warts}} -o {{path/to/output.warts}} -I "sniff -S
{{2001:db8:dead:beef::6}} icmp[icmpid] == {{101}}"
```

scan-build

Run a static analyzer over a codebase as part of performing a regular build.

More information: https://clang-analyzer.llvm.org/scan-build.html.

- Build and analyze the project in the current directory:

```
scan-build {{make}}
```

- Run a command and pass all subsequent options to it:

```
scan-build {{command}} {{command_arguments}}
```

- Display help:

```
scan-build
```

scc

Count lines of code. Written in Go.

More information: https://github.com/boyter/scc#usage.

- Print lines of code in the current directory:

```
scc
```

- Print lines of code in the target directory:

```
scc {{path/to/directory}}
```

- Display output for every file:

```
scc --by-file
```

- Display output using a specific output format (defaults to `tabular`):

```
scc {{[-f|--format]}} {{tabular|wide|json|csv|cloc-yaml|html|
html-table}}
```

- Only count files with specific file extensions:

```
scc {{[-i|--include-ext]}} {{go,java,js}}
```

- Exclude directories from being counted:

```
scc --exclude-dir {{.git,.hg}}
```

- Display output and sort by column (defaults to by files):

```
scc {{[-s|--sort]}} {{files|name|lines|blanks|code|comments|
complexity}}
```

- Display help:

```
scc {{[-h|--help]}}
```

sccache

A fast C/C++/Rust compiler cache.

Composed of a client and a server, both running on the machine.

More information: https://manned.org/sccache.

- Show compilation statistics:

```
sccache {{[-s|--show-stats]}}
```

- Run `gcc` (or any compiler command) through `sccache`:

```
sccache gcc {{path/to/file.c}}
```

- Start `sccache` server in the foreground and print logs:

```
sccache --stop-server; SCCACHE_LOG=trace
SCCACHE_START_SERVER=1 SCCACHE_NO_DAEMON=1 sccache
```

- Ask scheduler for distributed compilation status:

```
sccache --dist-status
```

sccmap

Extract strongly connected components of directed graphs.

Graphviz filters: **`acyclic`**, **`bcomps`**, **`comps`**, **`edgepaint`**, **`gvcolor`**, **`gvpack`**, **`mingle`**, **`nop`**, **`sccmap`**, **`tred`**, and **`unflatten`**.

More information: https://www.graphviz.org/pdf/sccmap.1.pdf.

- Extract strongly connected components of one or more directed graphs:

```
sccmap -S {{path/to/input1.gv path/to/input2.gv ...}} > {{path/to/output.gv}}
```

- Print statistics about a graph, producing no output graph:

```
sccmap -v -s {{path/to/input1.gv path/to/input2.gv ...}}
```

- Display help:

```
sccmap -?
```

scd

File manager focused on shell integration.

More information: https://github.com/cshuaimin/scd.

- Index paths recursively for the very first run:

```
scd -ar {{path/to/directory}}
```

- Change to a specific directory:

```
scd {{path/to/directory}}
```

- Change to a path matching specific patterns:

```
scd "{{pattern1 pattern2 ...}}"
```

- Show selection menu and ranking of 20 most likely directories:

```
scd -v
```

- Add a specific alias for the current directory:

```
scd --alias={{word}}
```

- Change to a directory using a specific alias:

```
scd {{word}}
```

scdoc

Generate **man** manual pages.

More information: https://git.sr.ht/~sircmpwn/scdoc/tree/master/item/scdoc.1.scd.

- Generate man pages from a scdoc (`.scd`) file:

```
scdoc < {{path/to/file.scd}} > {{path/to/file.1}}
```

- Generate man pages from a scdoc file and display the generated troff (man) source:

```
scdoc < {{path/to/file.scd}} | {{less}}
```

scheme

MIT Scheme language interpreter and REPL (interactive shell).

More information: https://www.gnu.org/software/mit-scheme/documentation/stable/mit-scheme-user.html#Command_002dLine-Options.

- Start a REPL (interactive shell):

```
scheme
```

- Run a scheme program (with no REPL output):

```
scheme < {{script.scm}} --quiet
```

- Load a scheme program into the REPL:

```
scheme --load {{script.scm}}
```

- Load scheme expressions into the REPL:

```
scheme --eval "{{(define foo 'x)}}"
```

- Open the REPL in quiet mode:

```
scheme --quiet
```

scim

A curses based, vim-like spreadsheet calculator.

Use **<h><j><k><l>** or **<ArrowKeys>** to navigate.

More information: https://github.com/andmarti1424/sc-im.

- Start SC-IM:

  `scim {{path/to/file.csv}}`

- Enter a string into the current cell:

  `{{<<>|<>>}}`

- Enter a numeric constant into the current cell:

  `<=>`

- Edit string in the current cell:

  `<E>`

- Edit number in the current cell:

  `<e>`

- Center align the current cell:

  `<|>`

scp

Secure copy.

Copy files between hosts using Secure Copy Protocol over SSH.

More information: https://man.openbsd.org/scp.

- Copy a local file to a remote host:

```
scp {{path/to/local_file}} {{remote_host}}:{{path/to/remote_file}}
```

- Use a specific port when connecting to the remote host:

```
scp -P {{port}} {{path/to/local_file}} {{remote_host}}:{{path/to/remote_file}}
```

- Copy a file from a remote host to a local directory:

```
scp {{remote_host}}:{{path/to/remote_file}} {{path/to/local_directory}}
```

- Recursively copy the contents of a directory from a remote host to a local directory:

```
scp -r {{remote_host}}:{{path/to/remote_directory}} {{path/to/local_directory}}
```

- Copy a file between two remote hosts transferring through the local host:

```
scp -3 {{host1}}:{{path/to/remote_file}} {{host2}}:{{path/to/remote_directory}}
```

- Use a specific username when connecting to the remote host:

```
scp {{path/to/local_file}} {{remote_username}}@{{remote_host}}:{{path/to/remote_directory}}
```

- Use a specific SSH private key for authentication with the remote host:

```
scp -i {{~/.ssh/private_key}} {{path/to/local_file}} {{remote_host}}:{{path/to/remote_file}}
```

- Use a specific proxy when connecting to the remote host:

```
scp -J {{proxy_username}}@{{proxy_host}} {{path/to/local_file}} {{remote_host}}:{{path/to/remote_file}}
```

scrapy

Web-crawling framework.

More information: https://docs.scrapy.org/en/latest/topics/commands.html#using-the-scrapy-tool.

- Create a project:

```
scrapy startproject {{project_name}}
```

- Create a spider (in project directory):

```
scrapy genspider {{spider_name}} {{website_domain}}
```

- Edit spider (in project directory):

```
scrapy edit {{spider_name}}
```

- Run spider (in project directory):

```
scrapy crawl {{spider_name}}
```

- Fetch a webpage as Scrapy sees it and print the source to `stdout`:

```
scrapy fetch {{url}}
```

- Open a webpage in the default browser as Scrapy sees it (disable JavaScript for extra fidelity):

```
scrapy view {{url}}
```

- Open Scrapy shell for URL, which allows interaction with the page source in a Python shell (or IPython if available):

```
scrapy shell {{url}}
```

scrcpy

Display and control your Android device on a desktop.

See also: **`adb connect`**.

More information: https://github.com/Genymobile/scrcpy.

- Display a mirror of a connected device:

```
scrcpy
```

- Turn the device screen off and prevent it from sleeping while mirroring:

```
scrcpy {{[-S|--turn-screen-off]}} {{[-w|--stay-awake]}}
```

- Display a mirror of a specific device based on its ID or IP address (find it under the `adb devices` command):

```
scrcpy {{[-s|--serial]}} {{0123456789abcdef|
192.168.0.1:5555}}
```

- Show touches on physical device:

```
scrcpy {{[-t|--show-touches]}}
```

- Record display screen:

```
scrcpy {{[-r|--record]}} {{path/to/file.mp4}}
```

- Specify the target directory for pushing files to device by drag and drop (non-APK):

```
scrcpy --push-target {{path/to/directory}}
```

- View the phone's camera (requires Android 12 or newer):

```
scrcpy --video-source camera
```

- Create a Video4Linux2 device from the phone's camera (`v4l2loopback` must be installed):

```
scrcpy --video-source camera --camera-size {{1920x1080}} --
v4l2-sink {{/dev/video0}} --no-playback
```

screen

Hold a session open on a remote server. Manage multiple windows with a single SSH connection.

See also: **`tmux`**, **`zellij`**, **`herdr`**.

More information: https://manned.org/screen.

- Start a new screen session:

```
screen
```

- Start a new named screen session:

```
screen -S {{session_name}}
```

- Start a new daemon and log the output to `screenlog.x`:

```
screen -dmLS {{session_name}} {{command}}
```

- Show open screen sessions:

```
screen -ls
```

- Reattach to an open screen:

```
screen -r {{session_name}}
```

- Detach from inside a screen:

```
<Ctrl a><d>
```

- Kill the current screen session:

```
<Ctrl a><k>
```

- Kill a detached screen:

```
screen -X -S {{session_name}} quit
```

screenfetch

Display system information.

More information: https://github.com/KittyKatt/screenFetch#running-screenfetch.

- Start `screenfetch`:

```
screenfetch
```

- Take a screenshot (requires `scrot`):

```
screenfetch -s
```

- Specify distribution logo:

```
screenfetch -A '{{distribution_name}}'
```

- Specify distribution logo and text:

```
screenfetch -D '{{distribution_name}}'
```

- Strip all color:

```
screenfetch -N
```

sd

Intuitive find and replace.

More information: https://manned.org/sd.

- Trim some whitespace using a `regex` (output stream: `stdout`):

```
{{echo 'lorem ipsum 23 '}} | sd '\s+$' ''
```

- Replace words using capture groups (output stream: `stdout`):

```
{{echo 'cargo +nightly watch'}} | sd '(\w+)\s+\+(\w+)\s+
(\w+)' 'cmd: $1, channel: $2, subcmd: $3'
```

- Find and replace in a specific file (output stream: `stdout`):

```
sd {{[-p|--preview]}} '{{window.fetch}}' '{{fetch}}' {{path/
to/file.js}}
```

- Find and replace in all files in the current project:

```
find . -type f -exec sd '{{from "react"}}' '{{from
"preact"}}' {} \;
```

sdcv

StarDict, a dictionary client.

Dictionaries are provided separately from the client.

More information: https://manned.org/sdcv.

- Start `sdcv` interactively:

```
sdcv
```

- List installed dictionaries:

```
sdcv --list-dicts
```

- Display a definition from a specific dictionary:

```
sdcv --use-dict {{dictionary_name}} {{search_term}}
```

- Look up a definition with a fuzzy search:

```
sdcv {{search_term}}
```

- Look up a definition with an exact search:

```
sdcv --exact-search {{search_term}}
```

- Look up a definition and format the output as JSON:

```
sdcv --json {{search_term}}
```

- Search for dictionaries in a specific directory:

```
sdcv --data-dir {{path/to/directory}} {{search_term}}
```

sdiff

Compare the differences between and optionally merge 2 files.

More information: https://manned.org/sdiff.

- Compare 2 files:

```
sdiff {{path/to/file1}} {{path/to/file2}}
```

- Compare 2 files, ignoring all tabs and whitespace:

```
sdiff {{[-W|--ignore-all-space]}} {{path/to/file1}} {{path/to/file2}}
```

- Compare 2 files, ignoring whitespace at the end of lines:

```
sdiff {{[-Z|--ignore-trailing-space]}} {{path/to/file1}} {{path/to/file2}}
```

- Compare 2 files in a case-insensitive manner:

```
sdiff {{[-i|--ignore-case]}} {{path/to/file1}} {{path/to/file2}}
```

- Compare and then merge, writing the output to a new file:

```
sdiff {{[-o|--output]}} {{path/to/merged_file}} {{path/to/file1}} {{path/to/file2}}
```

sdk

Manage parallel versions of multiple Software Development Kits.

Supports Java, Groovy, Scala, Kotlin, Gradle, Maven, Vert.x, and many others.

More information: https://sdkman.io/usage/.

- Install an SDK version:

```
sdk install {{sdk_name}} {{sdk_version}}
```

- Use a specific SDK version for the current terminal session:

```
sdk use {{sdk_name}} {{sdk_version}}
```

- Show the stable version of any available SDK:

```
sdk current {{sdk_name}}
```

- Show the stable versions of all installed SDKs:

```
sdk current
```

- List all available SDKs:

```
sdk list
```

- List all versions of an SDK:

```
sdk list {{sdk_name}}
```

- Upgrade an SDK to the latest stable version:

```
sdk upgrade {{sdk_name}}
```

- Uninstall a specific SDK version:

```
sdk rm {{sdk_name}} {{sdk_version}}
```

sdkmanager

Install packages for the Android SDK.

More information: https://developer.android.com/tools/sdkmanager.

- List available packages:

```
sdkmanager --list
```

- Install a package:

```
sdkmanager {{package}}
```

- Update every installed package:

```
sdkmanager --update
```

- Uninstall a package:

```
sdkmanager --uninstall {{package}}
```

searchsploit

Search Exploit Database for exploits, shellcodes and/or papers.

If known version numbers are used as search terms, exploits for both the exact version and others whose version range covers the one specified are shown.

More information: https://www.exploit-db.com/searchsploit.

- Search for an exploit, shellcode, or paper:

```
searchsploit {{search_terms}}
```

- Search for a known specific version, e.g. sudo version 1.8.27:

```
searchsploit sudo 1.8.27
```

- Show the exploit-db link to the found resources:

```
searchsploit {{[-w|--www]}} {{search_terms}}
```

- Copy the resource to the current directory (requires the number of the exploit):

```
searchsploit {{[-m|--mirror]}} {{exploit_number}}
```

- Examine the resource, using the pager defined in the `$PAGER` environment variable:

```
searchsploit {{[-x|--examine]}} {{exploit_number}}
```

- Update the local Exploit Database:

```
searchsploit {{[-u|--update]}}
```

- Search for the [c]ommon [v]ulnerabilities and [e]xposures (CVE) value:

```
searchsploit --cve {{2021-44228}}
```

- Check results in `nmap`'s XML output with service version (`nmap -sV -oX nmap-output.xml`) for known exploits:

```
searchsploit --nmap {{path/to/nmap-output.xml}}
```

secrethub

Keep secrets out of configuration files.

More information: https://github.com/secrethub/secrethub-cli.

- Print a secret to `stdout`:

```
secrethub read {{path/to/secret}}
```

- Generate a random value and store it as a new or updated secret:

```
secrethub generate {{path/to/secret}}
```

- Store a value from the clipboard as a new or updated secret:

```
secrethub write --clip {{path/to/secret}}
```

- Store a value supplied on `stdin` as a new or updated secret:

```
echo "{{secret_value}}" | secrethub write {{path/to/secret}}
```

- Audit a repository or secret:

```
secrethub audit {{path/to/repo_or_secret}}
```

secretsdump.py

Dump NTLM hashes, plaintext passwords, and domain credentials from remote Windows systems.

Part of the Impacket suite.

More information: https://github.com/fortra/impacket.

- Dump credentials from a Windows machine using a username and password:

```
secretsdump.py {{domain}}/{{username}}:{{password}}
@{{target}}
```

- Dump hashes from a machine using pass-the-hash authentication:

```
secretsdump.py -hashes {{LM_Hash}}:{{NT_Hash}} {{domain}}/
{{username}}@{{target}}
```

- Dump credentials from Active Directory's NTDS.dit file:

```
secretsdump.py -just-dc {{domain}}/{{username}}:{{password}}
@{{target}}
```

- Extract credentials from a local SAM database using registry hives:

```
secretsdump.py -sam {{path/to/SAM}} -system {{path/to/
SYSTEM}}
```

- Dump hashes from a machine without providing a password (if a valid authentication session exists, e.g. via Kerberos or NTLM SSO):

```
secretsdump.py -no-pass {{domain}}/{{username}}@{{target}}
```

security-checker

Check if a PHP application uses dependencies with known security vulnerabilities.

More information: https://github.com/sensiolabs/security-checker.

- Look for security issues in the project dependencies (based on the `composer.lock` file in the current directory):

  ```
  security-checker security:check
  ```

- Use a specific `composer.lock` file:

  ```
  security-checker security:check {{path/to/composer.lock}}
  ```

- Return results as a JSON object:

  ```
  security-checker security:check --format=json
  ```

sed

Edit text in a scriptable manner.

See also: **awk**, **ed**.

More information: https://manned.org/sed.1posix.

- Replace all `apple` (basic `regex`) occurrences with `mango` (basic `regex`) in all input lines and print the result to `stdout`:

```
{{command}} | sed 's/apple/mango/g'
```

- Execute a specific script [f]ile and print the result to `stdout`:

```
{{command}} | sed -f {{path/to/script.sed}}
```

- Print just a first line to `stdout`:

```
{{command}} | sed -n '1p'
```

select

Bash builtin construct for creating menus.

More information: https://www.gnu.org/software/bash/manual/bash.html#index-select.

- Create a menu out of individual words:

```
select {{word}} in {{apple orange pear banana}}; do echo ${{word}}; done
```

- Create a menu from the output of another command:

```
select {{line}} in $({{command}}); do echo ${{line}}; done
```

- Specify the prompt string for `select` and create a menu for picking a file or folder from the current directory:

```
PS3="{{Select a file: }}"; select {{file}} in *; do echo ${{file}}; done
```

- Create a menu from a Bash array:

```
{{fruits}}=({{apple orange pear banana}}); select {{word}} in ${{{fruits[@]}}}; do echo ${{word}}; done
```

semver

Semantic version string parser.

More information: https://github.com/npm/node-semver.

- Check if a version string respects the semantic versioning format (prints an empty string if it does not match):

```
semver {{1.2}}
```

- Convert a version string to the semantic versioning format:

```
semver --coerce {{1.2}}
```

- Test if `1.2.3` matches the `^1.0` range (prints an empty string if it does not match):

```
semver {{1.2.3}} --range "{{^1.0}}"
```

- Test with multiple ranges:

```
semver {{1.2.3}} --range "{{>=1.0}}" "{{<2.0}}"
```

- Test multiple version strings and return only the ones that match:

```
semver {{1.2.3}} {{2.0.0}} --range "{{^1.0}}"
```

sendmail

Send email.

More information: https://manned.org/sendmail.

- Send a message with the content of `message.txt` to the mail directory of local user `username`:

```
sendmail < {{message.txt}} {{username}}
```

- Send an email from `sender@example.com` (assuming the mail server is configured for this) to `receiver@example.com` containing the message in `message.txt`:

```
sendmail < message.txt -f sender@example.com receiver@example.com
```

- Send an email from `sender@example.com` (assuming the mail server is configured for this) to `receiver@example.com` containing the file `file.zip`:

```
sendmail < file.zip -f sender@example.com receiver@example.com
```

seq

Output a sequence of numbers to **stdout**.

More information: https://www.gnu.org/software/coreutils/manual/html_node/seq-invocation.html.

- Print a sequence from 1 to 10:

```
seq 10
```

- Print a sequence from 10 to 20:

```
seq 10 20
```

- Print every 3rd number from 5 to 20:

```
seq 5 3 20
```

- Print a reverse sequence from 10 to 1:

```
seq 10 -1 1
```

- Separate the output with a space instead of a newline:

```
seq {{[-s|--separator]}} " " {{5 3 20}}
```

- Format output width to a minimum of 4 digits padding with zeros as necessary:

```
seq {{[-f|--format]}} "%04g" {{5 3 20}}
```

- Print all numbers with the same width:

```
seq {{[-w|--equal-width]}} {{5 3 20}}
```

sequelize

Promise-based Node.js ORM for Postgres, MySQL, MariaDB, SQLite, and Microsoft SQL Server.

More information: https://github.com/sequelize/cli/blob/main/README.md.

- Create a model with 3 fields and a migration file:

```
sequelize model:generate --name {{table_name}} --attributes {{field1:integer,field2:string,field3:boolean}}
```

- Run the migration file:

```
sequelize db:migrate
```

- Revert all migrations:

```
sequelize db:migrate:undo:all
```

- Create a seed file with the specified name to populate the database:

```
sequelize seed:generate --name {{seed_filename}}
```

- Populate database using all seed files:

```
sequelize db:seed:all
```

sequin

Make ANSI escape sequences human-readable.

Useful for debugging, learning, or inspecting terminal output.

More information: https://github.com/charmbracelet/sequin.

- Describe ANSI escape sequences from a string:

```
printf "{{\x1b[38;5;4mCiao, \x1b[1;7mBaby.\x1b[0m\n}}" | sequin
```

- Inspect colorized output from another command (e.g., `ls`):

```
ls -l --color=always | sequin
```

- Examine a file containing ANSI sequences (e.g., a TUI golden file):

```
cat {{path/to/file.golden}} | sequin
```

- Execute a command directly within a fake TTY to inspect its output:

```
sequin -- {{ls -l go.*}}
```

- Highlight raw ANSI sequences inline for easier reading:

```
git -c status.color=always status -sb | sequin -r
```

serialver

Return the serialVersionUID of classes.

It does not set a security manager by default.

More information: https://docs.oracle.com/en/java/javase/25/docs/specs/man/serialver.html.

- Display the serialVersionUID of a class:

```
serialver {{classnames}}
```

- Display the serialVersionUID for a colon-separated list of classes and resources:

```
serialver -classpath {{path/to/directory}} {{classname1:classname2:...}}
```

- Use a specific option from reference page of Java application launcher to the Java Virtual Machine:

```
serialver -Joption {{classnames}}
```

serve

Static file serving and directory listing.

More information: https://github.com/vercel/serve.

- Start an HTTP server listening on the default port to serve the current directory:

```
serve
```

- Start an HTTP server on a specific [p]ort to serve a specific directory:

```
serve -p {{port}} {{path/to/directory}}
```

- Start an HTTP server with CORS enabled by including the `Access-Control-Allow-Origin: *` header in all responses:

```
serve {{[-C|--cors]}}
```

- Start an HTTP server on the default port rewriting all not-found requests to the `index.html` file:

```
serve {{[-s|--single]}}
```

- Start an HTTPS server on the default port using the specified certificate:

```
serve --ssl-cert {{path/to/cert.pem}} --ssl-key {{path/to/key.pem}}
```

- Start an HTTP server on the default port using a specific configuration file:

```
serve {{[-c|--config]}} {{path/to/serve.json}}
```

- Display help:

```
serve --help
```

serverless

Toolkit for deploying and operating serverless architectures on AWS, Google Cloud, Azure, and IBM OpenWhisk.

Commands can be run either using the **`serverless`** command or its alias, **`sls`**.

More information: https://www.serverless.com/framework/docs/providers/aws/cli-reference.

- Create a serverless project:

  ```
  serverless create
  ```

- Create a serverless project from a template:

  ```
  serverless create --template {{template_name}}
  ```

- Deploy to a cloud provider:

  ```
  serverless deploy
  ```

- Display information about a serverless project:

  ```
  serverless info
  ```

- Invoke a deployed function:

  ```
  serverless invoke -f {{function_name}}
  ```

- Follow the logs for a project:

  ```
  serverless logs {{[-t|--tail]}}
  ```

Set-NodeInstallLocation

Set the default Node.js installation directory for **`ps-nvm`**.

This command is part of **`ps-nvm`** and can only be run under PowerShell.

More information: https://github.com/aaronpowell/ps-nvm.

- Change the Node.js install location to a specified directory (`ps-nvm` will create a new `.nvm` subdirectory to install them):

```
Set-NodeInstallLocation {{path/to/directory}}
```

Set-NodeVersion

Set the default Node.js version for **`ps-nvm`**.

Part of **`ps-nvm`** and can only be run under PowerShell.

More information: https://github.com/aaronpowell/ps-nvm.

- Use a specific version of Node.js in the current PowerShell session:

  ```
  Set-NodeVersion {{node_version}}
  ```

- Use the latest installed Node.js version 20.x:

  ```
  Set-NodeVersion ^20
  ```

- Set the default Node.js version for the current user (only applies to future PowerShell sessions):

  ```
  Set-NodeVersion {{node_version}} -Persist User
  ```

- Set the default Node.js version for all users (must be run as Administrator/root and only applies to future PowerShell sessions):

  ```
  Set-NodeVersion {{node_version}} -Persist Machine
  ```

set

Toggle shell options or set the values of positional parameters.

More information: https://www.gnu.org/software/bash/manual/bash.html#The-Set-Builtin.

- Display the names and values of shell variables:

```
set
```

- Export newly initialized variables to child processes:

```
set -a
```

- Write formatted messages to `stderr` when jobs finish:

```
set -b
```

- Write and edit text in the command-line with `vi`-like keybindings (e.g. `yy`):

```
set -o vi
```

- Return to default (`emacs`) mode:

```
set -o emacs
```

- List all modes:

```
set -o
```

- Exit the shell when (some) command fails:

```
set -e
```

- Reset all shell parameters and assign new ones:

```
set -- {{argument1 argument2 ...}}
```

setopt

Set Z shell (**zsh**) options.

Note: Zsh options are case-insensitive and underscores are ignored.

See also: **unsetopt**.

More information: https://zsh.sourceforge.io/Doc/Release/Options.html.

- List enabled options:

```
setopt
```

- Set an option:

```
setopt {{option}}
```

- Display all available options and their status:

```
set -o
```

sf

A powerful command-line interface that simplifies development and build automation when working with your Salesforce org.

More information: https://developer.salesforce.com/tools/salesforcecli.

- Authorize a Salesforce Organization:

```
sf force:auth:web:login --setalias {{organization}} --instanceurl {{organization_url}}
```

- List all authorized organizations:

```
sf force:org:list
```

- Open a specific organization in the default web browser:

```
sf force:org:open --targetusername {{organization}}
```

- Display information about a specific organization:

```
sf force:org:display --targetusername {{organization}}
```

- Push source metadata to an Organization:

```
sf force:source:push --targetusername {{organization}}
```

- Pull source metadata from an Organization:

```
sf force:source:pull --targetusername {{organization}}
```

- Generate a password for the organization's logged-in user:

```
sf force:user:password:generate --targetusername {{organization}}
```

- Assign a permission set for the organization's logged-in user:

```
sf force:user:permset:assign --permsetname {{permission_set_name}} --targetusername {{organization}}
```

sfdk apply

Apply patches from RPM SPEC file.

More information: https://github.com/sailfishos/sailfish-qtcreator/blob/master/share/qtcreator/sfdk/modules/20-building-mb2/doc/command.apply.adoc.

- Apply all patches:

```
sfdk apply
```

- Reverse apply all patches:

```
sfdk apply -R
```

sfdk build-init

Initialize build directory.

More information: https://github.com/sailfishos/sailfish-qtcreator/blob/master/share/qtcreator/sfdk/modules/20-building-mb2/doc/command.build-init.adoc.

- Initialize the current directory as the build directory:

```
sfdk build-init
```

- Initialize the specified directory as the build directory:

```
sfdk build-init {{directory}}
```

sfdk build-requires

Update build time dependencies.

More information: https://github.com/sailfishos/sailfish-qtcreator/blob/master/share/qtcreator/sfdk/modules/20-building-mb2/doc/command.build-requires.adoc.

- Run a subcommand refreshing the cache:

```
sfdk build-requires --refresh {{subcommand}}
```

- Run a subcommand without refreshing the cache:

```
sfdk build-requires --no-refresh {{subcommand}}
```

- Install or update the build-time dependencies:

```
sfdk build-requires pull
```

- Install or update the build-time dependencies, omitting all extra ones:

```
sfdk build-requires reset
```

- Show the difference between current and clean build environments:

```
sfdk build-requires diff
```

sfdk build-shell

Execute custom steps in build engine.

See also: **`sfdk config`**, **`sfdk build-init`**.

More information: https://github.com/sailfishos/sailfish-qtcreator/blob/master/share/qtcreator/sfdk/modules/20-building-mb2/doc/command.build-shell.adoc.

- Launch interactive shell in the build engine:

  ```
  sfdk build-shell
  ```

- Run a specified command in the build shell:

  ```
  sfdk build-shell {{command}}
  ```

- Launch interactive shell in the build engine in maintenance mode, when inspecting or modifying the build environment:

  ```
  sfdk build-shell --maintain
  ```

sfdk check

Perform quality checks.

More information: https://github.com/sailfishos/sailfish-qtcreator/blob/master/share/qtcreator/sfdk/modules/20-building-mb2/doc/command.cmake.adoc.

- Display test suites:

```
sfdk check --list-suites
```

- Run all or essential test suites:

```
sfdk check
```

- Add testing level to the check:

```
sfdk check {{[-l|--levels]}} +{{level}}
```

- Remove testing level from the check:

```
sfdk check {{[-l|--levels]}} -{{level}}
```

- Add testing suite to the check:

```
sfdk check {{[-s|--suites]}} +{{suite}}
```

- Remove testing suite from the check:

```
sfdk check {{[-s|--suites]}} -{{suite}}
```

sfdk cmake

Execute cmake build step.

More information: https://github.com/sailfishos/sailfish-qtcreator/blob/master/share/qtcreator/sfdk/modules/20-building-mb2/doc/command.cmake.adoc.

- Run cmake:

```
sfdk cmake
```

- Run cmake in specified project directory:

```
sfdk cmake {{project}}
```

- Run cmake with extra arguments:

```
sfdk cmake -- {{arguments}}
```

- Run cmake build in current directory:

```
sfdk cmake --build .
```

- Run cmake build in current directory with extra cmake arguments:

```
sfdk cmake --build . {{cmake_arguments}}
```

- Run cmake build in current directory with extra build tool arguments:

```
sfdk cmake --build . -- {{build_tool_arguments}}
```

sfdk compiledb

Generate compilation database.

More information: https://github.com/sailfishos/sailfish-qtcreator/blob/master/share/qtcreator/sfdk/modules/70-ide-compiledb/doc/command.compiledb.adoc.

- Generate compilation database:

```
sfdk compiledb
```

- Generate compilation database with extra `make` arguments:

```
sfdk compiledb {{arguments}}
```

sfdk config

Configure sfdk.

More information: https://github.com/sailfishos/sailfish-qtcreator/blob/master/share/qtcreator/sfdk/modules/10-general/doc/command.config.adoc.

- Show configuration in all scopes:

```
sfdk config --show
```

- Set a configuration value:

```
sfdk config {{name}}={{value}}
```

- Mask an option as empty:

```
sfdk config {{name}}=
```

- Mask an option as empty without pushing it at the inner scope:

```
sfdk config {{name}}
```

- Clear option value:

```
sfdk --drop {{name}}
```

- Run subcommand in specified scope:

```
sfdk config --{{global|session|command}} {{subcommand}}
```

sfdk deploy

Deploy build results to a device.

More information: https://github.com/sailfishos/sailfish-qtcreator/blob/master/share/qtcreator/sfdk/modules/50-testing-mb2/doc/command.deploy.adoc.

- Deploy using a specified method:

```
sfdk deploy --{{pkcon|rsync|sdk|zypper|zypper-dup|manual}}
```

- Simulate a deployment without applying the changes:

```
sfdk deploy --{{method}} {{[-n|--dry-run]}}
```

- Deploy files in `glob` pattern `package*`:

```
sfdk deploy --{{method}} "+package*"
```

- Deploy all files excluding `ignore*`:

```
sfdk deploy --{{method}} "-ignore*"
```

- Undeploy using a specified method:

```
sfdk undeploy --{{pkcon|rpm|rsync|sdk|zypper}}
```

sfdk device

Maintain and control registered devices.

More information: https://docs.sailfishos.org/Develop/Apps/Tutorials/Building_packages_-_advanced_techniques/#running-the-sample-application-in-the-emulator.

- Display the registered devices:

```
sfdk device list
```

- Execute a command on a device by name or index:

```
sfdk device exec {{device_name_or_idx}} {{command}}
```

- Run an interactive shell on a device by name or index:

```
sfdk device exec {{device_name_or_idx}}
```

sfdk emulator device-model-list

The examples for this command have been moved together with **`sfdk emulator device-model-show`**.

- View documentation for `sfdk emulator device-model-show`:

  ```
  tldr sfdk emulator device-model-show
  ```

sfdk emulator device-model-show

Show emulated device model's properties.

More information: https://github.com/sailfishos/sailfish-qtcreator/blob/master/share/qtcreator/sfdk/modules/40-testing-maintain/doc/command.emulator.adoc.

- Show a model properties:

```
sfdk emulator device-model-show {{model}}
```

- Display available device models:

```
sfdk emulator device-model-list
```

sfdk emulator install

Install emulators.

More information: https://docs.sailfishos.org/Tools/Sailfish_SDK/Early_Access/#early-access-build-targets-and-emulator.

- Install an emulator:

```
sfdk emulator install {{name}}
```

- Remove an emulator:

```
sfdk emulator remove {{name}}
```

- Display the available emulators:

```
sfdk emulator list {{[-a|--available]}}
```

- Display the installed emulators:

```
sfdk emulator list
```

sfdk emulator remove

The examples for this command have been moved together with **`sfdk emulator install`**.

- View documentation for `sfdk emulator install`:

  ```
  tldr sfdk emulator install
  ```

sfdk emulator

Maintain and control emulators.

More information: https://github.com/sailfishos/sailfish-qtcreator/blob/master/share/qtcreator/sfdk/modules/40-testing-maintain/doc/command.emulator.adoc.

- Display the installed emulators:

```
sfdk emulator list
```

- Start an emulator:

```
sfdk emulator start {{name}}
```

- Stop an emulator:

```
sfdk emulator stop {{name}}
```

- Display emulator status:

```
sfdk emulator status {{name}}
```

- Run an interactive shell on an emulator:

```
sfdk emulator exec {{emulator}}
```

- Execute a command on an emulator:

```
sfdk emulator exec {{emulator}} {{command}}
```

- Set a property:

```
sfdk emulator set {{name}} {{property}}={{value}}
```

- Show emulator properties:

```
sfdk emulator show {{name}}
```

sfdk engine

Maintain and control the build engine.

More information: https://github.com/sailfishos/sailfish-qtcreator/blob/master/share/qtcreator/sfdk/modules/30-building-maintain/doc/command.engine.adoc.

- Start the build engine:

```
sfdk engine start
```

- Stop the build engine:

```
sfdk engine stop
```

- Show the build engine status:

```
sfdk engine status
```

- Set an engine property:

```
sfdk engine set {{property}}={{value}}
```

- Show the engine properties:

```
sfdk engine show
```

- Execute a command on the build engine:

```
sfdk engine exec {{command}}
```

- Start an interactive shell on the build engine:

```
sfdk engine exec
```

sfdk init

Initialize a new project.

More information: https://github.com/sailfishos/sailfish-qtcreator/blob/master/share/qtcreator/sfdk/modules/15-building-init/doc/command.init.adoc.

- Initialize a new project of the given type:

```
sfdk init {{[-t|--type]}} {{type}}
```

- Initialize a new project with a specified builder:

```
sfdk init {{[-t|--type]}} {{type}} {{[-b|--builder]}} {{builder}}
```

- Initialize a new project ignoring non-empty directory:

```
sfdk init {{[-t|--type]}} {{type}} --force
```

- List available project types:

```
sfdk init {{[-l|--list-types]}}
```

sfdk maintain

Launch the interactive SDK Maintenance tool.

More information: https://github.com/sailfishos/sailfish-qtcreator/blob/master/share/qtcreator/sfdk/modules/10-general/doc/command.maintain.adoc.

- Launch SDK Maintenance tool:

```
sfdk maintain
```

sfdk make-install

Execute make-install build step.

More information: https://docs.sailfishos.org/Develop/Apps/Tutorials/Building_packages_-_advanced_techniques/#building-the-sample-application.

- Run make-install section of RPM SPEC file:

```
sfdk make-install
```

sfdk make

Execute make build step.

More information: https://github.com/sailfishos/sailfish-qtcreator/blob/master/share/qtcreator/sfdk/modules/20-building-mb2/doc/command.make.adoc.

- Run make build:

```
sfdk make
```

- Run make with extra arguments:

```
sfdk make {{arguments}}
```

sfdk package

Execute package creation build step.

More information: https://github.com/sailfishos/sailfish-qtcreator/blob/master/share/qtcreator/sfdk/modules/20-building-mb2/doc/command.package.adoc.

- Create a package:

  ```
  sfdk package
  ```

- Create a package without executing the check section in RPM SPEC file:

  ```
  sfdk package --no-check
  ```

- Create and sign a package:

  ```
  sfdk package --sign
  ```

sfdk prepare

Execute preparation build step.

More information: https://github.com/sailfishos/sailfish-qtcreator/blob/master/share/qtcreator/sfdk/modules/20-building-mb2/doc/command.prepare.adoc.

- Prepare sources using the recipe from RPM SPEC file:

```
sfdk prepare
```

sfdk qmake

Execute qmake build step.

More information: https://github.com/sailfishos/sailfish-qtcreator/blob/master/share/qtcreator/sfdk/modules/20-building-mb2/doc/command.qmake.adoc.

- Run qmake build:

```
sfdk qmake
```

- Run shadow qmake build in a specified project:

```
sfdk qmake {{project}}
```

- Run build with extra qmake arguments:

```
sfdk qmake -- {{arguments}}
```

- Run shadow qmake build with extra qmake arguments:

```
sfdk qmake {{project}} {{arguments}}
```

sfdk qmltypes

Generate qmltypes files.

More information: https://github.com/sailfishos/sailfish-qtcreator/blob/master/share/qtcreator/sfdk/modules/80-ide-qmltypes/doc/command.qmltypes.adoc.

- Generate qmltypes files:

```
sfdk qmltypes
```

- Generate qmltypes files without deploying them (usually to emulator):

```
sfdk qmltypes --no-deploy
```

- Generate qmltypes files without restoring the emulator after deployment:

```
sfdk qmltypes --no-restore-emulator
```

- Generate qmltypes files and restore the emulator after deployment even on failure:

```
sfdk qmltypes --restore-emulator
```

- Generate qmltypes files without reverting changes which only include removal of statements with `sdk-make-qmltypes:keep` in comments:

```
sfdk qmltypes --no-keep
```

sfdk scrape

Convert source code modifications to patches.

More information: https://github.com/sailfishos/sailfish-qtcreator/blob/master/share/qtcreator/sfdk/modules/65-maintaining-mb2/doc/command.scrape.adoc.

- Save source modifications as patches:

```
sfdk scrape
```

- Simulate saving modifications as patches, listing the commits that would be converted:

```
sfdk scrape {{[-n|--dry-run]}}
```

- Scrape while preserving the original patches file names:

```
sfdk scrape --stable
```

- Scrape while saving patches to a specified output directory:

```
sfdk scrape {{[-o|--output-dir]}} {{directory}}
```

- Scrape without removing commits from submodules after creating patches:

```
sfdk scrape --keep
```

sfdk undeploy

Undeploy build results from a device.

More information: https://github.com/sailfishos/sailfish-qtcreator/blob/master/share/qtcreator/sfdk/modules/50-testing-mb2/doc/command.undeploy.adoc.

- Undeploy using a specified method:

```
sfdk undeploy --{{pkcon|rpm|rsync|sdk|zypper}}
```

- Simulate an undeployment without applying the changes:

```
sfdk undeploy --{{method}} {{[-n|--dry-run]}}
```

- Undeploy files in `glob` pattern `package*`:

```
sfdk undeploy --{{method}} "+package*"
```

- Undeploy all files excluding `ignore*`:

```
sfdk undeploy --{{method}} "-ignore*"
```

sfdk

Frontend of the Sailfish SDK.

Some subcommands such as **`init`**, **`build-init`**, **`device`**, etc. have their own usage documentation.

More information: https://github.com/sailfishos/sailfish-qtcreator/blob/master/share/qtcreator/sfdk/modules/10-general/doc/module.adoc.

- Set up the current environment for building for SailfishOS with a specific version and architecture target:

```
sfdk config target=SailfishOS-{{5.0.0.62}}-{{aarch64}}
```

- Initialize the current directory as the build directory:

```
sfdk build-init
```

- Execute build steps of the RPM SPEC file for a specific project:

```
sfdk -C {{path/to/project}} build
```

- List repositories in the SailfishOS 5.0.0.62 armv7hl build target:

```
sfdk -c 'target=SailfishOS-5.0.0.62-armv7hl' build-shell --maintain ssu lr
```

- Deploy the package to the emulator:

```
sfdk config device="{{Sailfish OS Emulator 5.0.0.62}}"; sfdk deploy --sdk
```

- Display help:

```
sfdk --help
```

- Display help for specific topic:

```
sfdk --help-{{building|testing|maintaining|ide|all}}
```

- Display version:

```
sfdk --version
```

sfdp

Render an image of a **scaled force-directed** network graph from a **graphviz** file.

Layouts: **dot**, **neato**, **twopi**, **circo**, **fdp**, **sfdp**, **osage** & **patchwork**.

More information: https://graphviz.org/doc/info/command.html.

- Render a PNG image with a filename based on the input filename and output format (uppercase -O):

```
sfdp -T {{png}} -O {{path/to/input.gv}}
```

- Render a SVG image with the specified output filename (lowercase -o):

```
sfdp -T {{svg}} -o {{path/to/image.svg}} {{path/to/input.gv}}
```

- Render the output in PS, PDF, SVG, Fig, PNG, GIF, JPEG, JSON, or DOT format:

```
sfdp -T {{format}} -O {{path/to/input.gv}}
```

- Render a GIF image using `stdin` and `stdout`:

```
echo "{{digraph {this -> that} }}" | sfdp -T {{gif}} >
{{path/to/image.gif}}
```

- Display help:

```
sfdp -?
```

sftp

Secure File Transfer Program.

Interactive program to copy files between hosts over SSH.

For non-interactive file transfers, see **`scp`** or **`rsync`**.

More information: https://manned.org/sftp.

- Connect to a remote server and enter an interactive command mode:

```
sftp {{remote_user}}@{{remote_host}}
```

- Connect using an alternate port:

```
sftp -P {{remote_port}} {{remote_user}}@{{remote_host}}
```

- Connect using a predefined host (in `~/.ssh/config`):

```
sftp {{host}}
```

- [Interactive] Transfer remote file to the local system:

```
get {{path/to/remote_file}}
```

- [Interactive] Transfer local file to the remote system:

```
put {{path/to/local_file}}
```

- [Interactive] Transfer remote directory to the local system recursively (works with `put` too):

```
get -R {{path/to/remote_directory}}
```

- [Interactive] Get list of files on local machine:

```
lls
```

- [Interactive] Get a list of files on the remote machine:

```
ls
```

sg

Ast-grep is a tool for code structural search, lint, and rewriting.

More information: https://ast-grep.github.io/guide/introduction.html.

- Scan for possible queries using interactive mode:

```
sg scan --interactive
```

- Rewrite code in the current directory using patterns:

```
sg run --pattern '{{pattern}}' --rewrite '{{replacement}}' --lang {{python}}
```

- Visualize possible changes without applying them:

```
sg run --pattern '{{useState<number>($A)}}' --rewrite '{{useState($A)}}' --lang {{typescript}}
```

- Output results as JSON, extract information using `jq`, and interactively view it using `jless`:

```
sg run --pattern '{{Some($A)}}' --rewrite '{{None}}' --json | jq '{{.[].replacement}}' | jless
```

sg_raw

Send arbitrary SCSI command to a connected device.

More information: https://manned.org/sg_raw.

- Send a command to an optical SCSI device assigned to `sr0` to load the media in its tray:

```
sg_raw /dev/sr0 EA 00 00 00 00 01
```

- Read data from `IFILE` instead of `stdin`:

```
sg_raw {{[-i|--infile]}} {{path/to/IFILE}} {{/dev/sgX}}
{{scsi_command}}
```

- Skip the first `LEN` bytes of input data:

```
sg_raw {{[-k|--skip]}} {{LEN}} {{/dev/sgX}} {{scsi_command}}
```

- Read `SLEN` bytes of data and send to the device:

```
sg_raw {{[-s|--send]}} {{SLEN}} {{/dev/sgX}} {{scsi_command}}
```

- Wait up to `SEC` seconds for `sg_raw` to finish processing:

```
sg_raw {{[-t|--timeout]}} {{SEC}} {{/dev/sgX}}
{{scsi_command}}
```

- Increase verbosity level by 1:

```
sg_raw {{[-v|--verbose]}} {{/dev/sgX}} {{scsi_command}}
```

- Dump returned data in binary form:

```
sg_raw {{[-b|--binary]}} {{/dev/sgX}} {{scsi_command}}
```

- Write data received from the specified device to an `OFILE`:

```
sg_raw {{[-o|--outfile]}} {{path/to/OFILE}} {{/dev/sgX}}
{{scsi_command}}
```

sgdisk

Manage GUID Partition Tables (GPT).

Part of the GPT fdisk suite; designed for scripting and automation.

More information: https://manned.org/sgdisk.

- Display basic GPT partition summary data for a device:

```
sudo sgdisk {{[-p|--print]}} {{/dev/sdX}}
```

- Wipe both GPT and MBR data structures from a device (destroys all partition information):

```
sudo sgdisk {{[-Z|--zap-all]}} {{/dev/sdX}}
```

- Convert a GPT disk to MBR format using up to four partitions:

```
sudo sgdisk {{[-m|--gpttombr]}} {{1:2:3:4}} {{/dev/sdX}}
```

- Delete a partition entry by number (data in sectors remains untouched):

```
sudo sgdisk {{[-d|--delete]}} {{1}} {{/dev/sdX}}
```

- Save the current in-memory GPT data (protective MBR, headers, and table) to a binary backup file:

```
sudo sgdisk {{[-b|--backup]}} {{/path/to/backup.gpt}} {{/dev/sdX}}
```

- Load GPT data from a backup file (restoring from a non-original disk is not recommended):

```
sudo sgdisk {{[-l|--load-backup]}} {{/path/to/backup.gpt}} {{/dev/sdX}}
```

- Verify GPT structures for CRC errors, mismatches, or inconsistencies:

```
sudo sgdisk {{[-v|--verify]}} {{/dev/sdX}}
```

- Display a summary of available partition type codes (no device required):

```
sgdisk {{[-L|--list-types]}}
```

sgitopnm

Convert an SGI file to a PNM file.

More information: https://netpbm.sourceforge.net/doc/sgitopnm.html.

- Convert an SGI image to a PNM file:

```
sgitopnm {{path/to/input.sgi}} > {{path/to/output.pnm}}
```

- Display information about the SGI file:

```
sgitopnm {{[-verb|-verbose]}} {{path/to/input.sgi}} > {{path/to/output.pnm}}
```

- Extract channel n of the SGI file:

```
sgitopnm {{[-c|-channel]}} {{n}} {{path/to/input.sgi}} > {{path/to/output.pnm}}
```

sgpt

Productivity tool powered by OpenAI's GPT models.

More information: https://github.com/TheR1D/shell_gpt#readme.

- Use it as a search engine, asking for the mass of the sun:

```
sgpt "{{mass of the sun}}"
```

- Execute Shell commands, and apply `chmod 444` to all files in the current directory:

```
sgpt --shell "{{make all files in current directory read only}}"
```

- Generate code, solving classic fizz buzz problem:

```
sgpt --code "{{solve fizz buzz problem using Python}}"
```

- Start a chat session with a unique session name:

```
sgpt --chat {{session_name}} "{{please remember my favorite number: 4}}"
```

- Start a REPL (Read-eval-print loop) session:

```
sgpt --repl {{command}}
```

- Display help:

```
sgpt --help
```

sh

Bourne shell, the standard command language interpreter.

See also: `!`, `^`.

More information: https://manned.org/sh.

- Start an interactive shell session:

```
sh
```

- Execute a command and then exit:

```
sh -c "{{command}}"
```

- Execute a script:

```
sh {{path/to/script.sh}}
```

- Read and execute commands from `stdin`:

```
sh -s
```

sha1sum

Calculate SHA1 cryptographic checksums.

More information: https://www.gnu.org/software/coreutils/manual/html_node/sha1sum-invocation.html.

- Calculate the SHA1 checksum for one or more files:

```
sha1sum {{path/to/file1 path/to/file2 ...}}
```

- Calculate and save the list of SHA1 checksums to a file:

```
sha1sum {{path/to/file1 path/to/file2 ...}} > {{path/to/file.sha1}}
```

- Calculate a SHA1 checksum from `stdin`:

```
{{command}} | sha1sum
```

- Read a file of SHA1 checksums and filenames and verify all files have matching checksums:

```
sha1sum {{[-c|--check]}} {{path/to/file.sha1}}
```

- Only show a message for missing files or when verification fails:

```
sha1sum {{[-c|--check]}} --quiet {{path/to/file.sha1}}
```

- Only show a message when verification fails, ignoring missing files:

```
sha1sum --ignore-missing {{[-c|--check]}} --quiet {{path/to/file.sha1}}
```

- Check a known SHA1 checksum of a file:

```
echo {{known_sha1_checksum_of_the_file}} {{path/to/file}} | sha1sum {{[-c|--check]}}
```

sha224sum

Calculate SHA224 cryptographic checksums.

More information: https://www.gnu.org/software/coreutils/manual/html_node/sha2-utilities.html.

- Calculate the SHA224 checksum for one or more files:

```
sha224sum {{path/to/file1 path/to/file2 ...}}
```

- Calculate and save the list of SHA224 checksums to a file:

```
sha224sum {{path/to/file1 path/to/file2 ...}} > {{path/to/file.sha224}}
```

- Calculate a SHA224 checksum from `stdin`:

```
{{command}} | sha224sum
```

- Read a file of SHA224 checksums and filenames and verify all files have matching checksums:

```
sha224sum {{[-c|--check]}} {{path/to/file.sha224}}
```

- Only show a message for missing files or when verification fails:

```
sha224sum {{[-c|--check]}} --quiet {{path/to/file.sha224}}
```

- Only show a message when verification fails, ignoring missing files:

```
sha224sum --ignore-missing {{[-c|--check]}} --quiet {{path/to/file.sha224}}
```

- Check a known SHA224 checksum of a file:

```
echo {{known_sha224_checksum_of_the_file}} {{path/to/file}} | sha224sum {{[-c|--check]}}
```

sha256sum

Calculate SHA256 cryptographic checksums.

More information: https://www.gnu.org/software/coreutils/manual/html_node/sha2-utilities.html.

- Calculate the SHA256 checksum for one or more files:

```
sha256sum {{path/to/file1 path/to/file2 ...}}
```

- Calculate and save the list of SHA256 checksums to a file:

```
sha256sum {{path/to/file1 path/to/file2 ...}} > {{path/to/file.sha256}}
```

- Calculate a SHA256 checksum from `stdin`:

```
{{command}} | sha256sum
```

- Read a file of SHA256 checksums and filenames and verify all files have matching checksums:

```
sha256sum {{[-c|--check]}} {{path/to/file.sha256}}
```

- Only show a message for missing files or when verification fails:

```
sha256sum {{[-c|--check]}} --quiet {{path/to/file.sha256}}
```

- Only show a message when verification fails, ignoring missing files:

```
sha256sum --ignore-missing {{[-c|--check]}} --quiet {{path/to/file.sha256}}
```

- Check a known SHA256 checksum of a file:

```
echo {{known_sha256_checksum_of_the_file}} {{path/to/file}} | sha256sum {{[-c|--check]}}
```

sha384sum

Calculate SHA384 cryptographic checksums.

More information: https://www.gnu.org/software/coreutils/manual/html_node/sha2-utilities.html.

- Calculate the SHA384 checksum for one or more files:

```
sha384sum {{path/to/file1 path/to/file2 ...}}
```

- Calculate and save the list of SHA384 checksums to a file:

```
sha384sum {{path/to/file1 path/to/file2 ...}} > {{path/to/file.sha384}}
```

- Calculate a SHA384 checksum from `stdin`:

```
{{command}} | sha384sum
```

- Read a file of SHA384 checksums and filenames and verify all files have matching checksums:

```
sha384sum {{[-c|--check]}} {{path/to/file.sha384}}
```

- Only show a message for missing files or when verification fails:

```
sha384sum {{[-c|--check]}} --quiet {{path/to/file.sha384}}
```

- Only show a message when verification fails, ignoring missing files:

```
sha384sum --ignore-missing {{[-c|--check]}} --quiet {{path/to/file.sha384}}
```

- Check a known SHA384 checksum of a file:

```
echo {{known_sha384_checksum_of_the_file}} {{path/to/file}} | sha384sum {{[-c|--check]}}
```

sha512sum

Calculate SHA512 cryptographic checksums.

More information: https://www.gnu.org/software/coreutils/manual/html_node/sha2-utilities.html.

- Calculate the SHA512 checksum for one or more files:

```
sha512sum {{path/to/file1 path/to/file2 ...}}
```

- Calculate and save the list of SHA512 checksums to a file:

```
sha512sum {{path/to/file1 path/to/file2 ...}} > {{path/to/file.sha512}}
```

- Calculate a SHA512 checksum from `stdin`:

```
{{command}} | sha512sum
```

- Read a file of SHA512 checksums and filenames and verify all files have matching checksums:

```
sha512sum {{[-c|--check]}} {{path/to/file.sha512}}
```

- Only show a message for missing files or when verification fails:

```
sha512sum {{[-c|--check]}} --quiet {{path/to/file.sha512}}
```

- Only show a message when verification fails, ignoring missing files:

```
sha512sum --ignore-missing {{[-c|--check]}} --quiet {{path/to/file.sha512}}
```

- Check a known SHA512 checksum of a file:

```
echo {{known_sha512_checksum_of_the_file}} {{path/to/file}} | sha512sum {{[-c|--check]}}
```

shar

Create a shell archive.

More information: https://manned.org/shar.

- Create a shell script that when executed extracts the given files from itself:

```
shar {{path/to/file1 path/to/file2 ...}} > {{path/to/
archive.sh}}
```

shards

Dependency management tool for the Crystal language.

More information: https://crystal-lang.org/reference/the_shards_command.

- Create a skeleton `shard.yml` file:

```
shards init
```

- Install dependencies from a `shard.yml` file:

```
shards install
```

- Update all dependencies:

```
shards update
```

- List all installed dependencies:

```
shards list
```

- Display version of dependency:

```
shards version {{path/to/dependency_directory}}
```

shasum

Calculate SHA cryptographic checksums.

More information: https://manned.org/shasum.

- Calculate the SHA1 checksum for one or more files:

```
shasum {{path/to/file1 path/to/file2 ...}}
```

- Calculate the SHA checksum for one or more files with the specified algorithm:

```
shasum --algorithm {{1|224|256|384|512|512224|512256}} {{path/to/file1 path/to/file2 ...}}
```

- Calculate a SHA1 checksum from `stdin`:

```
{{command}} | shasum
```

- Calculate and save the list of SHA256 checksums to a file:

```
shasum --algorithm 256 {{path/to/file1 path/to/file2 ...}} > {{path/to/file.sha256}}
```

- Read a file of SHA checksums and filenames and verify all files have matching checksums (the algorithm will be automatically detected):

```
shasum {{[-c|--check]}} {{path/to/file}}
```

- Only show a message for missing files or when verification fails:

```
shasum {{[-c|--check]}} --quiet {{path/to/file}}
```

- Only show a message when verification fails, ignoring missing files:

```
shasum --ignore-missing {{[-c|--check]}} --quiet {{path/to/file}}
```

- Check a known SHA checksum of a file (Note: two spaces separating checksum and path):

```
echo '{{known_sha_checksum_of_the_file}} {{path/to/file}}' | shasum {{[-c|--check]}}
```

shc

Generic shell script compiler.

More information: https://manned.org/shc.

- Compile a shell script:

```
shc -f {{script}}
```

- Compile a shell script and specify an output binary file:

```
shc -f {{script}} -o {{binary}}
```

- Compile a shell script and set an expiration date for the executable:

```
shc -f {{script}} -e {{dd/mm/yyyy}}
```

- Compile a shell script and set a message to display upon expiration:

```
shc -f {{script}} -e {{dd/mm/yyyy}} -m "{{Please contact your provider}}"
```

shellcheck

Statically check shell scripts for errors, usage of deprecated/insecure features, and bad practices.

More information: https://github.com/koalaman/shellcheck/wiki.

- Check a shell script:

```
shellcheck {{path/to/script.sh}}
```

- Check a shell script interpreting it as the specified shell dialect (overrides the shebang at the top of the script):

```
shellcheck {{[-s|--shell]}} {{sh|bash|dash|ksh}} {{path/to/script.sh}}
```

- Ignore one or more error types:

```
shellcheck {{[-e|--exclude]}} {{SC1009,SC1073,...}} {{path/to/script.sh}}
```

- Also check any sourced shell scripts:

```
shellcheck {{[-a|--check-sourced]}} {{path/to/script.sh}}
```

- Display output in the specified format (defaults to `tty`):

```
shellcheck {{[-f|--format]}} {{tty|checkstyle|diff|gcc|json|json1|quiet}} {{path/to/script.sh}}
```

- Enable one or more [o]ptional checks:

```
shellcheck {{[-o|--enable]}} {{add-default-case,avoid-nullary-conditions,...}} {{path/to/script.sh}}
```

- List all available optional checks that are disabled by default:

```
shellcheck --list-optional
```

- Adjust the level of severity to consider (defaults to `style`):

```
shellcheck {{[-S|--severity]}} {{error|warning|info|style}} {{path/to/script.sh}}
```

sherlock

Find usernames across social networks.

See also: **`maigret`**.

More information: https://github.com/sherlock-project/sherlock.

- Search for a specific username on social networks saving the results to a file:

```
sherlock {{username}} --output {{path/to/file}}
```

- Search for specific usernames on social networks saving the results into a directory:

```
sherlock {{username1 username2 ...}} --folderoutput {{path/to/directory}}
```

- Search for a specific username on social networks using the Tor network:

```
sherlock --tor {{username}}
```

- Make requests over Tor with a new Tor circuit after each request:

```
sherlock --unique-tor {{username}}
```

- Search for a specific username on social networks using a proxy:

```
sherlock {{username}} --proxy {{proxy_url}}
```

- Search for a specific username on social networks and open results in the default web browser:

```
sherlock {{username}} --browse
```

- Display help:

```
sherlock --help
```

shfmt

Shell parser, formatter, and interpreter.

More information: https://pkg.go.dev/mvdan.cc/sh#section-readme.

- Print a formatted version of a shell script:

```
shfmt {{path/to/file}}
```

- List unformatted files:

```
shfmt {{[-l|--list]}} {{path/to/directory}}
```

- Write the result to the file instead of printing it to the terminal:

```
shfmt {{[-w|--write]}} {{path/to/file}}
```

- Simplify the code, removing redundant pieces of syntax (e.g. removing "$" from vars in expressions):

```
shfmt {{[-s|--simplify]}} {{path/to/file}}
```

- Specify the amount of spaces to use for indentation (0 for tabs, which is also the default):

```
shfmt {{[-i|--indent]}} {{4}} {{path/to/file}}
```

- Format the code according to Google's style guide:

```
shfmt {{[-i|--indent]}} 2 {{[-ci|--case-indent]}} {{[-w|--write]}} {{path/to/file}}
```

shift

Move positional parameters.

More information: https://www.gnu.org/software/bash/manual/bash.html#index-shift.

- Remove the first positional parameter:

```
shift
```

- Remove the first `n` positional parameters:

```
shift {{n}}
```

shiori

Simple bookmark manager built with Go.

More information: https://github.com/go-shiori/shiori/blob/master/docs/Usage.md.

- Import bookmarks from HTML Netscape bookmark format file:

  ```
  shiori import {{path/to/bookmarks.html}}
  ```

- Save the specified URL as bookmark:

  ```
  shiori add {{url}}
  ```

- List the saved bookmarks:

  ```
  shiori print
  ```

- Open the saved bookmark in a browser:

  ```
  shiori open {{bookmark_id}}
  ```

- Start the web interface for managing bookmarks at port 8181:

  ```
  shiori serve --port 8181
  ```

shopt

Manage Bash shell options: variables (stored in **`$BASHOPTS`**) that control behavior specific to the Bash shell.

Generic POSIX shell variables (stored in **`$SHELLOPTS`**) are managed with the **`set`** command instead.

More information: https://www.gnu.org/software/bash/manual/bash.html#The-Shopt-Builtin.

- List all settable options and whether they are set:

```
shopt
```

- Set an option:

```
shopt -s {{option_name}}
```

- Unset an option:

```
shopt -u {{option_name}}
```

- Print a list of all options and their status formatted as runnable `shopt` commands:

```
shopt -p
```

- Display help:

```
help shopt
```

shotcut

A program for video editing.

More information: https://shotcut.org/notes/command-line-options/.

- Start Shotcut:

```
shotcut
```

- Open audio/video files:

```
shotcut {{path/to/file1 path/to/file2 ...}}
```

- Start with a specific audio driver:

```
shotcut --SDL_AUDIODRIVER "{{pulseaudio}}"
```

- Start in fullscreen:

```
shotcut --fullscreen
```

- Start with GPU processing:

```
shotcut --gpu
```

showfigfonts

Display available figlet fonts.

See also: **`figlet`**.

More information: https://manned.org/showfigfonts.

- Display available fonts:

```
showfigfonts
```

- Display available fonts using a specific text:

```
showfigfonts {{input_text}}
```

showmount

Display mount information for an NFS server.

More information: https://manned.org/showmount.

- Show clients currently mounting from the server:

```
showmount {{hostname}}
```

- Show the NFS server's export list:

```
showmount {{[-e|--exports]}} {{hostname}}
```

- Show all clients and their mounted directories:

```
showmount {{[-a|--all]}} {{hostname}}
```

- Show only the directories mounted by clients:

```
showmount {{[-d|--directories]}} {{hostname}}
```

- Show the export list without headers:

```
showmount {{[-e|--exports]}} --no-headers {{hostname}}
```

- Display help:

```
showmount {{[-h|--help]}}
```

shpool

Create and attach to persistent shell sessions.

See also: **`tmux`**, **`screen`**.

More information: https://github.com/shell-pool/shpool#usage.

- Create a new session or attach to an existing one:

```
shpool attach {{session_name}}
```

- List existing sessions:

```
shpool list
```

- Detach from the current session:

```
shpool detach
```

- Detach from a session:

```
shpool detach {{session_name}}
```

- Kill a named session:

```
shpool kill {{session_name}}
```

- Start the `shpool` daemon:

```
shpool daemon
```

shred

Overwrite files to securely delete data.

More information: https://www.gnu.org/software/coreutils/manual/html_node/shred-invocation.html.

- Overwrite a file:

```
shred {{path/to/file}}
```

- Overwrite a file and show progress on the screen:

```
shred {{[-v|--verbose]}} {{path/to/file}}
```

- Overwrite a file, leaving zeros instead of random data:

```
shred {{[-z|--zero]}} {{path/to/file}}
```

- Overwrite a file a specific number of times:

```
shred {{[-n|--iterations]}} {{25}} {{path/to/file}}
```

- Overwrite a file and remove it:

```
shred {{[-u|--remove]}} {{path/to/file}}
```

- Overwrite a file 100 times, add a final overwrite with zeros, remove the file after overwriting it, and show verbose progress on the screen:

```
shred {{[-vzu|--verbose --zero --remove]}} {{[-n|--iterations]}} 100 {{path/to/file}}
```

shuf

Generate random permutations.

More information: https://www.gnu.org/software/coreutils/manual/html_node/shuf-invocation.html.

- Randomize the order of lines in a file and output the result:

```
shuf {{path/to/file}}
```

- Only output the first 5 entries of the result:

```
shuf {{[-n|--head-count]}} 5 {{path/to/file}}
```

- Write the output to another file:

```
shuf {{path/to/input_file}} {{[-o|--output]}} {{path/to/output_file}}
```

- Generate 3 random numbers in the range 1-10 (inclusive, numbers can repeat):

```
shuf {{[-n|--head-count]}} 3 {{[-i|--input-range]}} 1-10 {{[-r|--repeat]}}
```

siege

HTTP loadtesting and benchmarking tool.

More information: https://www.joedog.org/siege/manual/.

- Test a URL with default settings:

```
siege {{https://example.com}}
```

- Test a list of URLs:

```
siege {{[-f|--file]}} {{path/to/url_list.txt}}
```

- Test list of URLs in a random order (Simulates internet traffic):

```
siege {{[-i|--internet]}} {{[-f|--file]}} {{path/to/
url_list.txt}}
```

- Benchmark a list of URLs (without waiting between requests):

```
siege {{[-b|--benchmark]}} {{[-f|--file]}} {{path/to/
url_list.txt}}
```

- Set the amount of concurrent connections:

```
siege {{[-c|--concurrent]}} {{50}} {{[-f|--file]}} {{path/to/
url_list.txt}}
```

- Set how long for the siege to run for:

```
siege {{[-t|--time]}} {{30s}} {{[-f|--file]}} {{path/to/
url_list.txt}}
```

silicon

Create an image of source code.

See also: **`freeze`**.

More information: https://github.com/Aloxaf/silicon#examples.

- Generate an image from a specific source file:

```
silicon {{path/to/source_file}} {{[-o|--output]}} {{path/to/output_image}}
```

- Generate an image from a source file with a specific programming language syntax highlighting (e.g. `rust`, `py`, `js`, etc.):

```
silicon {{path/to/source_file}} {{[-o|--output]}} {{path/to/output_image}} {{[-l|--language]}} {{language|extension}}
```

- Do not generate window decorations in the image:

```
silicon {{path/to/source_file}} {{[-o|--output]}} {{path/to/output_image}} --no-window-controls
```

- Generate an image from `stdin`:

```
{{command}} | silicon {{[-o|--output]}} {{path/to/output_image}}
```

- Display help:

```
silicon {{[-h|--help]}}
```

simple-mtpfs

Mount MTP devices (like Android phones) as a filesystem using FUSE.

More information: https://manned.org/simple-mtpfs.

- List available MTP devices:

```
simple-mtpfs {{[-l|--list-devices]}}
```

- Mount a device to a directory:

```
simple-mtpfs {{path/to/mount_point}}
```

- Mount a specific device to a directory (useful when multiple devices are connected):

```
simple-mtpfs --device {{number}} {{path/to/mount_point}}
```

- Unmount the filesystem:

```
umount {{path/to/mount_point}}
```

simplehttpserver

A simple HTTP/S server that supports file upload, basic authentication, and YAML rules for custom responses.

A Go alternative to Python's **`http.server`**.

More information: https://github.com/projectdiscovery/simplehttpserver.

- Start the HTTP server serving the current directory with verbose output (listen on all interfaces and port 8000 by default):

```
simplehttpserver -verbose
```

- Start the HTTP server with basic authentication serving a specific path over port 80 on all interfaces:

```
sudo simplehttpserver -basic-auth {{username}}:{{password}} -path {{/var/www/html}} -listen 0.0.0.0:80
```

- Start the HTTP server, enabling HTTPS using a self-signed certificate with custom SAN on all interfaces:

```
sudo simplehttpserver -https -domain {{*.selfsigned.com}} -listen 0.0.0.0:443
```

- Start the HTTP server with custom response headers and upload capability:

```
simplehttpserver -upload -header '{{X-Powered-By: Go}}' -header '{{Server: SimpleHTTPServer}}'
```

- Start the HTTP server with customizable rules in YAML (see documentation for DSL):

```
simplehttpserver -rules {{rules.yaml}}
```

sindresorhus

Sindre Sorhus's personal CLI.

More information: https://github.com/sindresorhus/sindresorhus-cli.

- Start Sindre's interactive CLI:

```
sindresorhus
```

singularity

Manage Singularity containers and images.

More information: https://singularity-docs.readthedocs.io/en/latest/#commands.

- Download a remote image from Sylabs Cloud:

```
singularity pull --name {{image.sif}} {{library://godlovedc/funny/lolcow:latest}}
```

- Rebuild a remote image using the latest Singularity image format:

```
singularity build {{image.sif}} {{docker://godlovedc/lolcow}}
```

- Start a container from an image and get a shell inside it:

```
singularity shell {{image.sif}}
```

- Start a container from an image and run a command:

```
singularity exec {{image.sif}} {{command}}
```

- Start a container from an image and execute the internal runscript:

```
singularity run {{image.sif}}
```

- Build a singularity image from a recipe file:

```
sudo singularity build {{image.sif}} {{recipe}}
```

sipcalc

Calculate IP subnet information for IPv4 and IPv6 addresses.

See also: **`ipcalc`**.

More information: https://manned.org/sipcalc.

- Display subnet information for an IPv4 CIDR address:

```
sipcalc {{192.168.1.0/24}}
```

- Display all available information for an address:

```
sipcalc {{[-a|--all]}} {{192.168.1.0/24}}
```

- Split an IPv4 network into subnets of a specified mask:

```
sipcalc {{[-s|--v4split]}} {{255.255.255.128}}
{{192.168.1.0/24}}
```

- Display IPv6 reverse DNS information:

```
sipcalc {{[-r|--v6rev]}} {{2001:db8::/32}}
```

- Enable DNS name resolution:

```
sipcalc {{[-d|--resolve]}} {{192.168.1.0/24}}
```

- Display help:

```
sipcalc {{[-h|--help]}}
```

sirtopnm

Convert a Solitaire Image Recorder file to a PNM file.

More information: https://netpbm.sourceforge.net/doc/sirtopnm.html.

- Convert a SIR image to a PNM file:

```
sirtopnm {{path/to/input.sir}} > {{path/to/output.pnm}}
```

sk

Fuzzy finder written in Rust.

Similar to **`fzf`**.

More information: https://github.com/skim-rs/skim.

- Start `skim` on all files in the specified directory:

```
find {{path/to/directory}} -type f | sk
```

- Start `skim` for running processes:

```
ps aux | sk
```

- Start `skim` with a specified query:

```
sk --query "{{query}}"
```

- Select multiple files with `<Shift Tab>` and write to a file:

```
find {{path/to/directory}} -type f | sk --multi > {{path/to/file}}
```

skaffold

Facilitate continuous development for Kubernetes applications.

More information: https://skaffold.dev/docs/references/cli/.

- Build the artifacts:

  ```
  skaffold build {{[-f|--filename]}} {{skaffold.yaml}}
  ```

- Build and deploy your app every time your code changes:

  ```
  skaffold dev {{[-f|--filename]}} {{skaffold.yaml}}
  ```

- Run a pipeline file:

  ```
  skaffold run {{[-f|--filename]}} {{skaffold.yaml}}
  ```

- Run a diagnostic on Skaffold:

  ```
  skaffold diagnose {{[-f|--filename]}} {{skaffold.yaml}}
  ```

- Deploy the artifacts:

  ```
  skaffold deploy {{[-f|--filename]}} {{skaffold.yaml}}
  ```

skate

Simple and powerful key-value store.

More information: https://manned.org/skate.

- Store a key and a value on the default database:

```
skate set "{{key}}" "{{value}}"
```

- Show your keys saved on the default database:

```
skate list
```

- Delete key and value from the default database:

```
skate delete "{{key}}"
```

- Create a new key and value in a new database:

```
skate set "{{key}}"@"{{database_name}}" "{{value}}"
```

- Show your keys saved in a non default database:

```
skate list @"{{database_name}}"
```

- Delete key and value from a specific database:

```
skate delete "{{key}}"@"{{database_name}}"
```

- Show the databases available:

```
skate list-dbs
```

- Delete local db and pull down fresh copy from Charm Cloud:

```
skate reset @"{{database_name}}"
```

skicka

Manage your Google Drive.

More information: https://github.com/google/skicka#usage.

- Upload a file/folder to Google Drive:

```
skicka upload {{path/to/local}} {{path/to/remote}}
```

- Download a file/folder from Google Drive:

```
skicka download {{path/to/remote}} {{path/to/local}}
```

- List files:

```
skicka ls {{path/to/folder}}
```

- Show amount of space used by children folders:

```
skicka du {{path/to/parent_folder}}
```

- Create a folder:

```
skicka mkdir {{path/to/folder}}
```

- Delete a file:

```
skicka rm {{path/to/file}}
```

skills

Manage reusable agent skills across AI coding agents.

More information: https://github.com/vercel-labs/skills.

- Search for skills interactively or by keyword:

```
skills {{[f|find]}} {{keyword}}
```

- List all installed skills:

```
skills {{[ls|list]}}
```

- Install all skills from a repository:

```
skills {{[a|add]}} {{owner}}/{{repo}}
```

- Install specific skills to particular agents:

```
skills {{[a|add]}} {{owner}}/{{repo}} {{[-s|--skill]}}
{{skill_name}} {{[-a|--agent]}} {{agent_name}}
```

- Remove installed skills:

```
skills {{[rm|remove]}} {{skill_name}}
```

- Update all installed skills:

```
skills update
```

- Create a new `SKILL.md` template:

```
skills init {{skill_name}}
```

skopeo

Container image management toolbox.

Provides various utility commands to manage remote container images.

More information: https://github.com/containers/skopeo/blob/main/docs/skopeo.1.md.

- Inspect a remote image from a registry:

```
skopeo inspect docker://{{registry_hostname}}/{{image:tag}}
```

- List available tags for a remote image:

```
skopeo list-tags docker://{{registry_hostname}}/{{image}}
```

- Download an image from a registry:

```
skopeo copy docker://{{registry_hostname}}/{{image:tag}} dir:{{path/to/directory}}
```

- Copy an image from one registry to another:

```
skopeo copy docker://{{source_registry}}/{{image:tag}} docker://{{destination_registry}}/{{image:tag}}
```

- Delete an image from a registry:

```
skopeo delete docker://{{registry_hostname}}/{{image:tag}}
```

- Log in to a registry:

```
skopeo login --username {{username}} {{registry_hostname}}
```

sl

Steam locomotive running through your terminal.

More information: https://github.com/mtoyoda/sl.

- Let a steam locomotive run through your terminal:

```
sl
```

- Make the train burn and people scream:

```
sl -a
```

- Let the train fly:

```
sl -F
```

- Make the train little:

```
sl -l
```

- Let the user exit (<Ctrl c>):

```
sl -e
```

slackcat

Utility for passing files and command output to Slack.

More information: https://github.com/bcicen/slackcat#usage.

- Post a file to Slack:

```
slackcat {{[-c|--channel]}} {{channel_name}} {{path/to/file}}
```

- Post a file to Slack with a custom filename:

```
slackcat {{[-c|--channel]}} {{channel_name}} {{[-n|--
filename]}} {{filename}} {{path/to/file}}
```

- Pipe command output to Slack as a text snippet:

```
{{command}} | slackcat {{[-c|--channel]}} {{channel_name}}
{{[-n|--filename]}} {{snippet_name}}
```

- Stream command output to Slack continuously:

```
{{command}} | slackcat {{[-c|--channel]}} {{channel_name}}
{{[-s|--stream]}}
```

sldtoppm

Convert an AutoCAD slide file to a PPM image.

More information: https://netpbm.sourceforge.net/doc/sldtoppm.html.

- Convert an SLD file to a PPM image:

```
sldtoppm {{path/to/input.sld}} > {{path/to/output.ppm}}
```

- Compensate for non-square pixels by scaling the width of the image:

```
sldtoppm {{[-a|-adjust]}} {{path/to/input.sld}} > {{path/to/output.ppm}}
```

sleep

Delay for a specified amount of time.

More information: https://manned.org/sleep.

- Delay in seconds:

```
sleep {{seconds}}
```

- Execute a specific command after 20 seconds delay:

```
sleep 20 && {{command}}
```

slideshow

Make presentation slides in the Racket language.

More information: https://docs.racket-lang.org/slideshow.

- Display a default slide with options to run the tutorial or load a `.rkt` presentation file:

  ```
  slideshow
  ```

- Start a presentation in full screen:

  ```
  slideshow {{path/to/presentation.rkt}}
  ```

- Display the presentation window with a title bar and resize border:

  ```
  slideshow --keep-titlebar {{path/to/presentation.rkt}}
  ```

- Set the width and height (in pixels) of the presentation window:

  ```
  slideshow {{[-s|--size]}} {{width}} {{height}} {{path/to/presentation.rkt}}
  ```

- Export a presentation to a PDF file:

  ```
  slideshow {{[-D|--pdf]}} -o {{path/to/presentation.pdf}} {{path/to/presentation.rkt}}
  ```

slim

Analyze and optimize Docker images.

More information: https://github.com/slimtoolkit/slim#usage-details.

- Start Slim on interactive mode:

```
slim
```

- Analyze Docker layers from a specific image:

```
slim xray --target {{image:tag}}
```

- Lint a Dockerfile:

```
slim lint --target {{path/to/Dockerfile}}
```

- Analyze and generate an optimized Docker image:

```
slim build {{image:tag}}
```

- Display help for a subcommand:

```
slim {{subcommand}} --help
```

slimrb

Convert Slim files to HTML.

More information: https://rubydoc.info/gems/slim/frames#slim-command-slimrb.

- Convert a Slim file to HTML:

```
slimrb {{input.slim}} {{output.html}}
```

- Convert a Slim file and output to prettified HTML:

```
slimrb --pretty {{input.slim}} {{output.html}}
```

- Convert a Slim file to ERB:

```
slimrb --erb {{input.slim}} {{output.erb}}
```

slocate

Secure variant of GNU Locate.

See also: **`locate`**.

More information: https://manned.org/slocate.

- Enable quiet mode to suppress error messages:

```
slocate -q
```

- Limit the number of results shown:

```
slocate -n {{number}}
```

- Build an `slocate` database starting at path `/`:

```
slocate -u
```

- Build an `slocate` database starting at a given directory:

```
slocate -U {{path/to/directory}}
```

- Update an `slocate` database using the default `/etc/updatedb.conf` configuration:

```
slocate -c
```

- Set the security level of `slocate`, with `0` being disabled, and `1` being secure:

```
slocate -l {{0|1}}
```

- Specify the database that `slocate` should search in:

```
slocate {{[-d|--database]}} {{path/to/directory}}
```

- Search the `slocate` database using a specific `regex` string:

```
slocate {{[-r|--regexp]}} {{regex}}
```

smalltalkci

Framework for testing Smalltalk projects with GitHub Actions, Travis CI, AppVeyor, GitLab CI, and others.

More information: https://github.com/hpi-swa/smalltalkCI.

- Run tests for a configuration file:

  ```
  smalltalkci {{path/to/.smalltalk.ston}}
  ```

- Run tests for the `.smalltalk.ston` configuration in the current directory:

  ```
  smalltalkci
  ```

- Debug tests in headful mode (show VM window):

  ```
  smalltalkci --headful
  ```

- Download and prepare a well-known smalltalk image for the tests:

  ```
  smalltalkci --smalltalk {{Squeak64-Trunk}}
  ```

- Specify a custom Smalltalk image and VM:

  ```
  smalltalkci --image {{path/to/Smalltalk.image}} --vm {{path/to/vm}}
  ```

- Clean up caches and delete builds:

  ```
  smalltalkci --clean
  ```

smartctl

Monitor disk health including SMART data.

More information: https://manned.org/smartctl.

- Display SMART health summary:

```
sudo smartctl {{[-H|--health]}} {{/dev/sdX}}
```

- Display device information:

```
sudo smartctl {{[-i|--info]}} {{/dev/sdX}}
```

- Start a short/long self-test in the background:

```
sudo smartctl {{[-t|--test]}} {{short|long}} {{/dev/sdX}}
```

- Display the self-test log:

```
sudo smartctl {{[-l|--log]}} selftest
```

- Display current/last self-test status and other SMART capabilities:

```
sudo smartctl {{[-c|--capabilities]}} {{/dev/sdX}}
```

- Display exhaustive SMART data:

```
sudo smartctl {{[-a|--all]}} {{/dev/sdX}}
```

smbclient

FTP-like client to access SMB/CIFS resources on servers.

More information: https://manned.org/smbclient.

- List available shares on a server anonymously:

```
smbclient {{[-L|--list]}} {{server}} --no-pass
```

- Connect to a share (will prompt for a password):

```
smbclient //{{server}}/{{share}}
```

- Connect to a share as a specific user:

```
smbclient {{[-U|--user]}} {{domain/username}} //{{server}}/
{{share}}
```

- Connect to a share as a specific user with inline password:

```
smbclient {{[-U|--user]}} {{domain/username%password}} //
{{server}}/{{share}}
```

- Connect to a share using a specific workgroup:

```
smbclient {{[-W|--workgroup]}} {{domain}} {{[-U|--user]}}
{{username}} //{{server}}/{{share}}
```

- Download a file from a specific directory on a share:

```
smbclient {{[-U|--user]}} {{domain/username}} //{{server}}/
{{share}} {{[-D|--directory]}} {{path/to/directory}} {{[-c|--
command]}} 'get {{filename}}'
```

- Upload a file to a specific directory on a share:

```
smbclient {{[-U|--user]}} {{domain/username}} //{{server}}/
{{share}} {{[-D|--directory]}} {{path/to/directory}} {{[-c|--
command]}} 'put {{path/to/local_file}}'
```

smbclient.py

Interact with SMB servers.

Part of the Impacket suite.

More information: https://github.com/fortra/impacket.

- Connect to an SMB server with username and password:

```
smbclient.py {{domain}}/{{username}}:{{password}}@{{target}}
```

- Connect using NTLM hashes for authentication:

```
smbclient.py -hashes {{LM_HASH}}:{{NT_HASH}} {{domain}}/
{{username}}@{{target}}
```

- Connect using Kerberos authentication:

```
smbclient.py -k {{domain}}/{{username}}@{{target}}
```

- Connect specifying a domain controller IP:

```
smbclient.py -dc-ip {{domain_controller_ip}} {{domain}}/
{{username}}:{{password}}@{{target}}
```

- Connect to a specific target IP instead of NetBIOS name:

```
smbclient.py -target-ip {{target_ip}} {{domain}}/
{{username}}:{{password}}@{{target}}
```

- Connect to a non-standard SMB port:

```
smbclient.py -port {{port}} {{domain}}/{{username}}:
{{password}}@{{target}}
```

- Execute commands from an input file in the SMB shell:

```
smbclient.py -inputfile {{path/to/input_file}} {{domain}}/
{{username}}:{{password}}@{{target}}
```

- Log SMB client commands to an output file:

```
smbclient.py -outputfile {{path/to/output_file}} {{domain}}/
{{username}}:{{password}}@{{target}}
```

smbmap

Enumerate samba share drives across an entire domain.

More information: https://github.com/ShawnDEvans/smbmap#help.

- Enumerate hosts with NULL sessions enabled and open shares:

```
smbmap --host-file {{path/to/file}}
```

- Display SMB shares and permissions on a [H]ost, prompting for user's password or NTLM hash:

```
smbmap {{[-u|--username]}} {{username}} --prompt -H
{{ip_address}}
```

- Execute a shell command on a remote system:

```
smbmap {{[-u|--username]}} {{username}} --prompt -H
{{ip_address}} -x {{command}}
```

- Enumerate hosts and check SMB file permissions:

```
smbmap --host-file {{path/to/file}} {{[-u|--username]}}
{{username}} {{[-p|--password]}} {{password}} -q
```

- Connect to an ip or hostname through smb using a username and password:

```
smbmap {{[-u|--username]}} {{username}} {{[-p|--password]}}
{{password}} -d {{domain}} -H {{ip_or_hostname}}
```

- Locate and download files [R]ecursively up to n levels depth, searching for filename pattern (regex), and excluding certain shares:

```
smbmap --host-file {{path/to/file}} {{[-u|--username]}}
{{username}} {{[-p|--password]}} {{password}} -q -R --depth
{{n}} --exclude {{sharename}} -A {{filepattern}}
```

- Upload file through smb using username and password:

```
smbmap {{[-u|--username]}} {{username}} {{[-p|--password]}}
{{password}} -d {{domain}} -H {{ip_or_hostname}} --upload
{{path/to/file}} '{{/share_name/remote_filename}}'
```

- Display SMB shares and recursively list directories and files, searching for file content matching a regex:

```
smbmap {{[-u|--username]}} {{username}} --prompt -H
{{ip_address}} -R -F {{pattern}}
```

smbserver.py

Host SMB shares.

Part of the Impacket suite.

More information: https://github.com/fortra/impacket.

- Set up a basic SMB share:

```
smbserver.py {{sharename}} {{path/to/share}}
```

- Set up a share with a custom comment:

```
smbserver.py -comment {{my_share}} {{sharename}} {{path/to/share}}
```

- Set up a share with username and password authentication:

```
smbserver.py -username {{username}} -password {{password}} {{sharename}} {{path/to/share}}
```

- Set up a share with NTLM hash authentication:

```
smbserver.py -hashes {{LMHASH}}:{{NTHASH}} {{sharename}} {{path/to/share}}
```

- Set up a share on a specific interface:

```
smbserver.py {{[-ip|--interface-address]}} {{interface_ip_address}} {{sharename}} {{path/to/share}}
```

- Set up a share on a non-standard SMB port:

```
smbserver.py -port {{port}} {{sharename}} {{path/to/share}}
```

- Set up a share with SMB2 support:

```
smbserver.py -smb2support {{sharename}} {{path/to/share}}
```

- Set up a share and log commands to an output file:

```
smbserver.py -outputfile {{path/to/output_file}} {{sharename}} {{path/to/share}}
```

sn

Mono StrongName utility for signing and verifying IL assemblies.

More information: https://manned.org/sn.

- Generate a new StrongNaming key:

```
sn -k {{path/to/key.snk}}
```

- Re-sign an assembly with the specified private key:

```
sn -R {{path/to/assembly.dll}} {{path/to/key_pair.snk}}
```

- Show the public key of the private key that was used to sign an assembly:

```
sn -T {{path/to/assembly.exe}}
```

- Extract the public key to a file:

```
sn -e {{path/to/assembly.dll}} {{path/to/output.pub}}
```

snakefmt

Format Snakemake files.

More information: https://github.com/snakemake/snakefmt#usage.

- Format a specific Snakefile:

```
snakefmt {{path/to/snakefile}}
```

- Format all Snakefiles recursively in a specific directory:

```
snakefmt {{path/to/directory}}
```

- Format a file using a specific configuration file:

```
snakefmt --config {{path/to/config.toml}} {{path/to/
snakefile}}
```

- Format a file using a specific maximum line length:

```
snakefmt --line-length {{100}} {{path/to/snakefile}}
```

- Simulate formatting and display the changes that would be made:

```
snakefmt --diff {{path/to/snakefile}}
```

sngrep

Display SIP calls message flows from terminal.

More information: https://manned.org/sngrep.

- Visualize SIP packets from a PCAP file:

```
sngrep -I {{path/to/file.pcap}}
```

- Visualize only dialogs starting with INVITE packets with RTP packets from a PCAP file:

```
sngrep -crI {{path/to/file.pcap}}
```

- Display a real-time interface with only dialogs starting with INVITE packets, including RTP packets:

```
sngrep -cr
```

- Only capture packets without interface to a file:

```
sngrep -NO {{path/to/file.pcap}}
```

sniff.py

Capture and display network packets using the **pcapy** library.

Part of the Impacket suite.

More information: https://github.com/fortra/impacket.

- List available network interfaces and select one to start capturing packets (requires `sudo`):

```
sudo sniff.py
```

- Capture packets and save output to a file while displaying it on the terminal:

```
sudo sniff.py | sudo tee {{path/to/output_file}}
```

sniffer.py

Capture and display network packets for specified protocols using raw sockets.

Part of the Impacket suite.

More information: https://github.com/fortra/impacket.

- Capture packets for default protocols (ICMP, TCP, UDP):

  ```
  sniffer.py
  ```

- Capture packets for specific protocols (e.g., ICMP, TCP):

  ```
  sniffer.py {{protocol1 protocol2 ...}}
  ```

- Capture packets for specific protocols (e.g., TCP):

  ```
  sniffer.py tcp
  ```

snmpbulkget

Query the next value in the MIB tree and all of its adjacent values.

More information: https://manned.org/snmpbulkget.

- Request the next value from the SNMP agent:

```
snmpbulkget -v {{version}} -c {{community}} {{ip_address}}
{{oid}}
```

- Display the full Object Identifier (OID) path:

```
snmpbulkget -v {{version}} -c {{community}} -O f
{{ip_address}} {{oid}}
```

- Display help:

```
snmpbulkget {{[-h|--help]}}
```

snmpdf

Fetch disk space usage information.

More information: https://manned.org/snmpdf.

- Fetch the disk space usage:

```
snmpdf -v {{version}} -c {{community}} {{ip_address}}
```

- Display help:

```
snmpdf {{[-h|--help]}}
```

snmpget

Query using the SNMP protocol.

More information: https://manned.org/snmpget.

- Request a single value from the SNMP agent:

```
snmpget -v {{version}} -c {{community}} {{ip_address}}
{{oid}}
```

- Display the full Object Identifier (OID) path:

```
snmpget -v {{version}} -c {{community}} -O f {{ip_address}}
{{oid}}
```

- Display help:

```
snmpget {{[-h|--help]}}
```

snmpgetnext

Query the next value in the MIB tree.

More information: https://manned.org/snmpgetnext.

- Request the next value from the SNMP agent:

```
snmpgetnext -v {{version}} -c {{community}} {{ip_address}}
{{oid}}
```

- Display the full Object Identifier (OID) path:

```
snmpgetnext -v {{version}} -c {{community}} -O f
{{ip_address}} {{oid}}
```

- Display help:

```
snmpgetnext {{[-h|--help]}}
```

snmpnetstat

Fetch networking status using SNMP.

More information: https://manned.org/snmpnetstat.

- Fetch the networking status:

```
snmpnetstat -v {{version}} -c {{community}} {{ip_address}}
```

- Display help:

```
snmpnetstat {{[-h|--help]}}
```

snmpset

Set a value using the SNMP protocol.

More information: https://manned.org/snmpset.

- Set a value:

```
snmpset -v {{version}} -c {{community}} {{ip_address}}
{{oid}} {{value_type}} {{value}}
```

- Display help:

```
snmpset {{[-h|--help]}}
```

snmpstatus

Fetch fixed MIB status values.

More information: https://manned.org/snmpstatus.

- Fetch the values:

```
snmpstatus -v {{version}} -c {{community}} {{ip_address}}
```

- Display help:

```
snmpstatus {{[-h|--help]}}
```

snmptable

Fetch data in tabular format.

More information: https://manned.org/snmptable.

- Fetch data:

```
snmptable -v {{version}} -c {{community}} {{ip_address}} {{oid}}
```

- Display help:

```
snmptable {{[-h|--help]}}
```

snmptest

Start an interactive SNMP prompt.

More information: https://manned.org/snmptest.

- Start the prompt:

```
snmptest -v {{version}} -c {{community}} {{ip_address}}
```

- Display help:

```
snmptest {{[-h|--help]}}
```

snmpwalk

SNMP query tool.

More information: https://manned.org/snmpwalk.

- Query the system information of a remote host using SNMPv1 and a community string:

```
snmpwalk -v 1 -c {{community}} {{ip_address}}
```

- Query system information on a remote host by OID using SNMPv2 on a specified port:

```
snmpwalk -v 2c -c {{community}} {{ip_address}}:{{port}} {{oid}}
```

- Query system information on a remote host by OID using SNMPv3 and authentication without encryption:

```
snmpwalk -v 3 -l {{authNoPriv}} -u {{username}} -a {{MD5|SHA}} -A {{passphrase}} {{ip_address}} {{oid}}
```

- Query system information on a remote host by OID using SNMPv3, authentication, and encryption:

```
snmpwalk -v 3 -l {{authPriv}} -u {{username}} -a {{MD5|SHA}} -A {{auth_passphrase}} -x {{DES|AES}} -X {{enc_passphrase}} {{ip_address}} {{oid}}
```

- Query system information on a remote host by OID using SNMPv3 without authentication or encryption:

```
snmpwalk -v 3 -l {{noAuthNoPriv}} -u {{username}} {{ip_address}} {{oid}}
```

- Display help:

```
snmpwalk {{[-h|--help]}}
```

snort

Open-source network intrusion detection system.

More information: https://www.snort.org/#documents.

- Capture packets with verbose output:

```
sudo snort -v -i {{interface}}
```

- Capture packets and dump application layer data with verbose output:

```
sudo snort -vd -i {{interface}}
```

- Capture packets and display link layer packet headers with verbose output:

```
sudo snort -ve -i {{interface}}
```

- Capture packets and save them in the specified directory:

```
sudo snort -i {{interface}} -l {{path/to/directory}}
```

- Capture packets according to rules and save offending packets along with alerts:

```
sudo snort -i {{interface}} -c {{path/to/rules.conf}} -l
{{path/to/directory}}
```

snowsql

SnowSQL client for Snowflake's Data Cloud.

More information: https://docs.snowflake.com/en/user-guide/snowsql.

- Connect to a specific instance at https://account.snowflakecomputing.com (password can be provided in prompt or configuration file):

```
snowsql --accountname {{account}} --username {{username}} --dbname {{database}} --schemaname {{schema}}
```

- Connect to an instance specified by a specific configuration file (defaults to `~/.snowsql/config`):

```
snowsql --config {{path/to/configuration_file}}
```

- Connect to the default instance using a token for multi-factor authentication:

```
snowsql --mfa-passcode {{token}}
```

- Execute a single SQL query or SnowSQL command on the default connection (useful in shell scripts):

```
snowsql --query '{{query}}'
```

- Execute commands from a specific file on the default connection:

```
snowsql --filename {{path/to/file.sql}}
```

snyk

Find vulnerabilities in your code and remediate risks.

More information: https://docs.snyk.io/developer-tools/snyk-cli/commands.

- Log in to your Snyk account:

```
snyk auth
```

- Test your code for any known vulnerabilities:

```
snyk test
```

- Test a local Docker image for any known vulnerabilities:

```
snyk test --docker {{docker_image}}
```

- Record the state of dependencies and any vulnerabilities on snyk.io:

```
snyk monitor
```

- Auto patch and ignore vulnerabilities:

```
snyk wizard
```

socat

Multipurpose relay (SOcket CAT).

More information: http://www.dest-unreach.org/socat/.

- Listen to a port, wait for an incoming connection, and transfer data to STDIO:

```
sudo socat - TCP-LISTEN:8080,fork
```

- Listen on a port using SSL and print to `stdout`:

```
sudo socat OPENSSL-LISTEN:4433,reuseaddr,cert=./
cert.pem,cafile=./ca.cert.pem,key=./key.pem,verify=0 STDOUT
```

- Create a connection to a host and port, transfer data in STDIO to connected host:

```
sudo socat - TCP4:www.example.com:80
```

- Forward incoming data of a local port to another host and port:

```
sudo socat TCP-LISTEN:80,fork TCP4:www.example.com:80
```

- Send data with multicast routing scheme:

```
{{echo "Hello Multicast"}} | socat - UDP4-DATAGRAM:
{{224.0.0.1}}:{{5000}}
```

- Receive data from a multicast:

```
socat - UDP4-RECVFROM:{{5000}}
```

soffice

CLI for the powerful and free LibreOffice suite.

More information: https://help.libreoffice.org/latest/en-US/text/shared/guide/pdf_params.html.

- Open one or more files in read-only mode:

```
soffice --view {{path/to/file1 path/to/file2 ...}}
```

- Display the content of one or more files:

```
soffice --cat {{path/to/file1 path/to/file2 ...}}
```

- Print files using a specific printer:

```
soffice --pt {{printer_name}} {{path/to/file1 path/to/file2 ...}}
```

- Convert all `.doc` files in the current directory to PDF:

```
soffice --convert-to pdf *.doc
```

solcjs

A set of JavaScript bindings for the Solidity compiler.

More information: https://github.com/argotorg/solc-js.

- Compile a specific contract to hex:

```
solcjs --bin {{path/to/file.sol}}
```

- Compile the ABI of a specific contract:

```
solcjs --abi {{path/to/file.sol}}
```

- Specify a base path to resolve imports from:

```
solcjs --bin --base-path {{path/to/directory}} {{path/to/
file.sol}}
```

- Specify one or more paths to include containing external code:

```
solcjs --bin --include-path {{path/to/directory path/to/
file.sol ...}}
```

- Optimize the generated bytecode:

```
solcjs --bin --optimize {{path/to/file.sol}}
```

solo

Interact with Solo hardware security keys.

More information: https://github.com/solokeys/solo1-cli.

- List connected Solos:

  ```
  solo ls
  ```

- Update the currently connected Solo's firmware to the latest version:

  ```
  solo key update
  ```

- Blink the LED of a specific Solo:

  ```
  solo key wink --serial {{serial_number}}
  ```

- Generate random bytes using the currently connected Solo's secure random number generator:

  ```
  solo key rng raw
  ```

- Monitor the serial output of a Solo:

  ```
  solo monitor {{path/to/serial_port}}
  ```

sonar-scanner

A generic scanner for SonarQube projects that do not use build tools such as Maven, Gradle, or Ant.

More information: https://docs.sonarsource.com/sonarqube-server/analyzing-source-code/scanners/sonarscanner.

- Scan a project with configuration file in your project's root directory named `sonar-project.properties`:

  ```
  sonar-scanner
  ```

- Scan a project using configuration file other than `sonar-project.properties`:

  ```
  sonar-scanner {{[-D|--define]}} {{project.settings=myproject.properties}}
  ```

- Print debugging information:

  ```
  sonar-scanner {{[-X|--debug]}}
  ```

- Display help:

  ```
  sonar-scanner {{[-h|--help]}}
  ```

sops

SOPS (Secrets OPerationS): a simple and flexible tool for managing secrets.

More information: https://github.com/getsops/sops.

- Encrypt a file:

```
sops -e {{path/to/file.json}} > {{path/to/file.enc.json}}
```

- Decrypt a file to `stdout`:

```
sops -d {{path/to/file.enc.json}}
```

- Update the declared keys in a `sops` file:

```
sops updatekeys {{path/to/file.enc.yaml}}
```

- Rotate data keys for a `sops` file:

```
sops -r {{path/to/file.enc.yaml}}
```

- Change the extension of the file once encrypted:

```
sops -d --input-type json {{path/to/file.enc.json}}
```

- Extract keys by naming them, and array elements by numbering them:

```
sops -d --extract '["an_array"][1]' {{path/to/file.enc.json}}
```

- Show the difference between two `sops` files:

```
diff <(sops -d {{path/to/secret1.enc.yaml}}) <(sops -d
{{path/to/secret2.enc.yaml}})
```

sort

Sort lines of text files.

More information: https://www.gnu.org/software/coreutils/manual/html_node/sort-invocation.html.

- Sort a file in ascending order:

```
sort {{path/to/file}}
```

- Sort a file in descending order:

```
sort {{[-r|--reverse]}} {{path/to/file}}
```

- Sort a file in case-insensitive way:

```
sort {{[-f|--ignore-case]}} {{path/to/file}}
```

- Sort a file using numeric rather than alphabetic order:

```
sort {{[-n|--numeric-sort]}} {{path/to/file}}
```

- Sort `/etc/passwd` by the 3rd field onward of each line numerically, using `:` as a field separator:

```
sort {{[-t|--field-separator]}} : {{[-k|--key]}} 3n /etc/passwd
```

- Sort `/etc/passwd` numerically by the 3rd field, and when items in the 3rd field are equal, sort by the 4th field by numbers with exponents:

```
sort {{[-t|--field-separator]}} : {{[-k|--key]}} 3,3n {{[-k|--key]}} 4,4g /etc/passwd
```

- Sort a file preserving only unique lines:

```
sort {{[-u|--unique]}} {{path/to/file}}
```

- Sort a file, printing the output to the specified output file (can be used to sort a file in-place):

```
sort {{[-o|--output]}} {{path/to/output_file}} {{path/to/input_file}}
```

soupault

A static website generator based on HTML element tree rewriting.

It can also be used as an HTML post-processor or metadata extractor.

More information: https://soupault.net/reference-manual/.

- Initialize a minimal website project in the current working directory:

  ```
  soupault --init
  ```

- Build a website:

  ```
  soupault
  ```

- Override default configuration file and directory locations:

  ```
  soupault --config {{config_path}} --site-dir
  {{input_directory}} --build-dir {{output_directory}}
  ```

- Extract metadata into a JSON file without generating pages:

  ```
  soupault --index-only --dump-index-json {{path/to/file.json}}
  ```

- Show the effective configuration (values from `soupault.toml` plus defaults):

  ```
  soupault --show-effective-config
  ```

source

Execute commands from a file in the current shell.

More information: https://www.gnu.org/software/bash/manual/bash.html#index-source.

- Evaluate contents of a given file:

```
source {{path/to/file}}
```

- Evaluate a file with arguments:

```
source {{path/to/file}} {{argument1 argument2 ...}}
```

- Search and evaluate a file from `$PATH`:

```
source {{file}}
```

- Search and evaluate a file in a given set of directories:

```
source -p {{path/to/directory1:path/to/directory2:...}} {{file}}
```

- Evaluate contents of a given file (alternatively replacing `source` with `.`):

```
. {{path/to/file}}
```

sox

Sound eXchange: play, record, and convert audio files.

Audio formats are identified by the extension.

More information: https://manned.org/sox.

- Merge two audio files into one:

```
sox {{[-m|--combine mix]}} {{path/to/input_audio1}} {{path/to/input_audio2}} {{path/to/output_audio}}
```

- Trim an audio file to the specified times:

```
sox {{path/to/input_audio}} {{path/to/output_audio}} trim {{start}} {{duration}}
```

- Normalize an audio file (adjust volume to the maximum peak level, without clipping):

```
sox --norm {{path/to/input_audio}} {{path/to/output_audio}}
```

- Reverse and save an audio file:

```
sox {{path/to/input_audio}} {{path/to/output_audio}} reverse
```

- Print statistical data of an audio file:

```
sox {{path/to/input_audio}} {{[-n|--null]}} stat
```

- Increase the volume of an audio file by 2x:

```
sox {{[-v|--volume]}} 2.0 {{path/to/input_audio}} {{path/to/output_audio}}
```

soxi

SoXI - Sound eXchange Information, display sound file metadata.

More information: https://manned.org/soxi.

- Display the sound file metadata:

```
soxi {{path/to/file.wav}}
```

spark

The Laravel Spark tool.

More information: https://spark.laravel.com/.

- Register your API token:

  ```
  spark register {{token}}
  ```

- Display the currently registered API token:

  ```
  spark token
  ```

- Create a new Spark project:

  ```
  spark new {{project_name}}
  ```

- Create a new Spark project with Braintree stubs:

  ```
  spark new {{project_name}} --braintree
  ```

- Create a new Spark project with team-based billing stubs:

  ```
  spark new {{project_name}} --team-billing
  ```

spctoppm

Convert an Atari compressed Spectrum image to a PPM image.

More information: https://netpbm.sourceforge.net/doc/spctoppm.html.

- Convert an SPC file to a PPM image:

```
spctoppm {{path/to/input.spc}} > {{path/to/output.ppm}}
```

speak-ng

A multi-lingual software speech synthesizer.

See also: **`espeak-ng`**, **`espeak`**.

More information: https://github.com/espeak-ng/espeak-ng/blob/master/src/speak-ng.1.ronn.

- Speak a phrase aloud:

```
speak-ng "{{text}}"
```

- Speak text from `stdin`:

```
echo "{{text}}" | speak-ng
```

- Speak the contents of a [f]ile:

```
speak-ng -f {{path/to/file}}
```

- Speak using a specific [v]oice:

```
speak-ng -v {{voice}} "{{text}}"
```

- Speak at a specific [s]peed (default is 175) and [p]itch (default is 50):

```
speak-ng -s {{speed}} -p {{pitch}} "{{text}}"
```

- Output the audio to a [w]AV file instead of speaking it directly:

```
speak-ng -w {{path/to/output.wav}} "{{text}}"
```

- List all available voices:

```
speak-ng --voices
```

spectacle

KDE's screenshot utility.

More information: https://manned.org/spectacle.

- Capture a screenshot of the entire desktop:

```
spectacle
```

- Capture a screenshot of the active window:

```
spectacle {{[-a|--activewindow]}}
```

- Capture a screenshot of a specific region:

```
spectacle {{[-r|--region]}}
```

- Start another Spectacle instance so that you can screenshot Spectacle itself:

```
spectacle {{[-i|--new-instance]}}
```

speed-test

Test your internet connection speed and ping using https://speedtest.net.

More information: https://github.com/sindresorhus/speed-test.

- Test your internet connection and ping speed:

```
speed-test
```

- Print the results as JSON:

```
speed-test --json
```

- Print the results in megabytes per second (MBps):

```
speed-test --bytes
```

- Print more detailed information:

```
speed-test --verbose
```

speedcrunch

A high-precision scientific calculator.

More information: https://heldercorreia.bitbucket.io/speedcrunch/userguide/index.html.

- Start SpeedCrunch:

  `speedcrunch`

- Copy the result of the most recent calculation:

  `<Ctrl r>`

- Open the formula book:

  `<Ctrl 1>`

- Clear the calculator of recent calculations:

  `<Ctrl n>`

- Wrap highlighted in parentheses (defaults to wrapping all if nothing selected):

  `<Ctrl p>`

- Load a speedcrunch session:

  `<Ctrl l>`

- Save a speedcrunch session:

  `<Ctrl s>`

- Toggle keypad:

  `<Ctrl k>`

speedtest-cli

Test internet bandwidth using https://speedtest.net.

See also: **`speedtest`**.

More information: https://github.com/sivel/speedtest-cli.

- Run a speed test:

  `speedtest-cli`

- Run a speed test and display values in bytes, instead of bits:

  `speedtest-cli --bytes`

- Run a speed test using `HTTPS`, instead of `HTTP`:

  `speedtest-cli --secure`

- Run a speed test without performing download tests:

  `speedtest-cli --no-download`

- Run a speed test and generate an image of the results:

  `speedtest-cli --share`

- List all `speedtest.net` servers, sorted by distance:

  `speedtest-cli --list`

- Run a speed test to a specific speedtest.net server:

  `speedtest-cli --server {{server_id}}`

- Run a speed test and display the results as JSON (suppresses progress information):

  `speedtest-cli --json`

speedtest-rs

An unofficial Rust-based tool for testing network speeds using speedtest.net, limited to HTTP Legacy Fallback.

More information: https://github.com/nelsonjchen/speedtest-rs.

- Run a full speed test (download and upload):

  `speedtest-rs`

- Display a list of `speedtest.net` servers sorted by distance:

  `speedtest-rs --list`

- Run a download test only:

  `speedtest-rs --no-upload`

- Run an upload test only:

  `speedtest-rs --no-download`

- Generate a shareable link to the test results image:

  `speedtest-rs --share`

- Display basic output information only:

  `speedtest-rs --simple`

speedtest

Official command-line interface for testing internet bandwidth using https://speedtest.net.

These command examples apply only to the official client.

Note: Some platforms link **`speedtest`** to **`speedtest-cli`** or other tools like **`librespeed`**, which can also be installed as **`speedtest`** on certain Linux distributions.

More information: https://www.speedtest.net/apps/cli.

- Run a speed test:

```
speedtest
```

- Run a speed test and specify the unit of the output:

```
speedtest {{[-u|--unit]}} {{auto-decimal-bits|auto-decimal-bytes|auto-binary-bits|auto-binary-bytes}}
```

- Run a speed test and specify the output format:

```
speedtest {{[-f|--format]}} {{human-readable|csv|tsv|json|jsonl|json-pretty}}
```

- Run a speed test and specify the number of decimal points to use (0 to 8, defaults to 2):

```
speedtest {{[-P|--precision]}} {{precision}}
```

- Run a speed test and print its progress (only available for output format `human-readable` and `json`):

```
speedtest {{[-p|--progress]}} {{yes|no}}
```

- List all `speedtest.net` servers, sorted by distance:

```
speedtest {{[-L|--servers]}}
```

- Run a speed test to a specific `speedtest.net` server:

```
speedtest {{[-s|--server-id]}} {{server_id}}
```

spf

The superfile - Modern terminal file manager.

More information: https://github.com/yorukot/superfile.

- Launch `spf` with a specific path:

```
spf {{path/to/directory}}
```

- Launch `spf` with multiple paths:

```
spf {{path/to/directory1 path/to/directory2 ...}}
```

- Fix hotkey settings by appending missing keys:

```
spf {{[--fh|--fix-hotkeys]}}
```

- Fix the configuration file by appending missing entries:

```
spf {{[--fch|--fix-config-file]}}
```

- Use specific configuration and hotkey files:

```
spf {{[-c|--config-file]}} {{path/to/config.toml}} {{[--hf|--hotkey-file]}} {{path/to/hotkey.toml}}
```

- Write the path of the first selected file to this file and exit:

```
spf {{[--cf|--chooser-file]}} {{tmp/chooser-result}}
```

- Show internal configuration and data directory paths:

```
spf {{[pl|path-list]}}
```

spfquery

Query Sender Policy Framework records to validate e-mail senders.

More information: https://manned.org/spfquery.

- Check if an IP address is allowed to send an e-mail from the specified e-mail address:

```
spfquery -ip {{8.8.8.8}} -sender {{sender@example.com}}
```

- Turn on debugging output:

```
spfquery -ip {{8.8.8.8}} -sender {{sender@example.com}} --debug
```

sphinx-build

Sphinx documentation generator.

More information: https://www.sphinx-doc.org/en/master/man/sphinx-build.html.

- Build documentation:

```
sphinx-build {{[-b|--builder]}} {{html|epub|text|latex|
man|...}} {{path/to/source_directory}} {{path/to/
build_directory}}
```

- Build documentations intended for readthedocs.io (requires the sphinx-rtd-theme pip package):

```
sphinx-build {{[-b|--builder]}} {{html}} {{path/to/
docs_directory}} {{path/to/build_directory}}
```

spicetify

Customize the Spotify client UI and functionality.

More information: https://spicetify.app/docs/cli/.

- Generate a configuration file on very first run and display help:

  ```
  spicetify
  ```

- Back up and preprocess Spotify application files:

  ```
  spicetify backup
  ```

- Print all configuration fields and values:

  ```
  spicetify config
  ```

- Change the value of a configuration field:

  ```
  spicetify config {{field}} {{value}}
  ```

- Apply the customization changes to Spotify:

  ```
  spicetify apply
  ```

- Restore Spotify to its original state:

  ```
  spicetify restore
  ```

spike

A fully featured static website generator written in JavaScript.

More information: https://spike.readme.io/docs/command-line-interface.

- Create a new project using the default template:

  ```
  spike new {{project_name}}
  ```

- Compile your project, watch for changes, and auto-reload the browser:

  ```
  spike watch
  ```

- Compile your project once to the "public" directory:

  ```
  spike compile
  ```

- Remove the output directory:

  ```
  spike clean
  ```

split

Split a file into pieces.

More information: https://www.gnu.org/software/coreutils/manual/html_node/split-invocation.html.

- Split a file, each split having 10 lines (except the last split):

```
split {{[-l|--lines]}} 10 {{path/to/file}}
```

- Split a file into 5 files. File is split such that each split has same size (except the last split):

```
split {{[-n|--number]}} 5 {{path/to/file}}
```

- Split a file with 512 bytes in each split (except the last split; use 512k for kilobytes and 512m for megabytes):

```
split {{[-b|--bytes]}} 512 {{path/to/file}}
```

- Split a file with at most 512 bytes in each split without breaking lines:

```
split {{[-C|--line-bytes]}} 512 {{path/to/file}}
```

- Split into multiple files from `stdin`:

```
gzip {{[-cd|--stdout --decompress]}} {{path/to/
compressed_file.gz}} | split {{[-l|--lines]}} {{1000}} -
{{path/to/output}}
```

sponge

Soak up the input before writing the output file.

More information: https://manned.org/sponge.

- Append file content to the source file:

```
cat {{path/to/file}} | sponge -a {{path/to/file}}
```

- Remove all lines starting with # in a file:

```
grep {{[-v|--invert-match]}} '^{{#}}' {{path/to/file}} |
sponge {{path/to/file}}
```

spotdl

Download Spotify playlists and songs along with metadata.

More information: https://github.com/spotDL/spotify-downloader.

- Download songs from the provided URLs and embed metadata:

```
spotdl {{open.spotify.com/playlist/playlistId1
open.spotify.com/track/trackId2 ...}}
```

- Start a web interface to download individual songs:

```
spotdl web
```

- Save only the metadata without downloading anything:

```
spotdl save {{open.spotify.com/playlist/playlistId1
open.spotify.com/track/trackId2 ...}} --save-file {{path/to/
save_file.spotdl}}
```

spotify_player

A TUI Spotify client that implements all features of the official Spotify app.

More information: https://github.com/aome510/spotify-player#commands.

- Start a daemon that plays music in the background:

  ```
  spotify_player {{[-d|--daemon]}}
  ```

- Start the TUI (controls the daemon if available, otherwise starts its own client):

  ```
  spotify_player
  ```

- Use the specified theme:

  ```
  spotify_player {{[-t|--theme]}} {{theme_name}}
  ```

- Use configuration files (`app.toml`, `keymap.toml`, and `theme.toml`) in the specified directory:

  ```
  spotify_player {{[-c|--config-folder]}} {{path/to/directory}}
  ```

- Like the currently playing track:

  ```
  spotify_player like
  ```

- Display a list of keybindings:

  ```
  <?>
  ```

spottopgm

Convert a SPOT satellite image to PGM format.

More information: https://netpbm.sourceforge.net/doc/spottopgm.html.

- Convert the specified SPOT image to PGM format:

```
spottopgm {{path/to/file.spot}} > {{path/to/output.pgm}}
```

- Extract the specified color channel:

```
spottopgm -{{1|2|3}} {{path/to/file.spot}} > {{path/to/
output.pgm}}
```

- Extract the specified rectangle from the input image:

```
spottopgm {{first_col first_row last_col last_row}} {{path/
to/file.spot}} > {{path/to/output.pgm}}
```

sputoppm

Convert an Atari uncompressed Spectrum image to a PPM image.

More information: https://netpbm.sourceforge.net/doc/sputoppm.html.

- Convert an SPU file to a PPM image:

```
sputoppm {{path/to/input.spu}} > {{path/to/output.ppm}}
```

sq

A modern OpenPGP command-line tool.

See also: **gpg**.

More information: https://sequoia-pgp.gitlab.io/sequoia-sq/man/sq.1.html.

- Encrypt a file using a password (symmetric encryption):

```
sq encrypt --with-password --without-signature {{path/to/file}} --output {{path/to/file.pgp}}
```

- Decrypt a password-protected file:

```
sq decrypt {{path/to/file.pgp}} --output {{path/to/file}}
```

- Inspect an OpenPGP file to see its metadata and structure:

```
sq inspect {{path/to/file.pgp}}
```

- Verify a file with a detached signature and a certificate file:

```
sq verify --signer-file {{path/to/signer.asc}} --signature-file {{path/to/file.sig}} {{path/to/file}}
```

- Verify a file with an embedded (cleartext) signature and a certificate file:

```
sq verify --signer-file {{path/to/signer.asc}} --cleartext {{path/to/file}}
```

- Generate own key, and save it on the local key store:

```
sq key generate --own-key --name {{name}} --email {{name@example.com}}
```

- List all secret keys or certs managed by the local key store:

```
sq {{key|cert}} list
```

- List current configuration and storage paths:

```
sq config inspect paths
```

sqlfluff

Lint and auto-format SQL files across multiple dialects.

More information: https://docs.sqlfluff.com/en/stable/reference/cli.html.

- Lint a SQL file or directory with a specific dialect:

```
sqlfluff lint {{[-d|--dialect]}} {{dialect}} {{path/to/
file_or_directory}}
```

- Auto-format a SQL file or directory with a specific dialect:

```
sqlfluff format {{[-d|--dialect]}} {{dialect}} {{path/to/
file_or_directory}}
```

- Automatically fix linting violations in a SQL file or directory:

```
sqlfluff fix {{[-d|--dialect]}} {{dialect}} {{[-r|--rules]}}
{{rule1,rule2,...}} {{path/to/file_or_directory}}
```

- Parse a SQL file or directory and display the parse tree:

```
sqlfluff parse {{[-d|--dialect]}} {{dialect}} {{path/to/
file_or_directory}}
```

- Show all supported SQL dialects:

```
sqlfluff dialects
```

sqlite-utils

Manipulate SQLite databases in a number of different ways.

More information: https://sqlite-utils.datasette.io/en/stable/cli.html.

- Create a database:

```
sqlite-utils create-database {{path/to/database.db}}
```

- Create a table:

```
sqlite-utils create-table {{path/to/database.db}}
{{table_name}} {{id integer name text height float photo blob
--pk id}}
```

- List tables:

```
sqlite-utils tables {{path/to/database.db}}
```

- Upsert a record:

```
{{echo '[ {"id": 1, "name": "Linus Torvalds"}, {"id": 2,
"name": "Steve Wozniak"}, {"id": 3, "name": "Tony
Hoare"} ]'}} | sqlite-utils upsert {{path/to/database.db}}
{{table_name}} - {{--pk id}}
```

- Select records:

```
sqlite-utils rows {{path/to/database.db}} {{table_name}}
```

- Delete a record:

```
sqlite-utils query {{path/to/database.db}} "{{delete from
table_name where name = 'Tony Hoare'}}"
```

- Drop a table:

```
sqlite-utils drop-table {{path/to/database.db}}
{{table_name}}
```

- Display help:

```
sqlite-utils {{[-h|--help]}}
```

sqlite3

Interface to SQLite 3, which is a self-contained file-based embedded SQL engine.

More information: https://sqlite.org/cli.html.

- Start an interactive shell with a new database:

```
sqlite3
```

- Open an interactive shell against an existing database:

```
sqlite3 {{path/to/database.sqlite3}}
```

- Execute an SQL statement against a database and then exit:

```
sqlite3 {{path/to/database.sqlite3}} '{{SELECT * FROM some_table;}}'
```

sqlmap

Detect and exploit SQL injection flaws.

More information: https://github.com/sqlmapproject/sqlmap/wiki/Usage.

- Run sqlmap against a single target URL:

```
python sqlmap.py {{[-u|--url]}} "{{http://www.example.com/vuln.php?id=1}}"
```

- Send data in a POST request (`--data` implies POST request):

```
python sqlmap.py {{[-u|--url]}} "{{http://www.example.com/vuln.php}}" --data="{{id=1}}"
```

- Change the parameter delimiter (& is the default):

```
python sqlmap.py {{[-u|--url]}} "{{http://www.example.com/vuln.php}}" --data="{{query=foobar;id=1}}" --param-del="{{;}}"
```

- Select a random `User-Agent` from `./txt/user-agents.txt` and use it:

```
python sqlmap.py {{[-u|--url]}} "{{http://www.example.com/vuln.php}}" --random-agent
```

- Provide user credentials for HTTP protocol authentication:

```
python sqlmap.py {{[-u|--url]}} "{{http://www.example.com/vuln.php}}" --auth-type {{Basic}} --auth-cred "{{testuser:testpass}}"
```

sqlx

Utility for SQLx, the Rust SQL toolkit.

More information: https://github.com/launchbadge/sqlx/blob/main/sqlx-cli/README.md.

- Create the database specified in the `$DATABASE_URL` environment variable:

```
sqlx database create
```

- Drop the specified database:

```
sqlx database drop {{[-D|--database-url]}} {{database_url}}
```

- Create a new pair of up and down migration files with the given description in the "migrations" directory:

```
sqlx migrate add -r {{migration_description}}
```

- Run all pending migrations for the specified database:

```
sqlx migrate run {{[-D|--database-url]}} {{database_url}}
```

- Revert the latest migration for the specified database:

```
sqlx migrate revert {{[-D|--database-url]}} {{database_url}}
```

sqsc

An AWS Simple Queue Service client.

More information: https://github.com/yongfei25/sqsc.

- List all queues:

```
sqsc lq {{queue_prefix}}
```

- List all messages in a queue:

```
sqsc ls {{queue_name}}
```

- Copy all messages from one queue to another:

```
sqsc cp {{source_queue}} {{destination_queue}}
```

- Move all messages from one queue to another:

```
sqsc mv {{source_queue}} {{destination_queue}}
```

- Describe a queue:

```
sqsc describe {{queue_name}}
```

- Query a queue with SQL syntax:

```
sqsc query "SELECT body FROM {{queue_name}} WHERE body LIKE '%user%'"
```

- Pull all messages from a queue into a local SQLite database in your present working directory:

```
sqsc pull {{queue_name}}
```

squid

Cache and forward HTTP requests through a proxy server.

More information: https://manned.org/squid.

- Start Squid in the background:

```
sudo squid
```

- Start Squid in the foreground:

```
sudo squid -N
```

- Start Squid with a specific configuration file:

```
sudo squid -f {{path/to/squid.conf}}
```

- Test the configuration file for errors:

```
sudo squid -k parse
```

- Reload the configuration file:

```
sudo squid -k reconfigure
```

- Shut down Squid gracefully:

```
sudo squid -k shutdown
```

- Rotate the log files:

```
sudo squid -k rotate
```

sr

This command is an alias of **`surfraw`**.

- View documentation for the original command:

```
tldr surfraw
```

srftopam

Convert an SRF file to Netpbm format.

See also: **pamtosrf**.

More information: https://netpbm.sourceforge.net/doc/srftopam.html.

- Convert an SRF file to Netpbm format:

```
srftopam {{path/to/file.srf}} > {{path/to/output.pam}}
```

srm

Securely remove files or directories.

Overwrites the existing data one or multiple times. Drop in replacement for rm.

More information: https://srm.sourceforge.net/srm.html.

- Remove a file after a single-pass overwriting with random data:

```
srm {{[-s|--simple]}} {{path/to/file}}
```

- Remove a file after seven passes of overwriting with random data:

```
srm -m {{path/to/file}}
```

- Recursively remove a directory and its contents overwriting each file with a single-pass of random data:

```
srm {{[-r|--recursive]}} {{[-s|--simple]}} {{path/to/directory}}
```

- Prompt before every removal:

```
srm {{[-i|--interactive]}} {{\*}}
```

srun

Run a command under the Slurm workload manager.

More information: https://slurm.schedmd.com/srun.html.

- Run a simple command interactively:

```
srun hostname
```

- Run a job with 4 tasks (CPUs):

```
srun {{[-n|--ntasks]}} 4 {{path/to/program}}
```

- Allocate 8 GB of memory:

```
srun --mem 8G {{path/to/program}}
```

- Run a job on a specific partition:

```
srun {{[-p|--partition]}} gpu {{path/to/program}}
```

- Run a job and save the output to a file:

```
srun {{path/to/program}} > {{path/to/output}}
```

ss-local

Run a Shadowsocks client as a SOCKS5 proxy.

More information: https://manned.org/ss-local.

- Run a Shadowsocks proxy by specifying the host, server port, local port, password, and encryption method:

```
ss-local -s {{host}} -p {{server_port}} -l {{local_port}} -k {{password}} -m {{encrypt_method}}
```

- Run a Shadowsocks proxy by specifying the configuration file:

```
ss-local -c {{path/to/config_file.json}}
```

- Use a plugin to run the proxy client:

```
ss-local --plugin {{plugin_name}} --plugin-opts {{plugin_options}}
```

- Enable TCP fast open:

```
ss-local --fast-open
```

ssh-add

Manage loaded SSH keys in the **`ssh-agent`**.

Ensure that **`ssh-agent`** is up and running for the keys to be loaded in it.

More information: https://man.openbsd.org/ssh-add.

- Add the default SSH keys in `~/.ssh` to the ssh-agent:

```
ssh-add
```

- Add a specific key to the `ssh-agent`:

```
ssh-add {{path/to/private_key}}
```

- List fingerprints of currently loaded keys:

```
ssh-add -l
```

- Delete a key from the `ssh-agent`:

```
ssh-add -d {{path/to/private_key}}
```

- Delete all currently loaded keys from the `ssh-agent`:

```
ssh-add -D
```

- Add a key to the `ssh-agent` and the keychain:

```
ssh-add -K {{path/to/private_key}}
```

ssh-agent

Spawn an SSH Agent process.

Note: An SSH Agent holds SSH keys decrypted in memory until removed or the process is killed.

See also: **`ssh-add`**.

More information: https://man.openbsd.org/ssh-agent.

- Start an SSH Agent for the current shell:

```
eval $(ssh-agent)
```

- Kill the currently running agent:

```
ssh-agent -k
```

ssh-copy-id

Install your public key in a remote machine's authorized_keys.

More information: https://manned.org/ssh-copy-id.

- Copy your keys to the remote machine:

```
ssh-copy-id {{username}}@{{remote_host}}
```

- Copy the given public key to the remote:

```
ssh-copy-id -i {{path/to/certificate}} {{username}}
@{{remote_host}}
```

- Copy the given public key to the remote with specific port:

```
ssh-copy-id -i {{path/to/certificate}} -p {{port}}
{{username}}@{{remote_host}}
```

ssh-keygen

Generate SSH keys used for authentication, password-less logins, and other things.

See also: **`ssh-copy-id`**.

More information: https://man.openbsd.org/ssh-keygen.

- Generate a key interactively:

```
ssh-keygen
```

- Generate an ed25519 key with 32 key derivation function rounds and save the key to a specific file:

```
ssh-keygen -f {{~/.ssh/filename}} -t ed25519 -a 32
```

- Generate an RSA 4096-bit key with email as a comment:

```
ssh-keygen -t rsa -b 4096 -C "{{comment|email}}"
```

- Remove the keys of a host from the `known_hosts` file (useful when a known host has a new key):

```
ssh-keygen -R {{remote_host}}
```

- Retrieve the fingerprint of a key in MD5 Hex:

```
ssh-keygen -f {{~/.ssh/filename}} -l -E md5
```

- Change the password of a key:

```
ssh-keygen -f {{~/.ssh/filename}} -p
```

- Change the type of the key format (for example from OPENSSH format to PEM), the file will be rewritten in-place:

```
ssh-keygen -f {{~/.ssh/OpenSSH_private_key}} -p -m PEM
```

- Retrieve public key from private key:

```
ssh-keygen -f {{~/.ssh/OpenSSH_private_key}} -y
```

ssh-keyscan

Get the public SSH keys of remote hosts.

More information: https://man.openbsd.org/ssh-keyscan.

- Retrieve all public SSH keys of a remote host:

```
ssh-keyscan {{hostname}}
```

- Retrieve all public SSH keys of a remote host listening on a specific port:

```
ssh-keyscan -p {{port}} {{hostname}}
```

- Retrieve certain types of public SSH keys of a remote host:

```
ssh-keyscan -t {{rsa,dsa,ecdsa,ed25519}} {{hostname}}
```

- Manually update the SSH known_hosts file with the fingerprint of a given host:

```
ssh-keyscan -H {{hostname}} >> ~/.ssh/known_hosts
```

ssh

Secure Shell is a protocol used to securely log onto remote systems.

It can be used for logging or executing commands on a remote server.

More information: https://man.openbsd.org/ssh.

- Connect to a remote server:

```
ssh {{username}}@{{remote_host}}
```

- Connect to a remote server with a specific [i]dentity (private key):

```
ssh {{username}}@{{remote_host}} -i {{path/to/key_file}}
```

- Connect to a remote server with IP `10.0.0.1` and using a specific [p]ort (Note: `10.0.0.1` can be shortened to `10.1`):

```
ssh {{username}}@10.0.0.1 -p {{2222}}
```

- Run a command on a remote server with a [t]ty allocation allowing interaction with the remote command:

```
ssh {{username}}@{{remote_host}} -t {{command}} {{command_arguments}}
```

- SSH tunneling: Use [D]ynamic port forwarding (SOCKS proxy on `localhost:1080`):

```
ssh {{username}}@{{remote_host}} -D {{1080}}
```

- SSH tunneling: Forward a specific port (`localhost:9999` to `example.org:80`) along with disabling pseudo-[T]ty allocation and executio[N] of remote commands:

```
ssh {{username}}@{{remote_host}} -L {{9999}}:{{example.org}}:{{80}} -N -T
```

- SSH [J]umping: Connect through a jumphost to a remote server (Multiple jump hops may be specified separated by comma characters):

```
ssh {{username}}@{{remote_host}} -J {{username}}@{{jump_host}}
```

- Close a hanged session:

```
<Enter><~><.>
```

sshd

Secure Shell Daemon - allows remote machines to securely log in to the current machine.

Remote machines can execute commands as it is executed at this machine.

More information: https://man.openbsd.org/sshd.

- Start daemon in the background:

```
sshd
```

- Run sshd in the foreground:

```
sshd -D
```

- Run with verbose output (for debugging):

```
sshd -D -d
```

- Run on a specific port:

```
sshd -p {{port}}
```

sshfs

Filesystem client based on SSH.

More information: https://github.com/libfuse/sshfs/blob/master/sshfs.rst.

- Mount remote directory:

```
sshfs {{username}}@{{remote_host}}:{{remote_directory}} {{path/to/mount_point}}
```

- Unmount remote directory:

```
umount {{path/to/mount_point}}
```

- Mount remote directory from server with specific port:

```
sshfs {{username}}@{{remote_host}}:{{remote_directory}} -p {{2222}}
```

- Use compression:

```
sshfs {{username}}@{{remote_host}}:{{remote_directory}} -C
```

- Follow symbolic links:

```
sshfs -o follow_symlinks {{username}}@{{remote_host}}:{{remote_directory}} {{path/to/mount_point}}
```

sshpass

An SSH password provider.

It works by creating a TTY, feeding the password into it, and then redirecting **`stdin`** to the SSH session.

More information: https://manned.org/sshpass.

- Connect to a remote server using a password supplied on a file descriptor (in this case, `stdin`):

```
sshpass -d {{0}} ssh {{user}}@{{hostname}}
```

- Connect to a remote server with the password supplied as an option, and automatically accept unknown SSH keys:

```
sshpass -p {{password}} ssh -o StrictHostKeyChecking=no
{{user}}@{{hostname}}
```

- Connect to a remote server using the first line of a file as the password, automatically accept unknown SSH keys, and launch a command:

```
sshpass -f {{path/to/file}} ssh -o StrictHostKeyChecking=no
{{user}}@{{hostname}} "{{command}}"
```

sshuttle

Transparent proxy server that tunnels traffic over an SSH connection.

Doesn't require root or any special setup on the remote SSH server, though root access on the local machine is prompted for.

More information: https://manned.org/sshuttle.

- Forward all IPv4 TCP traffic via a remote SSH server:

```
sshuttle {{[-r|--remote]}} {{username}}@{{sshserver}}
{{0.0.0.0/0}}
```

- Also forward all DNS traffic to the server's default DNS resolver:

```
sshuttle --dns {{[-r|--remote]}} {{username}}@{{sshserver}}
{{0.0.0.0/0}}
```

- Forward all traffic except that which is bound for a specific subnet:

```
sshuttle {{[-r|--remote]}} {{username}}@{{sshserver}}
{{0.0.0.0/0}} {{[-x|--exclude]}} {{192.168.0.1/24}}
```

- Use the tproxy method to forward all IPv4 and IPv6 traffic:

```
sshuttle --method tproxy {{[-r|--remote]}} {{username}}
@{{sshserver}} {{0.0.0.0/0}} {{::/0}} {{[-x|--exclude]}}
{{your_local_ip_address}} {{[-x|--exclude]}}
{{ssh_server_ip_address}}
```

sslscan

Check SSL/TLS protocols and ciphers supported by a server.

More information: https://manned.org/sslscan.

- Test a server on port 443:

```
sslscan {{example.com}}
```

- Test a specified port:

```
sslscan {{example.com}}:{{465}}
```

- Show certificate information:

```
sslscan --show-certificate {{example.com}}
```

st-flash

Flash binary files to STM32 ARM Cortex microcontrollers.

More information: https://github.com/stlink-org/stlink/blob/testing/doc/man/st-flash.md.

- Read 4096 bytes from the device starting from 0x8000000:

```
st-flash read {{firmware}}.bin 0x8000000 4096
```

- Write firmware to device starting from 0x8000000:

```
st-flash write {{firmware}}.bin 0x8000000
```

- Erase firmware from device:

```
st-flash erase
```

st-info

Get information about connected STLink and STM32 devices.

More information: https://github.com/stlink-org/stlink/blob/testing/doc/man/st-info.md.

- Display amount of program memory available:

```
st-info --flash
```

- Display amount of SRAM memory available:

```
st-info --sram
```

- Display summarized information of the device:

```
st-info --probe
```

st-util

Run GDB (GNU Debugger) server to interact with STM32 ARM Cortex microcontroller.

More information: https://github.com/stlink-org/stlink/blob/testing/doc/man/st-util.md.

- Run GDB server on port 4500:

```
st-util {{[-p|--listen_port]}} {{4500}}
```

- [Interactive] Connect to GDB server within `gdb`:

```
target extended-remote {{localhost}}:{{4500}}
```

- [Interactive] Write firmware to device:

```
load {{firmware.elf}}
```

st

st can refer to multiple commands with the same name.

- View documentation for the terminal emulator:

  `tldr st.term`

- View documentation for the statistics tool:

  `tldr st.stat`

st

Print basic descriptive statistics from input numbers.

More information: https://github.com/nferraz/st.

- Print count, min, max, sum, mean, and standard deviation for numbers in a file:

```
st {{path/to/file}}
```

- Print statistics from `stdin`:

```
cat {{path/to/file}} | st
```

- Print only the sum of the numbers:

```
st {{[-s|--sum]}} {{path/to/file}}
```

- Print only the mean of the numbers:

```
st {{[-m|--mean]}} {{path/to/file}}
```

- Print only the standard deviation:

```
st {{[-s|--sd]}} {{path/to/file}}
```

- Transpose output (keys in one column, values in another):

```
st {{[-t|--transpose]}} {{path/to/file}}
```

st4topgm

Convert an SBIG ST-4 file to PGM.

More information: https://netpbm.sourceforge.net/doc/st4topgm.html.

- Convert an SBIG ST-4 file to a PGM file:

```
st4topgm {{path/to/input_file.st4}} > {{path/to/output.pgm}}
```

stack

Manage Haskell projects.

More information: https://docs.haskellstack.org/en/stable/commands/.

- Create a new package:

```
stack new {{package}} {{template}}
```

- Compile a package:

```
stack build
```

- Run tests inside a package:

```
stack test
```

- Compile a project and re-compile every time a file changes:

```
stack build --file-watch
```

- Compile a project and execute a command after compilation:

```
stack build --exec "{{command}}"
```

- Run a program and pass an argument to it:

```
stack exec {{program}} -- {{argument}}
```

standard-version

Automate versioning and changelog generation, with SemVer and Conventional Commits.

More information: https://github.com/conventional-changelog/standard-version.

- Update the changelog file and tag a release:

  ```
  standard-version
  ```

- Tag a release without bumping the version:

  ```
  standard-version --first-release
  ```

- Update the changelog and tag an alpha release:

  ```
  standard-version --prerelease alpha
  ```

- Update the changelog and tag a specific release type:

  ```
  standard-version --release-as {{major|minor|patch}}
  ```

- Tag a release, preventing hooks from being verified during the commit step:

  ```
  standard-version --no-verify
  ```

- Tag a release committing all staged changes, not just files affected by `standard-version`:

  ```
  standard-version --commit-all
  ```

- Update a specific changelog file and tag a release:

  ```
  standard-version --infile {{path/to/file.md}}
  ```

- Simulate a release, displaying what would be performed:

  ```
  standard-version --dry-run
  ```

standard

The JavaScript Standard Style tool for linting and fixing JavaScript code.

More information: https://standardjs.com/#usage.

- Lint all JavaScript source files in the current directory:

  ```
  standard
  ```

- Lint specific JavaScript file(s):

  ```
  standard {{path/to/file1 path/to/file2 ...}}
  ```

- Apply automatic fixes during linting:

  ```
  standard --fix
  ```

- Declare any available global variables:

  ```
  standard --global {{variable}}
  ```

- Use a custom ESLint plugin when linting:

  ```
  standard --plugin {{plugin}}
  ```

- Use a custom JS parser when linting:

  ```
  standard --parser {{parser}}
  ```

- Use a custom ESLint environment when linting:

  ```
  standard --env {{environment}}
  ```

starship init

Print shell integration code for starship.

More information: https://starship.rs/.

- Print the starship integration code for the specified shell:

```
starship init {{bash|elvish|fish|ion|powershell|tcsh|zsh}}
```

- Append the `starship` integration code to `~/.bashrc`:

```
starship init {{bash}} >> {{~/.bashrc}}
```

- Append the `starship` integration code to `~/.zshrc`:

```
starship init {{zsh}} >> {{~/.zshrc}}
```

- Display help:

```
starship init --help
```

starship

The minimal, blazing-fast, and infinitely customizable prompt for any shell.

Some subcommands such as **`init`** have their own usage documentation.

More information: https://starship.rs/.

- Print the starship integration code for the specified shell:

```
starship init {{bash|elvish|fish|ion|powershell|tcsh|zsh|nu|xonsh|cmd}}
```

- Explain each part of the current prompt and show the time taken to render them:

```
starship explain
```

- Print the computed starship configuration (use `--default` to print default configuration instead):

```
starship print-config
```

- List supported modules:

```
starship module --list
```

- Edit the starship configuration in the default editor:

```
starship config
```

- Create a bug report GitHub issue pre-populated with information about the system and starship configuration:

```
starship bug-report
```

- Print the completion script for the specified shell:

```
starship completions {{bash|elvish|fish|powershell|zsh}}
```

- Display help for a subcommand:

```
starship {{subcommand}} --help
```

stat

Display file and filesystem information.

See also: **`file`**.

More information: https://www.gnu.org/software/coreutils/manual/html_node/stat-invocation.html.

- Display properties about a specific file such as size, permissions, creation date, and access date among others:

```
stat {{path/to/file}}
```

- Display properties about a specific file, only showing the raw result data without labels:

```
stat {{[-t|--terse]}} {{path/to/file}}
```

- Display information about the filesystem where a specific file is located:

```
stat {{[-f|--file-system]}} {{path/to/file}}
```

- Show only octal file permissions:

```
stat {{[-c|--format]}} "%a %n" {{path/to/file}}
```

- Show the owner and group of a specific file:

```
stat {{[-c|--format]}} "%U %G" {{path/to/file}}
```

- Show the size of a specific file in bytes:

```
stat {{[-c|--format]}} "%s %n" {{path/to/file}}
```

stdbuf

Run a command with modified buffering operations for its standard streams.

More information: https://www.gnu.org/software/coreutils/manual/html_node/stdbuf-invocation.html.

- Change `stdin` buffer size to 512 KiB:

```
stdbuf {{[-i|--input]}} 512K {{command}}
```

- Change `stdout` buffer to line-buffered:

```
stdbuf {{[-o|--output]}} L {{command}}
```

- Change `stderr` buffer to unbuffered:

```
stdbuf {{[-e|--error]}} 0 {{command}}
```

steam

Video game platform by Valve.

More information: https://developer.valvesoftware.com/wiki/Command_Line_Options.

- Launch Steam, printing debug messages to `stdout`:

  ```
  steam
  ```

- Launch Steam and enable its in-app debug console tab:

  ```
  steam -console
  ```

- Launch Steam without opening the GUI:

  ```
  steam -silent
  ```

- Enable and open the Steam console tab in a running Steam instance:

  ```
  steam steam://open/console
  ```

- Log into Steam with the specified credentials:

  ```
  steam -login {{username}} {{password}}
  ```

- Launch Steam in Big Picture Mode:

  ```
  steam -tenfoot
  ```

- Open a URL:

  ```
  steam steam://openurl/{{https://example.com}}
  ```

- Exit Steam:

  ```
  steam -shutdown
  ```

steamcmd

A command-line version of the Steam client.

More information: https://manned.org/steamcmd.

- Install or update an application anonymously:

```
steamcmd +login {{anonymous}} +app_update {{app_id}} +quit
```

- Install or update an application using the specified credentials:

```
steamcmd +login {{username}} +app_update {{app_id}} +quit
```

- Define a custom install location:

```
steamcmd +force_install_dir {{path/to/directory}} +login
{{anonymous}} +app_update {{app_id}} validate +quit
```

- Install an application for a specific platform:

```
steamcmd +@sSteamCmdForcePlatformType {{windows}} +login
{{anonymous}} +app_update {{app_id}} validate +quit
```

- Run a script file:

```
steamcmd +runscript {{script.txt}}
```

- Clear cached login credentials for a user:

```
steamcmd +login {{username}} +logout +quit
```

step

An easy-to-use CLI tool for building, operating, and automating Public Key Infrastructure (PKI) systems and workflows.

See also: **`openssl`**.

More information: https://smallstep.com/docs/step-cli/.

- Inspect the contents of a certificate:

```
step certificate inspect {{path/to/certificate.crt}}
```

- Create a root CA certificate and a key (append `--no-password --insecure` to skip private key password protection):

```
step certificate create "{{Example Root CA}}" {{path/to/root-ca.crt}} {{path/to/root-ca.key}} --profile root-ca
```

- Generate a certificate for a specific hostname and sign it with the root CA (generating a CSR can be skipped for simplification):

```
step certificate create {{hostname.example.com}} {{path/to/hostname.crt}} {{path/to/hostname.key}} --profile leaf --ca {{path/to/root-ca.crt}} --ca-key {{path/to/root-ca.key}}
```

- Verify a certificate chain:

```
step certificate verify {{path/to/hostname.crt}} --roots {{path/to/root-ca.crt}} --verbose
```

- Convert a PEM format certificate to DER and write it to disk:

```
step certificate format {{path/to/certificate.pem}} --out {{path/to/certificate.der}}
```

- Install or uninstall a root certificate in the system's default trust store:

```
step certificate {{install|uninstall}} {{path/to/root-ca.crt}}
```

- Create a RSA/EC private and public keypair (append `--no-password --insecure` to skip private key password protection):

```
step crypto keypair {{path/to/public_key}} {{path/to/private_key}} --kty {{RSA|EC}}
```

- Display help for subcommands:

```
step {{path|base64|certificate|completion|context|crl|crypto|
oauth|ca|beta|ssh}} --help
```

stern

Tail multiple pods and containers from Kubernetes.

More information: https://github.com/stern/stern#usage.

- Tail all pods within a current namespace:

```
stern .
```

- Tail all pods with a specific status:

```
stern . --container-state {{running|waiting|terminated}}
```

- Tail all pods that matches a given `regex`:

```
stern {{pod_query}}
```

- Tail matched pods from all namespaces:

```
stern {{pod_query}} {{[-A|--all-namespaces]}}
```

- Tail matched pods from 15 minutes ago:

```
stern {{pod_query}} {{[-s|--since]}} 15m
```

- Tail matched pods with a specific label:

```
stern {{pod_query}} {{[-l|--selector]}} {{release=canary}}
```

stl2gts

Convert STL files into the GTS (GNU triangulated surface library) file format.

More information: https://manned.org/stl2gts.

- Convert an STL file to a GTS file:

```
stl2gts < {{path/to/file.stl}} > {{path/to/file.gts}}
```

- Convert an STL file to a GTS file and revert face normals:

```
stl2gts < {{path/to/file.stl}} --revert > {{path/to/
file.gts}}
```

- Convert an STL file to a GTS file and do not merge vertices:

```
stl2gts < {{path/to/file.stl}} --nomerge > {{path/to/
file.gts}}
```

- Convert an STL file to a GTS file and display surface statistics:

```
stl2gts < {{path/to/file.stl}} --verbose > {{path/to/
file.gts}}
```

- Display help:

```
stl2gts --help
```

stolonctl

CLI for Stolon, a cloud native PostgreSQL manager for PostgreSQL high availability.

More information: https://github.com/sorintlab/stolon/blob/master/doc/commands/stolonctl.md.

- Get cluster status:

```
stolonctl --cluster-name {{cluster_name}} --store-backend {{store_backend}} --store-endpoints {{store_endpoints}} status
```

- Get cluster data:

```
stolonctl --cluster-name {{cluster_name}} --store-backend {{store_backend}} --store-endpoints {{store_endpoints}} clusterdata
```

- Get cluster specification:

```
stolonctl --cluster-name {{cluster_name}} --store-backend {{store_backend}} --store-endpoints {{store_endpoints}} spec
```

- Update cluster specification with a patch in JSON format:

```
stolonctl --cluster-name {{cluster_name}} --store-backend {{store_backend}} --store-endpoints {{store_endpoints}} update --patch '{{cluster_spec}}'
```

stormlock

Centralized locking system.

More information: https://github.com/tmccombs/stormlock#usage.

- Acquire a lease for resource:

```
stormlock acquire {{resource}}
```

- Release the given lease for the given resource:

```
stormlock release {{resource}} {{lease_id}}
```

- Show information on the current lease for a resource, if any:

```
stormlock current {{resource}}
```

- Test if a lease for given resource is currently active:

```
stormlock is-held {{resource}} {{lease_id}}
```

stow

Symlink manager.

Often used to manage dotfiles.

See also: **`chezmoi`**, **`tuckr`**, **`vcsh`**, **`homeshick`**.

More information: https://www.gnu.org/software/stow/manual/stow.html#Invoking-Stow.

- Symlink all files recursively to a given directory:

```
stow {{[-t|--target]}} {{path/to/target_directory}} {{path/to/file_or_directory1 path/to/file_or_directory2 ...}}
```

- Delete symlinks recursively from a given directory:

```
stow {{[-D|--delete]}} {{[-t|--target]}} {{path/to/target_directory}} {{path/to/file_or_directory1 path/to/file_or_directory2 ...}}
```

- Simulate to see what the result would be like:

```
stow {{[-n|--simulate]}} {{[-t|--target]}} {{path/to/target_directory}} {{path/to/file_or_directory1 path/to/file_or_directory2 ...}}
```

- Delete and resymlink:

```
stow {{[-R|--restow]}} {{[-t|--target]}} {{path/to/target_directory}} {{path/to/file_or_directory1 path/to/file_or_directory2 ...}}
```

- Exclude files matching a `regex`:

```
stow --ignore={{regex}} {{[-t|--target]}} {{path/to/target_directory}} {{path/to/file_or_directory1 path/to/file_or_directory2 ...}}
```

streamlink

Extract streams from various services and pipes them into a video player of choice.

More information: https://streamlink.github.io/cli.html#command-line-usage.

- Attempt to extract streams from the URL specified, and if it's successful, print out a list of available streams to choose from:

```
streamlink {{example.com/stream}}
```

- Open a stream with the specified quality:

```
streamlink {{example.com/stream}} {{720p60}}
```

- Select the highest or lowest available quality:

```
streamlink {{example.com/stream}} {{best|worst}}
```

- Use a specific player to feed stream data to (VLC is used by default if found):

```
streamlink {{[-p|--player]}} {{mpv}} {{example.com/stream}}
{{best}}
```

- Skip a specific amount of time from the beginning of the stream. For live streams, this is a negative offset from the end of the stream (rewind):

```
streamlink --hls-start-offset {{HH:MM:SS}} {{example.com/
stream}} {{best}}
```

- Skip to the beginning of a live stream, or as far back as possible:

```
streamlink --hls-live-restart {{example.com/stream}} {{best}}
```

- Write stream data to a file instead of playing it:

```
streamlink {{[-o|--output]}} {{path/to/file.ts}}
{{example.com/stream}} {{best}}
```

- Open the stream in the player, while at the same time writing it to a file:

```
streamlink {{[-r|--record]}} {{path/to/file.ts}}
{{example.com/stream}} {{best}}
```

streamlit

Framework for creating interactive, data-driven web apps in Python.

More information: https://docs.streamlit.io/develop/api-reference/cli.

- Check for the Streamlit installation:

  ```
  streamlit hello
  ```

- Run a Streamlit application:

  ```
  streamlit run {{project_name}}
  ```

- Display help:

  ```
  streamlit --help
  ```

- Display version:

  ```
  streamlit --version
  ```

stress-ng

Load and stress a Linux system in various ways (CPU, memory, I/O, etc.).

Useful for benchmarking, hardware validation, and stability testing.

More information: https://manned.org/stress-ng.

- Stress all CPUs with 4 workers for 60 seconds:

```
stress-ng {{[-c|--cpu]}} 4 {{[-t|--timeout]}} 60s
```

- Stress virtual memory with 2 workers for 30 seconds:

```
stress-ng {{[-m|--vm]}} 2 --vm-bytes {{512M}} {{[-t|--timeout]}} 30s
```

- Stress the I/O subsystem with 3 workers for 45 seconds:

```
stress-ng {{[-i|--io]}} 3 {{[-t|--timeout]}} 45s
```

- Run all stress tests for 2 minutes:

```
stress-ng {{[-a|--all]}} {{1}} {{[-t|--timeout]}} 2m
```

stressapptest

Userspace memory and IO test.

More information: https://manned.org/stressapptest.

- Test the given amount of memory (in Megabytes):

```
stressapptest -M {{memory}}
```

- Test memory as well as I/O for the given file:

```
stressapptest -M {{memory}} -f {{path/to/file}}
```

- Test specifying the verbosity level, where 0=lowest, 20=highest, 8=default:

```
stressapptest -M {{memory}} -v {{level}}
```

strings

Find printable strings in an object file or binary.

More information: https://manned.org/strings.

- Print all strings in a binary:

```
strings {{path/to/file}}
```

- Limit results to strings at least n characters long:

```
strings {{[-n|--bytes]}} {{n}} {{path/to/file}}
```

- Prefix each result with its offset within the file:

```
strings {{[-t|--radix]}} d {{path/to/file}}
```

- Prefix each result with its offset within the file in hexadecimal:

```
strings {{[-t|--radix]}} x {{path/to/file}}
```

strip-nondeterminism

Remove non-deterministic information (e.g. timestamps) from files.

More information: https://salsa.debian.org/reproducible-builds/strip-nondeterminism.

- Strip nondeterministic information from a file:

```
strip-nondeterminism {{path/to/file}}
```

- Strip nondeterministic information from a file manually specifying the filetype:

```
strip-nondeterminism --type {{filetype}} {{path/to/file}}
```

- Strip nondeterministic information from a file; instead of removing timestamps set them to the specified UNIX timestamp:

```
strip-nondeterminism --timestamp {{unix_timestamp}} {{path/to/file}}
```

stripe docs

Browse https://docs.stripe.com from the terminal.

More information: https://docs.stripe.com/cli/docs.

- Read a documentation page by path:

```
stripe docs {{/payments}}
```

- Read an API reference page by resource name:

```
stripe docs api {{product}}
```

- Read an API reference page by HTTP method and path:

```
stripe docs api {{GET /v1/products}}
```

- Read an API reference page for a webhook event:

```
stripe docs api {{product.created}}
```

- Search documentation by keywords:

```
stripe docs search "{{payment intents}}"
```

stripe listen

Forward Stripe webhook events to a local server for testing.

More information: https://docs.stripe.com/cli/listen.

- Forward all events to a local endpoint:

```
stripe listen --forward-to "{{localhost:3000/webhook}}"
```

- Forward only specific event types:

```
stripe listen --events
"{{payment_intent.succeeded,payment_intent.payment_failed}}"
--forward-to="{{localhost:3000/webhook}}"
```

- Print events as JSON without forwarding:

```
stripe listen --print-json
```

- Forward connect events to a separate local endpoint:

```
stripe listen --forward-to "{{localhost:3000/webhook}}" --
forward-connect-to "{{localhost:3000/connect-webhook}}"
```

- Skip SSL certificate verification when forwarding:

```
stripe listen --forward-to "{{localhost:3000/webhook}}" --
skip-verify
```

stripe logs

Tail and filter live Stripe API request logs.

More information: https://docs.stripe.com/cli/logs/tail.

- Tail all API request logs in real time:

```
stripe logs tail
```

- Filter logs by HTTP method:

```
stripe logs tail --filter-http-method {{GET}}
```

- Filter logs by API path:

```
stripe logs tail --filter-request-path {{/v1/customers}}
```

- Filter logs by response status code:

```
stripe logs tail --filter-http-status-code {{404}}
```

- Show logs as JSON:

```
stripe logs tail --format JSON
```

stripe

Interact with Stripe payment processor.

Some subcommands such as **`docs`**, **`listen`**, and **`logs`** have their own usage documentation.

More information: https://docs.stripe.com/cli.

- Browse Stripe documentation:

```
stripe docs
```

- Follow the logs of activity on the account:

```
stripe logs tail
```

- Listen for events, filtering on events with the name `charge.succeeded` and forwarding them to localhost:3000/events:

```
stripe listen --events="{{charge.succeeded}}" --forward-to="{{localhost:3000/events}}"
```

- Send a test webhook event:

```
stripe trigger {{charge.succeeded}}
```

- Create a customer:

```
stripe customers create --email "{{test@example.com}}" --name "{{Jenny Rosen}}"
```

- Print to JSON:

```
stripe listen --print-json
```

stty

Set or get options for a terminal device interface.

See also: **`tput`**.

More information: https://www.gnu.org/software/coreutils/manual/html_node/stty-invocation.html.

- Display current terminal size:

```
stty size
```

- Display all settings for the current terminal:

```
stty {{[-a|--all]}}
```

- Set the number of rows or columns:

```
stty {{rows|cols}} {{count}}
```

- Get the actual transfer speed of a device:

```
stty {{[-F|--file]}} {{path/to/device_file}} speed
```

- Reset all modes to reasonable values for the current terminal:

```
stty sane
```

- Switch between raw and normal mode:

```
stty {{raw|cooked}}
```

- Turn character echoing off or on:

```
stty {{-echo|echo}}
```

- Display help:

```
stty --help
```

stun

Classic STUN client.

More information: https://manned.org/stun.

- Make a STUN request:

```
stun {{stun.1und1.de}}
```

- Make a STUN request and specify the source port:

```
stun {{stun.1und1.de}} -p {{4302}}
```

stylua

An opinionated Lua code formatter.

More information: https://github.com/JohnnyMorganz/StyLua.

- Auto-format a file or an entire directory:

```
stylua {{path/to/file_or_directory}}
```

- Check if a specific file has been formatted:

```
stylua --check {{path/to/file}}
```

- Run with a specific configuration file:

```
stylua --config-path {{path/to/config_file}} {{path/to/file}}
```

- Format code from `stdin` and output to `stdout`:

```
stylua - < {{path/to/file.lua}}
```

- Format a file or directory using spaces and preferring single quotes:

```
stylua --indent-type {{Spaces}} --quote-style
{{AutoPreferSingle}} {{path/to/file_or_directory}}
```

subfinder

Discover valid subdomains for websites.

Designed as a passive framework to be useful for bug bounties and safe for penetration testing.

More information: https://docs.projectdiscovery.io/opensource/subfinder/usage.

- Find subdomains for a specific domain:

```
subfinder {{[-d|-domain]}} {{example.com}}
```

- Show only the subdomains found:

```
subfinder -silent {{[-d|-domain]}} {{example.com}}
```

- Show only active subdomains:

```
subfinder {{[-nW|-active]}} {{[-d|-domain]}} {{example.com}}
```

- Use all sources for enumeration:

```
subfinder -all {{[-d|-domain]}} {{example.com}}
```

- Use a given comma-separated list of [r]esolvers:

```
subfinder -r {{8.8.8.8,1.1.1.1,...}} {{[-d|-domain]}}
{{example.com}}
```

subl

Sublime Text editor.

More information: https://www.sublimetext.com/docs/command_line.html.

- Open the current directory in Sublime Text:

```
subl .
```

- Open a file or directory in Sublime Text:

```
subl {{path/to/file_or_directory}}
```

- Open a file and jump to a specific line number:

```
subl {{path/to/file}}:{{line_number}}
```

- Open a file or directory in the currently open window:

```
subl {{[-a|--add]}} {{path/to/file_or_directory}}
```

- Open a file or directory in a new window:

```
subl {{[-n|--new-window]}} {{path/to/file_or_directory}}
```

subliminal

Python-based subtitle downloader.

More information: https://manned.org/subliminal.

- Download English subtitles for a video:

```
subliminal download {{[-l|--language]}} {{en}} {{video.ext}}
```

sublist3r

Fast subdomains enumeration tool for penetration testers.

More information: https://github.com/aboul3la/Sublist3r.

- Find subdomains for a domain:

```
sublist3r --domain {{domain_name}}
```

- Find subdomains for a domain, also enabling brute force search:

```
sublist3r --domain {{domain_name}} --bruteforce
```

- Save the found subdomains to a text file:

```
sublist3r --domain {{domain_name}} --output {{path/to/output_file}}
```

- Display help:

```
sublist3r --help
```

sudo

Execute a single command as the superuser or another user.

See also: **`pkexec`**, **`run0`**, **`doas`**.

More information: https://www.sudo.ws/sudo.html.

- Run a command as the superuser:

```
sudo {{less /var/log/syslog}}
```

- Edit a file as the superuser with your default editor:

```
sudo {{[-e|--edit]}} {{/etc/fstab}}
```

- Run a command as another user and/or group:

```
sudo {{[-u|--user]}} {{user}} {{[-g|--group]}} {{group}} {{id -a}}
```

- Repeat the last command prefixed with `sudo` (only in Bash, Zsh, etc.):

```
sudo !!
```

- Launch the default shell with superuser privileges and run login-specific files (`.profile`, `.bash_profile`, etc.):

```
sudo {{[-i|--login]}}
```

- Launch the default shell with superuser privileges without changing the environment:

```
sudo {{[-s|--shell]}}
```

- Launch the default shell as the specified user, loading the user's environment and reading login-specific files (`.profile`, `.bash_profile`, etc.):

```
sudo {{[-i|--login]}} {{[-u|--user]}} {{user}}
```

- List the allowed (and forbidden) commands for the invoking user in longer format:

```
sudo {{[-ll|--list --list]}}
```

sudoedit

This command is an alias of **`sudo --edit`**.

- View documentation for the original command:

```
tldr sudo
```

sui client faucet

Interact with the Sui faucet.

More information: https://docs.sui.io/references/cli/client#request-a-sui-coin-from-faucet.

- Get a SUI coin from the faucet associated with the active network:

  ```
  sui client faucet
  ```

- Get a SUI coin for the address (accepts also an alias):

  ```
  sui client faucet --address {{address}}
  ```

- Get a SUI coin from custom faucet:

  ```
  sui client faucet --url {{custom_faucet_url}}
  ```

sui client ptb

Create, sign, and execute programmable transaction blocks.

More information: https://docs.sui.io/references/cli/ptb.

- Call a Move function from a package and module:

```
sui client ptb --move-call p::m::f "<{{type}}>" args
```

- Make a Move vector with two elements of type u64:

```
sui client ptb --make-move-vec "<u64>" "[1000,2000]"
```

- Split a gas coin and transfer it to address:

```
sui client ptb --split-coins gas "[1000]" --assign new_coins
--transfer-objects "[new_coins]" @{{address}}
```

- Transfer an object to an address:

```
sui client ptb --transfer-objects "[{{object_id}}]"
@{{address}}
```

- Publish a Move package and transfer the upgrade capability to sender:

```
sui client ptb --move-call sui::tx_context::sender --assign
sender --publish "." --assign upgrade_cap --transfer-objects
"[upgrade_cap]" sender
```

sui client

Publish smart contracts, get object information, execute transactions, and more.

More information: https://docs.sui.io/references/cli/client.

- Create a new address with the ED25519 scheme:

```
sui client new-address ed25519 {{address_alias}}
```

- Create a new testnet environment with an RPC URL and alias:

```
sui client new-env --rpc https://fullnode.testnet.sui.io:443
--alias testnet
```

- Switch to the address of your choice (accepts also an alias):

```
sui client switch --address {{address_alias}}
```

- Switch to the given environment:

```
sui client switch --env {{env_alias}}
```

- Publish a smart contract:

```
sui client publish {{package_path}}
```

- Interact with the Sui faucet:

```
sui client faucet {{subcommand}}
```

- List the gas coins for the given address (accepts also an alias):

```
sui client gas {{address}}
```

- Create, sign, and execute programmable transaction blocks:

```
sui client ptb {{options}} {{subcommand}}
```

sui move

Work with Move source code.

More information: https://docs.sui.io/references/cli/move.

- Create a new Move project in the given folder:

  ```
  sui move new {{project_name}}
  ```

- Test the Move project in the current directory:

  ```
  sui move test
  ```

- Test with coverage and get a summary:

  ```
  sui move test --coverage; sui move coverage summary
  ```

- Find which parts of your code are covered from tests (i.e. explain coverage results):

  ```
  sui move coverage source --module {{module_name}}
  ```

- Build the Move project in the current directory:

  ```
  sui move build
  ```

- Build the Move project from the given path:

  ```
  sui move build --path {{path}}
  ```

- Migrate to Move 2024 for the package at the provided path:

  ```
  sui move migrate {{path}}
  ```

sui

Interact with the Sui network.

More information: https://docs.sui.io/references/cli/cheatsheet.

- Execute a Sui subcommand:

```
sui {{subcommand}}
```

- Build tools for a smart contract:

```
sui move {{subcommand}}
```

- Publish smart contracts, get object information, execute transactions, and more:

```
sui client {{subcommand}}
```

- Start a local network:

```
sui start
```

- Update from source:

```
cargo install --locked --git https://github.com/MystenLabs/sui.git --branch testnet sui
```

sum

Compute checksums and the number of blocks for a file.

A predecessor to the more modern **`cksum`**.

More information: https://www.gnu.org/software/coreutils/manual/html_node/sum-invocation.html.

- Compute a checksum with BSD-compatible algorithm and 1024-byte blocks:

```
sum {{path/to/file}}
```

- Compute a checksum with System V-compatible algorithm and 512-byte blocks:

```
sum {{[-s|--sysv]}} {{path/to/file}}
```

sunicontopnm

Convert a Sun icon into a Netpbm image.

More information: https://netpbm.sourceforge.net/doc/sunicontopnm.html.

- Convert a Sun icon into a Netpbm image:

```
sunicontopnm {{path/to/input.ico}} > {{path/to/output.pbm}}
```

sup

Manage a RSS feed in the current directory.

See also: **`lb`**.

More information: https://github.com/LukeSmithxyz/lb.

- Add an article to the RSS feed:

```
sup {{path/to/file.html}}
```

supabase

Develop, deploy, and manage Supabase projects locally and on the cloud.

More information: https://supabase.com/docs/reference/cli.

- Log in to Supabase using an access token:

  ```
  supabase login
  ```

- Initialize a new Supabase project in the current directory:

  ```
  supabase init
  ```

- Start the local Supabase development stack:

  ```
  supabase start
  ```

- Stop the local Supabase development stack:

  ```
  supabase stop
  ```

- Show the status of the local Supabase development stack:

  ```
  supabase status
  ```

- Link the current directory to a remote Supabase project:

  ```
  supabase link --project-ref {{project_id}}
  ```

- List all Supabase projects:

  ```
  supabase projects list
  ```

- Generate the autocompletion script for a specific shell:

  ```
  supabase completion {{bash|fish|zsh|...}}
  ```

supervisorctl

Client/server system that allows its users to control a number of processes on UNIX-like operating systems.

Command-line client piece of the supervisor which provides a shell-like interface.

More information: https://supervisord.org/running.html#running-supervisorctl.

- Show the status of a process (or all processes if `process_name` is not specified):

```
supervisorctl status {{process_name}}
```

- Start/stop/restart a process:

```
supervisorctl {{start|stop|restart}} {{process_name}}
```

- Start/stop/restart all processes in a group:

```
supervisorctl {{start|stop|restart}} {{group_name}}:*
```

- Show last 100 bytes of process `stderr`:

```
supervisorctl tail -100 {{process_name}} stderr
```

- Keep displaying `stdout` of a process:

```
supervisorctl tail -f {{process_name}} stdout
```

- Reload process configuration file to add/remove processes as necessary:

```
supervisorctl update
```

supervisord

Client/server system for controlling some processes on UNIX-like operating systems.

Server part of supervisor; it is primarily managed via a configuration file.

More information: https://supervisord.org/running.html#running-supervisord.

- Start `supervisord` with specified configuration file:

```
supervisord {{[-c|--configuration]}} {{path/to/file}}
```

- Run supervisord in the foreground:

```
supervisord {{[-n|--nodaemon]}}
```

surfraw

Query a variety of web search engines.

Consists of a collection of elvi, each of which knows how to search a website.

More information: https://manned.org/surfraw.

- Display the list of supported website search scripts (elvi):

```
surfraw -elvi
```

- Open the elvi's results page for a specific search in the browser:

```
surfraw {{elvi_name}} "{{search_terms}}"
```

- Display an elvi description and its specific options:

```
surfraw {{elvi_name}} {{[-lh|-local-help]}}
```

- Search using an elvi with specific options and open the results page in the browser:

```
surfraw {{elvi_name}} {{elvi_options}} "{{search_terms}}"
```

- Display the URL to the elvi's results page for a specific search:

```
surfraw -print {{elvi_name}} "{{search_terms}}"
```

- Search using the alias:

```
sr {{elvi_name}} "{{search_terms}}"
```

surge

Simple web publishing.

More information: https://surge.sh/help/.

- Upload a new site to surge.sh:

```
surge {{path/to/project}}
```

- Deploy site to custom domain (note that the DNS records must point to the surge.sh subdomain):

```
surge {{path/to/project}} {{example.com}}
```

- List your surge projects:

```
surge list
```

- Remove a project:

```
surge teardown {{example.com}}
```

suspend

Suspend the execution of the current shell.

More information: https://www.gnu.org/software/bash/manual/bash.html#index-suspend.

- Suspend the current shell (useful for when you are in nested shells like `su`):

```
{{bash}} <Enter> suspend
```

- Continue from suspension if `suspend` was used in a non-nested shell (run this in a separate terminal):

```
pkill -CONT {{bash}}
```

- Force suspension even if this would lock you out of the system:

```
suspend -f
```

sv

Control a running runsv service.

More information: https://manned.org/sv.

- Start a service:

```
sudo sv up {{path/to/service}}
```

- Stop a service:

```
sudo sv down {{path/to/service}}
```

- Get service status:

```
sudo sv status {{path/to/service}}
```

- Reload a service:

```
sudo sv reload {{path/to/service}}
```

- Start a service, but only if it's not running and don't restart it if it stops:

```
sudo sv once {{path/to/service}}
```

svg2png

Render an SVG image to a PNG image using cairo.

More information: https://cairographics.org/.

- Convert an SVG file to PNG:

```
svg2png {{path/to/file.svg}} {{path/to/output.png}}
```

- Convert an SVG file to PNG with a specific width (preserving aspect ratio):

```
svg2png {{[-w|--width]}} {{800}} {{path/to/file.svg}} {{path/to/output.png}}
```

- Convert an SVG file to PNG with a specific height (preserving aspect ratio):

```
svg2png {{[-h|--height]}} {{600}} {{path/to/file.svg}} {{path/to/output.png}}
```

- Convert an SVG file to PNG with both width and height (image centered in space):

```
svg2png {{[-w|--width]}} {{800}} {{[-h|--height]}} {{600}} {{path/to/file.svg}} {{path/to/output.png}}
```

- Convert an SVG file to PNG scaled by a factor:

```
svg2png {{[-s|--scale]}} {{2.0}} {{path/to/file.svg}} {{path/to/output.png}}
```

- Convert an SVG from `stdin` to PNG on `stdout`:

```
cat {{path/to/file.svg}} | svg2png - - > {{path/to/output.png}}
```

- Flip the output image horizontally or vertically:

```
svg2png --flipx {{path/to/file.svg}} {{path/to/output.png}}
```

svgcleaner

SVG optimizing utility.

More information: https://github.com/RazrFalcon/svgcleaner.

- Optimize an SVG:

```
svgcleaner {{input.svg}} {{output.svg}}
```

- Optimize an SVG multiple times:

```
svgcleaner --multipass {{input.svg}} {{output.svg}}
```

svgo

SVG Optimizer: optimizing Scalable Vector Graphics files. Based in Node.js.

It applies a series of transformation rules (plugins), which can be toggled individually.

More information: https://manned.org/svgo.

- Optimize a file using the default plugins (overwrites the original file):

```
svgo {{test.svg}}
```

- Optimize a file and save the result to another file:

```
svgo {{test.svg}} {{[-o|--output]}} {{test.min.svg}}
```

- Optimize all SVG files within a directory (overwrites the original files):

```
svgo {{[-f|--folder]}} {{path/to/directory_with_svg_files}}
```

- Optimize all SVG files within a directory and save the resulting files to another directory:

```
svgo {{[-f|--folder]}} {{path/to/input_directory}} {{[-o|--output]}} {{path/to/output_directory}}
```

- Optimize SVG content passed from another command, and save the result to a file:

```
{{cat test.svg}} | svgo {{[-i|--input]}} - {{[-o|--output]}} {{test.min.svg}}
```

- Optimize a file and print out the result:

```
svgo {{test.svg}} {{[-o|--output]}} -
```

- Show available plugins:

```
svgo --show-plugins
```

svgr

Transform SVGs into React components.

More information: https://react-svgr.com/docs/options/.

- Transform a SVG file into a React component to `stdout`:

```
svgr -- {{path/to/file.svg}}
```

- Transform a SVG file into a React component using TypeScript to `stdout`:

```
svgr --typescript -- {{path/to/file.svg}}
```

- Transform a SVG file into a React component using JSX transform to `stdout`:

```
svgr --jsx-runtime automatic -- {{path/to/file.svg}}
```

- Transform all SVG files from a directory to React components into a specific directory:

```
svgr --out-dir {{path/to/output_directory}} {{path/to/input_directory}}
```

- Transform all SVG files from a directory to React components into a specific directory skipping already transformed files:

```
svgr --out-dir {{path/to/output_directory}} --ignore-existing {{path/to/input_directory}}
```

- Transform all SVG files from a directory to React components into a specific directory using a specific case for filenames:

```
svgr --out-dir {{path/to/output_directory}} --filename-case {{camel|kebab|pascal}} {{path/to/input_directory}}
```

- Transform all SVG files from a directory to React components into a specific directory without generating an index file:

```
svgr --out-dir {{path/to/output_directory}} --no-index {{path/to/input_directory}}
```

svgtopam

Convert an SVG file to Netpbm format.

More information: https://netpbm.sourceforge.net/doc/svgtopam.html.

- Convert an SVG file to Netpbm format:

```
svgtopam {{path/to/file.svg}} > {{path/to/output.pam}}
```

- Emit textual output describing the input image:

```
svgtopam {{[-t|-trace]}} {{path/to/file.svg}}
```

svn changelist

Associate a changelist with a set of files.

More information: https://svnbook.red-bean.com/en/1.7/svn-book.html#svn.ref.svn.c.changelist.

- Add files to a changelist, creating the changelist if it does not exist:

```
svn {{[cl|changelist]}} {{changelist_name}} {{path/to/file1 path/to/file2 ...}}
```

- Remove files from a changelist:

```
svn {{[cl|changelist]}} --remove {{path/to/file1 path/to/file2 ...}}
```

- Remove the whole changelist at once:

```
svn {{[cl|changelist]}} --remove {{[-R|--recursive]}} --changelist {{changelist_name}} .
```

- Add the contents of a space-separated list of directories to a changelist:

```
svn {{[cl|changelist]}} {{[-R|--recursive]}} {{changelist_name}} {{path/to/directory1 path/to/directory2 ...}}
```

- Commit a changelist:

```
svn commit --changelist {{changelist_name}}
```

svn

Subversion client tool.

More information: https://svnbook.red-bean.com/en/1.7/svn-book.html#svn.ref.svn.

- Check out a working copy from a repository:

```
svn {{[co|checkout]}} {{file:///path/to/repository}}
```

- Bring changes from the repository into the working copy:

```
svn {{[up|update]}}
```

- Put files and directories under version control, scheduling them for addition to repository. They will be added in next commit:

```
svn add {{path/to/file_or_directory}}
```

- Send changes from your working copy to the repository:

```
svn {{[ci|commit]}} {{[-m|--message]}} {{commit_log_message}} {{path/to/directory}}
```

- Display changes from the last 10 revisions, showing modified files for each revision:

```
svn log {{[-vl|--verbose --limit]}} {{10}}
```

- Display help:

```
svn {{[h|help]}}
```

swagger-codegen

Generate code and documentation for your REST api from an OpenAPI/swagger definition.

More information: https://github.com/swagger-api/swagger-codegen.

- Generate documentation and code from an OpenAPI/swagger file:

```
swagger-codegen generate {{[-i|--input-spec]}}
{{swagger_file}} {{[-l|--lang]}} {{language}}
```

- Generate Java code using the library retrofit2 and the option useRxJava2:

```
swagger-codegen generate {{[-i|--input-spec]}} {{http://
petstore.swagger.io/v2/swagger.json}} {{[-l|--lang]}}
{{java}} --library {{retrofit2}} -D{{useRxJava2}}={{true}}
```

- List available languages:

```
swagger-codegen langs
```

- Display help for a specific command:

```
swagger-codegen {{generate|config-help|meta|langs|version}}
--help
```

sway

A tiling Wayland compositor.

It uses the same config format as **`i3`**, with some Wayland-specific additions.

More information: https://github.com/swaywm/sway/wiki.

- Start `sway`:

  `sway`

- View documentation for `i3` (`sway` uses the same default keybindings):

  `tldr i3`

swaybg

Wallpaper tool for Wayland compositors.

Note: Sway starts **swaybg** automatically if a wallpaper is set in the config file.

More information: https://github.com/swaywm/swaybg/blob/master/swaybg.1.scd.

- Set the wallpaper on all monitors to an image:

```
swaybg {{[-i|--image]}} {{path/to/image}}
```

- Set the image scaling mode (default: `stretch`):

```
swaybg {{[-i|--image]}} {{path/to/image}} {{[-m|--mode]}}
{{stretch|fit|fill|center|tile|solid_color}}
```

- Set the wallpaper to a static color:

```
swaybg {{[-c|--color]}} {{rrggbb}}
```

- Set the wallpaper on a specific monitor:

```
swaybg {{[-o|--output]}} {{HDMI-1}} {{[-i|--image]}} {{path/
to/image}}
```

- Set different wallpapers on multiple monitors:

```
swaybg {{[-o|--output]}} {{HDMI-1}} {{[-i|--image]}} {{path/
to/image}} {{[-o|--output]}} {{DP-1}} {{[-i|--image]}}
{{path/to/image}}
```

swayidle

Idle management daemon for Wayland.

Note: The configuration options are documented in its man page.

More information: https://github.com/swaywm/swayidle/blob/master/swayidle.1.scd.

- Listen for idle activity using the configuration in `$XDG_CONFIG_HOME/swayidle/config` or `$HOME/swayidle/config`:

```
swayidle
```

- Specify an alternative path to the configuration file:

```
swayidle -C {{path/to/file}}
```

swaylock

Screen locking utility for Wayland compositors.

More information: https://manned.org/swaylock.

- Lock the screen using the config in `$HOME/.swaylock/config` or `$XDG_CONFIG_HOME/swaylock/config`:

```
swaylock
```

- Lock the screen with a simple color background (`rrggbb` format):

```
swaylock {{[-c|--color]}} {{0000ff}}
```

- Lock the screen with a background image:

```
swaylock {{[-i|--image]}} {{path/to/image}}
```

- Lock the screen and disable the unlock indicator (removes feedback on keypress):

```
swaylock {{[-u|--no-unlock-indicator]}}
```

- Detach from the controlling terminal after locking (like `i3lock`):

```
swaylock {{[-f|--daemonize]}}
```

- Lock the screen with a background image tiled over all monitors:

```
swaylock {{[-i|--image]}} {{path/to/image}} {{[-t|--tiling]}}
```

- Lock the screen and show the number of failed login attempts:

```
swaylock {{[-F|--show-failed-attempts]}}
```

- Load the configuration from a specific file:

```
swaylock {{[-C|--config]}} {{path/to/config}}
```

swaymsg

Send messages to a running instance of Sway using IPC.

See https://github.com/swaywm/sway/blob/master/sway/sway.5.scd for available commands.

More information: https://github.com/swaywm/sway/blob/master/swaymsg/swaymsg.1.scd.

- Run a Sway command:

```
swaymsg {{command}}
```

- Display a list of workspaces:

```
swaymsg {{[-t|--type]}} get_workspaces
```

- Display a list of input devices:

```
swaymsg {{[-t|--type]}} get_inputs
```

- Display a list of output devices:

```
swaymsg {{[-t|--type]}} get_outputs
```

- Display a layout tree of all open windows, containers, outputs, and workspaces:

```
swaymsg {{[-t|--type]}} get_tree
```

swaynag

Display a message in a bar on top of a screen.

More information: https://github.com/swaywm/sway/blob/master/swaynag/swaynag.1.scd.

- Display an error:

```
swaynag {{[-m|--message]}} "{{error message}}"
```

- Display a warning:

```
swaynag {{[-t|--type]}} warning {{[-m|--message]}} "{{warning message}}"
```

- Display a message with custom settings defined in the config:

```
swaynag {{[-t|--type]}} {{custom_type}} {{[-m|--message]}} "{{message}}"
```

- Use the specified font:

```
swaynag {{[-f|--font]}} "{{monospace bold 9}}" {{[-m|--message]}} "{{error message}}"
```

- Create a button and run a command in the specified terminal on click:

```
TERMINAL={{terminal_executable}} swaynag {{[-b|--button]}} "{{button text}}" {{command}} {{[-m|--message]}} "{{error message}}"
```

- Create a button and run a command on click:

```
swaynag {{[-B|--button-no-terminal]}} "{{button text}}" {{command}} {{[-m|--message]}} "{{error message}}"
```

- Display the bar on the bottom of the screen:

```
swaynag {{[-e|--edge]}} bottom {{[-m|--message]}} "{{error message}}"
```

- Open `swaynag` on the specified monitor:

```
swaynag {{[-o|--output]}} {{DP-1}} {{[-m|--message]}} "{{error message}}"
```

SWC

JavaScript and TypeScript compiler written in Rust.

More information: https://swc.rs/docs/usage/cli.

- Transpile a specified input file and output to `stdout`:

```
swc {{path/to/file}}
```

- Transpile the input file every time it is changed:

```
swc {{path/to/file}} {{[-w|--watch]}}
```

- Transpile a specified input file and output to a specific file:

```
swc {{path/to/input_file}} {{[-o|--out-file]}} {{path/to/output_file}}
```

- Transpile a specified input directory and output to a specific directory:

```
swc {{path/to/input_directory}} {{[-d|--out-dir]}} {{path/to/output_directory}}
```

- Transpile a specified input directory using a specific configuration file:

```
swc {{path/to/input_directory}} --config-file {{path/to/.swcrc}}
```

- Ignore files in a directory specified using `glob` path:

```
swc {{path/to/input_directory}} --ignore {{path/to/ignored_file1 path/to/ignored_file2 ...}}
```

swift

Create, run, and build Swift projects.

More information: https://manned.org/swiftc.

- Start a REPL (interactive shell):

```
swift repl
```

- Execute a program:

```
swift {{file.swift}}
```

- Start a new project with the package manager:

```
swift package init
```

- Update dependencies:

```
swift package update
```

- Compile project for release:

```
swift build {{[-c|--configuration]}} {{debug|release}}
```

swig

Generate bindings between C/C++ code and various high level languages such as JavaScript, Python, C#, and more.

It uses special **`.i`** or **`.swg`** files to generate the bindings (C/C++ with SWIG directives), then outputs a C/C++ file that contains all the wrapper code needed to build an extension module.

More information: https://www.swig.org/Doc4.4/SWIGDocumentation.html#SWIG_nn2.

- Generate a binding between C++ and Python:

```
swig -c++ -python -o {{path/to/output_wrapper.cpp}} {{path/to/swig_file.i}}
```

- Generate a binding between C++ and Go:

```
swig -go -cgo -intgosize 64 -c++ {{path/to/swig_file.i}}
```

- Generate a binding between C and Java:

```
swig -java {{path/to/swig_file.i}}
```

- Generate a binding between C and Ruby and prefix the Ruby module with `foo::bar::`:

```
swig -ruby -prefix "{{foo::bar::}}" {{path/to/swig_file.i}}
```

swipl

SWI-Prolog - A comprehensive free Prolog environment.

More information: https://www.swi-prolog.org/pldoc/man?section=cmdline.

- Start an interactive session:

```
swipl
```

- Execute a command without showing any output:

```
swipl --quiet -t "{{command}}"
```

- Execute a script:

```
swipl {{path/to/file.pl}}
```

- Print all shell configuration variables:

```
swipl --dump-runtime-variables
```

- Display version:

```
swipl --version
```

syft

Generate a Software Bill of Materials (SBOM) from container images and filesystems.

More information: https://oss.anchore.com/docs/reference/syft/cli/.

- Generate an SBOM from a container image:

```
syft {{image:tag}}
```

- Generate an SBOM from a local directory:

```
syft {{path/to/directory}}
```

- Generate an SBOM from a container archive file:

```
syft {{path/to/archive.tar}}
```

- Generate an SBOM in SPDX JSON format:

```
syft {{image:tag}} {{[-o|--output]}} spdx-json
```

- Generate an SBOM in CycloneDX JSON format:

```
syft {{image:tag}} {{[-o|--output]}} cyclonedx-json
```

- Write the SBOM to a file in a specific format:

```
syft {{image:tag}} {{[-o|--output]}} {{format}}={{path/to/output_file}}
```

- Display help:

```
syft {{[-h|--help]}}
```

- Display version:

```
syft --version
```

symfony

The console component for the Symfony framework.

More information: https://symfony.com/doc/current/setup.html.

- Create a new Symfony project:

  ```
  symfony new {{name}}
  ```

- Run a local web server:

  ```
  symfony serve
  ```

- Stop the local web server:

  ```
  symfony server:stop
  ```

- Check for security issues in the project's dependencies:

  ```
  symfony security:check
  ```

syncthing

Continuous bidirectional decentralized folder synchronization tool.

More information: https://docs.syncthing.net/users/syncthing.html.

- Start Syncthing:

```
syncthing
```

- Start Syncthing without opening a web browser:

```
syncthing --no-browser
```

- Change the home directory:

```
syncthing --home {{path/to/directory}}
```

- Run Syncthing with increased logging:

```
syncthing --verbose
```

- Pause all devices:

```
syncthing cli config devices pause --all
```

- Resume all devices:

```
syncthing cli config devices resume --all
```

- Change the address upon which the web interface listens:

```
syncthing --gui-address {{ip_address:port|path/to/
socket.sock}}
```

- Set the log level for output:

```
syncthing --log-level {{info|warning|error|debug}}
```

sysbench

Benchmark a System's CPU, IO, and memory.

More information: https://github.com/akopytov/sysbench#usage.

- Run a CPU benchmark with 1 thread for 10 seconds:

```
sysbench cpu run
```

- Run a CPU benchmark with multiple threads for a specified time:

```
sysbench --threads={{number_of_threads}} --time={{seconds}}
```

- Run a memory benchmark with 1 thread for 10 seconds:

```
sysbench memory run
```

- Prepare a filesystem-level read benchmark:

```
sysbench fileio prepare
```

- Run a filesystem-level benchmark:

```
sysbench --file-test-mode={{rndrd|rndrw|rndwr|seqrd|seqrewr|
seqwr}} fileio run
```

tabula

Extract tables from PDF files.

More information: https://github.com/tabulapdf/tabula-java#commandline-usage-examples.

- Extract all tables from a PDF to a CSV file:

```
tabula {{[-o|--outfile]}} {{file.csv}} {{file.pdf}}
```

- Extract all tables from a PDF to a JSON file:

```
tabula {{[-f|--format]}} JSON {{[-o|--outfile]}}
{{file.json}} {{file.pdf}}
```

- Extract tables from pages 1, 2, 3, and 6 of a PDF:

```
tabula {{[-p|--pages]}} 1-3,6 {{file.pdf}}
```

- Extract tables from page 1 of a PDF, guessing which portion of the page to examine:

```
tabula {{[-g|--guess]}} {{[-p|--pages]}} 1 {{file.pdf}}
```

- Extract all tables from a PDF, using ruling lines to determine cell boundaries:

```
tabula {{[-r|--spreadsheet]}} {{file.pdf}}
```

- Extract all tables from a PDF, using blank space to determine cell boundaries:

```
tabula {{[-n|--no-spreadsheet]}} {{file.pdf}}
```

tac

Display and concatenate files with lines in reversed order.

See also: **`cat`**.

More information: https://www.gnu.org/software/coreutils/manual/html_node/tac-invocation.html.

- Concatenate specific files in reversed order:

```
tac {{path/to/file1 path/to/file2 ...}}
```

- Display `stdin` in reversed order:

```
{{cat path/to/file}} | tac
```

- Use a specific separator:

```
tac {{[-s|--separator]}} {{separator}} {{path/to/file1 path/to/file2 ...}}
```

- Use a specific `regex` as a separator:

```
tac {{[-r|--regex]}} {{[-s|--separator]}} {{separator}} {{path/to/file1 path/to/file2 ...}}
```

- Use a separator before each file:

```
tac {{[-b|--before]}} {{path/to/file1 path/to/file2 ...}}
```

tail

Display the last part of a file.

See also: **head**.

More information: https://www.gnu.org/software/coreutils/manual/html_node/tail-invocation.html.

- Show last 10 lines in a file:

```
tail {{path/to/file}}
```

- Show last 10 lines of multiple files:

```
tail {{path/to/file1 path/to/file2 ...}}
```

- Show last 5 lines in file:

```
tail {{[-5|--lines 5]}} {{path/to/file}}
```

- Print a file from a specific line number:

```
tail {{[-n|--lines]}} +{{count}} {{path/to/file}}
```

- Print a specific count of bytes from the end of a given file:

```
tail {{[-c|--bytes]}} {{count}} {{path/to/file}}
```

- Print the last lines of a given file and keep reading it until `<Ctrl c>`:

```
tail {{[-f|--follow]}} {{path/to/file}}
```

- Keep reading file until `<Ctrl c>`, even if the file is inaccessible:

```
tail {{[-F|--retry --follow]}} {{path/to/file}}
```

- Show last `count` lines in a file and refresh every `seconds` seconds:

```
tail {{[-n|--lines]}} {{count}} {{[-s|--sleep-interval]}}
{{seconds}} {{[-f|--follow]}} {{path/to/file}}
```

tailcat

WireGuard-encrypted tunnels using Tailscale's data plane, like **`netcat`** but encrypted.

In the examples below, an **`addrblob`** is the connection token (**`tcom...`**) printed by a running **`tailcat`** server, used by clients to reach it.

More information: https://github.com/tailscale/tailcat#usage.

- Start a server that accepts one connection and writes to `stdout` (no local port; clients connect via the printed addrblob):

```
tailcat
```

- Start a server that exposes specific local TCP ports (e.g. an existing service on 22/80/443) to clients via the tunnel:

```
tailcat --serve={{22,80,443}}
```

- Start a server as an exit node, routing client traffic through this host's network:

```
tailcat --serve=exit-node
```

- Start an auth-free SSH server (Linux/macOS):

```
tailcat --serve=no-auth-ssh
```

- Connect to a server with an addrblob on a specific port, sending `stdin` to it:

```
cat {{path/to/file}} | tailcat {{addrblob}} {{port}}
```

- Ping a server to test connectivity, waiting for a direct path:

```
tailcat ping --until-direct {{addrblob}}
```

- SSH into a remote machine (server must expose port 22):

```
tailcat ssh {{addrblob}}
```

- Generate a new server key and print its addrblob:

```
tailcat genkey --force
```

tailscale file

Send files across connected devices on a Tailscale network.

It currently does not support sending files to devices owned by other users even on the same Tailscale network.

More information: https://tailscale.com/kb/1106/taildrop.

- Send a file to a specific node:

```
tailscale file cp {{path/to/file}} {{hostname|ip}}:
```

- Store files that were sent to the current node into a specific directory:

```
tailscale file get {{path/to/directory}}
```

tailscale funnel

Share a local server on the internet using Tailscale.

More information: https://tailscale.com/kb/1311/tailscale-funnel.

- Expose a local file or directory in the foreground:

```
tailscale funnel {{path/to/file_or_directory}}
```

- Expose an HTTP server running at 127.0.0.1:3000 in the foreground:

```
tailscale funnel 3000
```

- Expose an HTTP server running at 127.0.0.1:3000 in the background:

```
tailscale funnel --bg 3000
```

- Expose an HTTPS server with invalid or self-signed certificates at https://localhost:8443:

```
tailscale funnel https+insecure://localhost:8443
```

tailscale set

Change the specified preferences.

These options can also be changed during the initial setup.

This command can set all options documented in the page for **`tailscale up`**.

More information: https://tailscale.com/kb/1080/cli#set.

- View documentation for `tailscale up`:

```
tldr tailscale up
```

tailscale ssh

SSH to a Tailscale machine (Linux Only).

More information: https://tailscale.com/kb/1193/tailscale-ssh.

- Advertise/Disable SSH on the host:

```
tailscale up --ssh={{true|false}}
```

- SSH to a specific host which has Tailscale-SSH enabled:

```
tailscale ssh {{username}}@{{host}}
```

tailscale up

Connect the client to the Tailscale network.

All options described here can be changed later using **`tailscale set --option argument`**. Use **`--option=false`** to disable options that don't require arguments.

Note: Run **`sudo tailscale set --operator $USER`** to allow the current user to run these commands.

More information: https://tailscale.com/kb/1080/cli/#up.

- Connect to Tailscale:

  ```
  tailscale up
  ```

- Connect and offer the current machine to be an exit node for internet traffic:

  ```
  tailscale up --advertise-exit-node
  ```

- Connect using a specific node for internet traffic:

  ```
  tailscale up --exit-node {{exit_node_ip}}
  ```

- Connect and block incoming connections to the current node:

  ```
  tailscale up --shields-up
  ```

- Connect and don't accept DNS configuration from the admin panel (defaults to `true`):

  ```
  tailscale up --accept-dns=false
  ```

- Connect and configure Tailscale as a subnet router:

  ```
  tailscale up --advertise-routes
  {{10.0.0.0/24,10.0.1.0/24,...}}
  ```

- Connect and accept subnet routes from Tailscale:

  ```
  tailscale up --accept-routes
  ```

- Reset unspecified settings to their default values and connect:

  ```
  tailscale up --reset
  ```

tailscale

A private WireGuard network service.

Some subcommands such as **up** have their own usage documentation.

More information: https://tailscale.com/kb/1080/cli.

- Allow the current user to operate on the Tailscale daemon:

```
sudo tailscale set --operator $USER
```

- Handle connection to Tailscale (connect, disconnect, check status):

```
tailscale {{up|down|status}}
```

- Offer the current machine to be an exit node for internet traffic:

```
tailscale set --advertise-exit-node
```

- Use a specific exit node for internet traffic:

```
tailscale set --exit-node {{ip_address|hostname}}
```

- Ping a peer node at the Tailscale layer and display which route it took for each response:

```
tailscale ping {{ip_address|hostname}}
```

- Analyze the local network conditions and display the result:

```
tailscale netcheck
```

- Start a web server for controlling the Tailscale daemon:

```
tailscale web
```

- Display a shareable identifier to help diagnose issues:

```
tailscale bugreport
```

takeout

A Docker-based development-only dependency manager.

More information: https://github.com/tighten/takeout.

- Display a list of available services:

```
takeout enable
```

- Enable a specific service:

```
takeout enable {{name}}
```

- Enable a specific service with the default parameters:

```
takeout enable --default {{name}}
```

- Display a list of enabled services:

```
takeout disable
```

- Disable a specific service:

```
takeout disable {{name}}
```

- Disable all services:

```
takeout disable --all
```

- Start a specific container:

```
takeout start {{container_id}}
```

- Stop a specific container:

```
takeout stop {{container_id}}
```

talosctl

Interact with Talos Linux, a minimal and immutable Kubernetes distribution.

See also: **`kubectl`**.

More information: https://docs.siderolabs.com/talos/latest/reference/cli.

- Apply a config to a fresh node:

```
talosctl apply-config {{[-i|--insecure]}} {{[-n|--nodes]}}
{{control_plane_ip}} {{[-f|--file]}} {{path/to/
control_plane.yaml}}
```

- Bootstrap the `etcd` cluster on a node:

```
talosctl bootstrap {{[-n|--nodes]}} {{node_ip}}
```

- Edit an API resource:

```
talosctl edit {{resource_to_edit}} {{[-n|--nodes]}}
{{node_ip}}
```

- Get resources:

```
talosctl get {{resource_to_get}} {{[-n|--nodes]}} {{node_ip}}
```

- Download the admin kube configuration from a node:

```
talosctl kubeconfig {{[-n|--nodes]}} {{node_ip}}
```

- Reset a node:

```
talosctl reset {{[-n|--nodes]}} {{node_ip}}
```

tar

Archiving utility.

Often combined with a compression method, such as **gzip** or **bzip2**.

More information: https://www.gnu.org/software/tar/manual/tar.html.

- [c]reate an archive and write it to a [f]ile:

```
tar cf {{path/to/target.tar}} {{path/to/file1 path/to/file2 ...}}
```

- [c]reate a g[z]ipped archive and write it to a [f]ile:

```
tar czf {{path/to/target.tar.gz}} {{path/to/file1 path/to/file2 ...}}
```

- [c]reate a g[z]ipped (compressed) archive from a directory using relative paths:

```
tar czf {{path/to/target.tar.gz}} {{[-C|--directory]}} {{path/to/directory}} .
```

- E[x]tract a (compressed) archive [f]ile into the current directory [v]erbosely:

```
tar xvf {{path/to/source.tar.ext}}
```

- E[x]tract a (compressed) archive [f]ile into the target directory:

```
tar xf {{path/to/source.tar.ext}} {{[-C|--directory]}} {{path/to/directory}}
```

- [c]reate a compressed archive and write it to a [f]ile, using the file extension to [a]utomatically determine the compression program:

```
tar caf {{path/to/target.tar.xz}} {{path/to/file1 path/to/file2 ...}}
```

- Lis[t] the contents of a tar [f]ile [v]erbosely:

```
tar tvf {{path/to/source.tar}}
```

- E[x]tract files matching a pattern from an archive [f]ile:

```
tar xf {{path/to/source.tar}} --wildcards "{{*.html}}"
```

tarsnap-keygen

Generate a key file for use with Tarsnap, an online backup service.

More information: https://www.tarsnap.com/man-tarsnap-keygen.1.html.

- Register a machine with the Tarsnap server:

```
sudo tarsnap-keygen --keyfile {{path/to/file.key}} --user
{{user_email}} --machine {{machine_name}}
```

- Encrypt the key file (a passphrase will be requested twice):

```
sudo tarsnap-keygen --keyfile {{path/to/file.key}} --user
{{user_email}} --machine {{machine_name}} --passphrased
```

tarsnap

Manipulate remote Tarsnap encrypted backups.

Note: You don't need to specify the key file and the cache directory if you configure them in **`/usr/local/etc/tarsnap.conf`** or **`~/.tarsnaprc`**.

See also: **`tarsnap-keygen`**.

More information: https://www.tarsnap.com/man-tarsnap.1.html.

- [c]reate a backup archive of one or more files or directories, specifying the cryptographic key and the cache directory:

```
tarsnap -c --keyfile {{path/to/key_file}} --cachedir {{path/to/cache_directory}} -f {{archive_name}} {{path/to/file_or_directory1 path/to/file_or_directory2 ...}}
```

- Simulate creating an archive, displaying how much data would be uploaded:

```
tarsnap -c --dry-run --print-stats --keyfile {{path/to/key_file}} --cachedir {{path/to/cache_directory}} -f {{archive_name}} {{path/to/file_or_directory1 path/to/file_or_directory2 ...}}
```

- List stored archives:

```
tarsnap --list-archives --keyfile {{path/to/key_file}}
```

- [d]elete a specific archive:

```
tarsnap -d --keyfile {{path/to/key_file}} --cachedir {{path/to/cache_directory}} -f {{archive_name}}
```

- Lis[t] the contents of a specific archive in [v]erbose mode:

```
tarsnap -tv --keyfile {{path/to/key_file}} -f {{archive_name}}
```

- Restore one or more files or directories from a specific archive:

```
tarsnap -x --keyfile {{path/to/key_file}} -f {{archive_name}} {{path/to/file_or_directory1 path/to/file_or_directory2 ...}}
```

- Copy an archive:

```
tarsnap -c --keyfile {{path/to/key_file}} -f {{new_archive_name}} @@{{source_archive_name}}
```

task

To-do list manager.

More information: https://taskwarrior.org/docs/.

- Add a new task which is due tomorrow:

```
task add {{description}} due:{{tomorrow}}
```

- Update a task's priority:

```
task {{task_id}} modify priority:{{H|M|L}}
```

- Complete a task:

```
task {{task_id}} done
```

- Delete a task:

```
task {{task_id}} delete
```

- List all open tasks:

```
task list
```

- List open tasks due before the end of the week:

```
task list due.before:{{eow}}
```

- Show a graphical burndown chart, by day:

```
task burndown.daily
```

- List all reports:

```
task reports
```

tb

Manage tasks and notes across multiple boards.

More information: https://github.com/klaudiosinani/taskbook#usage.

- Add a new task to a board:

```
tb {{[-t|--task]}} {{task_description}} @{{board_name}}
```

- Add a new note to a board:

```
tb {{[-n|--note]}} {{note_description}} @{{board_name}}
```

- Edit item's priority:

```
tb {{[-p|--priority]}} @{{item_id}} {{priority}}
```

- Check/uncheck item:

```
tb {{[-c|--check]}} {{item_id}}
```

- Archive all checked items:

```
tb --clear
```

- Move item to a board:

```
tb {{[-m|--move]}} @{{item_id}} {{board_name}}
```

tbl

Table preprocessor for the groff (GNU Troff) document formatting system.

See also: **`groff`**, **`troff`**.

More information: https://manned.org/tbl.

- Process input with tables, saving the output for future typesetting with groff to PostScript:

```
tbl {{path/to/input_file}} > {{path/to/output.roff}}
```

- Typeset input with tables to PDF using the [me] macro package:

```
tbl -T {{pdf}} {{path/to/input.tbl}} | groff -{{me}} -T
{{pdf}} > {{path/to/output.pdf}}
```

tcc

A tiny C compiler that can run C source files as scripts and otherwise has command-line options similar to **`gcc`**.

More information: https://bellard.org/tcc/tcc-doc.html.

- Compile and link 2 source files to generate an executable:

```
tcc -o {{executable_name}} {{path/to/file1.c}} {{path/to/file2.c}}
```

- Directly run an input file like a script and pass arguments to it:

```
tcc -run {{path/to/source_file.c}} {{arguments}}
```

- Interpret C source files with a shebang inside the file:

```
#!/{{path/to/tcc}} -run
```

tcpdump

Dump traffic on a network.

More information: https://www.tcpdump.org/manpages/tcpdump.1.html.

- List available network interfaces:

```
tcpdump {{[-D|--list-interfaces]}}
```

- Capture the traffic of a specific interface:

```
sudo tcpdump {{[-i|--interface]}} {{eth0}}
```

- Capture all TCP traffic showing contents ([A]SCII) in console:

```
sudo tcpdump -A tcp
```

- Capture the traffic from or to a host:

```
sudo tcpdump host {{www.example.com}}
```

- Capture the traffic from a specific interface, source, destination, and destination port:

```
sudo tcpdump {{[-i|--interface]}} {{eth0}} src {{192.168.1.1}} and dst {{192.168.1.2}} and dst port {{80}}
```

- Capture the traffic of a network:

```
sudo tcpdump net {{192.168.1.0/24}}
```

- Capture all traffic except traffic over port 22 and [w]rite to a dump file:

```
sudo tcpdump -w {{path/to/dumpfile.pcap}} port not 22
```

- [r]ead from a given dump file:

```
tcpdump -r {{path/to/dumpfile.pcap}}
```

tcpreplay

Replay network traffic stored in a **pcap** file.

More information: https://tcpreplay.appneta.com/wiki/tcpreplay-man.html.

- List available network interfaces:

```
tcpreplay --listnics
```

- Replay traffic to interface:

```
tcpreplay {{[-i|--intf1]}} {{eth0}} {{traffic.pcap}}
```

- Replay traffic to interface and `stdout`:

```
tcpreplay {{[-i|--intf1]}} {{eth0}} {{[-v|--verbose]}}
{{traffic.pcap}}
```

- Replay traffic to interface as fast as possible:

```
tcpreplay {{[-i|--intf1]}} {{eth0}} {{[-t|--topspeed]}}
{{traffic.pcap}}
```

- Replay traffic to interface at given Mbps:

```
tcpreplay {{[-i|--intf1]}} {{eth0}} {{[-M|--mbps]}} {{10}}
{{traffic.pcap}}
```

- Replay traffic to interface several times:

```
tcpreplay {{[-i|--intf1]}} {{eth0}} {{[-l|--loop]}}
{{num_times}} {{traffic.pcap}}
```

tcsh

C shell with file name completion and command-line editing.

See also: **csh**.

More information: https://manned.org/tcsh.

- Start an interactive shell session:

```
tcsh
```

- Start an interactive shell session without loading startup configs:

```
tcsh -f
```

- Execute specific [c]ommands:

```
tcsh -c "{{echo 'tcsh is executed'}}"
```

- Execute a specific script:

```
tcsh {{path/to/script.tcsh}}
```

- Check a specific script for syntax errors:

```
tcsh -n {{path/to/script.tcsh}}
```

- Execute specific commands from `stdin`:

```
{{echo "echo 'tcsh is executed'"}} | tcsh
```

tdf

A tui PDF viewer.

More information: https://github.com/itsjunetime/tdf.

- Open a specific file:

```
tdf {{path/to/file}}.pdf
```

- Open in fullscreen mode:

```
tdf {{[-f|--fullscreen]}} {{path/to/file}}.pdf
```

- Set a custom white color:

```
tdf {{[-w|--white-color]}} {{ffffff}} {{path/to/file}}.pdf
```

- Set a custom black color:

```
tdf {{[-b|--black-color]}} "rgb({{0}}, {{0}}, {{0}})" {{path/
to/file}}.pdf
```

tea

Interact with Gitea servers.

More information: https://gitea.com/gitea/tea.

- Log into a Gitea server:

```
tea login add --name "{{name}}" --url "{{url}}" --token "{{token}}"
```

- Display all repositories:

```
tea repos ls
```

- Display a list of issues:

```
tea issues ls
```

- Display a list of issues for a specific repository:

```
tea issues ls --repo "{{repository}}"
```

- Create a new issue:

```
tea issues create --title "{{title}}" --body "{{body}}"
```

- Display a list of open pull requests:

```
tea pulls ls
```

- Open the current repository in a browser:

```
tea open
```

tectonic

A modern, self-contained TeX/LaTeX engine.

More information: https://tectonic-typesetting.github.io/book/latest/.

- Compile a standalone TeX/LaTeX file:

```
tectonic -X compile {{path/to/file.tex}}
```

- Compile a standalone TeX/LaTeX file with synctex data:

```
tectonic -X compile --synctex {{path/to/file.tex}}
```

- Initialize a tectonic project in the current directory:

```
tectonic -X init
```

- Initialize a tectonic project in the specified directory:

```
tectonic -X new {{project_name}}
```

- Build the project in the current directory:

```
tectonic -X build
```

- Start a watcher to build the project in the current directory on change:

```
tectonic -X watch
```

tee

Read from **`stdin`** and write to **`stdout`** and files (or commands).

More information: https://www.gnu.org/software/coreutils/manual/html_node/tee-invocation.html.

- Copy `stdin` to each file, and also to `stdout`:

```
echo "example" | tee {{path/to/file}}
```

- Append to the given files, do not overwrite:

```
echo "example" | tee {{[-a|--append]}} {{path/to/file}}
```

- Print `stdin` to the terminal, and also pipe it into another program for further processing:

```
echo "example" | tee {{/dev/tty}} | {{xargs printf "[%s]"}}
```

- Create a directory called "example", count the number of characters in "example", and write "example" to the terminal:

```
echo "example" | tee >(xargs mkdir) >(wc {{[-c|--bytes]}})
```

telegram-desktop

Instant messenger with open source clients, chats, and stickers.

More information: https://manned.org/telegram-desktop.

- Start GUI:

```
telegram-desktop
```

- Run GUI as an autostart if allowed:

```
telegram-desktop -autostart
```

- Run GUI minimized to tray:

```
telegram-desktop -startintray
```

telnet

Connect to a specified port of a host using the telnet protocol.

More information: https://manned.org/telnet.

- Telnet to the default port of a host:

```
telnet {{host}}
```

- Telnet to a specific port of a host:

```
telnet {{ip_address}} {{port}}
```

- [Interactive] Exit a telnet session:

```
quit
```

- Emit the default escape character combination for terminating the session:

```
<Ctrl ]>
```

- Start `telnet` with "x" as the session termination character:

```
telnet {{[-e|--escape]}} {{x}} {{ip_address}} {{port}}
```

- Telnet to Star Wars animation:

```
telnet {{towel.blinkenlights.nl}}
```

termdown

Countdown timer and stopwatch.

More information: https://github.com/trehn/termdown.

- Start a stopwatch:

```
termdown
```

- Start a 1 minute and 30 seconds countdown:

```
termdown {{1m30s}}
```

- Start a 1 minute 30 seconds countdown with blinking the terminal at the end:

```
termdown 1m30s {{[-b|--blink]}}
```

- Show a title above countdown:

```
termdown {{1m30s}} {{[-T|--title]}} "{{Interesting title}}"
```

- Display current time:

```
termdown {{[-z|--time]}}
```

terminalizer

Record the terminal, generate animated GIFs and a web player, and optionally upload to https://terminalizer.com.

See also: **asciinema**.

More information: https://www.terminalizer.com/docs#getting-started.

- Create the global configuration directory:

```
terminalizer init
```

- Record the terminal and create a recording file:

```
terminalizer record {{path/to/recording.gif}}
```

- Play a recorded file on the terminal:

```
terminalizer play {{path/to/recording.gif}}
```

- Render a recording file as an animated GIF image:

```
terminalizer render {{path/to/recording.gif}}
```

- Upload a video to https://terminalizer.com:

```
terminalizer share {{path/to/recording.gif}}
```

terraform apply

Create or update infrastructure according to Terraform configuration files.

More information: https://developer.hashicorp.com/terraform/cli/commands/apply.

- Create or update infrastructure:

```
terraform apply
```

- Create or update infrastructure, skipping interactive approval:

```
terraform apply -auto-approve
```

- Apply a plan file:

```
terraform apply {{path/to/file.tfplan}}
```

- Specify values for input variables:

```
terraform apply -var '{{name1}}={{value1}}' -var '{{name2}}
={{value2}}'
```

- Specify values for input variables from a file:

```
terraform apply -var-file {{path/to/file.tfvars}}
```

- Apply changes to a specific resource:

```
terraform apply -target
{{resource_type.resource_name[instance_index]}}
```

- Replace a specific resource:

```
terraform apply -replace
{{resource_type.resource_name[instance_index]}}
```

- Destroy Terraform-managed infrastructure:

```
terraform apply -destroy
```

terraform console

Start an interactive console for evaluating Terraform expressions.

More information: https://developer.hashicorp.com/terraform/cli/commands/console.

- Start an interactive console to evaluate expressions:

```
terraform console
```

- Evaluate expressions against the planned state instead of current state:

```
terraform console -plan
```

- Evaluate a specific expression non-interactively:

```
echo "{{expression}}" | terraform console
```

- Specify values for input variables:

```
terraform console -var '{{name1}}={{value1}}' -var '{{name2}}={{value2}}'
```

- Specify values for input variables from a file:

```
terraform console -var-file {{path/to/file.tfvars}}
```

terraform destroy

Destroy all objects managed by a Terraform configuration.

More information: https://developer.hashicorp.com/terraform/cli/commands/destroy.

- Destroy all infrastructure in the current directory:

```
terraform destroy
```

- Destroy infrastructure, skipping interactive approval:

```
terraform destroy -auto-approve
```

- Destroy a specific resource:

```
terraform destroy -target
{{resource_type.resource_name[instance_index]}}
```

- Specify values for input variables:

```
terraform destroy -var '{{name1}}={{value1}}' -var '{{name2}}
={{value2}}'
```

- Specify values for input variables from a file:

```
terraform destroy -var-file {{path/to/file.tfvars}}
```

- Destroy infrastructure with compact warnings:

```
terraform destroy -compact-warnings
```

terraform fmt

Format configuration according to Terraform language style conventions.

More information: https://developer.hashicorp.com/terraform/cli/commands/fmt.

- Format the configuration in the current directory:

  ```
  terraform fmt
  ```

- Format the configuration in the current directory and subdirectories:

  ```
  terraform fmt -recursive
  ```

- Display diffs of formatting changes:

  ```
  terraform fmt -diff
  ```

- Do not list files that were formatted to `stdout`:

  ```
  terraform fmt -list=false
  ```

terraform get

Download and update modules referenced in the root module.

More information: https://developer.hashicorp.com/terraform/cli/commands/get.

- Download modules referenced in the configuration:

```
terraform get
```

- Update already-downloaded modules to the latest allowed versions:

```
terraform get -update
```

- Disable color output:

```
terraform get -no-color
```

terraform graph

Generate a visual representation of configuration or execution plan.

The output is in DOT format and can be rendered using GraphViz.

More information: https://developer.hashicorp.com/terraform/cli/commands/graph.

- Generate a dependency graph for the current configuration:

```
terraform graph
```

- Generate a graph and render it to a PNG file using GraphViz:

```
terraform graph | dot -Tpng > {{path/to/graph.png}}
```

- Generate a graph from a saved plan file:

```
terraform graph -plan={{path/to/tfplan}}
```

- Generate a graph highlighting dependency cycles:

```
terraform graph -draw-cycles
```

- Generate a graph of a specific type (plan, apply, etc.):

```
terraform graph -type={{plan|plan-refresh-only|plan-destroy|apply}}
```

terraform import

Import existing infrastructure into Terraform state.

More information: https://developer.hashicorp.com/terraform/cli/commands/import.

- Import an existing resource into Terraform state:

```
terraform import {{resource_type.resource_name}}
{{resource_id}}
```

- Import a resource into a module:

```
terraform import module.{{module_name}}.
{{resource_type.resource_name}} {{resource_id}}
```

- Import without interactive input prompts (useful for automation):

```
terraform import -input=false {{resource_type.resource_name}}
{{resource_id}}
```

- Import with variable values:

```
terraform import -var '{{name}}
={{value}}' {{resource_type.resource_name}} {{resource_id}}
```

- Import with a variable file:

```
terraform import -var-file={{path/to/variables.tfvars}}
{{resource_type.resource_name}} {{resource_id}}
```

- Import without state locking (use with caution):

```
terraform import -lock=false {{resource_type.resource_name}}
{{resource_id}}
```

terraform init

Initialize a new or existing Terraform working directory.

More information: https://developer.hashicorp.com/terraform/cli/commands/init.

- Initialize the current working directory:

```
terraform init
```

- Initialize and upgrade modules and providers to the latest allowed versions:

```
terraform init -upgrade
```

- Initialize and reconfigure the backend, ignoring any saved configuration:

```
terraform init -reconfigure
```

- Initialize and reconfigure the backend, attempting to migrate any existing state:

```
terraform init -migrate-state
```

- Initialize with additional backend configuration:

```
terraform init -backend-config '{{key}}={{value}}'
```

- Initialize without backend or HCP Terraform initialization:

```
terraform init -backend=false
```

- Initialize without interactive prompts (useful for automation):

```
terraform init -input=false
```

- Initialize with the dependency lockfile mode set to readonly:

```
terraform init -lockfile readonly
```

terraform login

Log in to a remote host.

See also: **`terraform logout`**.

More information: https://developer.hashicorp.com/terraform/cli/commands/login.

- Log in to HCP Terraform (app.terraform.io):

```
terraform login
```

- Log in to a specific hostname:

```
terraform login {{hostname}}
```

- Log in to HCP Terraform Europe:

```
terraform login app.terraform.io/eu
```

terraform logout

Log out from a remote host.

See also: **`terraform login`**.

More information: https://developer.hashicorp.com/terraform/cli/commands/logout.

- Log out from HCP Terraform (app.terraform.io):

```
terraform logout
```

- Log out from a specific hostname:

```
terraform logout {{hostname}}
```

terraform output

Export structured data about your Terraform resources.

More information: https://developer.hashicorp.com/terraform/cli/commands/output.

- Display all outputs for the root module:

```
terraform output
```

- Output only a value with specific name:

```
terraform output {{name}}
```

- Convert the output value to a raw string (useful for shell scripts):

```
terraform output -raw
```

- Format the outputs as a JSON object, with a key per output (useful with jq):

```
terraform output -json
```

terraform plan

Generate and show Terraform execution plans.

More information: https://developer.hashicorp.com/terraform/cli/commands/plan.

- Generate and show the execution plan in the current directory:

```
terraform plan
```

- Show a plan to destroy all remote objects that currently exist:

```
terraform plan -destroy
```

- Show a plan to update the Terraform state and output values:

```
terraform plan -refresh-only
```

- Specify values for input variables:

```
terraform plan -var '{{name1}}={{value1}}' -var '{{name2}}
={{value2}}'
```

- Focus Terraform's attention on only a subset of resources:

```
terraform plan -target
{{resource_type.resource_name[instance_index]}}
```

- Output a plan as JSON:

```
terraform plan -json
```

- Write a plan to a specific file:

```
terraform plan -no-color > {{path/to/file}}
```

terraform providers

Manage provider dependencies for Terraform configurations.

More information: https://developer.hashicorp.com/terraform/cli/commands/providers.

- Show providers required by the configuration:

```
terraform providers
```

- Update the dependency lock file for all providers:

```
terraform providers lock
```

- Update the lock file for multiple target platforms:

```
terraform providers lock -platform={{linux_amd64}} -platform={{darwin_arm64}}
```

- Mirror all required providers to a local directory:

```
terraform providers mirror {{path/to/mirror_directory}}
```

- Mirror providers for a specific platform:

```
terraform providers mirror -platform={{linux_amd64}} {{path/to/mirror_directory}}
```

- Print provider schemas in JSON format:

```
terraform providers schema -json
```

- Generate lock file entries using a filesystem mirror:

```
terraform providers lock -fs-mirror={{path/to/mirror}}
```

- Generate lock file entries using a network mirror:

```
terraform providers lock -net-mirror={{https://mirror.example.com/providers/}}
```

terraform query

Query remote infrastructure for resources matching criteria in **`.tfquery.hcl`** files.

More information: https://developer.hashicorp.com/terraform/cli/commands/query.

- Query infrastructure using `.tfquery.hcl` files in the current directory:

```
terraform query
```

- Query and generate import blocks and resource configuration:

```
terraform query -generate-config-out {{path/to/generated.tf}}
```

- Specify values for input variables defined in the query file:

```
terraform query -var '{{name1}}={{value1}}' -var '{{name2}}
={{value2}}'
```

- Specify values for input variables from a file:

```
terraform query -var-file {{path/to/file.tfvars}}
```

- Output results in JSON format:

```
terraform query -json
```

terraform show

Read and output a Terraform state or plan file in human-readable form.

More information: https://developer.hashicorp.com/terraform/cli/commands/show.

- Show the current state:

```
terraform show
```

- Show a specific state file:

```
terraform show {{path/to/terraform.tfstate}}
```

- Show a specific plan file:

```
terraform show {{path/to/file.tfplan}}
```

- Output in JSON format:

```
terraform show -json
```

- Output a plan file in JSON format:

```
terraform show -json {{path/to/file.tfplan}}
```

- Write to a file without color codes:

```
terraform show -no-color > {{path/to/file}}
```

terraform taint

Mark a resource instance as not fully functional to force replacement on next apply.

Note: This command is deprecated, use **`terraform apply -replace`** instead.

See also: **`terraform apply`**, **`terraform untaint`**.

More information: https://developer.hashicorp.com/terraform/cli/commands/taint.

- Mark a resource as tainted:

```
terraform taint
{{resource_type.resource_name[instance_index]}}
```

- Mark a resource as tainted, even if the resource is missing:

```
terraform taint -allow-missing
{{resource_type.resource_name[instance_index]}}
```

- Mark a resource as tainted without acquiring a state lock:

```
terraform taint -lock=false
{{resource_type.resource_name[instance_index]}}
```

- Mark a resource as tainted with a custom lock timeout:

```
terraform taint -lock-timeout={{duration}}
{{resource_type.resource_name[instance_index]}}
```

terraform untaint

Remove the tainted status from a resource instance.

See also: **`terraform taint`**.

More information: https://developer.hashicorp.com/terraform/cli/commands/untaint.

- Remove tainted status from a resource:

```
terraform untaint
{{resource_type.resource_name[instance_index]}}
```

- Remove tainted status, even if the resource is missing:

```
terraform untaint -allow-missing
{{resource_type.resource_name[instance_index]}}
```

- Remove tainted status without acquiring a state lock:

```
terraform untaint -lock=false
{{resource_type.resource_name[instance_index]}}
```

- Remove tainted status with a custom lock timeout:

```
terraform untaint -lock-timeout={{duration}}
{{resource_type.resource_name[instance_index]}}
```

terraform validate

Validate the configuration files in a directory.

More information: https://developer.hashicorp.com/terraform/cli/commands/validate.

- Validate the configuration in the current directory:

```
terraform validate
```

- Output the validation result in JSON format:

```
terraform validate -json
```

- Validate the configuration without validating test files:

```
terraform validate -no-tests
```

- Validate the configuration in a specific directory:

```
terraform validate {{path/to/directory}}
```

- Validate the configuration using a custom test directory:

```
terraform validate -test-directory {{path/to/test_directory}}
```

terraform

Create and deploy infrastructure as code to cloud providers.

More information: https://developer.hashicorp.com/terraform/cli/commands.

- Initialize a new or existing Terraform configuration:

  ```
  terraform init
  ```

- Verify that the configuration files are syntactically valid:

  ```
  terraform validate
  ```

- Format configuration according to Terraform language style conventions:

  ```
  terraform fmt
  ```

- Generate and show an execution plan:

  ```
  terraform plan
  ```

- Build or change infrastructure:

  ```
  terraform apply
  ```

- Destroy all infrastructure in the current directory:

  ```
  terraform destroy
  ```

terragrunt

Keep your Terraform CLI arguments DRY.

More information: https://terragrunt.gruntwork.io/docs/reference/cli/.

- Generate and show an execution plan:

  ```
  terragrunt plan
  ```

- Build or change infrastructure:

  ```
  terragrunt apply
  ```

- Show current deployment (from state):

  ```
  terragrunt show
  ```

- Show module output values:

  ```
  terragrunt output
  ```

- Destroy Terraform-managed infrastructure:

  ```
  terragrunt destroy
  ```

- Build or change infrastructure from a tree of Terragrunt modules (stack):

  ```
  terragrunt run-all apply
  ```

tesseract

OCR (Optical Character Recognition) engine.

More information: https://github.com/tesseract-ocr/tesseract/blob/main/doc/tesseract.1.asc.

- Recognize text in an image and save it to the given path (a `.txt` extension is added automatically):

```
tesseract {{path/to/image.png}} {{path/to/output_file}}
```

- Specify a custom [l]anguage (default is English) with an ISO 639-2 code (e.g. deu = Deutsch = German):

```
tesseract -l deu {{path/to/image.png}} {{path/to/output_file}}
```

- List the ISO 639-2 codes of installed languages:

```
tesseract --list-langs
```

- Specify a custom [p]age [s]egmentation [m]ode (default is 3):

```
tesseract --psm {{0..13}} {{path/to/image.png}} {{path/to/output_file}}
```

- List page segmentation modes and their descriptions:

```
tesseract --help-psm
```

test

Check file types and compare values.

Returns 0 if the condition evaluates to true, 1 if it evaluates to false.

See also: `[`.

More information: https://www.gnu.org/software/coreutils/manual/html_node/test-invocation.html.

- Test if a given variable is equal to a given string:

```
test "{{$MY_VAR}}" = "{{/bin/zsh}}"
```

- Test if a given variable is empty ([z]ero length):

```
test -z "{{$GIT_BRANCH}}"
```

- Test if a [f]ile exists:

```
test -f "{{path/to/file}}"
```

- Test if a [d]irectory does not exist:

```
test ! -d "{{path/to/directory}}"
```

- If A is true, then do B, or C in the case of an error (notice that C may run even if A fails):

```
test {{condition}} && {{echo "true"}} || {{echo "false"}}
```

- Use `test` in a conditional statement:

```
if test -f "{{path/to/file}}"; then echo "File exists"; else echo "File does not exist"; fi
```

- Display help:

```
help test
```

testdisk

Scan and repair disk partitions.

See also: **`photorec`**, **`fdisk`**.

More information: https://manned.org/testdisk.

- Start TestDisk on a specific device:

```
sudo testdisk {{/dev/sdX}}
```

- Start TestDisk on a disk image:

```
sudo testdisk {{path/to/image.dd}}
```

- Start TestDisk and create a log file (`testdisk.log`):

```
sudo testdisk /log {{/dev/sdX}}
```

- List current partitions:

```
sudo testdisk /list
```

- Display version:

```
testdisk /version
```

testparm

Check a Samba configuration file for internal correctness.

More information: https://manned.org/testparm.

- Check `/etc/samba/smb.conf` for correctness:

  `testparm`

- Check a specific configuration file for correctness:

  `testparm {{path/to/file}}`

- Display help:

  `testparm {{[-?|--help]}}`

testssl

Check SSL/TLS protocols and ciphers supported by a server.

More information: https://testssl.sh/doc/testssl.1.html.

- Test a server (run every check) on port 443:

```
testssl {{example.com}}
```

- Test a different port:

```
testssl {{example.com:465}}
```

- Only check available protocols:

```
testssl --protocols {{example.com}}
```

- Only check vulnerabilities:

```
testssl --vulnerable {{example.com}}
```

- Only check HTTP security headers:

```
testssl --headers {{example.com}}
```

- Test other STARTTLS enabled protocols:

```
testssl --starttls {{ftp|smtp|pop3|imap|xmpp|sieve|xmpp-
server|telnet|ldap|irc|lmtp|nntp|postgres|mysql}}
{{example.com}}:{{port}}
```

tex-fmt

Format LaTeX source code.

More information: https://github.com/WGUNDERWOOD/tex-fmt.

- Format a file, overwriting the original:

```
tex-fmt {{path/to/file.tex}}
```

- Check if a file is correctly formatted:

```
tex-fmt --check {{path/to/file.tex}}
```

- Format a file read from `stdin` and print to `stdout`:

```
cat {{path/to/file.tex}} | tex-fmt --stdin
```

tex

Compile a DVI document from TeX source files.

More information: https://www.tug.org/begin.html.

- Compile a DVI document:

```
tex {{source.tex}}
```

- Compile a DVI document, specifying an output directory:

```
tex -output-directory={{path/to/directory}} {{source.tex}}
```

- Compile a DVI document, exiting on each error:

```
tex -halt-on-error {{source.tex}}
```

texconfig

Configure TeX Live or teTeX.

Superseded in many cases by **`tlmgr`**.

More information: https://manned.org/texconfig.

- Display the current TeX configuration:

```
texconfig conf
```

- Set the default paper size for supported programs:

```
texconfig paper {{a4|letter|...}}
```

- Set the default paper size for PDFTeX:

```
texconfig pdftex paper {{a4|letter|...}}
```

- Rebuild all TeX formats and font maps:

```
texconfig init
```

- Rebuild a specific format:

```
texconfig init {{format}}
```

- Refresh the TeX filename database:

```
texconfig rehash
```

texcount

Count words in TeX documents omitting macros.

Note: If the TeX document uses **`\include`** or **`\input`** and you want to count the included files, **`texcount`** must be run in the directory of the root TeX file.

More information: https://app.uio.no/ifi/texcount/howto.html.

- Count words in a TeX file:

```
texcount {{path/to/file.tex}}
```

- Count words in a document and subdocuments built with `\input` or `\include`:

```
texcount -merge {{file.tex}}
```

- Count words in a document and subdocuments, listing each file separately (and a total count):

```
texcount -inc {{file.tex}}
```

- Count words in a document and subdocuments, producing subcounts by chapter (instead of subsection):

```
texcount -merge -sub=chapter {{file.tex}}
```

- Count words with verbose output:

```
texcount -v {{path/to/file.tex}}
```

texdoc

Search for appropriate documentation for (La)TeX commands or packages.

More information: https://manned.org/texdoc.

- Open the first search result in the default PDF viewer:

```
texdoc {{search}}
```

- List the best search results:

```
texdoc {{[-l|--list]}} {{search}}
```

- Open full documentation of texdoc:

```
texdoc texdoc
```

texliveonfly

Download missing TeX Live packages while compiling `.tex` files.

More information: https://ctan.org/tex-archive/support/texliveonfly.

- Download missing packages while compiling:

```
texliveonfly {{source.tex}}
```

- Use a specific compiler (defaults to `pdflatex`):

```
texliveonfly {{[-c|--compiler]}} {{compiler}} {{source.tex}}
```

- Use a custom TeX Live `bin` folder:

```
texliveonfly --texlive_bin={{path/to/texlive_bin}}
{{source.tex}}
```

textmaker

SoftMaker Office's word processor application.

More information: https://help.softmaker.com/textmaker2026/en/index.html.

- Launch the word processor application with a new blank document:

```
textmaker
```

- Open an existing file with TextMaker:

```
textmaker {{path/to/file.tmdx}}
```

- Launch TextMaker with [N]o open documents:

```
textmaker -N
```

textql

Execute SQL against structured text like CSV or TSV files.

More information: https://github.com/dinedal/textql#usage.

- Print the lines in the specified CSV file that match an SQL query to `stdout`:

```
textql -sql "{{SELECT * FROM filename}}" {{path/to/
filename.csv}}
```

- Query a TSV file:

```
textql -dlm=tab -sql "{{SELECT * FROM filename}}" {{path/to/
filename.tsv}}
```

- Query file with header row:

```
textql -dlm={{delimiter}} -header -sql "{{SELECT * FROM
filename}}" {{path/to/filename.csv}}
```

- Read data from `stdin`:

```
cat {{path/to/file}} | textql -sql "{{SELECT * FROM stdin}}"
```

- Join two files on a specified common column:

```
textql -header -sql "SELECT * FROM {{path/to/file1}} JOIN
{{file2}} ON {{path/to/file1}}.{{c1}} = {{file2}}.{{c1}}
LIMIT {{10}}" -output-header {{path/to/file1.csv}} {{path/to/
file2.csv}}
```

- Format output using an output delimiter with an output header line:

```
textql -output-dlm={{delimiter}} -output-header -sql "SELECT
{{column}} AS {{alias}} FROM {{filename}}" {{path/to/
filename.csv}}
```

tgatoppm

Convert a TrueVision Targa file to a Netpbm image.

More information: https://netpbm.sourceforge.net/doc/tgatoppm.html.

- Convert a TrueVision Targa file to a PPM image:

```
tgatoppm {{path/to/file.tga}} > {{path/to/output.ppm}}
```

- Dump information from the TGA header to `stdout`:

```
tgatoppm {{[-h|-headerdump]}} {{path/to/file.tga}} > {{path/
to/output.ppm}}
```

- Write the transparency channel values of the input image to the specified file:

```
tgatoppm {{[-a|-alphaout]}} {{path/to/transparency_file.pgm}}
{{path/to/file.tga}} > {{path/to/output.ppm}}
```

- Display version:

```
tgatoppm {{[-v|-version]}}
```

tgcloud

Manage a Telegram account.

See also: **`tgsend`**, **`tginfo`**, **`tgutil`**.

More information: https://pypi.org/project/telegram-cloud/.

- Upload a file to a chat with a caption:

```
tgcloud {{[-m|--mode]}} upload {{[-n|--name]}}
{{session_name}} {{[-u|--username]}} {{chat_id}} {{[-p|--
path]}} {{path_of_the_file}} {{[-c|--caption]}} {{caption}}
```

- Download a file from a chat and store it in `path/to/store` with a caption:

```
tgcloud {{[-m|--mode]}} download {{[-n|--name]}}
{{session_name}} {{[-u|--username]}} {{chat_id}} {{[-p|--
path]}} {{path/to/store}} {{[-c|--caption]}} {{caption}}
```

tginfo

Manage a Telegram account.

See also: **`tgcloud`**, **`tgsend`**, **`tgutil`**.

More information: https://pypi.org/project/telegram-cloud/.

- Search for all files inside a Telegram conversation based on their filename or caption:

```
tginfo {{[-n|--name]}} {{session_name}} {{[-u|--username]}} {{chat_id}} {{[-s|--search]}} "{{query}}"
```

- Get info for all media inside a Telegram chat:

```
tginfo {{[-n|--name]}} {{session_name}} {{[-u|--username]}} {{chat_id}}
```

tgpt

Talk to an AI chatbot without the need for API keys.

Available providers: **`openai`**, **`opengpts`**, **`koboldai`**, **`phind`**, **`llama2`**, **`blackboxai`**.

More information: https://github.com/aandrew-me/tgpt.

- Chat with the default provider (GPT-3.5-turbo):

```
tgpt "{{prompt}}"
```

- Start multi-line interactive mode:

```
tgpt {{[-m|--multiline]}}
```

- Generate images and save them to the current directory:

```
tgpt {{[-img|--image]}} "{{prompt}}"
```

- Generate code with the default provider (GPT-3.5-turbo):

```
tgpt {{[-c|--code]}} "{{prompt}}"
```

- Chat with a specific provider quietly (without animations):

```
tgpt --provider {{openai|opengpts|koboldai|phind|llama2|
blackboxai}} {{[-q|--quiet]}} {{[-w|--whole]}} "{{prompt}}"
```

- Generate and execute shell commands using a specific provider (with a confirmation prompt):

```
tgpt --provider {{llama2}} {{[-s|--shell]}} "{{prompt}}"
```

- Prompt with an API key, model, max response length, temperature, and `top_p` (required when using `openai` provider):

```
tgpt --provider openai --key "{{api_key}}" --model
"{{gpt-3.5-turbo}}" --max-length {{10}} --temperature {{0.7}}
--top_p {{0.9}} "{{prompt}}"
```

- Feed a file as additional pre-prompt input:

```
tgpt < {{path/to/file}} --provider {{blackboxai}}
"{{prompt}}"
```

tgsend

Manage a Telegram account.

See also: **`tgcloud`**, **`tginfo`**, **`tgutil`**.

More information: https://pypi.org/project/telegram-cloud/.

- Send a message to a chat:

```
tgsend {{[-n|--name]}} {{session_name}} {{[-u|--username]}}
{{chat_id}} "{{message}}"
```

- Send a message to chat with silent notification:

```
tgsend {{[-n|--name]}} {{session_name}} {{[-u|--username]}}
{{chat_id}} --silent "{{message}}"
```

tgutil

Manage a Telegram account.

See also: **`tgcloud`**, **`tgsend`**, **`tginfo`**.

More information: https://pypi.org/project/telegram-cloud/.

- Edit the last text message on a chat with new text:

```
tgutil {{[-n|--name]}} {{session_name}} {{[-u|--username]}}
{{chat_id}} {{[-m|--mode]}} edit --text "{{current_text}}" --
newtext "{{new_text}}"
```

- Edit all text messages that contain `current_text` with `new_text`:

```
tgutil {{[-n|--name]}} {{session_name}} {{[-u|--username]}}
{{chat_id}} {{[-m|--mode]}} editall --text "{{current_text}}"
--newtext "{{new_text}}"
```

- Delete the last text message on a chat with search value:

```
tgutil {{[-n|--name]}} {{session_name}} {{[-u|--username]}}
{{chat_id}} {{[-m|--mode]}} delete --text "{{current_text}}"
```

- Delete all messages containing the `query` value:

```
tgutil {{[-n|--name]}} {{session_name}} {{[-u|--username]}}
{{chat_id}} {{[-m|--mode]}} deleteall --text "{{query}}"
```

theHarvester

A tool designed to be used in the early stages of a penetration test.

More information: https://github.com/laramies/theHarvester.

- Gather information on a domain using Google:

```
theHarvester --domain {{domain_name}} --source google
```

- Gather information on a domain using multiple sources:

```
theHarvester --domain {{domain_name}} --source
{{duckduckgo,bing,crtsh}}
```

- Change the limit of results to work with:

```
theHarvester --domain {{domain_name}} --source {{google}} --
limit {{200}}
```

- Save the output to two files in XML and HTML format:

```
theHarvester --domain {{domain_name}} --source {{google}} --
file {{output_file_name}}
```

- Display help:

```
theHarvester --help
```

then

This shell keyword is used in combination with **`if`** and **`elif`** to separate branches and branch conditions.

- View documentation for `if` command:

```
tldr if
```

thinkjettopbm

Convert a HP ThinkJet printer commands file to a PBM file.

More information: https://netpbm.sourceforge.net/doc/thinkjettopbm.html.

- Convert a HP ThinkJet printer commands file to a PBM file:

```
thinkjettopbm {{path/to/input}} > {{path/to/output.pbm}}
```

- Print debug information to `stderr`:

```
thinkjettopbm {{[-d|-debug]}} {{path/to/input}} > {{path/to/
output.pbm}}
```

thunderbird

Email client and RSS reader.

More information: https://manned.org/thunderbird.

- Open thunderbird:

```
thunderbird
```

- Use a specific user profile:

```
thunderbird -P {{profile_name}}
```

- Use a specific user profile directory:

```
thunderbird --profile {{path/to/profile_directory}}
```

ticketConverter.py

Convert Kerberos tickets between kirbi and ccache formats.

Part of the Impacket suite.

More information: https://github.com/fortra/impacket.

- Convert kirbi to ccache:

```
ticketConverter.py {{path/to/ticket.kirbi}} {{path/to/ticket.ccache}}
```

- Convert ccache to kirbi:

```
ticketConverter.py {{path/to/ticket.ccache}} {{path/to/ticket.kirbi}}
```

tidy-viewer

A data pretty-printer with column styling for CSV, TSV, PSV, Parquet, and Arrow IPC files.

Commonly aliased as **`tv`**.

More information: https://github.com/alexhallam/tv#help.

- Pretty-print the first 25 rows of a CSV file:

```
tidy-viewer {{path/to/file.csv}}
```

- Pretty-print data piped from `stdin`:

```
cat {{path/to/file.csv}} | tidy-viewer
```

- Pretty-print a file with a custom [s]eparator (e.g. a pipe):

```
tidy-viewer {{[-s|--delimiter]}} '|' {{path/to/file.psv}}
```

- Display data with a specific color palette (1: nord, 2: one_dark, 3: gruvbox, 4: dracula, 5: solarized light):

```
tidy-viewer {{[-c|--color]}} {{3}} {{path/to/file.csv}}
```

- Print all rows in color, paging through the output:

```
tidy-viewer {{[-af|--color-always --force-all-rows]}} {{path/to/file.csv}} | less -RS
```

- Display help:

```
tidy-viewer {{[-h|--help]}}
```

- Display version:

```
tidy-viewer {{[-V|--version]}}
```

tidy

Clean up and pretty print HTML, XHTML, and XML files.

Note: **`tidy`** cannot preserve original indentation.

More information: https://api.html-tidy.org/tidy/tidylib_api_next/group__options__cli.html#gad7a9fcaf7b2a712a82e625e84c042b28.

- Pretty print an HTML file:

```
tidy {{path/to/file.html}}
```

- Enable indentation, wrapping lines in 100, saving to `output.html`:

```
tidy {{[-i|--indent]}} y {{[-w|--wrap]}} 100 {{[-o|-output]}}
{{path/to/output.html}} {{path/to/file.html}}
```

- Modify an HTML file in-place using a configuration file:

```
tidy -config {{path/to/configuration}} {{[-m|-modify]}}
{{path/to/file.html}}
```

tifftopnm

Convert a TIFF image to a PNM image.

More information: https://netpbm.sourceforge.net/doc/tifftopnm.html.

- Convert a TIFF to a PNM file:

```
tifftopnm {{path/to/input_file.tiff}} > {{path/to/
output_file.pnm}}
```

- Create a PGM file containing the alpha channel of the input image:

```
tifftopnm {{[-a|-alphaout]}} {{path/to/alpha_file.pgm}}
{{path/to/input_file.tiff}} > {{path/to/output_file.pnm}}
```

- Respect the `fillorder` tag in the input TIFF image:

```
tifftopnm {{[-r|-respectfillorder]}} {{path/to/
input_file.tiff}} > {{path/to/output_file.pnm}}
```

- Print TIFF header information to `stderr`:

```
tifftopnm {{[-h|-headerdump]}} {{path/to/input_file.tiff}} >
{{path/to/output_file.pnm}}
```

tig

A configurable **ncurses**-based TUI for Git.

See also: **gitui**, **git-gui**.

More information: https://jonas.github.io/tig/doc/manual.html.

- Show the sequence of commits starting from the current one in reverse chronological order:

```
tig
```

- Show the history of a specific branch:

```
tig {{branch}}
```

- Show the history of specific files or directories:

```
tig {{path1 path2 ...}}
```

- Show the difference between two references (such as branches or tags):

```
tig {{base_ref}}..{{compared_ref}}
```

- Browse `git blame` interactively (press `<,>` to jump to parent):

```
tig blame {{path/to/file}}
```

- Display commits from all branches and stashes:

```
tig --all
```

- Start in stash view, displaying all saved stashes:

```
tig stash
```

- Display help in TUI:

```
<h>
```

time

Measure how long a command took to run.

Note: **`time`** can either exist as a shell builtin, a standalone program, or both.

See also: **`times`**.

More information: https://manned.org/time.

- Run the `command` and print the time measurements to `stdout`:

```
time {{command}}
```

- Create a very simple stopwatch (only works in Bash):

```
time read
```

timeout

Run a command with a time limit.

More information: https://www.gnu.org/software/coreutils/manual/html_node/timeout-invocation.html.

- Run `sleep 10` and terminate it after 3 seconds:

```
timeout 3s sleep 10
```

- Send a signal to the command after the time limit expires (`TERM` by default, `kill -l` to list all signals):

```
timeout {{[-s|--signal]}} {{INT|HUP|KILL|...}} {{5s}} {{sleep 10}}
```

- Send verbose output to `stderr` showing signal sent upon timeout:

```
timeout {{[-v|--verbose]}} {{0.5s|1m|1h|1d|...}} {{command}}
```

- Preserve the exit status of the command regardless of timing out:

```
timeout {{[-p|--preserve-status]}} {{1s|1m|1h|1d|...}} {{command}}
```

- Send a forceful `KILL` signal after certain duration if the command ignores initial signal upon timeout:

```
timeout {{[-k|--kill-after]}} {{5m}} {{30s}} {{command}}
```

times

Print the cumulative CPU usage time of the current shell.

First line is current shell CPU usage for User and System. Second is all child processes.

See also: **`time`**.

More information: https://www.gnu.org/software/bash/manual/bash.html#index-times.

- Print CPU usage:

```
times
```

timetrap

Simple time tracker written in Ruby.

More information: https://github.com/samg/timetrap.

- Create a new timesheet:

```
timetrap sheet {{timesheet}}
```

- Check in an entry started 5 minutes ago:

```
timetrap in --at "{{5 minutes ago}}" {{entry_notes}}
```

- Display the current timesheet:

```
timetrap display
```

- Edit the last entry's end time:

```
timetrap edit --end {{time}}
```

timew

A time tracking tool used to measure the duration of activities.

More information: https://timewarrior.net/docs/.

- Start tracking an activity:

```
timew start
```

- Tag the current activity:

```
timew tag {{activity_tag}}
```

- Start tracking and tag a new activity:

```
timew start {{activity_tag}}
```

- Stop the current activity:

```
timew stop
```

- Track an activity in the past:

```
timew track {{start_time}} - {{end_time}} {{activity_tag}}
```

- View tracked items of the day:

```
timew summary
```

- View report for the last day, week, current month, etc.:

```
timew summary :{{today|yesterday|week|lastweek|month|
lastmonth|year|lastyear}}
```

timg

A terminal image and video viewer.

More information: https://github.com/hzeller/timg#synopsis.

- Display a static image:

```
timg {{image.jpg}}
```

- Display all JPEG images in the current directory:

```
timg *.jpg
```

- Display all the bitmaps in icons file:

```
timg {{example.ico}}
```

- Play a video:

```
timg {{video.mp4}}
```

- Play contents of webcam:

```
timg {{/dev/videoX}}
```

- Play an animated GIF:

```
timg {{gif.gif}}
```

- Display version:

```
timg --version
```

timidity

Play and convert MIDI files.

More information: https://manned.org/timidity.

- Play a MIDI file:

```
timidity {{path/to/file.mid}}
```

- Play a MIDI file in a loop:

```
timidity {{[--l|--loop]}} {{path/to/file.mid}}
```

- Play a MIDI file in a specific key (0 = C major/A minor, -1 = F major/D minor, +1 = G major/E minor, etc.):

```
timidity --force-keysig={{-flats|+sharps}} {{path/to/
file.mid}}
```

- Convert a MIDI file to PCM (WAV) audio:

```
timidity --output-mode={{w}} --output-file={{path/to/
file.wav}} {{path/to/file.mid}}
```

- Convert a MIDI file to FLAC audio:

```
timidity --output-mode={{F}} --output-file={{path/to/
file.flac}} {{path/to/file.mid}}
```

tio

Monitor and interact with serial ports.

See also: **`picocom`**, **`cu`**, **`minicom`**.

More information: https://github.com/tio/tio#3-usage.

- Open a serial port with default settings:

```
tio {{/dev/ttyUSB0}}
```

- Open a serial port with a specific baud rate:

```
tio {{[-b|--baudrate]}} {{9600}} {{/dev/ttyUSB0}}
```

- Open a serial port and log output to a file:

```
tio {{[-L|--log]}} --log-file {{log_file}} {{/dev/ttyUSB0}}
```

- Open a serial port and enable hexadecimal output:

```
tio --output-mode hex {{/dev/ttyUSB0}}
```

- List available serial ports:

```
tio {{[-l|--list]}}
```

- Exit `tio` session:

```
<Ctrl t><q>
```

tip

Connect to a remote system or serial console.

More information: https://manned.org/tip.

- Connect to a remote system defined in `/etc/remote`:

```
tip {{system_name}}
```

- Connect at a specific baud rate:

```
tip -{{115200}} {{system_name}}
```

- Connect with verbose output:

```
tip -v {{system_name}}
```

- Connect with tilde escape sequences disabled:

```
tip -n {{system_name}}
```

tldr-lint

Lint and format **`tldr`** pages.

Note: **`tldrl`** can be used as an alias for **`tldr-lint`**.

More information: https://github.com/tldr-pages/tldr-lint#usage.

- Lint a single page or all pages in a directory:

```
tldr-lint {{path/to/page_or_directory}}
```

- Ignore specific `tldr-lint` error codes while linting:

```
tldr-lint {{[-I|--ignore]}} {{TLDR001,TLDR002,...}}
```

- Format a specific page to `stdout`:

```
tldr-lint {{[-f|--format]}} {{path/to/page.md}}
```

- Format a page in place:

```
tldr-lint {{[-f|--format]}} {{[-i|--in-place]}} {{path/to/page.md}}
```

tldr

Display simple help pages for command-line tools from the tldr-pages project.

Note: The **`--language`** and **`--list`** options are not required by the client specification, but most clients implement them.

See also: **`cheatshh`**, **`cheat`**, **`navi`**.

More information: https://github.com/tldr-pages/tldr/blob/main/CLIENT-SPECIFICATION.md#command-line-interface.

- Print the tldr page for a specific command (hint: this is how you got here!):

```
tldr {{command}}
```

- Print the tldr page for a specific subcommand:

```
tldr {{command}} {{subcommand}}
```

- Print the tldr page for a command in the given language (if available, otherwise fall back to English):

```
tldr {{[-L|--language]}} {{language_code}} {{command}}
```

- Print the tldr page for a command from a specific platform:

```
tldr {{[-p|--platform]}} {{android|cisco-ios|common|dos|
freebsd|linux|netbsd|openbsd|osx|sunos|windows}} {{command}}
```

- Update the local cache of tldr pages:

```
tldr {{[-u|--update]}}
```

- List all pages for the current platform and `common`:

```
tldr {{[-l|--list]}}
```

- Print the tldr page for a command and display short options:

```
tldr --short-options {{command}}
```

- Browse tldr pages in a terminal window (`fzf` must be available):

```
tldr {{[-l|--list]}} | fzf --preview "tldr {1} --
color=always" --preview-window=right,70% | xargs tldr
```

tldrl

This command is an alias of **`tldr-lint`**.

- View documentation for the original command:

```
tldr tldr-lint
```

tlmgr arch

This command is an alias of **`tlmgr platform`**.

- View documentation for the original command:

  ```
  tldr tlmgr platform
  ```

tlmgr backup

Manage backups of TeX Live packages.

The default backup directory is specified by the **`backupdir`** option, and can be obtained with **`tlmgr option`**.

More information: https://www.tug.org/texlive/doc/tlmgr.html#backup.

- Make a backup of one or more packages:

```
tlmgr backup {{package1 package2 ...}}
```

- Make a backup of all packages:

```
tlmgr backup --all
```

- Make a backup to a custom directory:

```
tlmgr backup {{package}} --backupdir {{path/to/
backup_directory}}
```

- Remove a backup of one or more packages:

```
tlmgr backup clean {{package1 package2 ...}}
```

- Remove all backups:

```
tlmgr backup clean --all
```

tlmgr candidates

Get available candidate repositories from which a TeX Live package can be installed.

More information: https://www.tug.org/texlive/doc/tlmgr.html#candidates-pkg.

- List all available repositories from which a package can be installed:

```
tlmgr candidates {{package}}
```

tlmgr check

Check the consistency of a TeX Live installation.

More information: https://www.tug.org/texlive/doc/tlmgr.html#check-option...-depends-executes-files-runfiles-texmfdbs-all.

- Check the consistency of the whole TeX Live installation:

```
tlmgr check all
```

- Check the consistency of the whole TeX Live information in verbose mode:

```
tlmgr check all -v
```

- Check for missing dependencies:

```
tlmgr check depends
```

- Check if all TeX Live executables are present:

```
tlmgr check executes
```

- Check if all files listed in the local TLPDB are present:

```
tlmgr check files
```

- Check for duplicate filenames in the runfiles sections:

```
tlmgr check runfiles
```

tlmgr conf

Manage the TeX Live configuration.

More information: https://www.tug.org/texlive/doc/tlmgr.html#conf.

- Show the current TeX Live configuration:

```
tlmgr conf
```

- Show the current `texmf`, `tlmgr`, or `updmap` configuration:

```
tlmgr conf {{texmf|tlmgr|updmap}}
```

- Show only a specific configuration option:

```
tlmgr conf {{texmf|tlmgr|updmap}} {{configuration_key}}
```

- Set a specific configuration option:

```
tlmgr conf {{texmf|tlmgr|updmap}} {{configuration_key}}
{{value}}
```

- Delete a specific configuration option:

```
tlmgr conf {{texmf|tlmgr|updmap}} --delete
{{configuration_key}}
```

- Disable the execution of system calls via `\write18`:

```
tlmgr conf texmf {{shell_escape}} {{0}}
```

- Show all additional `texmf` trees:

```
tlmgr conf auxtrees show
```

tlmgr dump-tlpdb

Dump the TeX Live package database.

More information: https://www.tug.org/texlive/doc/tlmgr.html#dump-tlpdb-option...---json.

- Dump the local package database:

```
tlmgr dump-tlpdb --local
```

- Dump the remote package database:

```
tlmgr dump-tlpdb --remote
```

- Dump the local package database as JSON:

```
tlmgr dump-tlpdb --local --json
```

tlmgr generate

Remake configuration files from information stored locally.

More information: https://www.tug.org/texlive/doc/tlmgr.html#generate.

- Remake the configuration file storing into a specific location:

```
tlmgr generate --dest {{output_file}}
```

- Remake the configuration file using a local configuration file:

```
tlmgr generate --localcfg {{local_configuration_file}}
```

- Run necessary programs after rebuilding configuration files:

```
tlmgr generate --rebuild-sys
```

tlmgr gui

Start a graphical user interface for **`tlmgr`**.

`tlmgr gui` depends on the package **`perl-tk`**, which has to be installed manually.

More information: https://www.tug.org/texlive/doc/tlmgr.html#gui.

- Start a GUI for `tlmgr`:

```
sudo tlmgr gui
```

- Start a GUI specifying the background color:

```
sudo tlmgr gui -background "{{#f39bc3}}"
```

- Start a GUI specifying the foreground color:

```
sudo tlmgr gui -foreground "{{#0ef3bd}}"
```

- Start a GUI specifying the font and font size:

```
sudo tlmgr gui -font "{{helvetica 18}}"
```

- Start a GUI setting a specific geometry:

```
sudo tlmgr gui -geometry {{width}}x{{height}}-{{xpos}}+{{ypos}}
```

- Start a GUI passing an arbitrary X resource string:

```
sudo tlmgr gui -xrm {{xresource}}
```

tlmgr info

Show information about TeX Live packages.

More information: https://www.tug.org/texlive/doc/tlmgr.html#info.

- List all available TeX Live packages, prefixing installed ones with `i`:

```
tlmgr info
```

- List all available collections:

```
tlmgr info collections
```

- List all available schemes:

```
tlmgr info scheme
```

- Show information about a specific package:

```
tlmgr info {{package}}
```

- List all files contained in a specific package:

```
tlmgr info {{package}} --list
```

- List all installed packages:

```
tlmgr info --only-installed
```

- Show only specific information about a package:

```
tlmgr info {{package}} --data "{{name}},{{category}},
{{installed}},{{size}},{{depends}},{{...}}"
```

- Print all available packages as JSON encoded array:

```
tlmgr info --json
```

tlmgr install

Install TeX Live packages.

More information: https://www.tug.org/texlive/doc/tlmgr.html#install-option...-pkg.

- Install a package and its dependencies:

```
sudo tlmgr install {{package}}
```

- Reinstall a package:

```
sudo tlmgr install --reinstall {{package}}
```

- Simulate installing a package without making any changes:

```
tlmgr install --dry-run {{package}}
```

- Install a package without its dependencies:

```
sudo tlmgr install --no-depends {{package}}
```

- Install a package from a specific file:

```
sudo tlmgr install --file {{path/to/package}}
```

tlmgr key

Manage GPG keys used to verify TeX Live databases.

More information: https://www.tug.org/texlive/doc/tlmgr.html#key.

- List all keys for TeX Live:

```
tlmgr key list
```

- Add a key from a specific file:

```
sudo tlmgr key add {{path/to/key.gpg}}
```

- Add a key from `stdin`:

```
cat {{path/to/key.gpg}} | sudo tlmgr key add -
```

- Remove a specific key by its ID:

```
sudo tlmgr key remove {{key_id}}
```

tlmgr option

TeX Live settings manager.

More information: https://www.tug.org/texlive/doc/tlmgr.html#option.

- List all TeX Live settings:

```
tlmgr option showall
```

- List all currently set Tex Live settings:

```
tlmgr option show
```

- Print all TeX Live settings in JSON format:

```
tlmgr option showall --json
```

- Show the value of a specific TeX Live setting:

```
tlmgr option {{setting}}
```

- Modify the value of a specific TeX Live setting:

```
tlmgr option {{setting}} {{value}}
```

- Set TeX Live to get future updates from the internet after installing from DVD:

```
tlmgr option {{repository}} {{https://mirror.ctan.org/
systems/texlive/tlnet}}
```

tlmgr paper

Manage paper size options of an TeX Live installation.

More information: https://www.tug.org/texlive/doc/tlmgr.html#paper.

- Show the default paper size used by all TeX Live programs:

```
tlmgr paper
```

- Set the default paper size for all TeX Live programs to A4:

```
sudo tlmgr paper {{a4}}
```

- Show the default paper size used by a specific TeX Live program:

```
tlmgr {{pdftex}} paper
```

- Set the default paper size for a specific TeX Live program to A4:

```
sudo tlmgr {{pdftex}} paper {{a4}}
```

- List all available paper sizes for a specific TeX Live program:

```
tlmgr {{pdftex}} paper --list
```

- Dump the default paper size used by all TeX Live programs in JSON format:

```
tlmgr paper --json
```

tlmgr path

Add or remove symlinks for TeX Live executables, man pages, and info pages.

This command has to be re-run for files added in the future.

More information: https://www.tug.org/texlive/doc/tlmgr.html#path.

- Add symlinks to TeX Live files:

```
sudo tlmgr path add
```

- Remove symlinks to TeX Live files:

```
sudo tlmgr path remove
```

tlmgr pinning

The pinning action manages the pinning file.

More information: https://www.tug.org/texlive/doc/tlmgr.html#pinning.

- Show the current pinning data:

```
tlmgr pinning show
```

- Pin the matching the packages to the given repository:

```
tlmgr pinning add {{repository}} {{package1 package2 ...}}
```

- Remove any packages recorded in the pinning file matching the packages for the given repository:

```
tlmgr pinning remove {{repository}} {{package1 package2 ...}}
```

- Remove all pinning data for the given repository:

```
tlmgr pinning remove {{repository}} --all
```

tlmgr platform

Manage TeX Live platforms.

More information: https://www.tug.org/texlive/doc/tlmgr.html#platform.

- List all available platforms in the package repository:

```
tlmgr {{[arch|platform]}} list
```

- Add the executables for a specific platform:

```
sudo tlmgr {{[arch|platform]}} add {{platform}}
```

- Remove the executables for a specific platform:

```
sudo tlmgr {{[arch|platform]}} remove {{platform}}
```

- Auto-detect and switch to the current platform:

```
sudo tlmgr {{[arch|platform]}} set auto
```

- Switch to a specific platform:

```
sudo tlmgr {{[arch|platform]}} set {{platform}}
```

tlmgr recreate-tlpdb

Recreate the TeX Live package database.

This command has a lack of documentation and should be used with caution.

More information: https://www.tug.org/texlive/tlmgr.html.

- Recreate the `texlive.tlpdb` database file and dump it to `stdout`:

```
sudo tlmgr recreate-tlpdb
```

tlmgr remove

Uninstall TeX Live packages.

By default, removed packages will be backed up to **`./tlpkg/backups`** under the TL installation directory.

More information: https://www.tug.org/texlive/doc/tlmgr.html#remove-option...-pkg.

- Uninstall a TeX Live package:

```
sudo tlmgr remove {{package}}
```

- Simulate uninstalling a package without making any changes:

```
tlmgr remove --dry-run {{package}}
```

- Uninstall a package without its dependencies:

```
sudo tlmgr remove --no-depends {{package}}
```

- Uninstall a package and back it up to a specific directory:

```
sudo tlmgr remove --backupdir {{path/to/directory}} {{package}}
```

- Uninstall all of TeX Live, asking for confirmation:

```
sudo tlmgr remove --all
```

tlmgr repository

Manage repositories of a TeX Live installation.

More information: https://www.tug.org/texlive/doc/tlmgr.html#repository.

- List all configured repositories and their tags (if set):

```
tlmgr repository list
```

- List all packages available in a specific repository:

```
tlmgr repository list {{path|url|tag}}
```

- Add a new repository with a specific tag (the tag is not required):

```
sudo tlmgr repository add {{path|url}} {{tag}}
```

- Remove a specific repository:

```
sudo tlmgr repository remove {{path|url|tag}}
```

- Set a new list of repositories, overwriting the previous list:

```
sudo tlmgr repository set {{path|url|tag}}#{{tag}} {{path|
url|tag}}#{{tag}} {{...}}
```

- Show the verification status of all configured repositories:

```
tlmgr repository status
```

tlmgr restore

Restore package backups created with **`tlmgr backup`**.

The default backup directory is specified by the **`backupdir`** option, and can be obtained with **`tlmgr option`**.

More information: https://www.tug.org/texlive/doc/tlmgr.html#restore.

- List all available backup revisions for all packages:

```
tlmgr restore
```

- List all available backup revisions for a specific package:

```
tlmgr restore {{package}}
```

- Restore a specific revision of a specific package:

```
tlmgr restore {{package}} {{revision}}
```

- Restore the latest revision of all backed-up packages:

```
tlmgr restore --all
```

- Restore a package from a custom backup directory:

```
tlmgr restore {{package}} {{revision}} --backupdir {{path/to/backup_directory}}
```

- Simulate a restore and print all actions that would be taken:

```
tlmgr restore --dry-run {{package}} {{revision}}
```

tlmgr search

Search for TeX Live packages using (Perl) **regex**.

More information: https://www.tug.org/texlive/doc/tlmgr.html#search.

- Search for a package name and descriptions of all locally installed packages from a specific `regex`:

```
tlmgr search "{{regex}}"
```

- Search for all file names of all locally installed packages from a `regex`:

```
tlmgr search --file "{{regex}}"
```

- Search for all file names, package names, and descriptions of all locally installed packages from a `regex`:

```
tlmgr search --all "{{regex}}"
```

- Search the TeX Live database, instead of the local installation:

```
tlmgr search --global "{{regex}}"
```

- Restrict the matches for package names and descriptions (but not for file names) to whole words:

```
tlmgr search --all --word "{{regex}}"
```

tlmgr shell

Start an interactive shell of the native TeX Live manager.

More information: https://www.tug.org/texlive/doc/tlmgr.html#shell.

- Start an interactive shell of `tlmgr`:

```
tlmgr shell
```

- [Interactive] Run any `tlmgr` subcommand in the interactive shell:

```
{{subcommand}} {{arguments}}
```

- [Interactive] Quit the interactive shell:

```
quit
```

- [Interactive] List all TeX Live variables:

```
get
```

- [Interactive] Get the value of a TeX Live variable:

```
get {{variable}}
```

- [Interactive] Set the value of a TeX Live variable:

```
set {{variable}} {{value}}
```

- [Interactive] Restart the interactive shell:

```
restart
```

- [Interactive] Display the version of the current protocol:

```
protocol
```

tlmgr update

Update TeX Live packages.

More information: https://www.tug.org/texlive/doc/tlmgr.html#update-option...-pkg.

- Update all TeX Live packages:

```
sudo tlmgr update --all
```

- Update tlmgr itself:

```
sudo tlmgr update --self
```

- Update a specific package:

```
sudo tlmgr update {{package}}
```

- Update all except a specific package:

```
sudo tlmgr update --all --exclude {{package}}
```

- Update all packages, making a backup of the current packages:

```
sudo tlmgr update --all --backup
```

- Update a specific package without updating its dependencies:

```
sudo tlmgr update --no-depends {{package}}
```

- Simulate updating all packages without making any changes:

```
sudo tlmgr update --all --dry-run
```

tlmgr

Manage packages and configuration options of an existing TeX Live installation.

Some subcommands such as **`paper`** have their own usage documentation.

More information: https://www.tug.org/texlive/doc/tlmgr.html#NAME.

- Install a package and its dependencies:

```
tlmgr install {{package}}
```

- Remove a package and its dependencies:

```
tlmgr remove {{package}}
```

- Display information about a package:

```
tlmgr info {{package}}
```

- Update all packages:

```
tlmgr update --all
```

- Show possible updates without updating anything:

```
tlmgr update --list
```

- Start a GUI version of tlmgr:

```
tlmgr gui
```

- List all TeX Live configurations:

```
tlmgr conf
```

tlsx

Fast and configurable TLS grabber focused on TLS based data collection and analysis.

More information: https://github.com/projectdiscovery/tlsx#usage.

- Display TLS version and cipher of one or more hosts:

```
tlsx {{[-u|-host]}} {{host1,host2,...}} {{[-tv|-tls-version]}} -cipher
```

- Enumerate and display supported TLS versions and ciphers of a host:

```
tlsx {{[-u|-host]}} {{host}} {{[-ve|-version-enum]}} {{[-ce|-cipher-enum]}}
```

- Scan a list of hosts from a file and mark hosts with expired/self-signed/mismatched/revoked/untrusted certificates:

```
tlsx {{[-l|-list]}} {{path/to/hosts.txt}} {{[-ex|-expired]}} {{[-ss|-self-signed]}} {{[-mm|-mismatched]}} {{[-re|-revoked]}} {{[-un|-untrusted]}}
```

- Adjust per host concurrency, timeout, retry, and delay parameters when scanning a list of hosts for wildcard SSL certificates:

```
tlsx {{[-l|-list]}} {{path/to/hosts.txt}} {{[-c|-concurrency]}} {{300}} -timeout {{5}} -retry {{3}} -delay {{200ms}} {{[-wc|-wildcard-cert]}}
```

- Display unique hostname(s) from SSL certificate response:

```
tlsx {{[-u|-host]}} {{host}} -dns
```

- Display Subject Alternative Names (SANs) from the TLS certificate of a host, with JSON output written to a file:

```
tlsx {{[-u|-host]}} {{host}} -san {{[-j|-json]}} {{[-o|-output]}} {{path/to/file.json}}
```

- Perform a self health-check of `tlsx` itself:

```
tlsx {{[-hc|-health-check]}}
```

tmpmail

A temporary email right from your terminal written in POSIX sh.

More information: https://github.com/sdushantha/tmpmail#usage.

- Create a temporary inbox:

```
tmpmail {{[-g|--generate]}}
```

- List messages and their numeric ID:

```
tmpmail
```

- Display the most recent received email:

```
tmpmail {{[-r|--recent]}}
```

- Open a specific message:

```
tmpmail {{email_id}}
```

- View email as raw text without HTML tags:

```
tmpmail {{[-t|--text]}}
```

- Open email with a specific browser (default is w3m):

```
tmpmail {{[-b|--browser]}} {{browser}}
```

tmsu

Simple tool for tagging files.

More information: https://tmsu.org/.

- Tag a specific file with multiple tags:

```
tmsu tag {{path/to/file.mp3}} {{music}} {{big-jazz}} {{mp3}}
```

- Tag multiple files:

```
tmsu tag --tags "{{music mp3}}" {{*.mp3}}
```

- List tags of specified file(s):

```
tmsu tags {{*.mp3}}
```

- List files with specified tag(s):

```
tmsu files {{big-jazz}} {{music}}
```

- List files with tags matching boolean expression:

```
tmsu files "{{(year >= 1990 and year <= 2000)}} and
{{grunge}}"
```

- Mount tmsu virtual filesystem to an existing directory:

```
tmsu mount {{path/to/directory}}
```

tmux

Terminal multiplexer.

It allows multiple sessions with windows, panes, and more.

See also: **`zellij`**, **`screen`**, **`herdr`**.

More information: https://github.com/tmux/tmux.

- Start a new session:

```
tmux
```

- Start a new named [s]ession:

```
tmux {{[new|new-session]}} -s {{name}}
```

- List existing sessions:

```
tmux {{[ls|list-sessions]}}
```

- Attach to a named session ([t]arget can be omitted to attach to the most recently used session):

```
tmux {{[a|attach]}} -t {{name}}
```

- Detach from the current session (inside a tmux session):

```
<Ctrl b><d>
```

- Create a new window (inside a tmux session):

```
<Ctrl b><c>
```

- Switch between sessions and windows (inside a tmux session):

```
<Ctrl b><w>
```

- Kill a session by [t]arget name:

```
tmux kill-session -t {{name}}
```

tmuxinator

Create and manage tmux sessions easily.

More information: https://manned.org/tmuxinator.

- Create a new project:

```
tmuxinator new {{project}}
```

- Edit a project:

```
tmuxinator edit {{project}}
```

- List projects:

```
tmuxinator list
```

- Start a tmux session based on project:

```
tmuxinator start {{project}}
```

- Stop a project's tmux session:

```
tmuxinator stop {{project}}
```

todo

A simple, standards-based, cli todo manager.

More information: https://todoman.readthedocs.io/en/stable/man.html.

- List startable tasks:

```
todo list --startable
```

- Add a new task to the work list:

```
todo new {{thing_to_do}} {{[-l|--list]}} {{work}}
```

- Add a location to a task with a given ID:

```
todo edit --location {{location_name}} {{task_id}}
```

- Show details about a task:

```
todo show {{task_id}}
```

- Mark tasks with the specified IDs as completed:

```
todo done {{task_id1 task_id2 ...}}
```

- Delete a task:

```
todo delete {{task_id}}
```

- Delete done tasks and reset the IDs of the remaining tasks:

```
todo flush
```

todo.sh

Simple and extensible shell script for managing your **`todo.txt`** file.

More information: https://github.com/todotxt/todo.txt-cli.

- List every item:

```
todo.sh ls
```

- Add an item with project and context tags:

```
todo.sh add '{{description}} +{{project}} @{{context}}'
```

- Mark an item as [do]ne:

```
todo.sh do {{item_no}}
```

- Remove an item:

```
todo.sh rm {{item_no}}
```

- Set an item's [pri]ority (A-Z):

```
todo.sh pri {{item_no}} {{priority}}
```

- Replace an item:

```
todo.sh replace {{item_no}} '{{new_description}}'
```

todoist

Access https://todoist.com from the command-line.

More information: https://github.com/sachaos/todoist#usage.

- Add a task:

```
todoist {{[a|add]}} "{{task_name}}"
```

- Add a high priority task with a label, project, and due date:

```
todoist {{[a|add]}} "{{task_name}}" --priority {{1}} --label-
ids "{{label_id}}" --project-name "{{project_name}}" --date
"{{tmr 9am}}"
```

- Add a high priority task with a label, project, and due date in quick mode:

```
todoist {{[q|quick]}} '#{{project_name}} "{{tmr 9am}}" p{{1}}
{{task_name}} @{{label_name}}'
```

- List all tasks with a header and color:

```
todoist --header --color list
```

- List all high priority tasks:

```
todoist {{[l|list]}} --filter p{{1}}
```

- List today's tasks with high priority that have the specified label:

```
todoist {{[l|list]}} --filter '(@{{label_name}} | {{today}})
& p{{1}}'
```

todoman

This command is an alias of **todo**.

- View documentation for the original command:

```
tldr todo
```

tofu fmt

Format configuration according to OpenTofu language style conventions.

More information: https://opentofu.org/docs/cli/commands/fmt/.

- Format the configuration in the current directory:

  ```
  tofu fmt
  ```

- Format the configuration in the current directory and subdirectories:

  ```
  tofu fmt -recursive
  ```

- Display diffs of formatting changes:

  ```
  tofu fmt -diff
  ```

- Do not list files that were formatted to `stdout`:

  ```
  tofu fmt -list=false
  ```

tofu output

Export structured data about your OpenTofu resources.

More information: https://opentofu.org/docs/cli/commands/output/.

- Display all outputs for the root module:

```
tofu output
```

- Output only a value with specific name:

```
tofu output {{name}}
```

- Convert the output value to a raw string (useful for shell scripts):

```
tofu output -raw
```

- Format the outputs as a JSON object, with a key per output (useful with `jq`):

```
tofu output -json
```

tofu plan

Generate and show OpenTofu execution plans.

More information: https://opentofu.org/docs/cli/commands/plan/.

- Generate and show the execution plan in the currently directory:

```
tofu plan
```

- Show a plan to destroy all remote objects that currently exist:

```
tofu plan -destroy
```

- Show a plan to update the Tofu state and output values:

```
tofu plan -refresh-only
```

- Specify values for input variables:

```
tofu plan -var '{{name1}}={{value1}}' -var '{{name2}}
={{value2}}'
```

- Focus Tofu's attention on only a subset of resources:

```
tofu plan -target {{resource_type.resource_name}}
```

- Output a plan as JSON:

```
tofu plan -json
```

- Write a plan to a specific file:

```
tofu plan -no-color > {{path/to/file}}
```

tofu

Create and deploy infrastructure as code to cloud providers. Open-source fork of Terraform.

More information: https://opentofu.org/docs/cli/commands/.

- Initialize a new or existing OpenTofu configuration:

  ```
  tofu init
  ```

- Verify that the configuration files are syntactically valid:

  ```
  tofu validate
  ```

- Format configuration according to OpenTofu language style conventions:

  ```
  tofu fmt
  ```

- Generate and show an execution plan:

  ```
  tofu plan
  ```

- Build or change infrastructure:

  ```
  tofu apply
  ```

- Destroy Tofu-managed infrastructure:

  ```
  tofu destroy
  ```

toipe

Yet another typing test, but crab flavored.

A trusty terminal typing tester.

More information: https://github.com/Samyak2/toipe.

- Start the typing test with the default wordlist:

```
toipe
```

- Use a specific wordlist:

```
toipe {{[-w|--wordlist]}} {{wordlist_name}}
```

- Use a custom wordlist:

```
toipe {{[-f|--file]}} {{path/to/file}}
```

- Specify the number of words on each test:

```
toipe {{[-n|--num]}} {{number_of_words}}
```

- Include punctuation:

```
toipe {{[-p|--punctuation]}}
```

tokei

Display statistics about code.

More information: https://github.com/XAMPPRocky/tokei#options.

- Display a report for the code in a directory and all subdirectories:

```
tokei {{path/to/directory}}
```

- Display a report for a directory excluding `.min.js` files:

```
tokei {{path/to/directory}} {{[-e|--exclude]}} {{*.min.js}}
```

- Display statistics for individual files in a directory:

```
tokei {{path/to/directory}} {{[-f|--files]}}
```

- Display a report for all files of type Rust and Markdown:

```
tokei {{path/to/directory}} {{[-t|--types]}} {{Rust}},
{{Markdown}}
```

tookie-osint

Username OSINT scanner.

More information: https://github.com/Alfredredbird/tookie-osint.

- Scan a username:

```
tookie-osint {{[-u|--user]}} {{username}}
```

- Scan a username with JSON output and 10 threads:

```
tookie-osint {{[-u|--user]}} {{username}} {{[-o|--output]}}
json {{[-t|--threads]}} 10
```

- Scan usernames from a file with CSV output:

```
tookie-osint {{[-U|--userfile]}} {{path/to/users.txt}} {{[-
o|--output]}} csv
```

- Scan a username using a proxy and show all results:

```
tookie-osint {{[-u|--user]}} {{username}} {{[-p|--proxy]}}
{{http://127.0.0.1:8080}} {{[-a|--all]}}
```

- Scan a username with the webscraper enabled:

```
tookie-osint {{[-u|--user]}} {{username}} {{[-W|--
webscraper]}}
```

- Display help:

```
tookie-osint {{[-h|--help]}}
```

topgrade

Update all applications on the system.

More information: https://github.com/r-darwish/topgrade.

- Run updates:

```
topgrade
```

- Say yes to all updates:

```
topgrade {{[-y|--yes]}}
```

- Clean up temporary/old files:

```
topgrade {{[-c|--cleanup]}}
```

- Disable a certain update operation:

```
topgrade --disable {{operation}}
```

- Only perform a certain update operation:

```
topgrade --only {{operation}}
```

- Edit the configuration file with default editor:

```
topgrade --edit-config
```

topydo

A to-do list application that uses the todo.txt format.

More information: https://github.com/topydo/topydo.

- Add a to-do to a specific project with a given context:

```
topydo add "{{todo_message}} +{{project_name}}
@{{context_name}}"
```

- Add a to-do with a due date of tomorrow with a priority of `A`:

```
topydo add "(A) {{todo _message}} due:{{1d}}"
```

- Add a to-do with a due date of Friday:

```
topydo add "{{todo_message}} due:{{fri}}"
```

- Add a non-strict repeating to-do (next due = now + rec):

```
topydo add "water flowers due:{{mon}} rec:{{1w}}"
```

- Add a strict repeating to-do (next due = current due + rec):

```
topydo add "{{todo_message}} due:{{2020-01-01}} rec:{{+1m}}"
```

- Revert the last `topydo` command executed:

```
topydo revert
```

touch

Create files and set access/modification times.

More information: https://www.gnu.org/software/coreutils/manual/html_node/touch-invocation.html.

- Create specific files or update their timestamps if they already exist:

```
touch {{path/to/file1 path/to/file2 ...}}
```

- Set the file [a]ccess or [m]odification times to the current one and don't create file if it doesn't exist:

```
touch {{[-c|--no-create]}} {{-a|-m}} {{path/to/file1 path/to/file2 ...}}
```

- Set the file [t]ime to a specific value and don't create file if it doesn't exist:

```
touch {{[-c|--no-create]}} -t {{YYYYMMDDHHMM.SS}} {{path/to/file1 path/to/file2 ...}}
```

- Set the files' timestamp to the reference file's timestamp, and do not create the file if it does not exist:

```
touch {{[-c|--no-create]}} {{[-r|--reference]}} {{path/to/reference_file}} {{path/to/file1 path/to/file2 ...}}
```

- Set the timestamp by parsing a string:

```
touch {{[-d|--date]}} "{{last year|5 hours|next thursday|nov 14|...}}" {{path/to/file}}
```

- Create multiple files with an increasing number:

```
touch {{path/to/file{1..10}}}
```

- Create multiple files with a letter range:

```
touch {{path/to/file{a..z}}}
```

tox

Automate Python testing across multiple Python versions.

Use tox.ini to configure environments and test command.

More information: https://github.com/tox-dev/tox.

- Run tests on all test environments:

  ```
  tox
  ```

- Create a `tox.ini` configuration:

  ```
  tox-quickstart
  ```

- List the available environments:

  ```
  tox {{[-a|--listenvs-all]}}
  ```

- Run tests on a specific environment (e.g. Python 3.6):

  ```
  tox -e {{py36}}
  ```

- Force the virtual environment to be recreated:

  ```
  tox {{[-r|--recreate]}} -e {{py27}}
  ```

tpm2 pcrextend

Extend a PCR.

More information: https://manned.org/tpm2_pcrextend.

- Extend the PCR 16 value of the sha1 bank:

```
tpm2 pcrextend
16:sha1={{f1d2d2f924e986ac86fdf7b36c94bcdf32beec15}}
```

- Extend the PCR 16 value of the sha1 and sha256 banks value:

```
tpm2 pcrextend
16:sha1={{f1d2d2f924e986ac86fdf7b36c94bcdf32beec15}},sha256={{b5bb9d80
```

- Extend the PCR 16 value of the sha1 bank and PCR 23 of the sha256 bank:

```
tpm2 pcrextend
16:sha1={{f1d2d2f924e986ac86fdf7b36c94bcdf32beec15}}
23:sha256={{b5bb9d8014a0f9b1d61e21e796d78dccdf1352f23cd32812f4850b878a
```

tpm2 pcrread

Read the PCR values from a TPM.

More information: https://manned.org/tpm2_pcrread.

- Read all PCR values:

```
tpm2 pcrread
```

- Read all PCR values of the sha256 bank:

```
tpm2 pcrread sha256:all
```

- Read specific PCR values from multiple banks and write them to a file:

```
tpm2 pcrread {{[-o|--output]}} {{path/to/file}}
{{sha1:16,17,18+sha256:16,17,18}}
```

tpm2 pcrreset

Reset one or more PCR banks.

Note: On operating system's locality, only PCR 16 and 23 can be reset.

More information: https://manned.org/tpm2_pcrreset.

- Reset the PCR 23 banks:

```
tpm2 pcrreset 23
```

- Reset the PCR 16 and 23 banks:

```
tpm2 pcrreset 16 23
```

tpm2

Run various tpm2-tools via a single unified executable.

Some subcommands such as **`pcrread`**, **`pcrreset`**, etc. have their own usage documentation.

More information: https://manned.org/tpm2.

- Reset the PCR 16 banks:

```
tpm2 pcrreset 16
```

- Extend the PCR 16 sha1 bank with `f1d2d2f924e986ac86fdf7b36c94bcdf32beec15`:

```
tpm2 pcrextend
16:sha1=f1d2d2f924e986ac86fdf7b36c94bcdf32beec15
```

- Read the PCR 16 sha1 bank:

```
tpm2 pcrread sha1:16
```

- Run a subcommand in verbose mode:

```
tpm2 {{[-V|--verbose]}} {{subcommand}}
```

- Run a subcommand without writing to `stdout`:

```
tpm2 {{[-Q|--quiet]}} {{subcommand}}
```

- Display help:

```
tpm2 {{[-h|--help]}}
```

tpp

Command-Line based presentation tool.

More information: https://manned.org/tpp.

- View a presentation:

```
tpp {{path/to/file}}
```

- Output a presentation:

```
tpp -t {{type}} -o {{path/to/output}} {{path/to/file}}
```

tput

View and modify terminal settings and capabilities.

See also: **`stty`**.

More information: https://manned.org/tput.

- Move the cursor to a screen location:

```
tput cup {{row}} {{column}}
```

- Set foreground (af) or background (ab) color:

```
tput {{setaf|setab}} {{ansi_color_code}}
```

- Reverse text and background colors:

```
tput rev
```

- Reset all terminal text attributes:

```
tput sgr0
```

- Show number of columns, lines, or colors:

```
tput {{cols|lines|colors}}
```

- Enable or disable word wrap:

```
tput {{smam|rmam}}
```

- Hide or show the terminal cursor:

```
tput {{civis|cnorm}}
```

- Save or restore terminal text status (smcup also captures scroll wheel events):

```
tput {{smcup|rmcup}}
```

tqdm

Show progress over time of a command.

More information: https://tqdm.github.io/docs/cli/.

- Show iterations per second and use `stdout` afterwards:

```
{{seq 10000000}} | tqdm | {{command}}
```

- Create a progress bar:

```
{{seq 10000000}} | tqdm --total {{10000000}} | {{command}}
```

- Create an archive out of a directory and use the file count of that directory to create a progress bar:

```
zip {{[-r|--recurse-paths]}} {{path/to/archive.zip}} {{path/to/directory}} | tqdm --total $(find {{path/to/directory}} | wc {{[-l|--lines]}}) --unit files --null
```

- Create an archive with `tar` and create a progress bar (system agnostic, GNU `tar` uses `stdout` while BSD `tar` uses `stderr`):

```
tar vzcf {{path/to/archive.tar.gz}} {{path/to/directory}} 2>&1 | tqdm --total $(find {{path/to/directory}} | wc {{[-l|--lines]}}) --unit files --null
```

tr

Translate characters: run replacements based on single characters and character sets.

More information: https://www.gnu.org/software/coreutils/manual/html_node/tr-invocation.html.

- Replace all occurrences of a character in a file, and print the result:

```
tr < {{path/to/file}} {{find_character}}
{{replace_character}}
```

- Replace all occurrences of a character from another command's output:

```
echo {{text}} | tr {{find_character}} {{replace_character}}
```

- Map each character of the first set to the corresponding character of the second set:

```
tr < {{path/to/file}} '{{abcd}}' '{{jkmn}}'
```

- Delete all occurrences of the specified set of characters from the input:

```
tr < {{path/to/file}} {{[-d|--delete]}}
'{{input_characters}}'
```

- Compress a series of identical characters to a single character:

```
tr < {{path/to/file}} {{[-s|--squeeze-repeats]}}
'{{input_characters}}'
```

- Translate the contents of a file to upper-case:

```
tr < {{path/to/file}} "[:lower:]" "[:upper:]"
```

- Strip out non-printable characters from a file:

```
tr < {{path/to/file}} {{[-cd|--complement --delete]}}
"[:print:]"
```

traceroute

Print the route packets trace to network host.

See also: **`mtr`**.

More information: https://manned.org/traceroute.

- Traceroute to a host:

```
traceroute {{example.com}}
```

- Disable IP address and host name mapping:

```
traceroute -n {{example.com}}
```

- Specify wait time in seconds for response:

```
traceroute {{[-w|--wait]}} {{0.5}} {{example.com}}
```

- Specify number of queries per hop:

```
traceroute {{[-q|--queries]}} {{5}} {{example.com}}
```

- Specify size in bytes of probing packet:

```
traceroute {{example.com}} {{42}}
```

- Determine the MTU to the destination:

```
traceroute --mtu {{example.com}}
```

- Use ICMP instead of UDP for tracerouting:

```
traceroute {{[-I|--icmp]}} {{example.com}}
```

traefik

An HTTP reverse proxy and load balancer.

More information: https://doc.traefik.io/traefik/v3.4/operations/cli/.

- Start the server with the default configuration:

  ```
  traefik
  ```

- Start the server with a custom configuration file:

  ```
  traefik --ConfigFile {{config_file.toml}}
  ```

- Start the server with cluster mode enabled:

  ```
  traefik --cluster
  ```

- Start server with web UI enabled:

  ```
  traefik --web
  ```

trafilatura

A Python tool for web scraping and crawling that extracts main text, metadata, and comments from web pages.

Designed for creating text corpora and extracting structured content.

More information: https://trafilatura.readthedocs.io/en/latest/usage-cli.html#further-information.

- Extract text from a URL:

  ```
  trafilatura {{[-u|--URL]}} {{url}}
  ```

- Extract text and save to a file:

  ```
  trafilatura {{[-u|--URL]}} {{url}} {{[-o|--output-dir]}} {{path/to/output.txt}}
  ```

- Extract text in JSON format:

  ```
  trafilatura {{[-u|--URL]}} {{url}} --json
  ```

- Extract text from multiple URLs listed in a file:

  ```
  trafilatura {{[-i|--input-file]}} {{path/to/url_list.txt}}
  ```

- Crawl a website using its sitemap:

  ```
  trafilatura --sitemap {{url_to_sitemap.xml}}
  ```

- Extract text while preserving HTML formatting:

  ```
  trafilatura {{[-u|--URL]}} {{url}} --formatting
  ```

- Extract text including comments:

  ```
  trafilatura {{[-u|--URL]}} {{url}} --with-comments
  ```

- Display help:

  ```
  trafilatura {{[-h|--help]}}
  ```

trans

Translate Shell, a command-line translator.

More information: https://github.com/soimort/translate-shell.

- Translate a word (language is detected automatically):

```
trans "{{word_or_sentence_to_translate}}"
```

- Get a brief translation:

```
trans {{[-b|-brief]}} "{{word_or_sentence_to_translate}}"
```

- Translate a word into french:

```
trans :{{fr}} {{word}}
```

- Translate a word from German to English:

```
trans {{de}}:{{en}} {{Schmetterling}}
```

- Behave like a dictionary to get the meaning of a word:

```
trans {{[-d|-dictionary]}} {{word}}
```

transcode

Transcode video and audio codecs, and convert between media formats.

More information: https://manned.org/transcode.

- Create stabilization file to be able to remove camera shakes:

```
transcode -J stabilize -i {{input_file}}
```

- Remove camera shakes after creating stabilization file, transform video using XviD:

```
transcode -J transform -i {{input_file}} -y xvid -o
{{output_file}}
```

- Resize the video to 640x480 pixels and convert to MPEG4 codec using XviD:

```
transcode -Z 640x480 -i {{input_file}} -y xvid -o
{{output_file}}
```

transcrypt

Transparently encrypt files within a Git repository.

More information: https://github.com/elasticdog/transcrypt#command-line-options.

- Initialize an unconfigured repository:

```
transcrypt
```

- List the currently encrypted files:

```
git ls-crypt
```

- Display the credentials of a configured repository:

```
transcrypt {{[-d|--display]}}
```

- Initialize and decrypt a fresh clone of a configured repository:

```
transcrypt {{[-c|--cipher]}} {{cipher}}
```

- Rekey to change the encryption cipher or password:

```
transcrypt {{[-r|--rekey]}}
```

transfersh

An unofficial client for transfer.sh.

More information: https://github.com/AlpixTM/transfersh.

- Upload a file to transfer.sh:

```
transfersh {{path/to/file}}
```

- Upload a file showing a progress bar (requires Python package `requests_toolbelt`):

```
transfersh {{[-p|--progress]}} {{path/to/file}}
```

- Upload a file using a different file name:

```
transfersh {{[-n|--name]}} {{filename}} {{path/to/file}}
```

- Upload a file to a custom transfer.sh server:

```
transfersh {{[-sn|--servername]}} {{upload.server.name}}
{{path/to/file}}
```

- Upload all files from a directory recursively:

```
transfersh {{[-r|--recursive]}} {{path/to/directory}}/
```

- Upload a specific directory as an uncompressed tar:

```
transfersh {{[-rt|--recursive --tar]}} {{path/to/directory}}
```

transmission-cli

A lightweight, command-line BitTorrent client.

Note: This command is deprecated, use **`transmission-remote`** instead.

More information: https://manned.org/transmission-cli.

- Download a specific torrent:

```
transmission-cli {{url|magnet|path/to/file}}
```

- Download a torrent to a specific directory:

```
transmission-cli {{[-w|--download-dir]}} {{path/to/
download_directory}} {{url|magnet|path/to/file}}
```

- Create a torrent file from a specific file or directory:

```
transmission-cli --new {{path/to/source_file_or_directory}}
```

- Specify the download speed limit (in KB/s):

```
transmission-cli {{[-d|--downlimit]}} {{50}} {{url|magnet|
path/to/file}}
```

- Specify the upload speed limit (in KB/s):

```
transmission-cli {{[-u|--uplimit]}} {{50}} {{url|magnet|path/
to/file}}
```

- Use a specific port for connections:

```
transmission-cli {{[-p|--port]}} {{port_number}} {{url|
magnet|path/to/file}}
```

- Force encryption for peer connections:

```
transmission-cli {{[-er|--encryption-required]}} {{url|
magnet|path/to/file}}
```

- Use a Bluetack-formatted peer blocklist:

```
transmission-cli {{[-b|--blocklist]}} {{blocklist_url|path/
to/blocklist}} {{url|magnet|path/to/file}}
```

transmission-create

Create BitTorrent **`.torrent`** files.

See also: **`transmission`**.

More information: https://manned.org/transmission-create.

- Create a torrent with a specific piece size (in KB):

```
transmission-create {{[-o|--outfile]}} {{path/to/
example.torrent}} {{[-t|--tracker]}} {{tracker_announce_url}}
{{[-s|--piecesize]}} {{2048}} {{path/to/file_or_directory}}
```

- Create a private torrent with a specific piece size (in KB):

```
transmission-create {{[-p|--private]}} {{[-o|--outfile]}}
{{path/to/example.torrent}} {{[-t|--tracker]}}
{{tracker_announce_url}} {{[-s|--piecesize]}} {{2048}}
{{path/to/file_or_directory}}
```

- Create a torrent with a comment:

```
transmission-create {{[-o|--outfile]}} {{path/to/
example.torrent}} {{[-t|--tracker]}} {{tracker_url1}} {{[-
c|--comment]}} {{comment}} {{path/to/file_or_directory}}
```

- Create a torrent with multiple trackers:

```
transmission-create {{[-o|--outfile]}} {{path/to/
example.torrent}} {{[-t|--tracker]}} {{tracker_url1}} {{[-
t|--tracker]}} {{tracker_url2}} {{path/to/file_or_directory}}
```

- Display help:

```
transmission-create {{[-h|--help]}}
```

transmission-daemon

Daemon controlled with **`transmission-remote`** or its web interface.

See also: **`transmission`**.

More information: https://manned.org/transmission-daemon.

- Start a headless `transmission` session:

```
transmission-daemon
```

- Start and watch a specific directory for new torrents:

```
transmission-daemon {{[-c|--watch-dir]}} {{path/to/
directory}}
```

- Dump daemon settings in JSON format:

```
transmission-daemon {{[-d|--dump-settings]}} > {{path/to/
file.json}}
```

- Start with specific settings for the web interface:

```
transmission-daemon {{[-t|--auth]}} {{[-u|--username]}}
{{username}} {{[-v|--password]}} {{password}} {{[-p|--port]}}
{{9091}} {{[-a|--allowed]}} {{127.0.0.1}}
```

transmission-edit

Modify announce URLs from torrent files.

See also: **`transmission`**.

More information: https://manned.org/transmission-edit.

- Add a URL to a torrent's announce list:

```
transmission-edit {{[-a|--add]}} {{http://example.com}} {{path/to/file.torrent}}
```

- Remove a URL from a torrent's announce list:

```
transmission-edit {{[-d|--delete]}} {{http://example.com}} {{path/to/file.torrent}}
```

- Update a tracker's passcode in a torrent file:

```
transmission-edit {{[-r|--replace]}} {{old_passcode}} {{new_passcode}} {{path/to/file.torrent}}
```

transmission-remote

Remote control utility for **`transmission-daemon`** and **`transmission`**.

More information: https://manned.org/transmission-remote.

- Add a torrent file or magnet link to Transmission and download to a specified directory:

```
transmission-remote {{hostname}} {{[-a|--all]}} {{torrent|
url}} {{[-w|--download-dir]}} /{{path/to/download_directory}}
```

- Change the default download directory:

```
transmission-remote {{hostname}} {{[-w|--download-dir]}} /
{{path/to/download_directory}}
```

- List all torrents:

```
transmission-remote {{hostname}} {{[-l|--list]}}
```

- Start torrent 1 and 2, stop torrent 3:

```
transmission-remote {{hostname}} {{[-t|--torrent]}}
"1,2" {{[-s|--start]}} {{[-t|--torrent]}} 3 {{[-S|--stop]}}
```

- Remove torrent 1 and 2, and also delete local data for torrent 2:

```
transmission-remote {{hostname}} {{[-t|--torrent]}} 1 {{[-
r|--remove]}} {{[-t|--torrent]}} 2 {{[-rad|--remove-and-
delete]}}
```

- Stop all torrents:

```
transmission-remote {{hostname}} {{[-t|--torrent]}} {{all}}
{{[-S|--stop]}}
```

- Move torrents 1-10 and 15-20 to a new directory (which will be created if it does not exist):

```
transmission-remote {{hostname}} {{[-t|--torrent]}}
"1-10,15-20" --move /{{path/to/new_directory}}
```

transmission-show

Get information about a torrent file.

See also: **`transmission`**.

More information: https://manned.org/transmission-show.

- Display metadata for a specific torrent:

```
transmission-show {{path/to/file.torrent}}
```

- Generate a magnet link for a specific torrent:

```
transmission-show {{[-m|--magnet]}} {{path/to/file.torrent}}
```

- Query a torrent's trackers and print the current number of peers:

```
transmission-show {{[-s|--scrape]}} {{path/to/file.torrent}}
```

transmission

A simple torrent client.

Note: Transmission isn't a command, but a set of commands.

More information: https://transmissionbt.com/.

- View documentation for running Transmission's daemon:

```
tldr transmission-daemon
```

- View documentation for interacting with the daemon:

```
tldr transmission-remote
```

- View documentation for creating torrent files:

```
tldr transmission-create
```

- View documentation for modifying torrent files:

```
tldr transmission-edit
```

- View documentation for getting info about torrent files:

```
tldr transmission-show
```

- View documentation for the deprecated method for interacting with the daemon:

```
tldr transmission-cli
```

trap

Execute a command upon an event.

More information: https://manned.org/trap.1posix.

- List the commands and the names of the expected events:

```
trap
```

- Execute a command when a signal is received:

```
trap 'echo "Caught signal {{SIGHUP}}"' {{HUP}}
```

- Remove commands:

```
trap - {{HUP}} {{INT}}
```

trash-cli

This command is an alias of **`trash`**.

- View documentation for the original command:

  ```
  tldr trash
  ```

travis

Interface with Travis CI.

More information: https://github.com/travis-ci/travis.rb#command-line-client.

- Authenticate the CLI client against the server, using an authentication token:

  `travis login`

- List repositories the user has permissions on:

  `travis repos`

- Encrypt values in `.travis.yml`:

  `travis encrypt {{token}}`

- Generate a `.travis.yml` file and enable the project:

  `travis init`

- Display version:

  `travis version`

trawl

Print out network interface information to the console, much like **`ifconfig`**/**`ipconfig`**/**`ip`**/**`ifdata`**.

More information: https://github.com/robphoenix/trawl.

- Show column names:

```
trawl -n
```

- Filter interface names using a case-insensitive `regex`:

```
trawl -f wi
```

- List available interfaces:

```
trawl -i
```

- Include the loopback interface:

```
trawl -l
```

trdsql

Execute SQL on CSV, LTSV, JSON, YAML, and TBLN files.

More information: https://noborus.github.io/trdsql/.

- Convert object data from multiple JSON files to a CSV file with header (`-oh`) and double quote:

```
trdsql -ocsv -oh "SELECT * FROM {{path/to/directory/*.json}}"
| sed 's/\([^,]*\)/"&"/g' > {{path/to/file.csv}}
```

- Interpret JSON list as a table and put objects inside as columns (`path/to/file.json: {"list":[{"age":"26","name":"Tanaka"}]}`):

```
trdsql "SELECT * FROM {{path/to/file.json}}::.list"
```

- Manipulate complex SQL query with data from multiple CSV files with first line is header (`-ih`):

```
trdsql -icsv -ih "SELECT {{column1,column2}} FROM {{path/to/
file*.csv}} WHERE column2 != '' ORDER BY {{column1}} GROUP BY
{{column1}}"
```

- Merge content of 2 CSV files to one CSV file:

```
trdsql "SELECT {{column1,column2}} FROM {{path/to/file1.csv}}
UNION SELECT {{column1,column2}} FROM {{path/to/file2.csv}}"
```

- Connect to PostgreSQL database:

```
trdsql -driver postgres -dsn "host={{hostname}} port={{5433}}
dbname={{database_name}}" "SELECT 1"
```

- Create table data to MySQL database from CSV file:

```
trdsql -driver mysql -dsn "{{username}}:{{password}}
@{{hostname}}/{{database}}" -ih "CREATE TABLE {{table}}
({{column1}} int, {{column2}} varchar(20)) AS SELECT
{{column3}} AS {{column1}},{{column2}} FROM {{path/to/
header_file.csv}}"
```

- Show data from compress log files:

```
trdsql -iltsv "SELECT * FROM {{path/to/access.log.gz}}"
```

tre

Show the contents of the current directory as a tree.

Respects the **`.gitignore`** settings by default.

More information: https://github.com/dduan/tre#everything-else.

- Print directories only:

```
tre {{[-d|--directories]}}
```

- Print JSON containing files in the tree hierarchy instead of the normal tree diagram:

```
tre {{[-j|--json]}}
```

- Print files and directories up to the specified depth limit (where 1 means the current directory):

```
tre {{[-l|--limit]}} {{depth}}
```

- Print all hidden files and directories using the specified colorization mode:

```
tre {{[-a|--all]}} {{[-c|--color]}} {{automatic|always|never}}
```

- Print files within the tree hierarchy, assigning a shell alias to each file that, when called, will open the associated file using the provided `command` (or in `$EDITOR` by default):

```
tre {{[-e|--editor]}} {{command}}
```

- Print files within the tree hierarchy, excluding all paths that match the provided `regex`:

```
tre {{[-E|--exclude]}} {{regex}}
```

- Display help:

```
tre {{[-h|--help]}}
```

- Display version:

```
tre {{[-V|--version]}}
```

tred

Compute the transitive reduction of directed graphs.

Graphviz filters: **`acyclic`**, **`bcomps`**, **`comps`**, **`edgepaint`**, **`gvcolor`**, **`gvpack`**, **`mingle`**, **`nop`**, **`sccmap`**, **`tred`**, and **`unflatten`**.

More information: https://www.graphviz.org/pdf/tred.1.pdf.

- Construct the transitive reduction graph of one or more directed graphs:

```
tred {{path/to/input1.gv path/to/input2.gv ...}} > {{path/to/output.gv}}
```

- Display help:

```
tred -?
```

tree

Show the contents of the current directory as a tree.

More information: https://manned.org/tree.

- Print files and directories up to `num` levels of depth (where 1 means the current directory):

```
tree -L {{num}}
```

- Print directories only:

```
tree -d
```

- Print hidden files too with colorization on:

```
tree -a -C
```

- Print the tree without indentation lines, showing the full path instead (use `-N` to not escape non-printable characters):

```
tree -i -f
```

- Print the size of each file and the cumulative size of each directory, in human-readable format:

```
tree -s -h --du
```

- Print files within the tree hierarchy, using a wildcard (`glob`) pattern, and pruning out directories that don't contain matching files:

```
tree -P '{{*.txt}}' --prune
```

- Print directories within the tree hierarchy, using the wildcard (`glob`) pattern, and pruning out directories that aren't ancestors of the wanted one:

```
tree -P {{directory_name}} --matchdirs --prune
```

- Print the tree ignoring the given directories:

```
tree -I '{{directory_name1|directory_name2}}'
```

treemd

View markdown files with tree-based navigation and an interactive TUI.

More information: https://github.com/Epistates/treemd#usage.

- Open a markdown file in interactive TUI mode:

```
treemd {{path/to/file.md}}
```

- List all headings in a markdown file:

```
treemd {{[-l|--list]}} {{path/to/file.md}}
```

- Show the heading tree structure of a markdown file:

```
treemd --tree {{path/to/file.md}}
```

- Extract a specific section by heading name:

```
treemd {{[-s|--section]}} {{heading_name}} {{path/to/
file.md}}
```

- Filter headings by a specific pattern:

```
treemd {{[-l|--list]}} --filter {{pattern}} {{path/to/
file.md}}
```

- Query and extract markdown structure using the treemd query language:

```
treemd {{[-q|--query]}} '{{.h2 | text}}' {{path/to/file.md}}
```

trip

A network diagnostic tool.

Combines the functionality of **`traceroute`** and **`ping`**.

Designed to assist with the analysis of networking issues.

More information: https://trippy.rs/reference/cli/.

- Trace the route to a host with default parameters:

```
sudo trip {{example.com}}
```

- Trace without requiring elevated privileges (supported platforms only):

```
trip {{example.com}} --unprivileged
```

- Trace using `IPv6` only:

```
sudo trip {{example.com}} --ipv6
```

- Trace using the `udp` protocol:

```
sudo trip {{example.com}} --protocol {{udp}}
```

- Use custom destination port `443` for `tcp` tracing:

```
sudo trip {{example.com}} --protocol {{tcp}} --target-port
{{443}}
```

- Use custom source port `5000` for `udp` tracing:

```
sudo trip {{example.com}} --protocol {{udp}} --source-port
{{5000}}
```

trivy

Scanner for vulnerabilities in container images, filesystems, and Git repositories, as well as for configuration issues.

More information: https://trivy.dev/docs/latest/guide/references/configuration/cli/trivy/.

- Scan a Docker image for vulnerabilities and exposed secrets:

```
trivy image {{image:tag}}
```

- Scan a Docker image filtering the output by severity:

```
trivy image {{[-s|--severity]}} {{HIGH,CRITICAL}} {{alpine:3.15}}
```

- Scan a Docker image ignoring any unfixed/unpatched vulnerabilities:

```
trivy image --ignore-unfixed {{alpine:3.15}}
```

- Scan the filesystem for vulnerabilities and misconfigurations:

```
trivy fs --scanners {{vuln,misconfig}} {{path/to/project_directory}}
```

- Scan an IaC (Terraform, CloudFormation, ARM, Helm, and Dockerfile) directory for misconfigurations:

```
trivy config {{path/to/iac_directory}}
```

- Scan a local or remote Git repository for vulnerabilities:

```
trivy repo {{path/to/local_repository_directory|remote_repository_url}}
```

- Scan a Git repository up to a specific commit hash:

```
trivy repo --commit {{commit_hash}} {{repository}}
```

- Generate output with a SARIF template:

```
trivy image {{[-f|--format]}} {{template}} {{[-t|--template]}} "{{@sarif.tpl}}" {{[-o|--output]}} {{path/to/report.sarif}} {{image:tag}}
```

troff

Typesetting processor for the groff (GNU Troff) document formatting system.

See also: **`groff`**.

More information: https://manned.org/troff.

- Format output for a PostScript printer, saving the output to a file:

```
troff {{path/to/input.roff}} | grops > {{path/to/output.ps}}
```

- Format output for a PostScript printer using the me macro package, saving the output to a file:

```
troff -{{me}} {{path/to/input.roff}} | grops > {{path/to/output.ps}}
```

- Format output as ASCII text using the man macro package:

```
troff -T {{ascii}} -{{man}} {{path/to/input.roff}} | grotty
```

- Format output as a pdf file, saving the output to a file:

```
troff -T {{pdf}} {{path/to/input.roff}} | gropdf > {{path/to/output.pdf}}
```

true

Return a successful exit status code of 0.

See also: **`false`**.

More information: https://www.gnu.org/software/bash/manual/bash.html#index-true.

- Return a successful exit code:

```
true
```

- Make a command always exit with 0:

```
{{command}} || true
```

truffle

Develop smart contracts for running services on the Ethereum blockchain.

More information: https://archive.trufflesuite.com/docs/truffle/reference/truffle-commands/.

- Download a pre-built Truffle project (Truffle Box):

  ```
  truffle unbox {{box_name}}
  ```

- Compile contract source files in the current directory:

  ```
  truffle compile
  ```

- Run JavaScript and Solidity tests:

  ```
  truffle test
  ```

- Run migrations to deploy contracts:

  ```
  truffle migrate
  ```

- Display help for a subcommand:

  ```
  truffle help {{subcommand}}
  ```

trufflehog

Find and verify credentials in files, Git repositories, S3 buckets, and Docker images.

More information: https://github.com/trufflesecurity/trufflehog#memo-usage.

- Scan a Git repository for verified secrets:

```
trufflehog git {{https://github.com/trufflesecurity/test_keys}} --only-verified
```

- Scan a GitHub organization for verified secrets:

```
trufflehog github --org {{trufflesecurity}} --only-verified
```

- Scan a GitHub repository for verified keys and get JSON output:

```
trufflehog git {{https://github.com/trufflesecurity/test_keys}} --only-verified --json
```

- Scan a GitHub repository along with its Issues and Pull Requests:

```
trufflehog github --repo {{https://github.com/trufflesecurity/test_keys}} --issue-comments --pr-comments
```

- Scan an S3 bucket for verified keys:

```
trufflehog s3 --bucket {{bucket_name}} --only-verified
```

- Scan S3 buckets using IAM Roles:

```
trufflehog s3 --role-arn {{iam_role_arn}}
```

- Scan individual files or directories:

```
trufflehog filesystem {{path/to/file_or_directory1 path/to/file_or_directory2 ...}}
```

- Scan a Docker image for verified secrets:

```
trufflehog docker --image {{trufflesecurity/secrets}} --only-verified
```

truncate

Shrink or extend the size of a file to the specified size.

More information: https://www.gnu.org/software/coreutils/manual/html_node/truncate-invocation.html.

- Set a size of 10 GB to an existing file, or create a new file with the specified size:

```
truncate {{[-s|--size]}} 10G {{path/to/file}}
```

- Extend the file size by 50 MiB, fill with holes (which reads as zero bytes):

```
truncate {{[-s|--size]}} +50M {{path/to/file}}
```

- Shrink the file by 2 GiB, by removing data from the end of file:

```
truncate {{[-s|--size]}} -2G {{path/to/file}}
```

- Empty the file's content:

```
truncate {{[-s|--size]}} 0 {{path/to/file}}
```

- Empty the file's content, but do not create the file if it does not exist:

```
truncate {{[-s|--size]}} 0 {{[-c|--no-create]}} {{path/to/file}}
```

trunk

Run linters, formatters, and security analyzers on code.

More information: https://docs.trunk.io/code-quality/overview/getting-started/commands-reference.

- Initialize trunk in a repository:

```
trunk init
```

- Run all applicable linters and formatters on changed files:

```
trunk check
```

- Run linters and formatters on specific files:

```
trunk check {{path/to/file1 path/to/file2 ...}}
```

- Format files in place:

```
trunk fmt
```

- List all available tools and their status:

```
trunk tools list
```

- Enable a tool at a specific version:

```
trunk tools enable {{tool}}@{{version}}
```

- Print an action's execution history:

```
trunk actions history {{action}}
```

trunk

trunk can refer to multiple commands with the same name.

- View documentation for the Rust WASM bundler:

  ```
  tldr trunk.rs
  ```

- View documentation for the trunk.io code quality platform:

  ```
  tldr trunk.io
  ```

trunk

Bundle and serve Rust WASM web applications.

More information: https://trunkrs.dev/commands/.

- Build the application in release mode and serve it locally:

```
trunk serve --release
```

- Build the application and serve it on a specific port:

```
trunk serve {{[-p|--port]}} {{port}}
```

- Build for production at a specific output directory:

```
trunk build --release {{[-d|--dist]}} {{path/to/
distribution}}
```

- Build with a specific public URL path for hosting in a subdirectory:

```
trunk build --release --public-url /{{path/to/
app_subdirectory}}
```

- Clean the output directory:

```
trunk clean
```

try-rs

Manage temporary project workspaces with an interactive TUI.

More information: https://try-rs.org/#usage.

- Open the interactive TUI:

```
try-rs
```

- Create or jump to a named experiment:

```
try-rs {{experiment_name}}
```

- Clone a repository into a dated folder:

```
try-rs {{https://github.com/user/repository}}
```

- Clone a repository into a specific destination folder:

```
try-rs {{https://github.com/user/repository}}
{{destination_name}}
```

- Create a Git worktree from the current repository:

```
try-rs --worktree {{worktree_name}}
```

- Generate shell integration for the specified shell:

```
try-rs --setup {{bash|fish|zsh|nu-shell|power-shell}}
```

ts-node

Run TypeScript code directly, without any compiling.

More information: https://typestrong.org/ts-node/docs/options/.

- Execute a TypeScript file without compiling (Node + `tsc`):

```
ts-node {{path/to/file.ts}}
```

- Execute a TypeScript file without loading `tsconfig.json`:

```
ts-node --skipProject {{path/to/file.ts}}
```

- Evaluate TypeScript code passed as a literal:

```
ts-node {{[-e|--eval]}} '{{console.log("Hello World")}}'
```

- Execute a TypeScript file in script mode:

```
ts-node --script-mode {{path/to/file.ts}}
```

- Transpile a TypeScript file to JavaScript without executing it:

```
ts-node {{[-T|--transpileOnly]}} {{path/to/file.ts}}
```

- Display help:

```
ts-node {{[-h|--help]}}
```

ts

Add timestamps to every line from **`stdin`**.

More information: https://manned.org/ts.

- Add a timestamp to the beginning of each line:

```
{{command}} | ts
```

- Add timestamps with microsecond precision:

```
{{command}} | ts "{{%b %d %H:%M:%.S}}"
```

- Add [i]ncremental timestamps with microsecond precision, starting from zero:

```
{{command}} | ts -i "{{%H:%M:%.S}}"
```

- Convert existing timestamps in a text file (e.g. a log file) into [r]elative format:

```
cat {{path/to/file}} | ts -r
```

tsc

TypeScript compiler.

More information: https://www.typescriptlang.org/docs/handbook/compiler-options.html.

- Initialize a TypeScript project:

```
tsc --init
```

- Compile a TypeScript file into a JavaScript file with the same name:

```
tsc {{path/to/file.ts}}
```

- Compile a TypeScript file into JavaScript using a specific target syntax (default is ES3):

```
tsc {{[-t|--target]}} {{ES5|ES2015|ES2016|ES2017|ES2018|
ESNEXT|...}} {{path/to/file.ts}}
```

- Compile a TypeScript file into a JavaScript file with a custom name:

```
tsc --outFile {{path/to/output_file.js}} {{path/to/
input_file.ts}}
```

- Compile all `.ts` files of a TypeScript project defined in a `tsconfig.json` file (`--build` can be omitted to build the project in the current working directory):

```
tsc {{[-b|--build]}} {{path/to/tsconfig.json}}
```

- Run the compiler using command-line options and arguments fetched from a text file:

```
tsc @{{args.txt}}
```

- Type-check multiple JavaScript files, and output only the errors:

```
tsc --allowJs --checkJs --noEmit {{src/**/*.js}}
```

- Run the compiler in watch mode, which automatically recompiles code when it changes:

```
tsc {{[-w|--watch]}}
```

tset

Initialize or reset terminal state.

More information: https://manned.org/tset.

- Initialize the terminal:

```
tset
```

- Set control characters and modes:

```
tset -c
```

- Print the terminal type to the (`stderr`) output:

```
tset -r
```

- Print shell commands to set the environment:

```
tset -s
```

- Resize the terminal window to the detected size:

```
tset -w
```

tslint

A pluggable linting utility for TypeScript.

More information: https://palantir.github.io/tslint/.

- Create TSLint config:

```
tslint --init
```

- Lint on a given set of files:

```
tslint {{path/to/file1.js path/to/file2.js ...}}
```

- Fix lint issues:

```
tslint --fix
```

- Lint with the configuration file in the project root:

```
tslint --project {{path/to/project_root}}
```

tsort

Perform a topological sort.

A common use is to show the dependency order of nodes in a directed acyclic graph.

More information: https://www.gnu.org/software/coreutils/manual/html_node/tsort-invocation.html.

- Perform a topological sort consistent with a partial sort per line of input separated by blanks:

```
tsort {{path/to/file}}
```

- Perform a topological sort consistent on strings:

```
echo -e "{{UI Backend\nBackend Database\nDocs UI}}" | tsort
```

tspin

A log file highlighter based on the **`less`** pager and basically behaves like any pager.

More information: https://github.com/bensadeh/tailspin#usage.

- View a log file using the default pager (`less`):

```
tspin {{path/to/file.log}}
```

- Read from another command and print to `stdout`:

```
{{command}} | tspin
```

- Read from a file and print to `stdout` without paging:

```
tspin {{path/to/file.log}} {{[-p|--print]}}
```

- Follow a file (mimics `tail -f`) and highlight new entries:

```
tspin {{[-f|--follow]}} {{path/to/file.log}}
```

- Highlight specific groups only (possible values: `numbers`, `urls`, `pointers`, `dates`, `paths`, `quotes`, `key-value-pairs`, `uuids`, `ip-addresses`, `processes`, `json`):

```
tspin --enable {{urls,ip-addresses,...}} {{path/to/file.log}}
```

- Use a custom pager (the `[FILE]` string is a required literal placeholder):

```
tspin --pager "{{bat -p}} [FILE]" {{path/to/file.log}}
```

- Highlight custom strings with custom colors:

```
tspin --highlight {{red}}:{{ERROR,WARNING,...}} {{path/to/
file.log}}
```

- Run the provided command and view the output in `less`:

```
tspin --exec='{{command}}'
```

tsv-filter

Filter lines of a TSV file by running tests against individual fields.

More information: https://github.com/eBay/tsv-utils#tsv-filter.

- Print the lines where a specific column is numerically equal to a given number:

```
tsv-filter -H --eq {{field_name}}:{{number}} {{path/to/tsv_file}}
```

- Print the lines where a specific column is [eq]ual/[n]on [e]qual/[l]ess [t]han/[l]ess than or [e]qual/[g]reater [t]han/[g]reater than or [e]qual to a given number:

```
tsv-filter --{{eq|ne|lt|le|gt|ge}} {{column_number}}:{{number}} {{path/to/tsv_file}}
```

- Print the lines where a specific column is [eq]ual/[n]ot [e]qual/part of/not part of a given string:

```
tsv-filter --str-{{eq|ne|in-fld|not-in-fld}} {{column_number}}:{{string}} {{path/to/tsv_file}}
```

- Filter for non-empty fields:

```
tsv-filter --not-empty {{column_number}} {{path/to/tsv_file}}
```

- Print the lines where a specific column is empty:

```
tsv-filter --invert --not-empty {{column_number}} {{path/to/tsv_file}}
```

- Print the lines that satisfy two conditions:

```
tsv-filter --eq {{column_number1}}:{{number}} --str-eq {{column_number2}}:{{string}} {{path/to/tsv_file}}
```

- Print the lines that match at least one condition:

```
tsv-filter --or --eq {{column_number1}}:{{number}} --str-eq {{column_number2}}:{{string}} {{path/to/tsv_file}}
```

- Count matching lines, interpreting first line as a [H]eader:

```
tsv-filter --count -H --eq {{field_name}}:{{number}} {{path/to/tsv_file}}
```

tt

A terminal based typing test.

More information: https://github.com/lemnos/tt.

- Start quote mode with the builtin quote list in English:

```
tt -quotes {{en}}
```

- Produce a test consisting of 50 randomly drawn words in 5 groups of 10 words each:

```
tt -n {{10}} -g {{5}}
```

- Start a timed test lasting 10 seconds:

```
tt -t {{10}}
```

- Start `tt` with no theming and showing your WPM as you type:

```
tt -showwpm -notheme
```

tte

A terminal visual effects engine, application, and library.

More information: https://github.com/ChrisBuilds/terminaltexteffects.

- Apply a random effect to a command's output:

```
{{command}} | tte {{[-R|--random-effect]}}
```

- Apply a specific effect to a command's output:

```
{{ls -la}} | tte {{matrix}}
```

- View the options for a specific effect:

```
tte {{decrypt}} {{[-h|--help]}}
```

- Apply an effect to text from a file:

```
tte {{[-i|--input-file]}} {{path/to/file}} {{beams}}
```

- Print shell completion scripts:

```
tte --print-completion {{bash}}
```

tts

Synthesize speech.

More information: https://github.com/coqui-ai/TTS#command-line-tts.

- Run text-to-speech with the default models, writing the output to "tts_output.wav":

```
tts --text "{{text}}"
```

- List provided models:

```
tts --list_models
```

- Query info for a model by idx:

```
tts --model_info_by_idx {{model_type/model_query_idx}}
```

- Query info for a model by name:

```
tts --model_info_by_name {{model_type/language/dataset/
model_name}}
```

- Run a text-to-speech model with its default vocoder model:

```
tts --text "{{text}}" --model_name {{model_type/language/
dataset/model_name}}
```

- Run your own text-to-speech model (using the Griffin-Lim vocoder):

```
tts --text "{{text}}" --model_path {{path/to/model.pth}} --
config_path {{path/to/config.json}} --out_path {{path/to/
file.wav}}
```

tty-clock

A customizable terminal-based digital clock.

More information: https://github.com/xorg62/tty-clock.

- Start the clock in the center of the terminal:

```
tty-clock -c
```

- Enable the display of seconds:

```
tty-clock -s
```

- Set the color of the clock using a color code (0-7):

```
tty-clock -C {{color_number}}
```

- Use a custom date format (strftime format):

```
tty-clock -f "{{%A, %B %d}}"
```

- Set a custom refresh delay in seconds (default is 1):

```
tty-clock -d {{seconds}}
```

- Exit the clock (while running):

```
<q>
```

tty

Return the terminal name.

More information: https://www.gnu.org/software/coreutils/manual/html_node/tty-invocation.html.

- Print the file name of this terminal:

```
tty
```

ttyd

Share a terminal or any command over the web.

More information: https://github.com/tsl0922/ttyd#command-line-options.

- Start a read only web server sharing Bash shell on the default port (7681):

```
ttyd bash
```

- Start Bash on a specific port:

```
ttyd {{[-p|--port]}} {{8080}} bash
```

- Allow clients to write to the terminal:

```
ttyd {{[-W|--writable]}} {{command}}
```

- Set client options:

```
ttyd {{[-t|--client-option]}} {{key=value}} {{command}}
```

- Display help:

```
ttyd {{[-h|--help]}}
```

- Display version:

```
ttyd {{[-v|--version]}}
```

tuc

Cut text (or bytes) where a delimiter matches, then keep the desired parts.

A more user-friendly and powerful version of **`cut`** with sensible defaults.

More information: https://github.com/riquito/tuc#help.

- Cut and rearrange fields:

```
echo "foo bar baz" | tuc {{[-d|--delimiter]}} '{{ }}' {{[-f|--fields]}} {{3,2,1}}
```

- Replace the delimiter space with an arrow:

```
echo "foo bar baz" | tuc {{[-d|--delimiter]}} ' ' {{[-r|--replace-delimiter]}} ' ➡ '
```

- Keep a range of fields:

```
echo "foo bar baz" | tuc {{[-d|--delimiter]}} ' ' {{[-f|--fields]}} {{2:}}
```

- Cut using regex:

```
echo "a,b, c" | tuc {{[-e|--regex]}} '{{[, ]+}}' {{[-f|--fields]}} {{1,3}}
```

- Emit JSON output:

```
echo "foo bar baz" | tuc {{[-d|--delimiter]}} '{{ }}' --json
```

tuckr

Dotfile manager written in Rust.

See also: **`chezmoi`**, **`vcsh`**, **`homeshick`**, **`stow`**.

More information: https://github.com/RaphGL/Tuckr#usage.

- Check dotfile status:

```
tuckr status
```

- Add all dotfiles to system:

```
tuckr add \*
```

- Add all dotfiles except specified programs:

```
tuckr add \* -e {{program1}},{{program2}}
```

- Remove all dotfiles from the system:

```
tuckr rm \*
```

- Add a program dotfile and run its setup script:

```
tuckr set {{program}}
```

tuir

A text user-interface (TUI) to view and interact with Reddit from your terminal.

Navigate with the Vim keys.

More information: https://gitlab.com/ajak/tuir.

- Launch tuir:

```
tuir
```

- Open a subreddit:

```
</>{{subreddit_name}}
```

- Open a link:

```
<o>
```

- Open a specific subreddit on launch:

```
tuir -s {{subreddit_name}}
```

- Open external links using programs defined in the mailcap config:

```
tuir --enable-media
```

tuitube

A terminal-based video downloader.

More information: https://github.com/remorses/tuitube.

- Start `tuitube`:

  `tuitube`

- Switch between options (navigate):

  `<Tab>`

- Submit:

  `<Enter>`

- Show menu:

  `<Ctrl k>`

tuptime

Report historical and statistical real time of the system, preserving it between restarts.

Like **`uptime`**, but extended with startups count, graceful and bad shutdowns, uptime/downtime percentages, and averages since first boot.

More information: https://github.com/rfmoz/tuptime.

- Show system uptime history and statistics:

```
tuptime
```

- Show system lifetime as table:

```
tuptime --table
```

- Show system lifetime as list:

```
tuptime --list
```

- Show table with kernel version and boot ID:

```
tuptime --table --kernel --bootid
```

- Report from startup range:

```
tuptime --table --since {{1}} --until {{5}}
```

- Limit the report from a given number of seconds ago (e.g. one year = 31557600):

```
tuptime --tsince -{{31557600}}
```

- Output time in seconds and datetimes in epoch format:

```
tuptime --seconds
```

- Report in CSV format:

```
tuptime --csv
```

turbo

High-performance build system for JavaScript and TypeScript codebases.

See also: **nx**.

More information: https://turborepo.com/docs/reference.

- Log in using the default web browser with a Vercel account:

```
turbo login
```

- Link the current directory to a Vercel organization and enable remote caching:

```
turbo link
```

- Build the current project:

```
turbo run build
```

- Run a task without concurrency:

```
turbo run {{task_name}} --concurrency={{1}}
```

- Run a task ignoring cached artifacts and forcibly re-execute all tasks:

```
turbo run {{task_name}} --force
```

- Run a task in parallel across packages:

```
turbo run {{task_name}} --parallel --no-cache
```

- Unlink the current directory from your Vercel organization and disable Remote Caching:

```
turbo unlink
```

- Generate a Dot graph of a specific task execution (the output file format can be controlled with the filename):

```
turbo run {{task_name}} --graph={{path/to/file}}.{{html|jpg|json|pdf|png|svg}}
```

tv

Cross-platform, fast, extensible fuzzy-finder tool.

Works with "channels" (e.g., files, env, git repos) or from **`stdin`**.

More information: https://alexpasmantier.github.io/television/.

- Launch with the default channel:

```
tv
```

- Open a specific channel:

```
tv {{files|env|git-repos|...}}
```

- List all available channels:

```
tv list-channels
```

- Fuzzy-pick from lines piped on `stdin`:

```
{{command}} | tv
```

- Pipe and show a live preview for each entry:

```
{{command}} | tv --preview '{{preview_command}}'
```

- Build a picker from commands (source + preview):

```
tv --source-command '{{source_command}}' --preview-command
'{{preview_command}}' --preview-size {{70}}
```

- Update and install community-maintained channels:

```
tv update-channels
```

- View tldr pages (you need to update channels first and have `tldr` installed):

```
tv tldr
```

tv

tv can refer to multiple commands with the same name.

- View documentation for the Television fuzzy finder:

  `tldr tv.fzf`

- View documentation for the tidy-viewer data pretty printer:

  `tldr tidy-viewer`

tw

View and query tabular data files using Tabiew.

More information: https://github.com/shshemi/tabiew#usage.

- Open one or more files, detecting the format based on the file extension:

```
tw {{path/to/file1 path/to/file2 ...}}
```

- Open a file, overriding the format detection:

```
tw {{path/to/file}} {{[-f|--format]}} {{csv|tsv|parquet|
sqlite|excel|...}}
```

- Open a delimiter-separated file with a custom separator:

```
tw {{path/to/file.csv}} --separator '{{|}}'
```

- Open a delimiter-separated file without a header row:

```
tw {{path/to/file.csv}} --no-header
```

- Read tabular data from `stdin`:

```
curl {{[-s|--silent]}} {{https://example.com/data.csv}} | tw
```

- Open files with identical columns and concatenate them vertically into a single table:

```
tw --multiparts {{path/to/part1.csv path/to/part2.csv ...}}
```

twine

Utility for publishing Python packages on PyPI.

More information: https://twine.readthedocs.io/en/stable/#commands.

- Upload to PyPI:

```
twine upload dist/*
```

- Upload to the Test PyPI repository to verify things look right:

```
twine upload {{[-r|--repository]}} testpypi dist/*
```

- Upload to PyPI with a specified username and password:

```
twine upload {{[-u|--username]}} {{username}} {{[-p|--password]}} {{password}} dist/*
```

- Upload to an alternative repository URL:

```
twine upload --repository-url {{repository_url}} dist/*
```

- Check that your distribution's long description should render correctly on PyPI:

```
twine check dist/*
```

- Upload using a specific pypirc configuration file:

```
twine upload --config-file {{configuration_file}} dist/*
```

- Continue uploading files if one already exists (only valid when uploading to PyPI):

```
twine upload --skip-existing dist/*
```

- Upload to PyPI showing detailed information:

```
twine upload --verbose dist/*
```

twm

A window manager for the X Window system.

More information: https://manned.org/twm.

- Connect to the default X server:

```
twm
```

- Connect to a specific X server:

```
twm {{[-d|-display]}} {{display}}
```

- Only manage the default screen:

```
twm {{[-s|-single]}}
```

- Use a specific startup file:

```
twm {{[-f|-file]}} {{path/to/file}}
```

- Enable verbose mode and print unexpected errors in X:

```
twm {{[-v|-verbose]}}
```

twopi

Render an image of a **radial** network graph from a **graphviz** file.

Layouts: **dot**, **neato**, **twopi**, **circo**, **fdp**, **sfdp**, **osage** & **patchwork**.

More information: https://graphviz.org/doc/info/command.html.

- Render a PNG image with a filename based on the input filename and output format (uppercase -O):

```
twopi -T {{png}} -O {{path/to/input.gv}}
```

- Render a SVG image with the specified output filename (lowercase -o):

```
twopi -T {{svg}} -o {{path/to/image.svg}} {{path/to/input.gv}}
```

- Render the output in PS, PDF, SVG, Fig, PNG, GIF, JPEG, JSON, or DOT format:

```
twopi -T {{format}} -O {{path/to/input.gv}}
```

- Render a GIF image using `stdin` and `stdout`:

```
echo "{{digraph {this -> that} }}" | twopi -T {{gif}} > {{path/to/image.gif}}
```

- Display help:

```
twopi -?
```

twurl-accounts

Manage and list Twitter accounts authorized with twurl.

More information: https://github.com/twitter/twurl#changing-your-default-profile.

- List all authorized Twitter accounts and their consumer keys:

```
twurl accounts
```

twurl authorize

Authorize twurl with Twitter API credentials.

More information: https://github.com/twitter/twurl.

- Authorize twurl using a consumer key and secret:

```
twurl authorize {{[-c|--consumer-key]}} {{consumer_key}} {{[-s|--consumer-secret]}} {{consumer_secret}}
```

- Authorize twurl using a consumer key and secret, and open the authorization URL in a browser:

```
twurl authorize {{[-c|--consumer-key]}} {{consumer_key}} {{[-s|--consumer-secret]}} {{consumer_secret}} --open
```

- Authorize twurl for a specific host:

```
twurl authorize {{[-c|--consumer-key]}} {{consumer_key}} {{[-s|--consumer-secret]}} {{consumer_secret}} {{[-H|--host]}} {{api.twitter.com}}
```

twurl

Curl-like command but tailored specifically for the Twitter API.

More information: https://github.com/twitter/twurl#getting-started.

- Authorize `twurl` to access a Twitter account:

```
twurl authorize {{[-c|--consumer-key]}} {{twitter_api_key}}
{{[-s|--consumer-secret]}} {{twitter_api_secret}}
```

- Make a GET request to an API endpoint:

```
twurl {{[-X|--request-method]}} GET {{twitter_api_endpoint}}
```

- Make a POST request to an API endpoint:

```
twurl {{[-X|--request-method]}} POST {{[-d|--data]}}
'{{endpoint_params}}' {{twitter_api_endpoint}}
```

- Upload media to Twitter:

```
twurl {{[-H|--host]}} "{{twitter_upload_url}}" {{[-X|--
request-method]}} POST "{{twitter_upload_endpoint}}" {{[-f|--
file]}} "{{path/to/media.jpg}}" {{[-F|--file-field]}} "media"
```

- Access a different Twitter API host:

```
twurl {{[-H|--host]}} {{twitter_api_url}} {{[-X|--request-
method]}} GET {{twitter_api_endpoint}}
```

- Create an alias for a requested resource:

```
twurl alias {{alias_name}} {{resource}}
```

tye

Develop, test, and deploy microservices and distributed applications easily.

More information: https://github.com/dotnet/tye.

- Scaffold a `tye.yaml` file representing the application:

  ```
  tye init
  ```

- Run an application locally:

  ```
  tye run
  ```

- Build an application's containers:

  ```
  tye build
  ```

- Push an application's containers:

  ```
  tye push
  ```

- Deploy an application to Kubernetes:

  ```
  tye deploy
  ```

- Remove a deployed application from Kubernetes:

  ```
  tye undeploy
  ```

type

Display the type of command the shell will execute.

Note: All examples are not POSIX compliant.

See also: **`whereis`**, **`which`**.

More information: https://www.gnu.org/software/bash/manual/bash.html#index-type.

- Display the type of a command:

```
type {{command}}
```

- Display all locations containing the specified executable (works only in Bash/fish/Zsh shells):

```
type -a {{command}}
```

- Display the name of the disk file that would be executed (works only in Bash/fish/Zsh shells):

```
type -p {{command}}
```

- Display the type of a specific command, alias/keyword/function/builtin/file (works only in Bash/fish shells):

```
type -t {{command}}
```

typeinc

An **ncurses** based terminal typing speed test program, written in Python.

Try out different difficulty levels and improve your typing speed.

More information: https://github.com/AnirudhG07/Typeinc.

- Enter the typing test:

  `typeinc`

- Display the top 10 rank list for input difficulty level:

  `typeinc {{[-r|--ranklist]}} {{difficulty_level}}`

- Get random English words present in our wordlist:

  `typeinc {{[-w|--words]}} {{word_count}}`

- Calculate hypothetical Typeinc score:

  `typeinc {{[-s|--score]}}`

typeorm

A JavaScript ORM that can run on Node.js, browser, Cordova, Ionic, React Native, NativeScript, and Electron platforms.

More information: https://typeorm.io/docs/advanced-topics/using-cli/#initialize-a-new-typeorm-project.

- Generate a new initial TypeORM project structure:

  ```
  typeorm init
  ```

- Create an empty migration file:

  ```
  typeorm migration:create --name {{migration_name}}
  ```

- Create a migration file with the SQL statements to update the schema:

  ```
  typeorm migration:generate --name {{migration_name}}
  ```

- Run all pending migrations:

  ```
  typeorm migration:run
  ```

- Create a new entity file in a specific directory:

  ```
  typeorm entity:create --name {{entity}} --dir {{path/to/directory}}
  ```

- Display the SQL statements to be executed by `typeorm schema:sync` on the default connection:

  ```
  typeorm schema:log
  ```

- Execute a specific SQL statement on the default connection:

  ```
  typeorm query {{sql_sentence}}
  ```

- Display help for a subcommand:

  ```
  typeorm {{subcommand}} --help
  ```

typeset

This command is an alias of **`declare`**.

- View documentation for the original command:

```
tldr declare
```

typos

Find and correct spelling mistakes in source code.

More information: https://github.com/crate-ci/typos/blob/master/docs/reference.md.

- Check a file or directory for spelling mistakes:

```
typos {{path/to/file_or_directory}}
```

- Fix typos automatically in a file or directory:

```
typos {{[-w|--write-changes]}} {{path/to/file_or_directory}}
```

- Preview the changes before applying them:

```
typos --diff {{path/to/file_or_directory}}
```

- Check a file or directory, including hidden files and directories:

```
typos --hidden {{path/to/file_or_directory}}
```

- Check a file or directory, ignoring files that match a specific `glob` pattern:

```
typos --exclude {{pattern}} {{path/to/file_or_directory}}
```

- Write the current configuration to a specific file:

```
typos --dump-config {{path/to/typos.toml}}
```

- List all supported file types:

```
typos --type-list
```

- Show spelling mistakes in a specific output format (defaults to `long`):

```
typos --format {{brief|long|json|...}} {{path/to/
file_or_directory}}
```

typst

Compile a Typst file to PDF.

Note: Specifying the output location is optional.

More information: https://manned.org/typst.

- Initialize a new Typst project in a given directory using a template (e.g., `@preview/charged-ieee`):

```
typst init "{{template}}" {{path/to/directory}}
```

- Compile a Typst file:

```
typst compile {{path/to/source.typ}} {{path/to/output.pdf}}
```

- Watch a Typst file and recompile on changes:

```
typst watch {{path/to/source.typ}} {{path/to/output.pdf}}
```

- List all discoverable fonts in the system and the given directory:

```
typst --font-path {{path/to/fonts_directory}} fonts
```

tzconfig

Manage and set your local timezone.

It accepts no parameters.

More information: https://manned.org/tzconfig.

- Launch timezone configuration utility:

```
tzconfig
```

u3d

A set of tools to interact with Unity.

More information: https://github.com/DragonBox/u3d.

- Open the project in the current directory using the correct Unity version:

  ```
  u3d
  ```

- List installed versions of Unity:

  ```
  u3d list
  ```

- List available versions of Unity that can be downloaded:

  ```
  u3d available
  ```

- Download and install latest stable Unity version:

  ```
  u3d install latest_stable
  ```

- Download and install Unity version and editor [p]ackages:

  ```
  u3d install {{2021.2.0f1}} -p {{Unity,iOS,Android}}
  ```

ufraw-batch

Convert RAW files from cameras into standard image files.

More information: https://manned.org/ufraw-batch.

- Simply convert RAW files to JPEG:

```
ufraw-batch --out-type=jpg {{path/to/file1 path/to/
file2 ...}}
```

- Simply convert RAW files to PNG:

```
ufraw-batch --out-type=png {{path/to/file1 path/to/
file2 ...}}
```

- Extract the preview image from the raw file:

```
ufraw-batch --embedded-image {{path/to/file1 path/to/
file2 ...}}
```

- Save the file with size up to the given maximums MAX1 and MAX2:

```
ufraw-batch --size=MAX1,MAX2 {{path/to/file1 path/to/
file2 ...}}
```

ug

This command is an alias of **`ugrep --config --pretty --sort`**.

- View documentation for the original command:

  `tldr ugrep`

ugrep

Ultra fast search tool with query TUI.

More information: https://github.com/Genivia/ugrep#man-page.

- Start a query TUI to search files in the current directory recursively (`<Ctrl z>` for help):

```
ugrep {{[-Q|--query]}}
```

- Search the current directory recursively for files containing a `regex` search pattern:

```
ugrep "{{search_pattern}}"
```

- Search in a specific file or in all files in a specific directory, showing line numbers of matches:

```
ugrep {{[-n|--line-number]}} "{{search_pattern}}" {{path/to/file_or_directory}}
```

- Search in all files in the current directory recursively and print the name of each matching file:

```
ugrep {{[-l|--files-with-matches]}} "{{search_pattern}}"
```

- Fuzzy search files with up to 3 extra, missing, or mismatching characters in the pattern:

```
ugrep {{[-Z|--fuzzy=]}}{{3}} "{{search_pattern}}"
```

- Also search compressed files, Zip, and `.tar` archives recursively:

```
ugrep {{[-z|--decompress]}} "{{search_pattern}}"
```

- Search only files whose filenames match a specific `glob` pattern:

```
ugrep {{[-g |--glob=]}}"{{glob_pattern}}" "{{search_pattern}}"
```

- Search only C++ source files (use `--file-type=list` to list all file types):

```
ugrep {{[-t |--file-type=]}}cpp "{{search_pattern}}"
```

ulimit

Get and set resource limits for user processes.

This is a shell builtin hence not shell-agnostic.

More information: https://www.gnu.org/software/bash/manual/bash.html#index-ulimit.

- Get the properties of all the user limits:

```
ulimit -a
```

- Get hard limit for the number of simultaneously opened files:

```
ulimit -H -n
```

- Get soft limit for the number of simultaneously opened files:

```
ulimit -S -n
```

- Set max per-user process limit:

```
ulimit -u {{30}}
```

- Display help (Bash only):

```
help ulimit
```

umask

Manage the read/write/execute permissions that are masked out (i.e. restricted) for newly created files by the user.

More information: https://www.gnu.org/software/bash/manual/bash.html#index-umask.

- Display the current mask in octal notation:

```
umask
```

- Display the current mask in symbolic (human-readable) mode:

```
umask -S
```

- Change the mask symbolically to allow read permission for all users (the rest of the mask bits are unchanged):

```
umask {{a+r}}
```

- Set the mask (using octal) to restrict no permissions for the file's owner, and restrict all permissions for everyone else:

```
umask {{077}}
```

umount

Unlink a filesystem from its mount point, making it no longer accessible.

A filesystem cannot be unmounted when it is busy.

More information: https://man.openbsd.org/umount.

- Unmount a filesystem, by passing the path to the source it is mounted from:

```
umount {{path/to/device_file}}
```

- Unmount a filesystem, by passing the path to the target where it is mounted:

```
umount {{path/to/mounted_directory}}
```

- Unmount all mounted filesystems (except the `proc` filesystem):

```
umount -a
```

unalias

Remove aliases.

See also: **alias**.

More information: https://www.gnu.org/software/bash/manual/bash.html#index-unalias.

- Remove an alias:

```
unalias {{alias_name}}
```

- Remove all aliases:

```
unalias -a
```

uname

Print details about the current machine and the operating system running on it.

See also: **`lsb_release`**.

More information: https://www.gnu.org/software/coreutils/manual/html_node/uname-invocation.html.

- Print kernel name:

```
uname
```

- Print all available system information:

```
uname {{[-a|--all]}}
```

- Print system architecture and processor information:

```
uname {{[-mp|--machine --processor]}}
```

- Print kernel name, kernel release, and kernel version:

```
uname {{[-srv|--kernel-name --kernel-release --kernel-version]}}
```

- Print system hostname:

```
uname {{[-n|--nodename]}}
```

- Print the current operating system name:

```
uname {{[-o|--operating-system]}}
```

- Display help:

```
uname --help
```

unar

Extract contents from archive files.

More information: https://manned.org/unar.

- Extract an archive to the current directory:

```
unar {{path/to/archive}}
```

- Extract an archive to the specified directory:

```
unar {{[-o|-output-directory]}} {{path/to/directory}} {{path/to/archive}}
```

- Force overwrite if files to be unpacked already exist:

```
unar {{[-f|-force-overwrite]}} {{path/to/archive}}
```

- Force rename if files to be unpacked already exist:

```
unar {{[-r|-force-rename]}} {{path/to/archive}}
```

- Force skip if files to be unpacked already exist:

```
unar {{[-s|-force-skip]}} {{path/to/archive}}
```

unclutter

Hide the mouse cursor.

More information: https://manned.org/unclutter.1x.

- Hide mouse cursor after 3 seconds:

```
unclutter -idle {{3}}
```

uncrustify

C, C++, C#, D, Java, and Pawn source code formatter.

More information: https://manned.org/uncrustify.

- Format a single file:

```
uncrustify -f {{path/to/file.cpp}} -o {{path/to/output.cpp}}
```

- Read filenames from `stdin`, and take backups before writing output back to the original filepaths:

```
find . -name "*.cpp" | uncrustify -F - --replace
```

- Don't make backups (useful if files are under version control):

```
find . -name "*.cpp" | uncrustify -F - --no-backup
```

- Use a custom configuration file and write the result to `stdout`:

```
uncrustify -c {{path/to/uncrustify.cfg}} -f {{path/to/
file.cpp}}
```

- Explicitly set a configuration variable's value:

```
uncrustify --set {{option}}={{value}}
```

- Generate a new configuration file:

```
uncrustify --update-config -o {{path/to/new.cfg}}
```

unexpand

Convert spaces to tabs.

More information: https://www.gnu.org/software/coreutils/manual/html_node/unexpand-invocation.html.

- Convert blanks in each file to tabs, writing to `stdout`:

```
unexpand {{path/to/file}}
```

- Convert blanks to tabs, reading from `stdout`:

```
unexpand
```

- Convert all blanks, instead of just initial blanks:

```
unexpand {{[-a|--all]}} {{path/to/file}}
```

- Convert only leading sequences of blanks (overrides -a):

```
unexpand --first-only {{path/to/file}}
```

- Have tabs a certain number of characters apart, not 8 (enables -a):

```
unexpand {{[-t|--tabs]}} {{number}} {{path/to/file}}
```

unflatten

Adjust directed graphs to improve the layout aspect ratio.

Graphviz filters: **`acyclic`**, **`bcomps`**, **`comps`**, **`edgepaint`**, **`gvcolor`**, **`gvpack`**, **`mingle`**, **`nop`**, **`sccmap`**, **`tred`**, and **`unflatten`**.

More information: https://www.graphviz.org/pdf/unflatten.1.pdf.

- Adjust one or more directed graphs to improve the layout aspect ratio:

```
unflatten {{path/to/input1.gv path/to/input2.gv ...}} > {{path/to/output.gv}}
```

- Use `unflatten` as a preprocessor for `dot` layout to improve aspect ratio:

```
unflatten {{path/to/input.gv}} | dot -T {{png}} {{path/to/output.png}}
```

- Display help:

```
unflatten -?
```

unfunction

This command is an alias of **`unhash -f`**.

- View documentation for the original command:

  `tldr unhash`

unhash

Remove hashed executable locations.

See also: **hash**.

More information: https://zsh.sourceforge.io/Doc/Release/Shell-Builtin-Commands.html.

- Remove a specific command from the hash table:

```
unhash {{command}}
```

- Unhash non-suffix [a]liases:

```
unhash -a {{alias}}
```

- Unhash [s]uffix aliases:

```
unhash -s {{alias}}
```

- Unhash shell [f]unctions:

```
unhash -f {{function}}
```

- Unhash [d]irectories:

```
unhash -d {{directory}}
```

- Unhash every function that [m]atches a pattern:

```
unhash -f -m "{{pattern}}"
```

unimatrix

Simulate the Matrix look with Unicode characters.

See also: **`cmatrix`**.

More information: https://github.com/will8211/unimatrix.

- Mimic the default output of `cmatrix` (no unicode, works in a TTY):

```
unimatrix --no-bold --speed {{96}} --character-list {{o}}
```

- Display characters without bold, slowly, with emojis, numbers, and a few symbols:

```
unimatrix --no-bold --speed {{50}} --character-list {{ens}}
```

- Change the color of characters:

```
unimatrix --color {{red|green|blue|white|...}}
```

- Select character set(s) using letter codes (see `unimatrix --help` for available character sets):

```
unimatrix --character-list {{character_sets}}
```

- Change the scrolling speed:

```
unimatrix --speed {{number}}
```

uniq

Output the unique lines from an input or file.

Since it does not detect repeated lines unless they are adjacent, we need to sort them first.

See also: **sort**.

More information: https://www.gnu.org/software/coreutils/manual/html_node/uniq-invocation.html.

- Display each line once:

```
sort {{path/to/file}} | uniq
```

- Display only unique lines:

```
sort {{path/to/file}} | uniq {{[-u|--unique]}}
```

- Display only duplicate lines:

```
sort {{path/to/file}} | uniq {{[-d|--repeated]}}
```

- Display each line once without case sensitivity:

```
sort {{path/to/file}} | uniq {{[-i|--ignore-case]}}
```

- Display number of occurrences of each line along with that line:

```
sort {{path/to/file}} | uniq {{[-c|--count]}}
```

- Display number of occurrences of each line, sorted by the most frequent:

```
sort {{path/to/file}} | uniq {{[-c|--count]}} | sort {{[-nr|--numeric-sort --reverse]}}
```

- Compare only the first 10 characters on each line for uniqueness:

```
sort {{path/to/file}} | uniq {{[-w|--check-chars]}} 10
```

- Compare text after the first 5 characters on each line for uniqueness:

```
sort {{path/to/file}} | uniq {{[-s|--skip-chars]}} 5
```

unison

Bidirectional file synchronization tool.

More information: https://github.com/bcpierce00/unison.

- Sync two directories (creates log first time these two directories are synchronized):

```
unison {{path/to/directory_1}} {{path/to/directory_2}}
```

- Automatically accept the (non-conflicting) defaults:

```
unison {{path/to/directory_1}} {{path/to/directory_2}} -auto
```

- Ignore some files using a pattern:

```
unison {{path/to/directory_1}} {{path/to/directory_2}} -
ignore {{pattern}}
```

- View documentation:

```
unison -doc {{topics}}
```

units

Convert between two units of measure.

More information: https://www.gnu.org/software/units/manual/units.html.

- Run in interactive mode:

```
units
```

- List all units containing a specific string in interactive mode:

```
search {{string}}
```

- Show the conversion between two simple units:

```
units {{quarts}} {{tablespoons}}
```

- Convert between units with quantities:

```
units "{{15 pounds}}" {{kilograms}}
```

- Show the conversion between two compound units:

```
units "{{meters / second}}" "{{inches / hour}}"
```

- Show the conversion between units with different dimensions:

```
units "{{acres}}" "{{ft^2}}"
```

- Show the conversion of byte multipliers:

```
units "{{15 megabytes}}" {{bytes}}
```

unity

A tool for installing and managing Unity Editors, projects, and modules.

More information: https://docs.unity.com/en-us/unity-cli/unity-cli-reference.

- Install a specific version of the Unity Editor:

```
unity {{[i|install]}} "{{unity_version}}"
```

- Log in to your Unity account:

```
unity {{[a|auth]}} login
```

- Install modules interactively:

```
unity {{[im|install-modules]}}
```

- Create a new Universal Render Pipeline 2D project:

```
unity {{[p|projects]}} new "{{project_name}}" --template
com.unity.template.universal-2d --path "{{path/to/
parent_directory}}"
```

- Open an existing project:

```
unity open "{{path/to/project_directory}}"
```

unlink

Remove a link to a file from the filesystem.

The file contents is lost if the link is the last one to the file.

More information: https://www.gnu.org/software/coreutils/manual/html_node/unlink-invocation.html.

- Remove the specified file if it is the last link:

```
unlink {{path/to/file}}
```

unlzma

This command is an alias of **`xz --format lzma --decompress`**.

- View documentation for the original command:

```
tldr xz
```

unp

Extract any archive.

Relevant extractors need to be installed, e.g. **`unrar`** for RAR.

More information: https://manned.org/unp.

- Extract an archive:

```
unp {{path/to/archive.zip}}
```

- Extract multiple archives:

```
unp {{path/to/archive1.tar.gz}} {{path/to/archive2.rar}}
```

unrar

Extract RAR archives.

More information: https://manned.org/unrar.

- Extract files with original directory structure:

```
unrar x {{compressed.rar}}
```

- Extract files to a specified path with the original directory structure:

```
unrar x {{compressed.rar}} {{path/to/extract}}
```

- Extract files into current directory, losing directory structure in the archive:

```
unrar e {{compressed.rar}}
```

- Test integrity of each file inside the archive file:

```
unrar t {{compressed.rar}}
```

- List files inside the archive file without decompressing it:

```
unrar l {{compressed.rar}}
```

unset

Remove shell variables or functions.

More information: https://www.gnu.org/software/bash/manual/bash.html#index-unset.

- Remove variable, or if the variable doesn't exist, remove the function of the same name:

```
unset {{variable}}
```

- Remove variables:

```
unset -v {{variable1 variable2 ...}}
```

- Remove the function:

```
unset -f {{function_name1 function_name2}}
```

unsetopt

Unset options for the Z shell (**zsh**).

Note: Zsh options are case-insensitive and underscores are ignored.

See also: **setopt**.

More information: https://zsh.sourceforge.io/Doc/Release/Options.html.

- List all currently unset options (use `setopt` to list set options):

```
unsetopt
```

- Unset a specific option:

```
unsetopt {{option_name}}
```

- Unset multiple options at once:

```
unsetopt {{option_name1 option_name2 ...}}
```

until

Simple shell loop that repeats until it receives zero as return value.

More information: https://www.gnu.org/software/bash/manual/bash.html#index-until.

- Execute a command until it succeeds:

```
until {{command}}; do :; done
```

- Try to connect to an SSH host until gracefully disconnected:

```
until ssh {{username}}@{{host}}; do sleep {{2}}; done
```

- Wait for a systemd service to be active:

```
until systemctl is-active {{[-q|--quiet]}} {{nginx}}; do
{{echo "Waiting..."}}; sleep 1; done; {{echo "Launched!"}}
```

unxz

This command is an alias of **`xz --decompress`**.

- View documentation for the original command:

  ```
  tldr xz
  ```

unzip

Extract files/directories from Zip archives.

See also: **`zip`**.

More information: https://manned.org/unzip.

- Extract all files/directories from specific archives into the current directory:

```
unzip {{path/to/archive1.zip path/to/archive2.zip ...}}
```

- Extract files/directories from archives to a specific path:

```
unzip {{path/to/archive1.zip path/to/archive2.zip ...}} -d
{{path/to/output}}
```

- Extract files/directories from archives to `stdout` alongside the extracted file names:

```
unzip -c {{path/to/archive1.zip path/to/archive2.zip ...}}
```

- Extract an archive created on Windows, containing files with non-ASCII (e.g. Chinese or Japanese characters) filenames:

```
unzip -O {{gbk}} {{path/to/archive1.zip path/to/
archive2.zip ...}}
```

- List the contents of a specific archive without extracting them:

```
unzip -l {{path/to/archive}}.zip
```

- Extract specific files from an archive:

```
unzip -j {{path/to/archive}}.zip {{path/to/file1_in_archive
path/to/file2_in_archive ...}}
```

unzstd

This command is an alias of **`zstd --decompress`**.

- View documentation for the original command:

  `tldr zstd`

updog

A replacement for Python's SimpleHTTPServer.

It allows uploading and downloading via HTTP/S, can set ad hoc SSL certificates, and use HTTP basic auth.

More information: https://github.com/sc0tfree/updog.

- Start a HTTP server for the current directory:

  ```
  updog
  ```

- Start a HTTP server for a specified directory:

  ```
  updog --directory /{{path/to/directory}}
  ```

- Start a HTTP server on a specified port:

  ```
  updog --port {{port}}
  ```

- Start a HTTP server with a password (To log in, leave the username blank and enter the password in the password field):

  ```
  updog --password {{password}}
  ```

- Enable transport encryption via SSL:

  ```
  updog --ssl
  ```

upt

Unified interface for managing packages across various operating systems, like Windows, many Linux distributions, macOS, FreeBSD, and even Haiku.

It requires the native OS package manager to be installed.

See also: **`flatpak`**, **`brew`**, **`scoop`**, **`apt`**, **`dnf`**.

More information: https://github.com/sigoden/upt.

- Update the list of available packages:

```
upt update
```

- Search for a given package:

```
upt search {{search_term}}
```

- Show information for a package:

```
upt info {{package}}
```

- Install a given package:

```
upt install {{package}}
```

- Remove a given package:

```
upt {{remove|uninstall}} {{package}}
```

- Upgrade all installed packages:

```
upt upgrade
```

- Upgrade a given package:

```
upt upgrade {{package}}
```

- List installed packages:

```
upt list
```

uptime

Tell how long the system has been running and other information.

More information: https://www.gnu.org/software/coreutils/manual/html_node/uptime-invocation.html.

- Print current time, uptime, number of logged-in users, and other information:

```
uptime
```

- Show only the amount of time the system has been booted for:

```
uptime {{[-p|--pretty]}}
```

- Print the date and time the system booted up at:

```
uptime {{[-s|--since]}}
```

- Display the time data in seconds:

```
uptime {{[-r|--raw]}}
```

- Display version:

```
uptime {{[-V|--version]}}
```

upx

Compress or decompress executables.

More information: https://github.com/upx/upx/blob/devel/doc/upx.pod.

- Compress executable:

```
upx {{path/to/file}}
```

- Decompress executable:

```
upx -d {{path/to/file}}
```

- Display help:

```
upx --help
```

users

Display a list of logged in users.

See also: **`who`**, **`w`**, **`useradd`**, **`userdel`**, **`usermod`**.

More information: https://www.gnu.org/software/coreutils/manual/html_node/users-invocation.html.

- Print logged in usernames:

```
users
```

- Print logged in usernames according to a given file:

```
users {{/var/log/wmtp}}
```

usleep

Delay execution for a specific interval in microseconds.

Note: This command is deprecated, use **`nanosleep`** instead.

See also: **`sleep`**.

More information: https://manned.org/usleep.1.

- Delay in microseconds:

```
usleep {{microseconds}}
```

- Execute a specific command after a 500,000 microseconds delay:

```
usleep 500000 && {{command}}
```

usql

Universal CLI interface for SQL databases.

More information: https://github.com/xo/usql#using.

- Connect to a specific database:

```
usql {{sqlserver|mysql|postgres|sqlite3|...}}://{{username}}:{{password}}@{{host}}:{{port}}/{{database_name}}
```

- Execute commands from a file:

```
usql {{[-f|--file]}} {{path/to/query.sql}}
```

- Execute a specific SQL command:

```
usql {{[-c|--command]}} "{{sql_command}}"
```

- [Interactive] Run an SQL command in the `usql` prompt:

```
{{command}}
```

- [Interactive] Display the database schema:

```
\d
```

- [Interactive] Export query results to a specific file:

```
\g {{path/to/file_with_results}}
```

- [Interactive] Import data from a CSV file into a specific table:

```
\copy {{path/to/data.csv}} {{table_name}}
```

uudecode

Decode files encoded by **uuencode**.

More information: https://manned.org/uudecode.

- Decode a file that was encoded with `uuencode` and print the result to `stdout`:

  `uudecode {{path/to/encoded_file}}`

- Decode a file that was encoded with `uuencode` and write the result to a file:

  `uudecode -o {{path/to/decoded_file}} {{path/to/encoded_file}}`

uuencode

Encode binary files into ASCII for transport via mediums that only support simple ASCII encoding.

More information: https://manned.org/uuencode.

- Encode a file and print the result to `stdout`:

```
uuencode {{path/to/input_file}}
{{output_file_name_after_decoding}}
```

- Encode a file and write the result to a file:

```
uuencode -o {{path/to/output_file}} {{path/to/input_file}}
{{output_file_name_after_decoding}}
```

- Encode a file using Base64 instead of the default uuencode encoding and write the result to a file:

```
uuencode {{[-m|--base64]}} -o {{path/to/output_file}} {{path/
to/input_file}} {{output_file_name_after_decoding}}
```

uv add

Add package dependencies to the **`pyproject.toml`** file.

Packages are specified according to https://peps.python.org/pep-0508/.

More information: https://docs.astral.sh/uv/reference/cli/#uv-add.

- Add the latest version of a package:

  ```
  uv add {{package}}
  ```

- Add multiple packages:

  ```
  uv add {{package1 package2 ...}}
  ```

- Add a package with a version requirement:

  ```
  uv add {{package>=1.2.3}}
  ```

- Add packages to an optional dependency group, which will be included when published:

  ```
  uv add --optional {{optional}} {{package1 package2 ...}}
  ```

- Add packages to a local group, which will not be included when published:

  ```
  uv add --group {{group}} {{package1 package2 ...}}
  ```

- Add packages to the dev group, shorthand for `--group dev`:

  ```
  uv add --dev {{package1 package2 ...}}
  ```

- Add package as editable:

  ```
  uv add --editable {{path/to/package}}/
  ```

- Enable an extra when installing package, may be provided multiple times:

  ```
  uv add {{package}} --extra {{extra_feature}}
  ```

uv build

Build Python packages into source distributions and wheels.

More information: https://docs.astral.sh/uv/reference/cli/#uv-build.

- Build a package in the current directory:

```
uv build
```

- Build a package from a specific directory:

```
uv build {{path/to/directory}}
```

- Build only a wheel (skip source distribution):

```
uv build --wheel
```

- Build only a source distribution (skip wheel):

```
uv build --sdist
```

- Build and output to a specific directory:

```
uv build {{[-o|--out-dir]}} {{path/to/output}}
```

- Build a specific package in a workspace:

```
uv build --package {{package_name}}
```

- Build all packages in the workspace:

```
uv build {{[--all|--all-packages]}}
```

- Build with a specific Python interpreter:

```
uv build {{[-p|--python]}} {{python3.11}}
```

uv cache

Manage **uv**'s global cache directory.

More information: https://docs.astral.sh/uv/reference/cli/#uv-cache.

- Show the cache directory path:

```
uv cache dir
```

- Clean the entire cache (removes all cached packages and environments):

```
uv cache clean
```

- Clean the cache for specific packages:

```
uv cache clean {{package1 package2 ...}}
```

- Prune all unreachable objects from the cache:

```
uv cache prune
```

- Prune cache optimized for CI environments like GitHub Actions:

```
uv cache prune --ci
```

- Use a specific cache directory:

```
uv cache clean --cache-dir {{path/to/cache}}
```

- Clean cache with verbose output:

```
uv cache clean {{[-v|--verbose]}}
```

uv export

Export the project's lockfile to an alternate format.

More information: https://docs.astral.sh/uv/reference/cli/#uv-export.

- Export dependencies to a `requirements.txt` file:

```
uv export --format requirements-txt {{[-o|--output-file]}} {{requirements.txt}}
```

- Export dependencies to `pylock.toml` format:

```
uv export --format pylock.toml
```

- Export only production dependencies (exclude dev dependencies):

```
uv export --no-dev
```

- Export including a specific optional dependency group:

```
uv export --extra {{group_name}}
```

- Export including all optional dependencies:

```
uv export --all-extras
```

- Export including a specific dependency group:

```
uv export --group {{group_name}}
```

- Export without hashes:

```
uv export --no-hashes
```

- Export dependencies for a specific package in the workspace:

```
uv export --package {{package_name}}
```

uv help

Display detailed documentation for **uv** commands.

More information: https://docs.astral.sh/uv/reference/cli/#uv-help.

- Display general help for uv:

```
uv help
```

- Display help for a specific command:

```
uv help {{command}}
```

- Display help for a subcommand:

```
uv help {{command}} {{subcommand}}
```

- Display help without using a pager:

```
uv help --no-pager {{command}}
```

uv init

Create a new Python project.

More information: https://docs.astral.sh/uv/reference/cli/#uv-init.

- Initialize a project in the current directory:

```
uv init
```

- Initialize a project with a certain name:

```
uv init {{project_name}}
```

- Create a project in a given directory:

```
uv init --directory {{path/to/directory}} {{project_name}}
```

- Create a project for a Python library:

```
uv init {{[--lib|--library]}} {{project_name}}
```

- Specify the build system:

```
uv init --build-backend {{build_backend}} {{project_name}}
```

- Only create a `pyproject.toml`:

```
uv init --bare {{project_name}}
```

- Set the project description:

```
uv init --description "{{description}}" {{project_name}}
```

uv lock

Update the project's lockfile.

More information: https://docs.astral.sh/uv/reference/cli/#uv-lock.

- Create or update the project's lockfile:

```
uv lock
```

- Check if the lockfile is up-to-date without updating it:

```
uv lock --check
```

- Assert that a lockfile exists without checking if it's current:

```
uv lock --check-exists
```

- Simulate locking, showing what would be locked without writing the lockfile:

```
uv lock --dry-run
```

- Lock a specific Python script instead of the current project:

```
uv lock --script {{path/to/script.py}}
```

- Upgrade all packages to their latest compatible versions:

```
uv lock --upgrade
```

- Upgrade only specific packages:

```
uv lock --upgrade-package {{package1}} --upgrade-package
{{package2}}
```

uv pip

Provide pip-like commands for installing, uninstalling, and managing packages.

More information: https://docs.astral.sh/uv/reference/cli/#uv-pip.

- Install a package:

```
uv pip install {{package}}
```

- Install packages from a requirements file:

```
uv pip install {{[-r|--requirements]}} {{requirements.txt}}
```

- Install a package with a specific version:

```
uv pip install {{package==1.2.3}}
```

- Uninstall a package:

```
uv pip uninstall {{package}}
```

- Lock dependencies from `pyproject.toml` to `requirements.txt`:

```
uv pip compile pyproject.toml {{[-o|--output-file]}}
requirements.txt
```

- List installed packages:

```
uv pip list
```

- Show information about an installed package:

```
uv pip show {{package}}
```

- Sync environment with a requirements file (install/uninstall to match exactly):

```
uv pip sync {{requirements.txt}}
```

uv publish

Upload distributions to an index.

More information: https://docs.astral.sh/uv/reference/cli/#uv-publish.

- Publish packages from `dist/` directory (default behavior):

```
uv publish
```

- Publish to a specific repository URL:

```
uv publish --publish-url {{https://upload.pypi.org/legacy/}}
```

- Publish using a specific username and password:

```
uv publish {{[-u|--username]}} {{username}} {{[-p|--
password]}} {{password}}
```

- Publish using an API token:

```
uv publish {{[-t|--token]}} {{your_api_token}}
```

- Publish specific distribution files:

```
uv publish {{path/to/dist/*.whl}} {{path/to/dist/*.tar.gz}}
```

- Publish to TestPyPI for testing:

```
uv publish --publish-url https://test.pypi.org/legacy/
```

uv python

Manage Python versions and installations.

More information: https://docs.astral.sh/uv/reference/cli/#uv-python.

- List all available Python installations:

```
uv python list
```

- Install a Python version:

```
uv python install {{version}}
```

- Uninstall a Python version:

```
uv python uninstall {{version}}
```

- Search for a Python installation:

```
uv python find {{version}}
```

- Pin the current project to use a specific Python version:

```
uv python pin {{version}}
```

- Show the uv Python installation directory:

```
uv python dir
```

uv remove

Remove dependencies from the project's **`pyproject.toml`** file.

More information: https://docs.astral.sh/uv/reference/cli/#uv-remove.

- Remove a dependency from the project:

  ```
  uv remove {{package}}
  ```

- Remove multiple dependencies:

  ```
  uv remove {{package1 package2 ...}}
  ```

- Remove a development dependency:

  ```
  uv remove --dev {{package}}
  ```

- Remove a dependency from an optional dependency group:

  ```
  uv remove --optional {{extra_name}} {{package}}
  ```

- Remove a dependency from a specific dependency group:

  ```
  uv remove --group {{group_name}} {{package}}
  ```

- Remove without syncing the virtual environment:

  ```
  uv remove --no-sync {{package}}
  ```

uv run

Run a command or script in the project environment.

More information: https://docs.astral.sh/uv/reference/cli/#uv-run.

- Run a Python script:

```
uv run {{path/to/script.py}}
```

- Run a Python module:

```
uv run {{[-m|--module]}} {{module_name}}
```

- Run a command with additional packages installed temporarily:

```
uv run {{[-w|--with]}} {{package}} {{command}}
```

- Run a script with packages from a requirements file:

```
uv run --with-requirements {{path/to/requirements.txt}}
{{path/to/script.py}}
```

- Run in an isolated environment (no project dependencies):

```
uv run --isolated {{path/to/script.py}}
```

- Run without syncing the environment first:

```
uv run --no-sync {{command}}
```

uv self

Manage the **uv** executable itself.

More information: https://docs.astral.sh/uv/reference/cli/#uv-self.

- Update uv to the latest version:

```
uv self update
```

- Update uv to a specific version:

```
uv self update {{0.4.0}}
```

- Simulate an update, checking for available uv updates without installing them:

```
uv self update --dry-run
```

- Update uv with verbose output:

```
uv self update {{[-v|--verbose]}}
```

- Display the current uv version:

```
uv self version
```

- Display only the version number:

```
uv self version --short
```

- Display version information in JSON format:

```
uv self version --output-format json
```

uv sync

Update the project's environment to match the lockfile.

More information: https://docs.astral.sh/uv/reference/cli/#uv-sync.

- Sync the project environment with the lockfile:

  ```
  uv sync
  ```

- Sync and include all optional dependencies:

  ```
  uv sync --all-extras
  ```

- Sync with specific optional dependencies:

  ```
  uv sync --extra {{extra_name}}
  ```

- Sync only development dependencies:

  ```
  uv sync --only-dev
  ```

- Sync excluding development dependencies:

  ```
  uv sync --no-dev
  ```

- Sync specific dependency groups:

  ```
  uv sync --group {{group_name}}
  ```

- Check if environment is already synchronized (no changes):

  ```
  uv sync --check
  ```

- Simulate syncing, showing what would be synced without making changes:

  ```
  uv sync --dry-run
  ```

uv tool

Install and run commands provided by Python packages.

More information: https://docs.astral.sh/uv/reference/cli/#uv-tool.

- Run a command from a package, without installing it:

  ```
  uv tool run {{command}}
  ```

- Install a Python package system-wide:

  ```
  uv tool install {{package}}
  ```

- Install from a specific git repo on a specific tag:

  ```
  uv tool install "git+{{repo_url}}@{{v1.2.3}}"
  ```

- Upgrade an installed Python package:

  ```
  uv tool upgrade {{package}}
  ```

- Uninstall a Python package:

  ```
  uv tool uninstall {{package}}
  ```

- List Python packages installed system-wide:

  ```
  uv tool list
  ```

uv tree

Display project dependencies in a tree format.

More information: https://docs.astral.sh/uv/reference/cli/#uv-tree.

- Show dependency tree for current environment:

```
uv tree
```

- Show dependency tree for all environments:

```
uv tree --universal
```

- Show dependency tree up to a certain depth:

```
uv tree {{[-d|--depth]}} {{n}}
```

- Show the latest available version for all outdated packages:

```
uv tree --outdated
```

- Exclude dependencies from the dev group:

```
uv tree --no-dev
```

- Show the inverted tree, so children are dependents instead of dependencies:

```
uv tree --invert
```

uv venv

Create an isolated Python environment for installing packages.

More information: https://docs.astral.sh/uv/reference/cli/#uv-venv.

- Create a virtual environment in the default location (`.venv`):

  ```
  uv venv
  ```

- Create a virtual environment at a specific path:

  ```
  uv venv {{path/to/venv}}
  ```

- Create using a specific Python version:

  ```
  uv venv {{[-p|--python]}} {{3.12}}
  ```

- Include seed packages such as `pip` when creating the virtual environment:

  ```
  uv venv --seed
  ```

- Create with a custom prompt prefix:

  ```
  uv venv --prompt {{my_project}}
  ```

- Create and allow overwriting existing environment:

  ```
  uv venv --allow-existing {{venv_name}}
  ```

uv version

Read or update a project's version.

More information: https://docs.astral.sh/uv/reference/cli/#uv-version.

- Display the current project version:

```
uv version
```

- Set the project version to a specific value:

```
uv version {{1.2.3}}
```

- Bump the project version using semantic versioning:

```
uv version --bump {{major|minor|patch}}
```

- Simulate a version bump without writing to `pyproject.toml`:

```
uv version --bump {{patch}} --dry-run
```

- Update version for a specific package in a workspace:

```
uv version --package {{package_name}} {{1.2.3}}
```

- Display version in JSON format:

```
uv version --output-format json
```

uv

A fast Python package and project manager.

Some subcommands such as **`tool`**, **`python`**, etc. have their own usage documentation.

More information: https://docs.astral.sh/uv/reference/cli/.

- Create a new Python project in the current directory:

  `uv init`

- Create a new Python project at the specified path:

  `uv init {{path/to/directory}}`

- Add a new dependency to the project:

  `uv add {{package}}`

- Remove a dependency from the project:

  `uv remove {{package}}`

- Run a script or a command in the project's environment:

  `uv run {{path/to/script.py|command}}`

- Update a project's environment from `pyproject.toml`:

  `uv sync`

- Create a lock file for the project's dependencies:

  `uv lock`

- Build the project into source and binary distributions:

  `uv build`

uvicorn

Python ASGI HTTP Server, for asynchronous projects.

More information: https://www.uvicorn.org/settings/.

- Run Python web app:

```
uvicorn {{import.path:app_object}}
```

- Listen on port 8080 on localhost:

```
uvicorn --host {{localhost}} --port {{8080}}
{{import.path:app_object}}
```

- Turn on live reload:

```
uvicorn --reload {{import.path:app_object}}
```

- Use 4 worker processes for handling requests:

```
uvicorn --workers {{4}} {{import.path:app_object}}
```

- Run app over HTTPS:

```
uvicorn --ssl-certfile {{cert.pem}} --ssl-keyfile {{key.pem}}
{{import.path:app_object}}
```

uvx

This command is an alias of **`uv tool run`**.

- View documentation for the original command:

  ```
  tldr uv tool
  ```

V

A tool for managing V source code.

More information: https://docs.vlang.io/getting-started.html.

- Compile a file and output its executable:

```
v {{path/to/file.v}}
```

- Compile the current project or directory:

```
v .
```

- Compile a file and run it:

```
v run {{path/to/file.v}}
```

- Compile a file and run it, output its executable:

```
v crun {{path/to/file.v}}
```

- Re-compile on every modification to a file:

```
v watch {{path/to/file.v}}
```

- Re-run on every modification to a file:

```
v watch run {{path/to/file.v}}
```

- Open the v repl:

```
v repl
```

- Format a file and [w]rite to it:

```
v fmt -w {{path/to/file.v}}
```

vacuumdb

Garbage-collect and analyze a PostgreSQL database.

More information: https://www.postgresql.org/docs/current/app-vacuumdb.html.

- Vacuum a specific database:

```
vacuumdb {{database_name}}
```

- Vacuum all databases:

```
vacuumdb {{[-a|--all]}}
```

- Vacuum a specific table in a database:

```
vacuumdb {{[-t|--table]}} {{table_name}} {{database_name}}
```

- Vacuum and update statistics for the query planner:

```
vacuumdb {{[-z|--analyze]}} {{database_name}}
```

- Perform a full vacuum (more aggressive, locks tables, rewrites the whole table):

```
vacuumdb {{[-f|--full]}} {{database_name}}
```

- Vacuum with verbose output:

```
vacuumdb {{[-v|--verbose]}} {{database_name}}
```

- Vacuum a database using multiple parallel jobs:

```
vacuumdb --jobs {{number_of_jobs}} {{database_name}}
```

vagrant box

Manage Vagrant boxes (virtual machine images).

More information: https://developer.hashicorp.com/vagrant/docs/cli/box.

- List all installed boxes:

```
vagrant box list
```

- Add a new box:

```
vagrant box add {{hashicorp/bionic64}}
```

- Add a box from a custom URL:

```
vagrant box add {{my-box}} {{https://example.com/my-box.box}}
```

- Remove an installed box:

```
vagrant box remove {{hashicorp/bionic64}}
```

- Update all boxes that are in use in the current Vagrant environment:

```
vagrant box update
```

- Update a specific box:

```
vagrant box update --box {{bento/debian-12}}
```

- Check if there is a new version available for the box that you are using:

```
vagrant box outdated
```

- Clean up old versions of installed boxes:

```
vagrant box prune
```

vagrant destroy

Stop a guest machine and destroy all its resources.

Any boxes installed are kept intact.

More information: https://developer.hashicorp.com/vagrant/docs/cli/destroy.

- Destroy the currently running machine:

  ```
  vagrant destroy
  ```

- Target a machine by name or ID:

  ```
  vagrant destroy {{name|id}}
  ```

- Do not ask for confirmation before destroying:

  ```
  vagrant destroy {{[-f|--force]}}
  ```

- Shut down the machine gracefully:

  ```
  vagrant destroy {{[-g|--graceful]}}
  ```

vagrant global-status

Display the state of all Vagrant machines on the system.

The info is based on a cache, which may become stale and require pruning.

See also: **`vagrant status`**.

More information: https://developer.hashicorp.com/vagrant/docs/cli/global-status.

- Display the state of all machines:

```
vagrant global-status
```

- Prune any stale entries from the output:

```
vagrant global-status --prune
```

vagrant halt

Shut down the running machine Vagrant is managing.

See also: **`vagrant box`**, **`vagrant plugin`**, **`vagrant validate`**.

More information: https://developer.hashicorp.com/vagrant/docs/cli/halt.

- Halt the currently running Vagrant machine gracefully:

  ```
  vagrant halt
  ```

- Halt a specific machine by its ID or name gracefully:

  ```
  vagrant halt {{id_or_name}}
  ```

- Forcefully halt the current running machine(s) (This can affect multiple running machines if they are part of the same Vagrant environment):

  ```
  vagrant halt {{[-f|--force]}}
  ```

- Forcefully halt a specific machine by its ID or name:

  ```
  vagrant halt {{[-f|--force]}} {{id_or_name}}
  ```

vagrant init

Initialize a Vagrant environment in the current directory by creating a **`Vagrantfile`**.

More information: https://developer.hashicorp.com/vagrant/docs/cli/init.

- Create a `Vagrantfile`:

  ```
  vagrant init
  ```

- Create a `Vagrantfile` without instructional comments:

  ```
  vagrant init {{[-m|--minimal]}}
  ```

- Specify the box name and URL:

  ```
  vagrant init {{box_name}} {{box_url}}
  ```

- Create a `Vagrantfile` with a specific box version:

  ```
  vagrant init --box-version {{version}} {{box_name}}
  ```

- Send the `Vagrantfile` to `stdout`:

  ```
  vagrant init {{[-o|--output]}} -
  ```

- Overwrite an existing `Vagrantfile`:

  ```
  vagrant init {{[-f|--force]}}
  ```

- Provide a custom ERB template for generating the `Vagrantfile`:

  ```
  vagrant init --template {{path/to/file.erb}}
  ```

vagrant plugin

Manage Vagrant plugins.

More information: https://developer.hashicorp.com/vagrant/docs/cli/plugin.

- List all the plugins currently installed:

```
vagrant plugin list
```

- Install a plugin from remote repositories, usually RubyGems:

```
vagrant plugin install {{vagrant_vbguest}}
```

- Install a plugin from a local file source:

```
vagrant plugin install {{path/to/my_plugin.gem}}
```

- Update all installed plugins to their latest version:

```
vagrant plugin update
```

- Update a plugin to the latest version:

```
vagrant plugin update {{vagrant_vbguest}}
```

- Uninstall a specific plugin:

```
vagrant plugin uninstall {{vagrant_vbguest}}
```

vagrant port

List mappings between guest and host ports.

More information: https://developer.hashicorp.com/vagrant/docs/cli/port.

- List all port mappings of machine(s) running in the current directory:

```
vagrant port
```

- List mappings for a specific machine (if `Vagrantfile` is multi-machine):

```
vagrant port {{machine_name}}
```

- Display info for a specific guest port:

```
vagrant port --guest {{port_number}}
```

- Display machine-readable output:

```
vagrant port --machine-readable
```

vagrant reload

Equivalent of running **`halt`** followed by **`up`**.

A reload is usually required for changes in a Vagrantfile to take effect.

More information: https://developer.hashicorp.com/vagrant/docs/cli/reload.

- Reload the currently running machine:

  ```
  vagrant reload
  ```

- Target a machine by name or ID:

  ```
  vagrant reload {{name|id}}
  ```

- Force the provisioners to run:

  ```
  vagrant reload --provision
  ```

vagrant resume

Resume a Vagrant managed machine that was previously suspended.

More information: https://developer.hashicorp.com/vagrant/docs/cli/resume.

- Resume machine specified by name or id:

```
vagrant resume {{name|id}}
```

- Resume and run all configured provisioners:

```
vagrant resume {{name|id}} --provision
```

- Resume and specify which provisioners to re-run:

```
vagrant resume {{name|id}} --provision-with {{provisioner}}
```

vagrant snapshot

Manage snapshots of Vagrant machines.

More information: https://developer.hashicorp.com/vagrant/docs/cli/snapshot.

- Take a snapshot of the machine (running or stopped):

```
vagrant snapshot save {{snapshot_name}}
```

- Restore a snapshot and start the machine:

```
vagrant snapshot restore {{snapshot_name}}
```

- Restore a snapshot without starting the machine:

```
vagrant snapshot restore --no-start {{snapshot_name}}
```

- Delete a snapshot:

```
vagrant snapshot delete {{snapshot_name}}
```

- List available snapshots of the machine:

```
vagrant snapshot list
```

vagrant ssh-config

Display configuration to SSH into a Vagrant machine manually (instead of using **`vagrant ssh`**).

More information: https://developer.hashicorp.com/vagrant/docs/cli/ssh_config.

- Get SSH configuration for the machine running in the current directory:

```
vagrant ssh-config
```

- Target a machine by name or ID:

```
vagrant ssh-config {{name|id}}
```

vagrant ssh

SSH into a running Vagrant machine.

More information: https://developer.hashicorp.com/vagrant/docs/cli/ssh.

- SSH into the machine running in the current directory:

```
vagrant ssh
```

- Target a running machine by name or ID:

```
vagrant ssh {{name|id}}
```

- Execute an SSH command and exit:

```
vagrant ssh {{[-c|--command]}} {{ssh_command}}
```

- SSH without authentication, leaving authentication up to the user:

```
vagrant ssh {{[-p|--plain]}}
```

vagrant status

Display the state of machines in the current Vagrant environment.

See also: **`vagrant global-status`**.

More information: https://developer.hashicorp.com/vagrant/docs/cli/status.

- View status of the machines in the current directory:

```
vagrant status
```

- Target a machine by name or ID:

```
vagrant status {{name|id}}
```

vagrant suspend

Save the state of the guest machine rather than fully shutting it down.

More information: https://developer.hashicorp.com/vagrant/docs/cli/suspend.

- Suspend the currently running machine:

```
vagrant suspend
```

- Target a machine by name or ID:

```
vagrant suspend {{name|id}}
```

vagrant upload

Upload files and directories from the host to the guest machine.

More information: https://developer.hashicorp.com/vagrant/docs/cli/upload.

- Upload file or directory from the host to the guest machine:

```
vagrant upload {{path/to/source_file_or_directory}} {{path/
to/destination_file_or_directory}} {{name|id}}
```

- Compress the file or directory before uploading to guest machine:

```
vagrant upload --compress {{path/to/
source_file_or_directory}} {{path/to/
destination_file_or_directory}} {{name|id}}
```

- Specify which type of compression to use. Default type is `zip`:

```
vagrant upload --compression-type {{tgz|zip}} {{path/to/
source_file_or_directory}} {{path/to/
destination_file_or_directory}} {{name|id}}
```

- Create a temporary location on the guest machine and upload files to that location:

```
vagrant upload --temporary {{path/to/
source_file_or_directory}} {{path/to/
destination_file_or_directory}} {{name|id}}
```

vagrant validate

Check the validity of a Vagrantfile.

See also: **`vagrant box`**, **`vagrant plugin`**.

More information: https://developer.hashicorp.com/vagrant/docs/cli/validate.

- Validate the syntax of the Vagrantfile to ensure it is correctly structured and free of errors:

  ```
  vagrant validate
  ```

- Ensure that the Vagrantfile is correctly structured while ignoring provider-specific configuration options:

  ```
  vagrant validate {{[-p|--ignore-provider]}} {{docker|hypervlibvirt|parallels|qemu|virtualbox|vmware_desktop}}
  ```

vagrant version

Display Vagrant version information.

Note: Internet access is required for vagrant version to check the latest available version.

More information: https://developer.hashicorp.com/vagrant/docs/cli/version.

- Display the currently installed version and latest version of Vagrant that is currently available:

  ```
  vagrant version
  ```

- Display version:

  ```
  vagrant --version
  ```

vagrant

Manage lightweight, reproducible, and portable development environments.

Some subcommands such as **`box`**, **`snapshot`**, **`halt`**, etc. have their own usage documentation.

More information: https://developer.hashicorp.com/vagrant/docs/cli.

- Create a `Vagrantfile` in the current directory with the base Vagrant box:

  ```
  vagrant init
  ```

- Create a `Vagrantfile` with a box from the Vagrant Public Registry:

  ```
  vagrant init {{ubuntu/focal64}}
  ```

- Start and provision the Vagrant environment:

  ```
  vagrant up
  ```

- Suspend the machine:

  ```
  vagrant suspend
  ```

- Halt the machine:

  ```
  vagrant halt
  ```

- Connect to the machine via SSH:

  ```
  vagrant ssh
  ```

- Output the SSH configuration file of the running Vagrant machine:

  ```
  vagrant ssh-config
  ```

- List all local boxes:

  ```
  vagrant box list
  ```

vainfo

Display information from VA API driver.

More information: https://wiki.archlinux.org/title/Hardware_video_acceleration#Verifying_VA-API.

- Show version and supported entrypoints:

```
vainfo
```

- Test a specific display protocol:

```
vainfo --display {{wayland|x11|drm|...}}
```

- Show available display protocols:

```
vainfo --display help
```

- Show all supported entrypoints:

```
vainfo {{[-a|--all]}}
```

- Display help:

```
vainfo --help
```

vala

Vala code runner.

Tutorial: https://wiki.gnome.org/Projects/Vala/Tutorial.

More information: https://docs.vala.dev/index.html.

- Run a vala file, with gtk+:

```
vala {{path/to/file.vala}} --pkg {{gtk+-3.0}}
```

- Display help:

```
vala --help
```

- Display version:

```
vala --version
```

valac

Vala code compiler.

Tutorial: https://wiki.gnome.org/Projects/Vala/Tutorial.

More information: https://docs.vala.dev/tutorials/programming-language/main/07-00-tools/07-01-valac.html.

- Compile a vala file, with gtk+:

```
valac {{path/to/file.vala}} --pkg {{gtk+-3.0}}
```

- Display help:

```
valac --help
```

- Display version:

```
valac --version
```

vale

Extensible style checker that supports multiple markup formats, such as Markdown and AsciiDoc.

More information: https://vale.sh/docs/cli.

- Check the style of a file:

```
vale {{path/to/file}}
```

- Check the style of a file with a specified configuration:

```
vale --config='{{path/to/.vale.ini}}' {{path/to/file}}
```

- Output the results in JSON format:

```
vale --output=JSON {{path/to/file}}
```

- Check style issues at the specific severity and higher:

```
vale --minAlertLevel={{suggestion|warning|error}} {{path/to/file}}
```

- Check the style from `stdin`, specifying markup format:

```
cat {{file.md}} | vale --ext=.md
```

- List the current configuration:

```
vale ls-config
```

valgrind

Wrapper for a set of expert tools for profiling, optimizing, and debugging programs.

Commonly used tools include **`memcheck`**, **`cachegrind`**, **`callgrind`**, **`massif`**, **`helgrind`**, and **`drd`**.

More information: https://valgrind.org/docs/manual/manual-core.html#manual-core.options.

- Use the (default) Memcheck tool to show a diagnostic of memory usage by `program`:

  ```
  valgrind {{program}}
  ```

- Use Memcheck to report all possible memory leaks of `program` in full detail:

  ```
  valgrind --leak-check=full --show-leak-kinds=all {{program}}
  ```

- Use the Cachegrind tool to profile and log CPU cache operations of `program`:

  ```
  valgrind --tool=cachegrind {{program}}
  ```

- Use the Massif tool to profile and log heap memory and stack usage of `program`:

  ```
  valgrind --tool=massif --stacks=yes {{program}}
  ```

valkey-cli

Open a connection to a Valkey server.

More information: https://valkey.io/topics/cli/.

- Connect to the local server:

```
valkey-cli
```

- Connect to a remote server on the default port (6379):

```
valkey-cli -h {{host}}
```

- Connect to a remote server specifying a port number:

```
valkey-cli -h {{host}} -p {{port}}
```

- Connect to a remote server specifying a URI:

```
valkey-cli -u {{uri}}
```

- Specify a password:

```
valkey-cli -a {{password}}
```

- Execute valkey command:

```
valkey-cli {{valkey_command}}
```

- Connect to the local cluster:

```
valkey-cli -c
```

var-dump-server

Symfony dump server.

Collects data dumped by the Symfony VarDumper component.

More information: https://symfony.com/doc/current/components/var_dumper.html#the-dump-server.

- Start the server:

  ```
  var-dump-server
  ```

- Dump the data in an HTML file:

  ```
  var-dump-server --format=html > {{path/to/file.html}}
  ```

- Make the server listen on a specific address and port:

  ```
  var-dump-server --host {{127.0.0.1:9912}}
  ```

varnishlog

Display Varnish logs.

More information: https://vinyl-cache.org/docs/trunk/reference/varnishlog.html.

- Display logs in real time:

```
varnishlog
```

- Only display requests to a specific domain:

```
varnishlog -q 'ReqHeader eq "Host: {{example.com}}"'
```

- Only display POST requests:

```
varnishlog -q 'ReqMethod eq "{{POST}}"'
```

- Only display requests to a specific path:

```
varnishlog -q 'ReqURL eq "/{{path}}"'
```

- Only display requests to paths matching a `regex`:

```
varnishlog -q 'ReqURL ~ "{{regex}}"'
```

vault

Interact with HashiCorp Vault.

More information: https://developer.hashicorp.com/vault/docs/commands.

- Connect to a Vault server and initialize a new encrypted data store:

  ```
  vault init
  ```

- Unseal (unlock) the vault, by providing one of the key shares needed to access the encrypted data store:

  ```
  vault unseal {{key-share-x}}
  ```

- Authenticate the CLI client against the Vault server, using an authentication token:

  ```
  vault auth {{authentication_token}}
  ```

- Store a new secret in the vault, using the generic back-end called "secret":

  ```
  vault write secret/{{hello}} value={{world}}
  ```

- Read a value from the vault, using the generic back-end called "secret":

  ```
  vault read secret/{{hello}}
  ```

- Read a specific field from the value:

  ```
  vault read -field={{field_name}} secret/{{hello}}
  ```

- Seal (lock) the Vault server, by removing the encryption key of the data store from memory:

  ```
  vault seal
  ```

VBoxManage clonevm

Create a clone of an existing virtual machine (VM).

More information: https://www.virtualbox.org/manual/ch08.html#vboxmanage-clonevm.

- Clone the specified VM:

```
VBoxManage clonevm {{vm_name}}
```

- Specify a new name for the new VM:

```
VBoxManage clonevm {{vm_name}} --name {{new_vm_name}}
```

- Indicate the folder where the new VM configuration is saved:

```
VBoxManage clonevm {{vm_name}} --basefolder {{path/to/directory}}
```

- Register the cloned VM in VirtualBox:

```
VBoxManage clonevm {{vm_name}} --register
```

VBoxManage cloud

VirtualBox command-line interface for managing cloud instances and images.

More information: https://www.virtualbox.org/manual/ch08.html#vboxmanage-cloud.

- List the instances in the specified state belonging to the specified compartment:

```
VBoxManage cloud --provider={{provider_name}} --
profile={{profile_name}} list instances --state={{running|
terminated|paused}} --compartment-id={{compartment_id}}
```

- Create a new instance:

```
VBoxManage cloud --provider={{provider_name}} --
profile={{profile_name}} instance create --domain-
name={{domain_name}} --image-id={{image_id}}
```

- Gather information about a particular instance:

```
VBoxManage cloud --provider={{provider_name}} --
profile={{profile_name}} instance info --id={{unique_id}}
```

- Terminate an instance:

```
VBoxManage cloud --provider={{provider_name}} --
profile={{profile_name}} instance terminate --
id={{unique_id}}
```

- List images within a specific compartment and state:

```
VBoxManage cloud --provider={{provider_name}} --
profile={{profile_name}} list images --compartment-
id={{compartment_id}} --state={{state_name}}
```

- Create a new image:

```
VBoxManage cloud --provider={{provider_name}} --
profile={{profile_name}} image create --instance-
id={{instance_id}} --display-name={{display_name}} --
compartment-id={{compartment_id}}
```

- Retrieve information about a particular image:

```
VBoxManage cloud --provider={{provider_name}} --
profile={{profile_name}} image info --id={{unique_id}}
```

- Delete an image:

```
VBoxManage cloud --provider={{provider_name}} --
profile={{profile_name}} image delete --id={{unique_id}}
```

VBoxManage controlvm

Change the state and the settings of a currently running virtual machine.

More information: https://www.virtualbox.org/manual/ch08.html#vboxmanage-controlvm.

- Temporarily stop the execution of a virtual machine:

```
VBoxManage controlvm {{uuid|vm_name}} pause
```

- Resume the execution of a paused virtual machine:

```
VBoxManage controlvm {{uuid|vm_name}} resume
```

- Perform a cold reset on the virtual machine:

```
VBoxManage controlvm {{uuid|vm_name}} reset
```

- Power off a virtual machine with the same effect as pulling the power cable of a computer:

```
VBoxManage controlvm {{uuid|vm_name}} poweroff
```

- Shut down the virtual machine and save its current state:

```
VBoxManage controlvm {{uuid|vm_name}} savestate
```

- Send an ACPI (Advanced Configuration and Power Interface) shutdown signal to the virtual machine:

```
VBoxManage controlvm {{uuid|vm_name}} acpipowerbutton
```

- Send command to reboot itself to the guest OS:

```
VBoxManage controlvm {{uuid|vm_name}} reboot
```

- Shut down the virtual machine without saving its state:

```
VBoxManage controlvm {{uuid|vm_name}} shutdown
```

VBoxManage createvm

Create a new virtual machine.

More information: https://www.virtualbox.org/manual/ch08.html#vboxmanage-createvm.

- Create a new VM with default settings:

```
VBoxManage createvm --name {{vm_name}}
```

- Set the base folder where the VM configuration will be stored:

```
VBoxManage createvm --name {{vm_name}} --basefolder {{path/to/directory}}
```

- Set the guest OS type (one of `VBoxManage list ostypes`) for the imported VM:

```
VBoxManage createvm --name {{vm_name}} --ostype {{ostype}}
```

- Register the created VM in VirtualBox:

```
VBoxManage createvm --name {{vm_name}} --register
```

- Set the VM to the specified groups:

```
VBoxManage createvm --name {{vm_name}} --group {{group1,group2,...}}
```

- Set the Universally Unique Identifier (UUID) of the VM:

```
VBoxManage createvm --name {{vm_name}} --uuid {{uuid}}
```

- Set the cipher to use for encryption:

```
VBoxManage createvm --name {{vm_name}} --cipher {{AES-128|AES-256}}
```

VBoxManage export

Export virtual machines to a virtual appliance (ISO) or a cloud service.

More information: https://www.virtualbox.org/manual/ch08.html#vboxmanage-export.

- Specify the target OVA file:

```
VBoxManage export --output {{path/to/file.ova}}
```

- Export in OVF 0.9 legacy mode:

```
VBoxManage export --legacy09
```

- Export in OVF (0.9|1.0|2.0) format:

```
VBoxManage export --{{ovf09|ovf10|ovf20}}
```

- Create manifest of the exported files:

```
VBoxManage export --manifest
```

- Specify a description of the VM:

```
VBoxManage export --description "{{vm_description}}"
```

VBoxManage extpack

Manage extension packs for Oracle VirtualBox.

More information: https://www.virtualbox.org/manual/ch08.html#vboxmanage-extpack.

- Install extension packs to VirtualBox (Note: You need to remove the existing version of the extension pack before installing a new version.):

```
VBoxManage extpack install {{path/to/file.vbox-extpack}}
```

- Remove the existing version of the VirtualBox extension pack:

```
VBoxManage extpack install --replace
```

- Uninstall extension packs from VirtualBox:

```
VBoxManage extpack uninstall {{extension_pack_name}}
```

- Uninstall extension packs and skip most uninstallation refusals:

```
VBoxManage extpack uninstall --force {{extension_pack_name}}
```

- Clean up temporary files and directories left by extension packs:

```
VBoxManage extpack cleanup
```

VBoxManage import

Import a previously exported virtual machine (VM).

More information: https://www.virtualbox.org/manual/ch08.html#vboxmanage-import.

- Import a VM from an OVF or OVA file:

```
VBoxManage import {{path/to/file.ovf}}
```

- Set the name of the imported VM:

```
VBoxManage import {{path/to/file.ovf}} --name {{vm_name}}
```

- Indicate the folder where the configuration of the imported VM will be stored:

```
VBoxManage import {{path/to/file.ovf}} --basefolder {{path/to/directory}}
```

- Register the imported VM in VirtualBox:

```
VBoxManage import {{path/to/file.ovf}} --register
```

- Simulate an import without actually importing:

```
VBoxManage import {{path/to/file.ovf}} --dry-run
```

- Set the guest OS type (one of `VBoxManage list ostypes`) for the imported VM:

```
VBoxManage import {{path/to/file.ovf}} --ostype {{ostype}}
```

- Set the memory (in megabytes) for the imported VM:

```
VBoxManage import {{path/to/file.ovf}} --memory {{1}}
```

- Set the number of CPUs for the imported VM:

```
VBoxManage import {{path/to/file.ovf}} --cpus {{1}}
```

VBoxManage list

List information about the Oracle VM VirtualBox software and associated service.

More information: https://www.virtualbox.org/manual/ch08.html#vboxmanage-list.

- List all VirtualBox virtual machines:

```
VBoxManage list vms
```

- Show DHCP servers available on the host system:

```
VBoxManage list dhcpservers
```

- Show Oracle VM VirtualBox extension packs currently installed:

```
VBoxManage list extpacks
```

- Show all virtual machine groups:

```
VBoxManage list groups
```

- Show virtual disk settings that are currently in use by VirtualBox:

```
VBoxManage list hdds
```

- Show host-only network interfaces available on host system:

```
VBoxManage list hostonlyifs
```

- Show the list of currently running virtual machines:

```
VBoxManage list runningvms
```

- Show host system information:

```
VBoxManage list hostinfo
```

VBoxManage modifyvm

Change settings for a virtual machine that is stopped.

More information: https://www.virtualbox.org/manual/ch08.html#vboxmanage-modifyvm.

- Rename the VM:

```
VBoxManage modifyvm {{uuid|vm_name}} --name {{new_name}}
```

- Adjust memory and CPU:

```
VBoxManage modifyvm {{uuid|vm_name}} --memory {{2048}} --cpus {{2}}
```

- Enable Remote Display (VRDE):

```
VBoxManage modifyvm {{uuid|vm_name}} --vrde on
```

- Enable session recording:

```
VBoxManage modifyvm {{uuid|vm_name}} --recording on
```

VBoxManage movevm

Move a virtual machine (VM) to a new location on the host system.

More information: https://www.virtualbox.org/manual/ch08.html#vboxmanage-movevm.

- Move the specified virtual machine to the current location:

```
VBoxManage movevm {{vm_name}}
```

- Specify the new location (full or relative pathname) of the virtual machine:

```
VBoxManage movevm {{vm_name}} --folder {{path/to/new_location}}
```

VBoxManage registervm

Register a virtual machine (VM).

More information: https://www.virtualbox.org/manual/ch08.html#vboxmanage-registervm.

- Register an existing VM:

```
VBoxManage registervm {{path/to/file.vbox}}
```

- Supply the encryption password file of the VM:

```
VBoxManage registervm {{path/to/file.vbox}} --password
{{path/to/password_file}}
```

- Prompt for the encryption password on the command-line:

```
VBoxManage registervm {{path/to/file.vbox}} --password -
```

VBoxManage showvminfo

Show information about registered virtual machine.

More information: https://www.virtualbox.org/manual/ch08.html#vboxmanage-showvminfo.

- Show information about a particular virtual machine:

```
VBoxManage showvminfo {{vm_name|uuid}}
```

- Show more detailed information about a particular virtual machine:

```
VBoxManage showvminfo --details {{vm_name|uuid}}
```

- Show information in a machine readable format:

```
VBoxManage showvminfo --machinereadable {{vm_name|uuid}}
```

- Specify password ID if the virtual machine is encrypted:

```
VBoxManage showvminfo --password-id {{password_id}}
{{vm_name|uuid}}
```

- Specify the password file if the virtual machine is encrypted:

```
VBoxManage showvminfo --password {{path/to/password_file}}
{{vm_name|uuid}}
```

- Show the logs of a specific virtual machine:

```
VBoxManage showvminfo --log {{vm_name|uuid}}
```

VBoxManage startvm

Start a virtual machine.

More information: https://www.virtualbox.org/manual/ch08.html#vboxmanage-startvm.

- Start a virtual machine:

```
VBoxManage startvm {{vm_name|uuid}}
```

- Start a virtual machine with the specified UI mode:

```
VBoxManage startvm {{vm_name|uuid}} --type {{headless|gui|sdl|separate}}
```

- Specify a password file to start an encrypted virtual machine:

```
VBoxManage startvm {{vm_name|uuid}} --password {{path/to/password_file}}
```

- Specify a password ID to start an encrypted virtual machine:

```
VBoxManage startvm {{vm_name|uuid}} --password-id {{password_id}}
```

- Start a virtual machine with an environment variable pair name value:

```
VBoxManage startvm {{vm_name|uuid}} {{[-E|--putenv]}} {{name}}={{value}}
```

VBoxManage unregistervm

Unregister a virtual machine (VM).

More information: https://www.virtualbox.org/manual/ch08.html#vboxmanage-unregistervm.

- Unregister an existing VM:

```
VBoxManage unregistervm {{uuid|vm_name}}
```

- Delete hard disk image files, all saved state files, VM logs, and XML VM machine files:

```
VBoxManage unregistervm {{uuid|vm_name}} --delete
```

- Delete all files from the VM:

```
VBoxManage unregistervm {{uuid|vm_name}} --delete-all
```

VBoxManage

Interface with VirtualBox.

Includes all the functionality of the GUI and more.

Some subcommands such as **`startvm`** have their own usage documentation.

More information: https://www.virtualbox.org/manual/ch08.html#vboxmanage-intro.

- List all VirtualBox virtual machines:

```
VBoxManage list vms
```

- Show information about a particular virtual machine:

```
VBoxManage showvminfo {{name|uuid}}
```

- Start a virtual machine:

```
VBoxManage startvm {{name|uuid}}
```

- Start a virtual machine in headless mode:

```
VBoxManage startvm {{name|uuid}} --type headless
```

- Shut down the virtual machine and save its current state:

```
VBoxManage controlvm {{name|uuid}} savestate
```

- Shut down the virtual machine without saving its state:

```
VBoxManage controlvm {{name|uuid}} poweroff
```

- Update VBox extension packs:

```
VBoxManage extpack install --replace
{{VboxExtensionPackFileName}}
```

- Display help:

```
VBoxManage --help
```

vc

This command is an alias of **`vercel`**.

- View documentation for the original command:

  ```
  tldr vercel
  ```

vcluster

Create and manage lightweight virtual Kubernetes clusters in namespaces.

More information: https://www.vcluster.com/docs/vcluster.

- Create a virtual cluster in a specific namespace:

```
vcluster create {{vcluster_name}} {{[-n|--namespace]}}
{{namespace}}
```

- Connect to a virtual cluster with a local port and insecure mode:

```
vcluster connect {{vcluster_name}} {{[-n|--namespace]}}
{{namespace}} --local-port {{port}} --insecure
```

- List all virtual clusters:

```
vcluster list
```

- Delete a virtual cluster:

```
vcluster delete {{vcluster_name}}
```

- List platform-managed virtual clusters:

```
vcluster platform list
```

- Create a platform-managed virtual cluster:

```
vcluster platform create {{vcluster_name}} {{[-n|--
namespace]}} {{namespace}}
```

- Connect to a platform-managed virtual cluster:

```
vcluster platform connect {{vcluster_name}} {{[-n|--
namespace]}} {{namespace}}
```

- Delete a platform-managed virtual cluster:

```
vcluster platform delete {{vcluster_name}} {{[-n|--
namespace]}} {{namespace}}
```

vcpkg

Package manager for C/C++ libraries.

Note: Packages are not installed in the system. To use them, you need to tell your build system (e.g. CMake) to use **`vckg`**.

More information: https://learn.microsoft.com/vcpkg/.

- Build and add package `libcurl` to the `vcpkg` environment:

  ```
  vcpkg install curl
  ```

- Build and add `zlib` using the `emscripten` toolchain:

  ```
  vcpkg install --triplet=wasm32-emscripten zlib
  ```

- Search for a package:

  ```
  vcpkg search {{pkg_name}}
  ```

- Configure a CMake project to use `vcpkg` packages:

  ```
  cmake -B build -DCMAKE_TOOLCHAIN_FILE={{path/to/
  vcpkg_install_directory}}/scripts/buildsystems/vcpkg.cmake
  ```

vcsh

Version Control System for the home directory using Git repositories.

See also: **`chezmoi`**, **`stow`**, **`tuckr`**, **`homeshick`**.

More information: https://manned.org/vcsh.

- Initialize an (empty) repository:

```
vcsh init {{repository_name}}
```

- Clone a repository into a custom directory name:

```
vcsh clone {{git_url}} {{repository_name}}
```

- List all managed repositories:

```
vcsh list
```

- Execute a Git command on a managed repository:

```
vcsh {{repository_name}} {{git_command}}
```

- Push/pull all managed repositories to/from remotes:

```
vcsh {{push|pull}}
```

- Write a custom `.gitignore` file for a managed repository:

```
vcsh write-gitignore {{repository_name}}
```

vdir

This command is an alias of **`ls -l --escape`**.

- View documentation for the original command:

  ```
  tldr ls
  ```

vectorize-pixelart

Convert PNG pixel art graphics to SVG/EPS vector images.

More information: https://github.com/und3f/vectorize-pixelart.

- Convert a PNG to a vector image format:

```
vectorize-pixelart {{path/to/input.png}} {{path/to/output}}.
{{svg|eps}}
```

vegeta

A utility and a library for HTTP load testing.

See also: **ab**.

More information: https://github.com/tsenart/vegeta#usage-manual.

- Launch an attack lasting 30 seconds:

```
echo "{{GET https://example.com}}" | vegeta attack -duration={{30s}}
```

- Launch an attack on a server with a self-signed HTTPS certificate:

```
echo "{{GET https://example.com}}" | vegeta attack -insecure -duration={{30s}}
```

- Launch an attack with a rate of 10 requests per second:

```
echo "{{GET https://example.com}}" | vegeta attack -duration={{30s}} -rate={{10}}
```

- Launch an attack and display a report:

```
echo "{{GET https://example.com}}" | vegeta attack -duration={{30s}} | vegeta report
```

- Launch an attack and plot the results on a graph (latency over time):

```
echo "{{GET https://example.com}}" | vegeta attack -duration={{30s}} | vegeta plot > {{path/to/results.html}}
```

- Launch an attack against multiple URLs from a file:

```
vegeta attack -duration={{30s}} -targets={{requests.txt}} | vegeta report
```

vela

Tools for the Vela pipeline.

More information: https://go-vela.github.io/docs/reference/cli.

- Trigger a pipeline to run from a Git branch, commit, or tag:

```
vela add deployment --org {{organization}} --repo
{{repository_name}} --target {{environment}} --ref {{branch|
commit|refs/tags/git_tag}} --description
"{{deploy_description}}"
```

- List deployments for a repository:

```
vela get deployment --org {{organization}} --repo
{{repository_name}}
```

- Inspect a specific deployment:

```
vela view deployment --org {{organization}} --repo
{{repository_name}} --deployment {{deployment_number}}
```

velero

Back up and migrate Kubernetes applications and their persistent volumes.

More information: https://velero.io/docs/main/.

- Create a backup containing all resources:

  ```
  velero backup create {{backup_name}}
  ```

- List all backups:

  ```
  velero backup get
  ```

- Delete a backup:

  ```
  velero backup delete {{backup_name}}
  ```

- Create a weekly backup, each living for 90 days (2160 hours):

  ```
  velero schedule create {{schedule_name}} --
  schedules="{{@every 7d}}" --ttl {{2160h0m0s}}
  ```

- Create a restore from the latest successful backup triggered by specific schedule:

  ```
  velero restore create --from-schedule {{schedule_name}}
  ```

venv

Create lightweight virtual environments in Python.

More information: https://docs.python.org/library/venv.html.

- Create a Python virtual environment:

```
python -m venv {{path/to/virtual_environment}}
```

- Activate the virtual environment (Linux and macOS):

```
{{[.|source]}} {{path/to/virtual_environment}}/bin/activate
```

- Activate the virtual environment (Windows):

```
{{path\to\virtual_environment}}\Scripts\activate.bat
```

- Deactivate the virtual environment:

```
deactivate
```

- Create an alias that generates a `venv` folder and automatically activates it:

```
alias venv='python -m venv .venv && source {{.venv/bin/
activate|.venv\Scripts\activate.bat}}'
```

vercel

Deploy and manage your Vercel deployments.

More information: https://vercel.com/docs/cli.

- Deploy the current directory:

```
vercel
```

- Deploy the current directory to production:

```
vercel --prod
```

- Deploy a directory:

```
vercel {{path/to/project}}
```

- Initialize an example project:

```
vercel init
```

- Deploy with environment variables:

```
vercel {{[-e|--env]}} {{ENV}}={{var}}
```

- Build with environment variables:

```
vercel {{[-b|--build-env]}} {{ENV}}={{var}}
```

- Set default regions to enable the deployment on:

```
vercel --regions {{region_id}}
```

- Remove a deployment:

```
vercel remove {{project_name}}
```

verilator

Convert Verilog and SystemVerilog hardware description language (HDL) design into a C++ or SystemC model to be executed after compiling.

More information: https://veripool.org/guide/latest/.

- Build a specific C project in the current directory:

```
verilator --binary --build-jobs 0 -Wall {{path/to/source.v}}
```

- Create a C++ executable in a specific folder:

```
verilator --cc --exe --build --build-jobs 0 -Wall {{path/to/source.cpp}} {{path/to/output.v}}
```

- Perform linting over a code in the current directory:

```
verilator --lint-only -Wall
```

- Create XML output about the design (files, modules, instance hierarchy, logic, and data types) to feed into other tools:

```
verilator --xml-output -Wall {{path/to/output.xml}}
```

|

Pipe data between programs.

More information: https://gnu.org/software/bash/manual/bash.html#Pipelines.

- Pipe `stdout` to `stdin`:

```
{{command}} | {{command}}
```

- Pipe both `stdout` and `stderr` to `stdin`:

```
{{command}} |& {{command}}
```

vet

Scan package manifests, directories, container images, or GitHub repositories to identify vulnerabilities, malicious packages, and enforce security policies using CEL expressions.

More information: https://safedep.github.io/vet/vet.html.

- Scan the current directory:

```
vet scan {{[-D|--directory]}} .
```

- Scan the `package-lock.json` manifest file:

```
vet scan {{[-M|--manifests]}} {{path/to/manifest_file}}
```

- Scan with filter to fail on any critical vulnerability found in the codebase:

```
vet scan {{[-D|--directory]}} {{path/to/directory}} --filter
'vulns.critical.exists(p, true)' --filter-fail
```

- Scan any OSS package for malware:

```
vet inspect malware --purl {{package_url}}
```

- Start the MCP server for AI enabled security in code editors like Cursor:

```
vet server mcp
```

vf

VirtualFish is a fish shell tool for managing Python virtual environments.

More information: https://virtualfish.readthedocs.io/en/latest/.

- Create a virtual environment:

```
vf new {{virtualenv_name}}
```

- Create a virtual environment for a specific Python version:

```
vf new --python {{/usr/local/bin/python3.8}}
{{virtualenv_name}}
```

- Activate and use the specified virtual environment:

```
vf activate {{virtualenv_name}}
```

- Connect the current virtualenv to the current directory, so that it is activated automatically as soon as you enter it (and deactivated as soon as you leave):

```
vf connect
```

- Deactivate the current virtual environment:

```
vf deactivate
```

- List all virtual environments:

```
vf ls
```

- Remove a virtual environment:

```
vf rm {{virtualenv_name}}
```

- Display help:

```
vf help
```

vgmstream_cli

Play a wide variety of audio formats used in video games and convert them into **`wav`**.

More information: https://github.com/vgmstream/vgmstream/blob/master/doc/USAGE.md.

- Decode an `adc` file to `wav`. (Default output name is `input.wav`):

```
vgmstream_cli {{path/to/input.adc}} -o {{path/to/output.wav}}
```

- Print metadata without decoding the audio:

```
vgmstream_cli {{path/to/input.adc}} -m
```

- Decode an audio file without loops:

```
vgmstream_cli {{path/to/input.adc}} -o {{path/to/output.wav}} -i
```

- Decode with three loops, then add a 3s delay followed by a 5s fadeout:

```
vgmstream_cli {{path/to/input.adc}} -o {{path/to/output.wav}} -l {{3.0}} -f {{5.0}} -d {{3.0}}
```

- Convert multiple files to `bgm_(original name).wav` (Default `-o` pattern is `?f.wav`):

```
vgmstream_cli -o {{path/to/bgm_?f.wav}} {{path/to/file1.adc path/to/file2.adc ...}}
```

- Play the file looping endlessly (`channels` and `rate` must match metadata):

```
vgmstream_cli {{path/to/input.adc}} -pec | aplay --format cd --channels {{1}} --rate {{44100}}
```

vgrep

A user friendly pager for grep.

See also: **`ugrep`**, **`rg`**.

More information: https://github.com/vrothberg/vgrep/blob/main/docs/vgrep.1.md.

- Recursively search the current directory for a pattern and cache it:

```
vgrep {{search_pattern}}
```

- Display the contents of the cache:

```
vgrep
```

- Open the "4th" match from the cache in the default editor:

```
vgrep {{[-s|--show]}} {{4}}
```

- Display a context of "3" lines for each match in the cache:

```
vgrep {{[-s|--show]}} {{[c|context]}}{{3}}
```

- Display the number of matches for each directory in the tree:

```
vgrep {{[-s|--show]}} {{[t|tree]}}
```

- Display the number of matches for each file in the tree:

```
vgrep {{[-s|--show]}} {{[f|files]}}
```

- Start an interactive shell with cached matches:

```
vgrep {{[-i|--interactive]}}
```

vhs

Generate terminal GIFs from a tape file.

More information: https://github.com/charmbracelet/vhs.

- Create a tape file (add commands to the tape file using an editor):

```
vhs new {{path/to/file.tape}}
```

- Record inputs to a tape file:

```
vhs record > {{path/to/file.tape}}
```

- Record inputs to a tape file using a specific shell:

```
vhs record {{[-s|--shell]}} {{shell}} > {{path/to/file.tape}}
```

- Stop recording:

```
exit
```

- Validate the syntax of a tape file:

```
vhs validate {{path/to/file.tape}}
```

- Create a GIF from a tape file:

```
vhs {{path/to/file.tape}}
```

- Publish a GIF to https://vhs.charm.sh and get a shareable URL:

```
vhs publish {{path/to/file.gif}}
```

vi

This command is an alias of **vim**.

- View documentation for the original command:

```
tldr vim
```

vibe

Natural language code assistant for the terminal, powered by MistralAI.

Reads and edits files in your current directory to fulfill requests.

More information: https://github.com/mistralai/mistral-vibe#usage.

- Start an interactive Mistral Vibe session in the current directory:

```
vibe
```

- Resume the most recent Vibe session in the current directory:

```
vibe {{[-c|--continue]}}
```

- Start an interactive Vibe session to set up an API key then exit:

```
vibe --setup
```

- Run a single Vibe prompt in the terminal with automatic approval of file edits and commands:

```
vibe {{[-p|--prompt]}} "{{your_prompt}}"
```

- Run a single Vibe prompt in the terminal with the specified output format:

```
vibe --output {{json|text|streaming}} {{[-p|--prompt]}} "{{your_prompt}}"
```

vidir

Edit directories in a text editor.

More information: https://manned.org/vidir.

- Edit the contents of the specified directories:

```
vidir {{path/to/directory1 path/to/directory2 ...}}
```

- Display each action taken by the program:

```
vidir {{[-v|--verbose]}} {{path/to/directory1 path/to/
directory2 ...}}
```

- Edit the contents of current directory:

```
vidir
```

- Use the specified text editor:

```
EDITOR={{vim}} vidir {{path/to/directory1 path/to/
directory2 ...}}
```

- Read a list of files to edit from `stdin`:

```
{{command}} | vidir -
```

view

A read-only version of **`vim`**.

This command is an alias of **`vim -R`**.

More information: https://www.vim.org/.

- Open a file:

```
view {{path/to/file}}
```

vifm

VI File Manager is a TUI file manager.

See also: **`clifm`**, **`mc`**, **`caja`**.

More information: https://github.com/vifm/vifm.

- Open the current directory:

```
vifm .
```

- Open specified directories on left or right plane:

```
vifm {{path/to/directory1 path/to/directory2 ...}}
```

vim

Vim (Vi IMproved), a command-line text editor, provides several modes for different kinds of text manipulation.

Pressing **<i>** in normal mode enters insert mode. Pressing **<Esc>** goes back to normal mode, which enables the use of Vim commands.

See also: **vimdiff**, **vimtutor**, **nvim**, **gvim**.

More information: https://www.vim.org/.

- Open a file:

```
vim {{path/to/file}}
```

- Open a file at a specified line number:

```
vim +{{line_number}} {{path/to/file}}
```

- View Vim's help manual:

```
<:>help<Enter>
```

- Save and quit the current buffer:

```
{{<Esc><Z><Z>|<Esc><:>x<Enter>|<Esc><:>wq<Enter>}}
```

- Enter normal mode and undo the last operation:

```
<Esc><u>
```

- Search for a pattern in the file (press <n>/<N> to go to next/previous match):

```
</>{{search_pattern}}<Enter>
```

- Perform a regex substitution in the whole file:

```
<:>%s/{{regex}}/{{replacement}}/g<Enter>
```

- Display the line numbers:

```
<:>set nu<Enter>
```

vimdiff

Open up two or more files in vim and show the differences between them.

See also: **`vim`**, **`vimtutor`**, **`nvim`**.

More information: https://www.vim.org/.

- Open two files and show the differences:

  `vimdiff {{path/to/file1}} {{path/to/file2}}`

- Move the cursor to the window on the left|right:

  `<Ctrl w>{{<h>|<l>}}`

- Jump to the previous difference:

  `<[><c>`

- Jump to the next difference:

  `<]><c>`

- Copy the highlighted difference from the other window to the current window:

  `<d><o>`

- Copy the highlighted difference from the current window to the other window:

  `<d><p>`

- Update all highlights and folds:

  `<:>diffupdate`

- Toggle the highlighted code fold:

  `<z><a>`

vimtutor

Vim tutor, teaching the basic vim commands.

See also: **`vim`**, **`vimdiff`**, **`nvim`**.

More information: https://manned.org/vimtutor.

- Launch the vim tutor using the given language:

```
vimtutor {{en|fr|de|...}}
```

- Exit the tutor:

```
<Esc><:>q<Enter>
```

vinmap

A multithreaded Nmap scanner that splits IP ranges into chunks, performs parallel scans, and merges XML or JSON results.

More information: https://pypi.org/project/vinmap.

- Perform a basic scan of a subnet:

```
vinmap {{[-ip|--ip_range]}} {{192.168.1.0/24}}
```

- Scan a domain with version and OS detection, saving results to a specific file:

```
vinmap {{[-ip|--ip_range]}} {{example.com}} {{[-s|--
scan_type]}} "-sV -O" -o {{path/to/scan_results.xml}}
```

- Scan an IP range using 10 chunks and 20 concurrent threads, uses half of the system's CPU cores if not specified:

```
vinmap {{[-ip|--ip_range]}} {{10.0.0.1-10.0.0.255}} {{[-n|--
num_chunks]}} 10 {{[-t|--threads]}} 20
```

- Output scan results in JSON format:

```
vinmap {{[-ip|--ip_range]}} {{192.168.1.1-192.168.1.100}}
{{[-f|--format]}} json
```

- Scan multiple IPs with default settings and save merged XML output:

```
vinmap {{[-ip|--ip_range]}} {{192.168.1.1,192.168.1.2,...}}
```

vipe

Run a text editor in the middle of a UNIX pipeline.

More information: https://manned.org/vipe.

- Edit the output of `command1` before piping it into `command2`:

```
{{command1}} | vipe | {{command2}}
```

- Buffer the output of `command1` in a temporary file with the specified file extension in order to aid syntax highlighting:

```
{{command1}} | vipe --suffix {{json}} | {{command2}}
```

- Use the specified text editor:

```
{{command1}} | EDITOR={{vim}} vipe | {{command2}}
```

virsh connect

Connect to a virtual machine hypervisor.

More information: https://manned.org/virsh.

- Connect to the default hypervisor:

```
virsh connect
```

- Connect as root to the local QEMU/KVM hypervisor:

```
virsh connect qemu:///system
```

- Launch a new instance of the hypervisor and connect to it as the local user:

```
virsh connect qemu:///session
```

- Connect as root to a remote hypervisor using SSH:

```
virsh connect qemu+ssh://{{user_name@host_name}}/system
```

virsh domblkinfo

Print block device size info.

More information: https://manned.org/virsh.

- Print block device info:

```
sudo virsh domblkinfo "{{vm_name}}" {{vda}}
```

- Display help:

```
virsh domblkinfo --help
```

virsh domblklist

List information about block devices associated with a virtual machine.

More information: https://manned.org/virsh.

- List the target name and source path of the block devices:

```
virsh domblklist {{vm_name}}
```

- List the disk type and device value as well as the target name and source path:

```
virsh domblklist {{vm_name}} --details
```

- Display help:

```
virsh domblklist --help
```

virsh dumpxml

Print virtual machine XML.

More information: https://manned.org/virsh.

- Print the XML of a virtual machine:

```
sudo virsh dumpxml "{{vm_name}}"
```

- Display help:

```
virsh dumpxml --help
```

virsh help

Display information about **`virsh`** commands or command groups.

More information: https://manned.org/virsh.

- List the `virsh` commands grouped into related categories:

```
virsh help
```

- List the command categories:

```
virsh help | grep "keyword"
```

- List the commands in a category:

```
virsh help {{category_keyword}}
```

- Display help for a command:

```
virsh help {{command}}
```

virsh list

List the ID, name, and state of virtual machines.

More information: https://manned.org/virsh.

- List information about running virtual machines:

```
virsh list
```

- List information about virtual machines regardless of state:

```
virsh list --all
```

- List information about virtual machines with autostart either enabled or disabled:

```
virsh list --all --{{autostart|no-autostart}}
```

- List information about virtual machines either with or without snapshots:

```
virsh list --all --{{with-snapshot|without-snapshot}}
```

virsh pool-autostart

Enable or disable autostart for a virtual machine storage pool.

More information: https://manned.org/virsh.

- Enable autostart for the storage pool specified by name or UUID (determine using `virsh pool-list`):

```
virsh pool-autostart --pool {{name|uuid}}
```

- Disable autostart for the storage pool specified by name or UUID:

```
virsh pool-autostart --pool {{name|uuid}} --disable
```

virsh pool-build

Build the underlying storage system for a virtual machine storage pool as defined in its configuration file in **`/etc/libvirt/storage`**.

See also: **`virsh pool-define-as`**, **`virsh pool-start`**.

More information: https://manned.org/virsh.

- Build the storage pool specified by name or UUID (determine using `virsh pool-list`):

```
virsh pool-build --pool {{name|uuid}}
```

virsh pool-define-as

Create a configuration file in **`/etc/libvirt/storage`** for a persistent virtual machine storage pool from the provided arguments.

See also: **`virsh pool-build`**, **`virsh pool-start`**.

More information: https://manned.org/virsh.

- Create the configuration file for a storage pool called pool_name using `/var/vms` as the underlying storage system:

```
virsh pool-define-as --name {{pool_name}} --type {{dir}} --target {{/var/vms}}
```

virsh pool-delete

Delete the underlying storage system of an inactive virtual machine storage pool.

See also: **`virsh pool-destroy`**, **`virsh pool-undefine`**.

More information: https://manned.org/virsh.

- Delete the underlying storage system for the storage pool specified by name or UUID (determine using `virsh pool-list`):

```
virsh pool-delete --pool {{name|uuid}}
```

virsh pool-destroy

Stop an active virtual machine storage pool.

See also: **`virsh pool-delete`**.

More information: https://manned.org/virsh.

- Stop a storage pool specified by name or UUID (determine using `virsh pool-list`):

```
virsh pool-destroy --pool {{name|uuid}}
```

virsh pool-info

List information about a virtual machine storage pool.

More information: https://manned.org/virsh.

- List the name, UUID, state, persistence type, autostart status, capacity, space allocated, and space available for the storage pool specified by name or UUID (determine using `virsh pool-list`):

```
virsh pool-info --pool {{name|uuid}}
```

virsh pool-list

List information about virtual machine storage pools.

See also: **`virsh pool-autostart`**, **`virsh pool-define-as`**.

More information: https://manned.org/virsh.

- List the name, state, and whether autostart is enabled or disabled for active storage pools:

```
virsh pool-list
```

- List information for active and inactive or just inactive storage pools:

```
virsh pool-list --{{all|inactive}}
```

- List extended information about persistence, capacity, allocation, and available space for active storage pools:

```
virsh pool-list --details
```

- List information for active storage pools with either autostart enabled or disabled:

```
virsh pool-list --{{autostart|no-autostart}}
```

- List information for active storage pools that are either persistent or transient:

```
virsh pool-list --{{persistent|transient}}
```

- List the name and UUID of active storage pools:

```
virsh pool-list --name --uuid
```

virsh pool-start

Start a previously configured but inactive virtual machine storage pool.

See also: **`virsh pool-define-as`**, **`virsh pool-destroy`**.

More information: https://manned.org/virsh.

- Start the storage pool specified by name or UUID (determine using `virsh pool-list`) and create the underlying storage system if it doesn't exist:

```
virsh pool-start --pool {{name|uuid}} --build
```

virsh pool-undefine

Delete the configuration file in **`/etc/libvirt/storage`** for a stopped virtual machine storage pool.

See also: **`virsh pool-destroy`**.

More information: https://manned.org/virsh.

- Delete the configuration for the storage pool specified name or UUID (determine using `virsh pool-list`):

  ```
  virsh pool-undefine --pool {{name|uuid}}
  ```

virsh snapshot-delete

Delete a snapshot.

More information: https://manned.org/virsh.

- Delete a snapshot and merge it to its children:

```
sudo virsh snapshot-delete "{{vm_name}}" "{{snapshot_name}}"
```

- Delete only the metadata, leaving the snapshot contents in place:

```
sudo virsh snapshot-delete "{{vm_name}}" "{{snapshot_name}}"
--metadata
```

- Display help:

```
virsh snapshot-delete --help
```

virsh snapshot-dumpxml

Print snapshot XML.

More information: https://manned.org/virsh.

- Print the XML of a snapshot:

```
sudo virsh snapshot-dumpxml "{{vm_name}}" "{{snapshot_name}}"
```

- Display help:

```
virsh snapshot-dumpxml --help
```

virsh snapshot-list

List available snapshots.

More information: https://manned.org/virsh.

- List all snapshots and their basic information:

```
sudo virsh snapshot-list "{{vm_name}}"
```

- List all snapshots in a tree structure:

```
sudo virsh snapshot-list "{{vm_name}}" --tree
```

- Display help:

```
virsh snapshot-list --help
```

virsh undefine

Delete a virtual machine.

More information: https://manned.org/virsh.

- Delete only the virtual machine configuration file:

```
virsh undefine --domain {{vm_name}}
```

- Delete the configuration file and all associated storage volumes:

```
virsh undefine --domain {{vm_name}} --remove-all-storage
```

- Delete the configuration file and the specified storage volumes using the target name or the source name (as obtained from the `virsh domblklist` command):

```
virsh undefine --domain {{vm_name}} --storage {{sda,sdb,path/to/source,...}}
```

virsh

Manage **`virsh`** guest domains.

Note: Some of the commands below may require specifying **`virsh --connect URI`** explicitly.

Some subcommands such as **`list`** have their own usage documentation.

More information: https://libvirt.org/manpages/virsh.html.

- Connect to a hypervisor session interactively:

```
virsh {{[-c|--connect]}} {{qemu:///system|qemu:///session|xen:///system|lxc:///system|...}}
```

- List all domains:

```
virsh {{[-c|--connect]}} {{uri}} list --all
```

- Activate a network named `default`:

```
sudo virsh net-start {{default}}
```

- Create a domain from a configuration file:

```
sudo virsh create {{path/to/config_file.xml}}
```

- Edit a domain's configuration file (editor can be changed with `$EDITOR` or `$VISUAL`):

```
sudo virsh edit {{domain}}
```

- Start/reboot/reset/shutdown/destroy/suspend/resume a domain:

```
sudo virsh {{start|reboot|reset|shutdown|destroy|suspend|resume}} {{domain}}
```

- Save the current running state of a domain (RAM, but not disk state) to a state file (domain will be powered off):

```
sudo virsh save {{domain}} {{path/to/state_file}}
```

- Remove storage and snapshots of a stopped domain:

```
sudo virsh undefine {{domain}} --remove-all-storage --snapshots-metadata
```

virt-viewer

Minimal graphical interface for a virtual machine (VM).

Note: **`domain`** refers to the name, UUID, or ID for the existing VMs.

See also: **`virsh`**.

More information: https://manned.org/virt-viewer.

- Launch `virt-viewer` with a prompt to select running virtual machines:

```
virt-viewer {{[-c|--connect]}} {{qemu:///system|qemu:///session|...}}
```

- Launch `virt-viewer` for a specific virtual machine by ID, UUID, or name:

```
virt-viewer {{[-c|--connect]}} {{uri}} {{domain}}
```

- Wait for a virtual machine to start and automatically reconnect if it shuts down and restarts:

```
virt-viewer {{[-c|--connect]}} {{uri}} {{[-r|--reconnect]}} {{[-w|--wait]}} {{domain}}
```

- Connect to a specific remote virtual machine over TLS (requires pre-configured TLS certificates):

```
virt-viewer {{[-c|--connect]}} {{qemu+tls://host/system}} {{domain}}
```

- Connect to a specific remote virtual machine over SSH (requires SSH access to the host):

```
virt-viewer {{[-c|--connect]}} {{xen+ssh://username@host/system}} {{domain}}
```

virtualenv

Create virtual isolated Python environments.

More information: https://virtualenv.pypa.io/en/latest/reference/cli.html.

- Create a new environment:

```
virtualenv {{path/to/venv}}
```

- Customize the prompt prefix:

```
virtualenv --prompt {{prompt_prefix}} {{path/to/venv}}
```

- Use a different version of Python with virtualenv:

```
virtualenv {{[-p|--python]}} {{path/to/pythonbin}} {{path/to/venv}}
```

- Start (select) the environment:

```
source {{path/to/venv}}/bin/activate
```

- Stop the environment:

```
deactivate
```

virtualenvwrapper

Group of simple wrapper commands for Python's **`virtualenv`** tool.

More information: https://virtualenvwrapper.readthedocs.io/en/latest/command_ref.html.

- Create a new Python `virtualenv` in `$WORKON_HOME`:

```
mkvirtualenv {{virtualenv_name}}
```

- Create a `virtualenv` for a specific Python version:

```
mkvirtualenv --python {{/usr/local/bin/python3.8}} {{virtualenv_name}}
```

- Activate or use a different `virtualenv`:

```
workon {{virtualenv_name}}
```

- Stop the `virtualenv`:

```
deactivate
```

- List all virtual environments:

```
lsvirtualenv
```

- Remove a `virtualenv`:

```
rmvirtualenv {{virtualenv_name}}
```

- Get summary of all virtualenvwrapper commands:

```
virtualenvwrapper
```

visudo

Safely edit the sudoers file.

More information: https://www.sudo.ws/docs/man/visudo.man/.

- Edit the sudoers file:

```
sudo visudo
```

- Check the sudoers file for errors:

```
sudo visudo {{[-c|--check]}}
```

- Edit the sudoers file using a specific editor:

```
sudo EDITOR={{editor}} visudo
```

- Display version:

```
visudo {{[-V|--version]}}
```

Vite

Create a Vite project.

Used to build JavaScript projects.

Available templates: vanilla, vanilla-ts, vue, vue-ts, react, react-ts, react-swc, react-swc-ts, preact, preact-ts, lit, lit-ts, svelte, svelte-ts.

More information: https://vite.dev/guide/.

- Set up using `npm` 6.x:

```
npm create vite@latest my-react-app --template react-ts
```

- Set up using `npm` 7+, extra double-dash is needed:

```
npm create vite@latest my-react-app -- --template react-ts
```

- Set up using `yarn`:

```
yarn create vite my-react-app --template react-ts
```

- Set up using `pnpm`:

```
pnpm create vite my-react-app --template react-ts
```

vitest

Fast, modern testing framework built for Vite, offering seamless integration, TypeScript support, and a Jest-compatible API for unit, integration, and snapshot testing.

More information: https://vitest.dev/guide/cli.html.

- Run all available tests:

  ```
  vitest run
  ```

- Run the test suites from the given files:

  ```
  vitest run {{path/to/file1 path/to/file2 ...}}
  ```

- Run the test suites from files within the current and subdirectories, whose paths match the given `regex`:

  ```
  vitest run {{regex1 regex2 ...}}
  ```

- Run the tests whose names match the given `regex`:

  ```
  vitest run {{[-t|--testNamePattern]}} {{regex}}
  ```

- Watch files for changes and automatically re-run related tests:

  ```
  vitest
  ```

- Run tests with coverage:

  ```
  vitest run --coverage
  ```

- Run all tests but stops immediately after the first test failure:

  ```
  vitest run --bail=1
  ```

- Display help:

  ```
  vitest --help
  ```

viu

View images on the terminal.

More information: https://github.com/atanunq/viu#command-line-options.

- Render an image or animated GIF:

```
viu {{path/to/file}}
```

- Render an image or GIF from the internet using `curl`:

```
curl {{[-s|--silent]}} {{https://example.com/image.png}} |
viu -
```

- Render an image with a transparent background:

```
viu {{[-t|--transparent]}} {{path/to/file}}
```

- Render an image with a specific width and height in pixels:

```
viu {{[-w|--width]}} {{width}} {{[-h|--height]}} {{height}}
{{path/to/file}}
```

- Render an image or GIF and display its file name:

```
viu {{[-n|--name]}} {{path/to/file}}
```

vivaldi

This command is an alias of **`chromium`**.

More information: https://vivaldi.com/.

- View documentation for the original command:

```
tldr chromium
```

vkcube

Test Vulkan rendering.

See also: **`glxgears`**.

More information: https://github.com/krh/vkcube.

- Run a Vulkan test window:

```
vkcube
```

- Use a specific display protocol:

```
vkcube --wsi {{xlib|wayland|...}}
```

- Display help:

```
vkcube -h
```

vladimyr

Dario Vladović's personal CLI.

More information: https://github.com/vladimyr/vladimyr-cli.

- Start Dario's interactive CLI:

```
vladimyr
```

vlc

Cross-platform multimedia player.

See also: **`mpv`**, **`mplayer`**, **`ytfzf`**.

More information: https://wiki.videolan.org/Documentation:Command_line/.

- Play a file:

```
vlc {{path/to/file}}
```

- Play in fullscreen:

```
vlc --fullscreen {{path/to/file}}
```

- Play muted:

```
vlc --no-audio {{path/to/file}}
```

- Play repeatedly:

```
vlc --loop {{path/to/file}}
```

- Play video from a URL:

```
vlc {{https://www.youtube.com/watch?v=oHg5SJYRHA0}}
```

vllm chat

Generate chat completions via the running API server using the OpenAI-compatible REST API.

More information: https://docs.vllm.ai/en/latest/serving/openai_compatible_server.html.

- Send a single chat prompt to the API server and get a response:

```
vllm chat --quick "{{message}}"
```

- Chat with a specific model name:

```
vllm chat --model-name {{model_name}} --quick "{{message}}"
```

- Chat with a custom system prompt:

```
vllm chat --system-prompt "{{system_prompt}}" --quick "{{message}}"
```

- Chat using a custom API server URL:

```
vllm chat --url {{http://custom-host:port/v1}} --quick "{{message}}"
```

- Chat with an API key for authentication:

```
vllm chat --api-key {{your_api_key}} --quick "{{message}}"
```

- Start an interactive chat session:

```
vllm chat
```

vllm

Serve large language models efficiently and interact with them through an OpenAI-compatible API.

More information: https://docs.vllm.ai/en/latest/getting_started/quickstart.html.

- Launch an OpenAI-compatible API server for a model:

```
vllm serve {{model_name}}
```

- Serve a model on a specific host and port:

```
vllm serve {{model_name}} --host {{0.0.0.0}} --port {{8000}}
```

- Start an interactive chat session:

```
vllm chat
```

- Run batch prompts from a file and write results to a file:

```
vllm run-batch -i {{input.jsonl}} -o {{output.jsonl}} --model
{{model_name}}
```

- Print environment information for bug reports:

```
vllm collect-env
```

- List all available subcommands:

```
vllm --help
```

vmtouch

Manage the filesystem cache.

More information: https://manned.org/vmtouch.

- Print the cache status of a file:

```
vmtouch {{path/to/file}}
```

- Load a file into cache:

```
vmtouch -t {{path/to/file}}
```

- Evict a file from cache:

```
vmtouch -e {{path/to/file}}
```

- Lock a file in cache to prevent eviction from memory:

```
vmtouch -l {{path/to/file}}
```

- Lock a file and daemonize the program:

```
vmtouch -ld {{path/to/file}}
```

volta

A JavaScript Tool Manager that installs Node.js runtimes, npm and Yarn package managers, or any binaries from npm.

More information: https://docs.volta.sh/reference/.

- List all installed tools:

```
volta list
```

- Install the latest version of a tool:

```
volta install {{node|npm|yarn|package_name}}
```

- Install a specific version of a tool:

```
volta install {{node|npm|yarn}}@version
```

- Choose a tool version for a project (will store it in `package.json`):

```
volta pin {{node|npm|yarn}}@version
```

- Display help:

```
volta help
```

- Display help for a subcommand:

```
volta help {{fetch|install|uninstall|pin|list|completions|
which|setup|run|help}}
```

vsce

Extension manager for Visual Studio Code.

More information: https://github.com/microsoft/vscode-vsce.

- List all the extensions created by a publisher:

  `vsce list {{publisher}}`

- Publish an extension as major, minor, or patch version:

  `vsce publish {{major|minor|patch}}`

- Unpublish an extension:

  `vsce unpublish {{extension_id}}`

- Package the current working directory as a `.vsix` file:

  `vsce package`

- Show the metadata associated with an extension:

  `vsce show {{extension_id}}`

vt

Interface for VirusTotal.

API key from a VirusTotal account is required for this command.

More information: https://github.com/VirusTotal/vt-cli.

- Scan a specific file for viruses:

```
vt scan file {{path/to/file}}
```

- Scan a URL for viruses:

```
vt scan url {{url}}
```

- Display information from a specific analysis:

```
vt analysis {{file_id|analysis_id}}
```

- Download files in encrypted Zip format (requires premium account):

```
vt download {{file_id}} --output {{path/to/directory}} --zip
--zip-password {{password}}
```

- Initialize or re-initialize `vt` to enter API key interactively:

```
vt init
```

- Display information about a domain:

```
vt domain {{url}}
```

- Display information for a specific URL:

```
vt url {{url}}
```

- Display information for a specific IP address:

```
vt domain {{ip_address}}
```

vue build

A subcommand provided by **`@vue/cli`** and **`@vue/cli-service-global`** that enables quick prototyping.

More information: https://cli.vuejs.org/guide/cli-service.html#vue-cli-service-serve.

- Build a `.js` or `.vue` file in production mode with zero config:

```
vue build {{filename}}
```

vue init

Legacy project initialization subcommand of the Vue.js framework.

More information: https://cli.vuejs.org/guide/creating-a-project.html#pulling-2-x-templates-legacy.

- Create a new project using one of the default templates:

```
vue init {{webpack|webpack-simple|browserify|browserify-simple|simple}} {{project_name}}
```

- Create a new project using a local template:

```
vue init {{path/to/template_directory}} {{project_name}}
```

- Create a new project using a template from GitHub:

```
vue init {{username}}/{{repository}} {{project_name}}
```

vue serve

A subcommand provided by **`@vue/cli`** and **`@vue/cli-service-global`** that enables quick prototyping.

More information: https://cli.vuejs.org/guide/cli-service.html#vue-cli-service-serve.

- Serve a `.js` or `.vue` file in development mode with zero config:

```
vue serve {{filename}}
```

vue

Multi-purpose CLI for Vue.js.

Some subcommands such as **`build`** have their own usage documentation.

More information: https://cli.vuejs.org/guide/.

- Create a new Vue project interactively:

  ```
  vue create {{project_name}}
  ```

- Create a new project with web UI:

  ```
  vue ui
  ```

vulkaninfo

Print system Vulkan information.

More information: https://vulkan.lunarg.com/doc/view/latest/linux/vulkaninfo.html.

- Print full Vulkan information:

```
vulkaninfo
```

- Print a summary:

```
vulkaninfo --summary
```

- Make a HTML document of the full Vulkan information:

```
vulkaninfo --html
```

- Display help:

```
vulkaninfo {{[-h|--help]}}
```

w

Display who is logged in and their processes.

See also: **`who`**, **`users`**.

More information: https://manned.org/w.

- Display information about all users who are currently logged in:

```
w
```

- Display information about a specific user:

```
w {{username}}
```

- Display logged-in user information without a header:

```
w {{[-h|--no-header]}}
```

- Display information without including the login, JCPU, and PCPU columns:

```
w {{[-s|--short]}}
```

w3m

A text-based web browser.

Supports SSL and mouse input, even over SSH.

More information: https://w3m.sourceforge.net/MANUAL.

- Open a URL:

```
w3m {{https://example.com}}
```

- Open a URL in monochrome mode:

```
w3m {{https://example.com}} -M
```

- Open a URL without mouse support:

```
w3m {{https://example.com}} -no-mouse
```

- Open a new browser tab:

```
<Shift t>
```

- Display your browser history:

```
<Ctrl h>
```

- Quit w3m:

```
<q><y>
```

wacli auth

Authenticate wacli with WhatsApp via QR code.

See also: **`wacli sync`**.

More information: https://wacli.sh/auth.html.

- Start the authentication process:

```
wacli auth
```

- Authenticate using a custom store path:

```
wacli auth --store {{path/to/store}}
```

wacli contacts alias set

Set a custom alias for a WhatsApp contact.

See also: **`wacli contacts show`**, **`wacli contacts search`**.

More information: https://wacli.sh/contacts.html.

- Set an alias for a specific contact:

```
wacli contacts alias set {{phone_number}}@s.whatsapp.net {{alias}}
```

- Set an alias using a custom store:

```
wacli contacts alias set {{phone_number}}@s.whatsapp.net {{alias}} --store {{path/to/store}}
```

wacli contacts refresh

Synchronize contacts from the WhatsApp store.

See also: **`wacli contacts search`**, **`wacli contacts show`**.

More information: https://wacli.sh/contacts.html.

- Refresh all contacts from the store:

```
wacli contacts refresh
```

- Refresh contacts using a custom store:

```
wacli contacts refresh --store {{path/to/store}}
```

wacli contacts search

Search WhatsApp contacts by name.

See also: **`wacli contacts show`**, **`wacli contacts refresh`**.

More information: https://wacli.sh/contacts.html.

- Search for contacts by name in JSON format:

```
wacli contacts search "{{name}}" --json
```

- Search for contacts using a custom store:

```
wacli contacts search "{{name}}" --json --store {{path/to/store}}
```

wacli contacts show

Display details of a specific WhatsApp contact.

See also: **`wacli contacts search`**, **`wacli contacts refresh`**.

More information: https://wacli.sh/contacts.html.

- Display details for a specific contact in JSON format:

```
wacli contacts show {{phone_number}}@s.whatsapp.net --json
```

- Display details using a custom store:

```
wacli contacts show {{phone_number}}@s.whatsapp.net --json --
store {{path/to/store}}
```

wacli contacts tags add

Add a tag to a WhatsApp contact.

See also: **`wacli contacts show`**, **`wacli contacts search`**.

More information: https://wacli.sh/contacts.html.

- Add a tag to a contact:

```
wacli contacts tags add {{phone_number}}@s.whatsapp.net
{{tag}}
```

- Add a tag using a custom store:

```
wacli contacts tags add {{phone_number}}@s.whatsapp.net
{{tag}} --store {{path/to/store}}
```

wacli messages context

Display messages surrounding a specific WhatsApp message.

See also: **`wacli messages show`**, **`wacli messages list`**.

More information: https://wacli.sh/messages.html.

- Show context around a specific message in JSON format:

```
wacli messages context {{message_id}} --json
```

- Show context around a message using a custom store:

```
wacli messages context {{message_id}} --json --store {{path/to/store}}
```

wacli messages list

List messages from a WhatsApp chat.

See also: **`wacli messages search`**, **`wacli messages show`**, **`wacli messages context`**.

More information: https://wacli.sh/messages.html.

- List messages from a specific chat in JSON format:

```
wacli messages list --chat {{phone_number}}@s.whatsapp.net --json
```

- List messages received after a specific date:

```
wacli messages list --chat {{phone_number}}@s.whatsapp.net --after {{2026-01-28}} --json
```

- List messages received before a specific date:

```
wacli messages list --chat {{phone_number}}@s.whatsapp.net --before {{2026-01-28}} --json
```

- List messages within a date range:

```
wacli messages list --chat {{phone_number}}@s.whatsapp.net --after {{2026-01-01}} --before {{2026-01-31}} --json
```

- Limit the number of results:

```
wacli messages list --chat {{phone_number}}@s.whatsapp.net --limit {{10}} --json
```

wacli messages search

Search WhatsApp messages using full-text search.

See also: **`wacli messages list`**, **`wacli messages show`**.

More information: https://wacli.sh/messages.html.

- Search messages in a specific chat:

```
wacli messages search "{{query}}" --chat {{phone_number}}
@s.whatsapp.net --json
```

- Search messages from a specific sender:

```
wacli messages search "{{query}}" --from {{phone_number}}
@s.whatsapp.net --json
```

- Search messages after a specific date:

```
wacli messages search "{{query}}" --chat {{phone_number}}
@s.whatsapp.net --after {{2026-01-28}} --json
```

- Search messages of a specific type:

```
wacli messages search "{{query}}" --type {{image|video|audio|
document}} --json
```

- Search messages with a result limit:

```
wacli messages search "{{query}}" --chat {{phone_number}}
@s.whatsapp.net --limit {{10}} --json
```

wacli messages show

Display a specific WhatsApp message by its ID.

See also: **`wacli messages list`**, **`wacli messages context`**.

More information: https://wacli.sh/messages.html.

- Show a specific message in JSON format:

```
wacli messages show {{message_id}} --json
```

- Show a specific message using a custom store:

```
wacli messages show {{message_id}} --json --store {{path/to/store}}
```

wacli send file

Send a file (image, video, audio, or document) via WhatsApp.

See also: **`wacli send text`**.

More information: https://wacli.sh/send.html.

- Send a file to a phone number:

```
wacli send file --to {{phone_number}} --file {{path/to/file}}
```

- Send a file to a specific JID:

```
wacli send file --to {{phone_number}}@s.whatsapp.net --file
{{path/to/file}}
```

- Send a file with a custom timeout:

```
wacli send file --to {{phone_number}} --file {{path/to/file}}
--timeout {{10m}}
```

wacli send text

Send a text message via WhatsApp.

See also: **`wacli send file`**.

More information: https://wacli.sh/send.html.

- Send a text message to a phone number:

```
wacli send text --to {{phone_number}} --message "{{message}}"
```

- Send a text message to a specific JID:

```
wacli send text --to {{phone_number}}@s.whatsapp.net --
message "{{message}}"
```

- Send a text message with a custom timeout:

```
wacli send text --to {{phone_number}} --message "{{message}}"
--timeout {{10m}}
```

- Send a text message using a custom store path:

```
wacli send text --to {{phone_number}} --message "{{message}}"
--store {{path/to/store}}
```

wacli sync

Synchronize WhatsApp messages to the local store.

See also: **`wacli auth`**, **`wacli messages list`**.

More information: https://wacli.sh/sync.html.

- Synchronize messages:

```
wacli sync
```

- Synchronize messages once and exit:

```
wacli sync --once
```

- Synchronize messages using a custom store:

```
wacli sync --store {{path/to/store}}
```

- Synchronize messages with a custom timeout:

```
wacli sync --timeout {{10m}}
```

wacli

WhatsApp command-line client for sending messages, managing chats, and contacts.

Some subcommands such as **`send`**, **`messages`**, **`contacts`**, etc. have their own usage documentation.

More information: https://wacli.sh/.

- Authenticate via QR code:

```
wacli auth
```

- Synchronize messages once and exit:

```
wacli sync --once
```

- Send a text message to a phone number:

```
wacli send text --to {{phone_number}} --message "{{message}}"
```

- List messages from a specific chat:

```
wacli messages list --chat {{phone_number}}@s.whatsapp.net --
json
```

- List all chats:

```
wacli chats list --json
```

- Search contacts by name:

```
wacli contacts search "{{name}}" --json
```

- Run diagnostics on the store:

```
wacli doctor
```

- Display version:

```
wacli version
```

wafw00f

Identify and fingerprint Web Application Firewall (WAF) products protecting a website.

More information: https://github.com/EnableSecurity/wafw00f/wiki/Usage#arguments-list.

- Check if a website is using any WAF:

```
wafw00f {{https://www.example.com}}
```

- Test for all detectable WAFs without stopping at the first match:

```
wafw00f {{[-a|--findall]}} {{https://www.example.com}}
```

- Pass requests through a proxy (such as BurpSuite):

```
wafw00f {{[-p|--proxy]}} {{http://localhost:8080}} {{https://www.example.com}}
```

- Test for a specific WAF product (run `wafw00f --list` to get list of all supported WAFs):

```
wafw00f {{[-t|--test]}} {{Cloudflare|Cloudfront|Fastly|ZScaler|...}} {{https://www.example.com}}
```

- Pass custom headers from a file:

```
wafw00f {{[-H|--headers]}} {{path/to/headers.txt}} {{https://www.example.com}}
```

- Read target inputs from a file and show verbose output (multiple `v` for more verbosity):

```
wafw00f {{[-i|--input]}} {{path/to/urls.txt}} -{{vv}}
```

- List all WAFs that can be detected:

```
wafw00f {{[-l|--list]}}
```

waifu2x-ncnn-vulkan

Image upscaler for manga/anime-style images using NCNN neural network framework.

More information: https://github.com/nihui/waifu2x-ncnn-vulkan.

- Upscale an image:

```
waifu2x-ncnn-vulkan -i {{path/to/input_file}} -o {{path/to/output_file}}
```

- Upscale an image by a custom scale factor and denoise it:

```
waifu2x-ncnn-vulkan -i {{path/to/input_file}} -o {{path/to/output_file}} -s {{1|2|4|8|16|32}} -n {{-1|0|1|2|3}}
```

- Save the upscaled image in a specific format:

```
waifu2x-ncnn-vulkan -i {{path/to/input_file}} -o {{path/to/output_file}} -f {{jpg|png|webp}}
```

wait

Wait for a process to complete before proceeding.

See also: **`ps`**, **`waitpid`**.

More information: https://www.gnu.org/software/bash/manual/bash.html#index-wait.

- Wait for a process to finish given its process ID and return its exit status:

```
wait {{process_id}}
```

- Wait for all processes known to the invoking shell to finish:

```
wait
```

- Wait for one of the processes to finish:

```
wait -n
```

- Wait for one of the processes to finish and store its PID in a variable:

```
wait -n -p {{variable}}
```

- Wait for a job to finish (run `jobs` to find the job number):

```
wait %{{job_number}}
```

- Display help:

```
wait --help
```

wait4x http

Wait for an HTTP(S) endpoint to become available with flexible validation options.

More information: https://github.com/wait4x/wait4x.

- Wait for an HTTP endpoint to respond with a specific status code:

```
wait4x http {{https://example.com/health}} --expect-status-code {{200}}
```

- Wait for a response body to match a `regex` pattern:

```
wait4x http {{https://api.example.com/status}} --expect-body-regex '{{\"status\":\s*\"healthy\"}}'
```

- Wait for a specific JSON field to exist using GJSON path syntax:

```
wait4x http {{https://api.example.com/status}} --expect-body-json "{{services.database.status}}"
```

- Wait for a response with custom request headers:

```
wait4x http {{https://api.example.com}} --request-header "{{Authorization: Bearer token123}}"
```

- Wait for a specific response header to match a value:

```
wait4x http {{https://api.example.com}} --expect-header "{{Content-Type=application/json}}"
```

- Wait using a TLS client certificate:

```
wait4x http {{https://example.com}} --cert-file {{path/to/cert.pem}} --key-file {{path/to/key.pem}}
```

- Wait with a custom timeout and inverted check (wait for endpoint to go down):

```
wait4x http {{https://example.com/health}} --expect-status-code {{200}} --invert-check --timeout {{60s}}
```

wait4x tcp

Wait for TCP port(s) to become available.

More information: https://github.com/wait4x/wait4x.

- Wait for a TCP port to become available:

```
wait4x tcp {{localhost:8080}}
```

- Wait for a port with a specific timeout:

```
wait4x tcp {{localhost:3306}} --timeout {{60s}}
```

- Wait for a port to become free (inverted check):

```
wait4x tcp {{localhost:8080}} --invert-check
```

- Wait for multiple ports in parallel:

```
wait4x tcp {{localhost:3306 localhost:6379 ...}}
```

- Run a command after the port becomes available:

```
wait4x tcp {{localhost:3306}} -- {{path/to/script.sh}}
```

- Wait with exponential backoff:

```
wait4x tcp {{localhost:8080}} --backoff-policy exponential --
backoff-exponential-max-interval {{30s}}
```

wait4x

Wait for a port or service to enter a requested state, with support for TCP, HTTP, DNS, databases, and message queues.

Some subcommands such as **`tcp`** and **`http`** have their own usage documentation.

More information: https://github.com/wait4x/wait4x.

- Wait for a TCP port to become available:

```
wait4x tcp {{localhost:8080}}
```

- Wait for an HTTP endpoint to return a specific status code:

```
wait4x http {{https://example.com/health}} --expect-status-code {{200}}
```

- Wait for a PostgreSQL database to become ready:

```
wait4x postgresql '{{postgres://user:password@localhost:5432/mydb?sslmode=disable}}'
```

- Wait for a Redis server to become available:

```
wait4x redis {{redis://localhost:6379}}
```

- Wait for a service with a custom timeout and check interval:

```
wait4x tcp {{localhost:3306}} --timeout {{30s}} --interval {{2s}}
```

- Wait for multiple services in parallel:

```
wait4x tcp {{localhost:3306 localhost:6379 ...}}
```

- Display help for a subcommand:

```
wait4x {{subcommand}} --help
```

- Display version:

```
wait4x version
```

waitress-serve

Pure Python WSGI HTTP Server.

More information: https://docs.pylonsproject.org/projects/waitress/en/latest/runner.html.

- Run a Python web app:

```
waitress-serve {{import.path:wsgi_func}}
```

- Listen on port 8080 on localhost:

```
waitress-serve --listen={{localhost}}:{{8080}}
{{import.path:wsgi_func}}
```

- Start waitress on a Unix socket:

```
waitress-serve --unix-socket={{path/to/socket}}
{{import.path:wsgi_func}}
```

- Use 4 threads to process requests:

```
waitress-serve --threads={{4}} {{import.path:wsgifunc}}
```

- Call a factory method that returns a WSGI object:

```
waitress-serve --call {{import.path.wsgi_factory}}
```

- Use the HTTPS URL scheme:

```
waitress-serve --url-scheme={{https}}
{{import.path:wsgi_func}}
```

wakeonlan

Send packets to wake-on-LAN (WOL) enabled PCs.

More information: https://manned.org/wakeonlan.

- Send packets to all devices on the local network (255.255.255.255) by specifying a MAC address:

```
wakeonlan {{01:02:03:04:05:06}}
```

- Send packet to a specific device via IP address:

```
wakeonlan {{01:02:03:04:05:06}} {{[-i|--ip]}}
{{192.168.178.2}}
```

- Simulate execution and print the commands without running them:

```
wakeonlan {{[-n|--dry-run]}} {{01:02:03:04:05:06}}
```

- Run in quiet mode:

```
wakeonlan {{[-q|--quiet]}} {{01:02:03:04:05:06}}
```

wal

Create color schemes based on the dominant colors of a wallpaper.

More information: https://github.com/dylanaraps/pywal/wiki/Getting-Started.

- Preview color scheme:

```
wal --preview {{image.png}}
```

- Create color scheme:

```
wal -i {{image.png}}
```

- Create a light color scheme:

```
wal -i {{image.png}} -l
```

- Skip setting the desktop wallpaper:

```
wal -i {{image.png}} -n
```

- Skip setting the terminal colors:

```
wal -i {{image.png}} -s
```

- Restore the previously generated color scheme and wallpaper:

```
wal -R
```

wapm

The WebAssembly package manager.

More information: https://wasmer.io/help/reference.

- Interactively create a new `wapm.toml` file:

```
wapm init
```

- Download all the packages listed as dependencies in `wapm.toml`:

```
wapm install
```

- Download a specific version of a package and add it to the list of dependencies in `wapm.toml`:

```
wapm install {{package}}@{{version}}
```

- Download a package and install it globally:

```
wapm install --global {{package}}
```

- Uninstall a package and remove it from the list of dependencies in `wapm.toml`:

```
wapm uninstall {{package}}
```

- Print a tree of locally installed dependencies:

```
wapm list
```

- List top-level globally installed packages:

```
wapm list --global
```

- Execute a package command using the Wasmer runtime:

```
wapm run {{command_name}} {{arguments}}
```

warp-cli

Connect, disconnect, and switch modes of a connection to Cloudflare's WARP service.

WARP is a VPN that encrypts traffic for privacy, security, and speed.

See also: **fastd**, **ivpn**, **mozillavpn**, **mullvad**.

More information: https://developers.cloudflare.com/warp-client/.

- Register the current device to WARP (must be run before first connection):

```
warp-cli registration new
```

- Display the current registration information:

```
warp-cli registration show
```

- Connect to WARP:

```
warp-cli connect
```

- Disconnect from WARP:

```
warp-cli disconnect
```

- Display the WARP connection status:

```
warp-cli status
```

- Display current application settings:

```
warp-cli settings list
```

- Switch to a specific mode:

```
warp-cli mode {{warp|doh|warp+doh|dot|warp+dot|proxy|
tunnel_only}}
```

warp-diag

Diagnostic and feedback tool for Cloudflare's WARP service.

See also: **`warp-cli`**.

More information: https://developers.cloudflare.com/warp-client/.

- Generate a Zip file with information about the system configuration and the WARP connection:

```
warp-diag
```

- Generate a Zip file with debug information including a timestamp to the output filename:

```
warp-diag --add-ts
```

- Save the output file under a specific directory:

```
warp-diag --output {{path/to/directory}}
```

- Submit a new feedback to Cloudflare's WARP interactively:

```
warp-diag feedback
```

wasm-objdump

Display information from WebAssembly binaries.

More information: https://webassembly.github.io/wabt/doc/wasm-objdump.1.html.

- Display the section headers of a given binary:

```
wasm-objdump {{[-h|--headers]}} {{file.wasm}}
```

- Display the entire disassembled output of a given binary:

```
wasm-objdump {{[-d|--disassemble]}} {{file.wasm}}
```

- Display the details of each section:

```
wasm-objdump {{[-x|--details]}} {{file.wasm}}
```

- Display the details of a given section:

```
wasm-objdump {{[-j|--section]}} '{{import}}' {{[-x|--
details]}} {{file.wasm}}
```

wasm-opt

Optimize WebAssembly binary files.

More information: https://manned.org/wasm-opt.

- Apply default optimizations and write to a given file:

```
wasm-opt -O {{input.wasm}} {{[-o|--output]}} {{output.wasm}}
```

- Apply all optimizations and write to a given file (takes more time, but generates optimal code):

```
wasm-opt -O4 {{input.wasm}} {{[-o|--output]}} {{output.wasm}}
```

- Optimize a file for size:

```
wasm-opt -Oz {{input.wasm}} {{[-o|--output]}} {{output.wasm}}
```

- Print the textual representation of the binary to console:

```
wasm-opt {{input.wasm}} --print
```

wasm2c

Convert a file from the WebAssembly binary format to a C source file and header.

More information: https://webassembly.github.io/wabt/doc/wasm2c.1.html.

- Convert a file to a C source file and header and display it to the console:

```
wasm2c {{file.wasm}}
```

- Write the output to a given file (`file.h` gets additionally generated):

```
wasm2c {{file.wasm}} {{[-o|--output]}} {{file.c}}
```

wasm2wat

Convert a file from the WebAssembly binary format to the text format.

More information: https://webassembly.github.io/wabt/doc/wasm2wat.1.html.

- Convert a file to the text format and display it to the console:

```
wasm2wat {{file.wasm}}
```

- Write the output to a given file:

```
wasm2wat {{file.wasm}} {{[-o|--output]}} {{file.wat}}
```

wat2wasm

Convert a file from the WebAssembly text format to the binary format.

More information: https://webassembly.github.io/wabt/doc/wat2wasm.1.html.

- Parse and check a file for errors:

```
wat2wasm {{file.wat}}
```

- Write the output binary to a given file:

```
wat2wasm {{file.wat}} {{[-o|--output]}} {{file.wasm}}
```

- Display simplified representation of every byte:

```
wat2wasm {{[-v|--verbose]}} {{file.wat}}
```

watch

Execute a program periodically and monitor the output in full-screen mode.

More information: https://manned.org/watch.

- Repeatedly run a command and show the result:

```
watch {{command}}
```

- Re-run a command every 60 seconds:

```
watch {{[-n|--interval]}} 60 {{command}}
```

- Monitor disk space, highlighting differences as they appear:

```
watch {{[-d|--differences]}} df
```

- Repeatedly run a pipeline and show the result:

```
watch "{{command1}} | {{command2}} | {{command3}}"
```

- Exit `watch` if the visible output changes:

```
watch {{[-g|--chgexit]}} {{lsblk}}
```

- Interpret terminal control characters:

```
watch {{[-c|--color]}} {{ls --color=always}}
```

watchexec

Run arbitrary commands when files change.

See also: **`entr`**.

More information: https://manned.org/watchexec.

- Call `ls -la` when any file in the current directory changes:

```
watchexec {{ls -la}}
```

- Run `make` when any JavaScript, CSS, and HTML file in the current directory changes:

```
watchexec {{[-e|--exts]}} {{js,css,html}} make
```

- Run `make` when any file in the `lib` or `src` directory changes:

```
watchexec {{[-w|--watch]}} {{lib}} {{[-w|--watch]}} {{src}} {{make}}
```

- Call/restart `my_server` when any file in the current directory changes, sending `SIGKILL` to stop the child process:

```
watchexec {{[-r|--restart]}} --stop-signal {{SIGKILL}} {{my_server}}
```

- Restart the execution of a command when any Java source file in the current directory changes, sending `SIGKILL` and only checking for updates every `10000` ms:

```
watchexec {{[-r|--restart]}} --stop-signal {{SIGKILL}} --poll 10000 {{[-e|--exts]}} {{java}} {{command}}
```

watchman

A service that watches files, and triggers actions when changes occur.

More information: https://facebook.github.io/watchman/docs/cli-options.

- Infer the root directory of the project containing the specified directory, and watch its files and sub-folders for changes:

```
watchman watch-project {{path/to/directory}}
```

- Add a trigger to run a command when files with a specified filename pattern in a watched directory change:

```
watchman -- trigger {{path/to/watched_directory}} {{trigger_name}} '{{pattern}}' -- {{command}}
```

- List all watched directories:

```
watchman watch-list
```

- Delete a watch on a directory and its associated triggers:

```
watchman watch-del {{path/to/watched_directory}}
```

- Delete all watched directories and triggers:

```
watchman watch-del-all
```

- List all triggers on a watched directory:

```
watchman trigger-list {{path/to/watched_directory}}
```

- Delete a trigger from a watched directory:

```
watchman trigger-del {{path/to/watched_directory}} {{trigger_name}}
```

- Temporarily stop `watchman`, until the next time you call a `watchman` command:

```
watchman shutdown-server
```

watson

A wonderful CLI to track your time.

More information: https://github.com/jazzband/Watson/blob/master/docs/user-guide/commands.md.

- Start monitoring time in project:

```
watson start {{project}}
```

- Start monitoring time in project with tags:

```
watson start {{project}} +{{tag}}
```

- Stop monitoring time for the current project:

```
watson stop
```

- Display the latest working sessions:

```
watson log
```

- Edit most recent frame:

```
watson edit
```

- Remove most recent frame:

```
watson remove
```

waybar

Highly customizable Wayland bar for Sway and Wlroots based compositors.

More information: https://github.com/Alexays/Waybar.

- Start `waybar` with the default configuration and stylesheet:

```
waybar
```

- Use a different configuration file:

```
waybar {{[-c|--config]}} {{path/to/config.jsonc}}
```

- Use a different stylesheet file:

```
waybar {{[-s|--style]}} {{path/to/stylesheet.css}}
```

- Set the logging level:

```
waybar {{[-l|--log-level]}} {{trace|debug|info|warning|error|
critical|off}}
```

wayland-info

Display information about a Wayland compositor and available protocols.

More information: https://manned.org/wayland-info.

- Display information about the current Wayland compositor and available protocols:

```
wayland-info
```

- Display information for interfaces matching a specific name:

```
wayland-info {{[-i|--interface]}} {{wl_output}}
```

- Save the output to a file:

```
wayland-info > {{path/to/file.txt}}
```

waymore

Fetch URLs of a domain from Wayback Machine, Common Crawl, Alien Vault OTX, URLScan, and VirusTotal.

Note: Unless specified, output is dumped into the **`results/`** directory where waymore's **`config.yml`** resides (by default in **`~/.config/waymore/`**).

More information: https://github.com/xnl-h4ck3r/waymore.

- Search for URLs of a domain (output will typically be in `~/.config/waymore/results/`):

```
waymore {{[-i|--input]}} {{example.com}}
```

- Limit search results to only include a list of URLs for a domain and store outputs to the specified file:

```
waymore -mode U {{[-oU|--output-urls]}} {{path/to/example.com-urls.txt}} {{[-i|--input]}} {{example.com}}
```

- Only output the content bodies of URLs and store outputs to the specified directory:

```
waymore -mode R {{[-oR|--output-responses]}} {{path/to/example.com-url-responses}} {{[-i|--input]}} {{example.com}}
```

- Filter the results by specifying date ranges:

```
waymore -from {{YYYYMMDD|YYYYMM|YYYY}} {{[-to|--to-date]}} {{YYYYMMDD|YYYYMM|YYYY}} {{[-i|--input]}} {{example.com}}
```

wbmptopbm

Convert a wireless bitmap file to a PBM image.

More information: https://netpbm.sourceforge.net/doc/wbmptopbm.html.

- Convert a WBMP file to a PBM image:

```
wbmptopbm {{path/to/input_file.wbpm}} > {{path/to/
output_file.pbm}}
```

wc

Count lines, words, and bytes.

More information: https://www.gnu.org/software/coreutils/manual/html_node/wc-invocation.html.

- Count all lines in a file:

```
wc {{[-l|--lines]}} {{path/to/file}}
```

- Count all words in a file:

```
wc {{[-w|--words]}} {{path/to/file}}
```

- Count all bytes in a file:

```
wc {{[-c|--bytes]}} {{path/to/file}}
```

- Count all characters in a file (taking multi-byte characters into account):

```
wc {{[-m|--chars]}} {{path/to/file}}
```

- Count all lines, words, and bytes from `stdin`:

```
{{find .}} | wc
```

- Count the length of the longest line in number of characters:

```
wc {{[-L|--max-line-length]}} {{path/to/file}}
```

wcurl

A simple wrapper around **`curl`** to easily download files.

See also: **`wget`**, **`curl`**.

More information: https://curl.se/wcurl/manual.html.

- Download the contents of a URL to a file indicated by the URL (`index.html` in this case):

```
wcurl {{https://example.com/index.html}}
```

- Download the contents of a URL to a file with a specified name:

```
wcurl {{[-o|--output]}} {{path/to/file}} {{https://example.com/index.html}}
```

- Download the contents of a URL, enabling progress bar and defaulting to HTTP/2:

```
wcurl --curl-options "--progress-bar --http2" {{https://example.com/index.html}}
```

- Resume from an interrupted download:

```
wcurl --curl-options "--clobber --continue-at -" {{https://example.com/index.html}}
```

wdiff

Display word differences between text files.

More information: https://www.gnu.org/software/wdiff/manual/wdiff.html#wdiff-invocation.

- Compare two files:

```
wdiff {{path/to/file1}} {{path/to/file2}}
```

- Ignore case when comparing:

```
wdiff {{[-i|--ignore-case]}} {{path/to/file1}} {{path/to/file2}}
```

- Display how many words are deleted, inserted, or replaced:

```
wdiff {{[-s|--statistics]}} {{path/to/file1}} {{path/to/file2}}
```

weasyprint

Render HTML to PDF or PNG.

More information: https://doc.courtbouillon.org/weasyprint/stable/api_reference.html#command-line-api.

- Render an HTML file to PDF:

```
weasyprint {{path/to/input.html}} {{path/to/output.pdf}}
```

- Render an HTML file to PNG, including an additional user stylesheet:

```
weasyprint {{path/to/input.html}} {{path/to/output.png}} --stylesheet {{path/to/stylesheet.css}}
```

- Output additional debugging information when rendering:

```
weasyprint {{path/to/input.html}} {{path/to/output.pdf}} --verbose
```

- Specify a custom resolution when outputting to PNG:

```
weasyprint {{path/to/input.html}} {{path/to/output.png}} --resolution {{300}}
```

- Specify a base URL for relative URLs in the input HTML file:

```
weasyprint {{path/to/input.html}} {{path/to/output.png}} --base-url {{url_or_filename}}
```

web-ext

Manage web extension development.

More information: https://github.com/mozilla/web-ext.

- Run the web extension in the current directory in Firefox:

```
web-ext run
```

- Run a web extension from a specific directory in Firefox:

```
web-ext run --source-dir {{path/to/directory}}
```

- Display verbose execution output:

```
web-ext run --verbose
```

- Run a web extension in Firefox Android:

```
web-ext run --target firefox-android
```

- Lint the manifest and source files for errors:

```
web-ext lint
```

- Build and package the extension:

```
web-ext build
```

- Display verbose build output:

```
web-ext build --verbose
```

- Sign a package for self-hosting:

```
web-ext sign --api-key {{api_key}} --api-secret
{{api_secret}}
```

webpack

Bundle a web project's js files and other assets into a single output file.

More information: https://webpack.js.org/api/cli/.

- Create a single output file from an entry point file:

```
webpack {{app.js}} {{bundle.js}}
```

- Load CSS files too from the JavaScript file (this uses the CSS loader for CSS files):

```
webpack {{app.js}} {{bundle.js}} --module-bind '{{css=css}}'
```

- Pass a configuration file (with e.g. the entry script and the output filename) and show compilation progress:

```
webpack {{[-c|--config]}} {{webpack.config.js}} --progress
```

- Automatically recompile on changes to project files:

```
webpack {{[-w|--watch]}} {{app.js}} {{bundle.js}}
```

webpmux

Create WebP animations.

More information: https://developers.google.com/speed/webp/docs/webpmux.

- Create a two-frame animation:

```
webpmux -frame {{path/to/frame1.webp}} +{{500}} -frame
{{path/to/frame2.webp}} +{{500}} -loop {{0}} -o {{path/to/
output.webp}}
```

webstorm

The JetBrains JavaScript IDE.

More information: https://www.jetbrains.com/help/webstorm/working-with-the-ide-features-from-command-line.html.

- Open the current directory in WebStorm:

```
webstorm
```

- Open a specific directory in WebStorm:

```
webstorm {{path/to/directory}}
```

- Open specific files in the LightEdit mode:

```
webstorm -e {{path/to/file1 path/to/file2 ...}}
```

- Open and wait until done editing a specific file in the LightEdit mode:

```
webstorm --wait -e {{path/to/file}}
```

- Open a file with the cursor at the specific line:

```
webstorm --line {{line_number}} {{path/to/file}}
```

- Open and compare files (supports up to 3 files):

```
webstorm diff {{path/to/file1 path/to/file2 path/to/
optional_file3}}
```

- Open and perform a three-way merge:

```
webstorm merge {{path/to/left_file}} {{path/to/right_file}}
{{path/to/target_file}}
```

webtorrent

The interface for WebTorrent.

Supports magnets, URLs, info hashes, and **`.torrent`** files.

More information: https://github.com/webtorrent/webtorrent-cli.

- Download a torrent:

```
webtorrent download "{{torrent_id}}"
```

- Stream a torrent to VLC media player:

```
webtorrent download "{{torrent_id}}" --vlc
```

- Stream a torrent to a Digital Living Network Alliance (DLNA) device:

```
webtorrent download "{{torrent_id}}" --dlna
```

- Display a list of files for a specific torrent:

```
webtorrent download "{{torrent_id}}" --select
```

- Specify a file index from the torrent to download:

```
webtorrent download "{{torrent_id}}" --select {{index}}
```

- Seed a specific file or directory:

```
webtorrent seed {{path/to/file_or_directory}}
```

- Create a new torrent file for the specified file path:

```
webtorrent create {{path/to/file}}
```

- Display information for a magnet URI or `.torrent` file:

```
webtorrent info {{path/to/file_or_magnet}}
```

weechat

Internet relay chat client with various features.

More information: https://weechat.org/doc/.

- Start WeeChat:

```
weechat
```

- Do not load any plugin(s) on startup:

```
weechat --no-plugin
```

- Do not load any script(s) on startup:

```
weechat --no-script
```

- Do not connect to servers automatically:

```
weechat --no-connect
```

- Write default terminal colors to `stdout`:

```
weechat --colors
```

wezterm cli

Interact with a running Wezterm GUI or multiplexer.

More information: https://wezterm.org/cli/cli/index.html.

- List windows, tabs, and panes:

```
wezterm cli list
```

- Split the current pane and print the new pane's ID to `stdout`:

```
wezterm cli split-pane --{{left|right|top|bottom}} --{{cells|percent}} {{n}}
```

- Activate (focus) a pane:

```
wezterm cli activate-pane --pane-id {{pane_id}}
```

- Kill a pane:

```
wezterm cli kill-pane --pane-id {{pane_id}}
```

wezterm

Wez's Terminal Emulator - a powerful cross-platform terminal emulator and multiplexer.

Some subcommands such as **`cli`** have their own usage documentation.

More information: https://wezterm.org/cli/general.

- Start a new Wezterm process and create a window:

```
wezterm
```

- Establish an `ssh` session in a new Wezterm window:

```
wezterm ssh {{user}}@{{host}}:{{port}}
```

- Connect to the multiplexer (`wezterm-mux-server`):

```
wezterm connect {{domain_name}}
```

- Output an image to the terminal:

```
wezterm imgcat {{path/to/image}}
```

- Record a terminal session as an asciicast (by default recordings are saved to `/tmp`):

```
wezterm record
```

- Replay an asciicast terminal session:

```
wezterm replay {{path/to/cast_file}}
```

- Specify the configuration file to use (overrides the normal configuration file resolution):

```
wezterm --config-file {{path/to/config_file}}
```

- Display help:

```
wezterm help
```

wfuzz

A web application bruteforcer.

More information: https://wfuzz.readthedocs.io/en/latest/user/basicusage.html.

- Brute force directories and files using the specified [w]ordlist and also [p]roxy the traffic:

```
wfuzz -w {{path/to/file}} -p {{127.0.0.1:8080:HTTP}} {{http://example.com/FUZZ}}
```

- Save the results to a [f]ile:

```
wfuzz -w {{path/to/file}} -f {{filename}} {{http://example.com/FUZZ}}
```

- Show [c]olorized output while only showing the declared response codes in the output:

```
wfuzz -c -w {{path/to/file}} --sc {{200,301,302}} {{http://example.com/FUZZ}}
```

- Use a custom [H]eader to fuzz subdomains while [h]iding specific response [c]odes and word counts. Increase the [t]hreads to 100 and include the target ip/domain:

```
wfuzz -w {{path/to/file}} -H "{{Host: FUZZ.example.com}}" --hc {{301}} --hw {{222}} -t {{100}} {{example.com}}
```

- Brute force Basic Authentication using a list of usernames and passwords from files for each FUZ[z] keyword, [h]iding response [c]odes of unsuccessful attempts:

```
wfuzz -c --hc {{401}} -s {{delay_between_requests_in_seconds}} -z file,{{path/to/usernames}} -z file,{{path/to/passwords}} --basic 'FUZZ:FUZ2Z' {{https://example.com}}
```

- Provide wordlist directly from the command-line and use POST request for fuzzing:

```
wfuzz -z list,{{word1-word2-...}} {{https://api.example.com}} -d "{{id=FUZZ&showwallet=true}}"
```

- Provide wordlists from a file applying Base64 and MD5 encoding on them (`wfuzz -e encoders` lists all available encoders):

```
wfuzz -z file,{{path/to/file}},none-base64-md5 {{https://
example.com/FUZZ}}
```

- List available encoders/payloads/iterators/printers/scripts:

```
wfuzz -e {{encoders|payloads|iterators|printers|scripts}}
```

wg-quick

Quickly set up WireGuard tunnels based on config files.

More information: https://manned.org/wg-quick.

- Set up a VPN tunnel based on `/etc/wireguard/interface.conf`:

```
sudo wg-quick up {{interface}}
```

- Delete a VPN tunnel:

```
sudo wg-quick down {{interface}}
```

- Save the current config of a tunnel to `/etc/wireguard/interface.conf`:

```
sudo wg-quick save {{interface}}
```

- Print the config of a tunnel with `wg-quick`-specific options removed:

```
sudo wg-quick strip {{interface}}
```

wg

Manage the configuration of WireGuard interfaces.

More information: https://www.wireguard.com/quickstart/.

- Check status of currently active interfaces:

```
sudo wg
```

- Check status of the specified interface:

```
sudo wg show {{interface}}
```

- Generate a new private key and print it to `stdout`:

```
wg genkey
```

- Generate a public key from a private key and print it to `stdout`:

```
wg < {{path/to/private_key}} pubkey
```

- Generate a public and private key and save them to files:

```
wg genkey | tee {{path/to/private_key}} | wg pubkey > {{path/to/public_key}}
```

- Generate a pre-shared key and print it to `stdout`:

```
wg genpsk
```

- Show the active configuration of an interface:

```
sudo wg showconf {{interface}}
```

wget

Download files from the Web.

Supports HTTP, HTTPS, and FTP.

See also: **`wcurl`**, **`curl`**.

More information: https://www.gnu.org/software/wget/manual/wget.html.

- Download the contents of a URL to a file (named "foo" in this case):

```
wget {{https://example.com/foo}}
```

- Download the contents of a URL to a specific file:

```
wget {{[-O|--output-document]}} {{path/to/file}} {{https://example.com/foo}}
```

- Download a single web page and all its resources with 3-second intervals between requests (scripts, stylesheets, images, etc.):

```
wget {{[-pkw|--page-requisites --convert-links --wait]}} 3 {{https://example.com/some_page.html}}
```

- Download all listed files within a directory and its sub-directories (does not download embedded page elements):

```
wget {{[-mnp|--mirror --no-parent]}} {{https://example.com/some_path/}}
```

- Limit the download speed and the number of connection retries:

```
wget --limit-rate {{300k}} {{[-t|--tries]}} {{100}} {{https://example.com/some_path/}}
```

- Download a file from an HTTP server using Basic Auth (also works for FTP):

```
wget --user {{username}} --password {{password}} {{https://example.com}}
```

- Continue an incomplete download:

```
wget {{[-c|--continue]}} {{https://example.com}}
```

- Download all URLs stored in a text file to a specific directory:

```
wget {{[-P|--directory-prefix]}} {{path/to/directory}} {{[-
i|--input-file]}} {{path/to/URLs.txt}}
```

wget2

An improved version of **`wget`** for downloading files from the web.

Supports HTTP, HTTPS, and HTTP/2 protocols with enhanced performance.

By default, **`wget2`** uses multiple threads for faster downloads.

More information: https://manned.org/wget2.

- Download the contents of a URL to a file using multiple threads (default behavior differs from `wget`):

```
wget2 {{https://example.com/resource}}
```

- Limit the number of threads used for downloading (default is 5 threads):

```
wget2 --max-threads {{10}} {{https://example.com/resource}}
```

- Download a single web page and all its resources (scripts, stylesheets, images, etc.):

```
wget2 {{[-p|--page-requisites]}} {{[-k|--convert-links]}} {{https://example.com/somepage.html}}
```

- Mirror a website, but do not ascend to the parent directory (does not download embedded page elements):

```
wget2 {{[-m|--mirror]}} {{[-np|--no-parent]}} {{https://example.com/somepath/}}
```

- Limit the download speed and the number of connection retries:

```
wget2 --limit-rate {{300k}} {{[-t|--tries]}} {{100}} {{https://example.com/somepath/}}
```

- Continue an incomplete download (behavior is consistent with `wget`):

```
wget2 {{[-c|--continue]}} {{https://example.com}}
```

- Download all URLs stored in a text file to a specific directory:

```
wget2 {{[-P|--directory-prefix]}} {{path/to/directory}} {{[-i|--input-file]}} {{URLs.txt}}
```

- Download a file from an HTTP server using Basic Auth (also works for HTTPS):

```
wget2 --user {{username}} --password {{password}} {{https://example.com}}
```

whatwaf

Detect and bypass web application firewalls and protection systems.

More information: https://github.com/Ekultek/WhatWaf#basic-help-menu.

- Detect protection on a single URL, optionally use verbose output:

```
whatwaf {{[-u|--url]}} {{https://example.com}} --verbose
```

- Detect protection on a list of URLs in parallel from a file (one URL per line):

```
whatwaf {{[-t|--threads]}} {{number}} {{[-l|--list]}} {{path/to/file}}
```

- Send requests through a proxy and use custom payload list from a file (one payload per line):

```
whatwaf --proxy {{http://127.0.0.1:8080}} --pl {{path/to/file}} {{[-u|--url]}} {{https://example.com}}
```

- Send requests through Tor (Tor must be installed) using custom payloads (comma-separated):

```
whatwaf --tor {{[-p|--payloads]}} '{{payload1,payload2,...}}' {{[-u|--url]}} {{https://example.com}}
```

- Use a random user-agent, set throttling and timeout, send a POST request, and force HTTPS connection:

```
whatwaf --ra --throttle {{seconds}} --timeout {{seconds}} {{[-P|--post]}} --force-ssl {{[-u|--url]}} {{http://example.com}}
```

- List all WAFs that can be detected:

```
whatwaf --wafs
```

- List all available tamper scripts:

```
whatwaf --tampers
```

whatweb

Next-generation web scanner.

More information: https://github.com/urbanadventurer/WhatWeb#usage.

- Scan websites/targets for web technologies:

```
whatweb {{website1 website2 ...}}
```

- Read targets/websites from a file:

```
whatweb {{[-i|--input-file]}} {{targets_file}}
```

- Scan a website/target in verbose mode:

```
whatweb {{[-v|--verbose]}} {{example.com}}
```

- Run an aggressive scan on a website:

```
whatweb {{[-a|--aggression]}} 3 {{example.com}}
```

- Scan a network and suppress errors:

```
whatweb --no-errors {{192.168.0.0/24}}
```

- List plugins:

```
whatweb {{[-l|--list-plugins]}}
```

- List plugin details:

```
whatweb {{[-I|--info-plugins]}} {{plugin_name}}
```

whence

A Zsh builtin to indicate how a command would be interpreted.

More information: https://zsh.sourceforge.io/Doc/Release/Shell-Builtin-Commands.html#index-whence.

- Interpret `command`, with expansion if defined as an `alias` (similar to the `command -v` builtin):

```
whence "{{command}}"
```

- Display type of `command`, with location if defined as a function or binary (equivalent to the `type` and `command -V` builtins):

```
whence -v "{{command}}"
```

- Display type of `command`, with content of shell functions instead of location (equivalent to `which` builtin):

```
whence -c "{{command}}"
```

- Display type of `command`, with content of shell functions and all occurrences on command path (equivalent to the `where` builtin):

```
whence -ca "{{command}}"
```

- Search only the `$PATH` for `command`, ignoring builtins, aliases, or shell functions (equivalent to the `where` command):

```
whence -p "{{command}}"
```

where

Report all known instances of a command.

It could be an executable in the **`$PATH`** environment variable, an alias, or a shell builtin.

More information: https://zsh.sourceforge.io/Doc/Release/Shell-Builtin-Commands.html.

- Find all instances of a command:

```
where {{command}}
```

which

Locate a program in the user's **`$PATH`**.

See also: **`whereis`**, **`type`**.

More information: https://manned.org/which.

- Search the `$PATH` environment variable and display the location of any matching executables:

```
which {{executable}}
```

- If there are multiple executables which match, display all:

```
which {{[-a|--all]}} {{executable}}
```

while

Simple shell loop that repeats while the return value remains zero.

More information: https://www.gnu.org/software/bash/manual/bash.html#index-while.

- Read `stdin` and perform an action on every line:

```
while read line; do {{echo "$line"}}; done
```

- Execute a command forever once every second:

```
while :; do {{command}}; sleep 1; done
```

- Execute a command until it fails:

```
while {{command}}; do :; done
```

whisper

Convert audio files to **`txt`**, **`vtt`**, **`srt`**, **`tsv`**, and **`json`**.

More information: https://github.com/openai/whisper.

- Convert a specific audio file to all of the given file formats:

```
whisper {{path/to/audio.mp3}}
```

- Convert an audio file specifying the output format of the converted file:

```
whisper {{path/to/audio.mp3}} --output_format {{txt}}
```

- Convert an audio file using a specific model for conversion:

```
whisper {{path/to/audio.mp3}} --model
{{tiny.en,tiny,base.en,base,small.en,small,medium.en,medium,large-
v1,large-v2,large}}
```

- Convert an audio file specifying which language the audio file is in to reduce conversion time:

```
whisper {{path/to/audio.mp3}} --language {{english}}
```

- Convert an audio file and save it to a specific location:

```
whisper {{path/to/audio.mp3}} --output_dir "{{path/to/
output}}"
```

- Convert an audio file in quiet mode:

```
whisper {{path/to/audio.mp3}} --verbose {{False}}
```

who

Display who is logged in and related data (processes, boot time).

See also: **`users`**, **`w`**, **`whoami`**.

More information: https://www.gnu.org/software/coreutils/manual/html_node/who-invocation.html.

- Display the username, line, and time of all currently logged-in sessions:

```
who
```

- Display all available information:

```
who {{[-a|--all]}}
```

- Display all available information with table headers:

```
who {{[-aH|--all --heading]}}
```

whoami

This command is an alias of **`id --user --name`**.

- View documentation for the original command:

  ```
  tldr id
  ```

whois

Client for the WHOIS (RFC 3912) protocol.

More information: https://manned.org/whois.

- Get information about a domain name:

```
whois {{example.com}}
```

- Get information about an IP address:

```
whois {{8.8.8.8}}
```

- Get abuse contact for an IP address:

```
whois -b {{8.8.8.8}}
```

wiggle

A patch application tool resolving conflicts in patches that **`patch`** cannot handle.

Note: Wiggle forcefully applies all changes, merging when conflicts arise, and reporting unresolvable issues.

More information: https://manned.org/wiggle.

- Apply changes from the patch file to the original file:

```
wiggle {{path/to/file.patch}}
```

- Apply changes to the output file:

```
wiggle {{path/to/file.patch}} {{[-o|--output]}} {{path/to/output_file.txt}}
```

- Take any changes in `file.rej` that could not have been applied and merge them into a file:

```
wiggle {{[-r|--replace]}} {{path/to/file}} {{path/to/file.rej}}
```

- Extract one branch of a patch or merge file:

```
wiggle {{[-x|--extract]}} {{path/to/file.patch}}
```

- Apply a patch and save the compared words to the output file:

```
wiggle {{[-w|--words]}} {{path/to/my_word_patch.patch}} {{[-o|--output]}} {{path/to/word_patched_code.c}}
```

- Display help about the merge function:

```
wiggle {{[-m|--merge]}} {{[-h|--help]}}
```

wikiman

Offline search engine for documentation.

Supports manual pages, Arch Wiki, Gentoo Wiki, FreeBSD documentation, and tldr-pages.

More information: https://github.com/filiparag/wikiman#usage.

- Search for a specific topic in all installed sources:

```
wikiman {{search_term}}
```

- Search for a topic in a specific [s]ource:

```
wikiman -s {{source}} {{search_term}}
```

- Search for a topic in two or more specific [s]ources:

```
wikiman -s {{source1,source2,...}} {{search_term}}
```

- List existing [S]ources:

```
wikiman -S
```

- Display [h]elp:

```
wikiman -h
```

wikit

Easily get Wikipedia summaries.

More information: https://github.com/KorySchneider/wikit#usage.

- Show a short summary of a specific topic on Wikipedia:

```
wikit {{topic}}
```

- Specify a language (ISO 639-1 language code):

```
wikit {{topic}} {{[-l|--lang]}} {{language_code}}
```

- Open the full Wikipedia article in the default browser:

```
wikit {{topic}} -b
```

- Open a disambiguation menu:

```
wikit {{topic}} -d
```

winicontopam

Convert a Windows ICO file to a PAM file.

More information: https://netpbm.sourceforge.net/doc/winicontopam.html.

- Read an ICO file and convert the best quality image contained therein to the PAM format:

```
winicontopam {{path/to/input_file.ico}} > {{path/to/output.pam}}
```

- Convert all images in the input file to PAM:

```
winicontopam {{[-al|-allimages]}} {{path/to/input_file.ico}} > {{path/to/output.pam}}
```

- Convert the n'th image in the input file to PAM:

```
winicontopam {{[-i|-image]}} {{n}} {{path/to/input_file.ico}} > {{path/to/output.pam}}
```

- If the image(s) to be extracted contain graded transparency data and an AND mask, write the AND mask into the fifth channel of the output PAM file:

```
winicontopam {{[-an|-andmasks]}} {{path/to/input_file.ico}} > {{path/to/output.pam}}
```

winicontoppm

This command has been superseded by **`winicontopam`**.

More information: https://netpbm.sourceforge.net/doc/winicontoppm.html.

- View documentation for the current command:

```
tldr winicontopam
```

wipeclean

Clear the terminal screen using an animated wiper.

More information: https://github.com/JeanJouliaCode/wipeClean#usage.

- Clear the terminal screen:

```
wipeclean
```

- Set the animation speed in frames per second (defaults to 150):

```
wipeclean {{[-s|--speed]}} {{speed}}
```

wishlist

SSH directory and multiplexer.

Acts as a single entry point for connecting to SSH servers or Wish applications.

More information: https://github.com/charmbracelet/wishlist.

- Explore SSH servers listed in your `~/.ssh/config` file (local mode):

```
wishlist
```

- Start Wishlist in server mode to provide remote access:

```
wishlist {{[s|serve]}}
```

- Use a custom configuration file:

```
wishlist {{[-c|--config]}} {{path/to/config.yaml}}
```

- Discover SSH endpoints using Zeroconf (mDNS/Bonjour):

```
wishlist --zeroconf.enabled
```

- Discover SSH nodes from DNS SRV records:

```
wishlist --srv.domain {{example.com}}
```

- Discover SSH nodes from a Tailscale tailnet:

```
wishlist --tailscale.net={{tailnet_name}} --
tailscale.key={{tskey-api-abc123}}
```

witr

Inspect processes, services, and ports by tracing their origin.

More information: https://github.com/pranshuparmar/witr.

- Inspect a process by name:

```
witr {{process_name}}
```

- Inspect a process by PID:

```
witr --pid {{process_id}}
```

- Find which process is using a network port:

```
witr --port {{port}}
```

- Display a full process tree for a specific PID:

```
witr --pid {{process_id}} --tree
```

- Display a short summary output:

```
witr --short {{process_name}}
```

- Display the results in a JSON format:

```
witr --pid {{process_id}} --json
```

wkhtmltopdf

Convert HTML documents or web pages into PDF files.

More information: https://wkhtmltopdf.org/usage/wkhtmltopdf.txt.

- Convert a HTML document into PDF:

```
wkhtmltopdf {{input.html}} {{output.pdf}}
```

- Specify the PDF page size (please see `PaperSize` of `QPrinter` for supported sizes):

```
wkhtmltopdf --page-size {{A4}} {{input.html}} {{output.pdf}}
```

- Set the PDF page margins:

```
wkhtmltopdf --margin-{{top|bottom|left|right}} {{10mm}}
{{input.html}} {{output.pdf}}
```

- Set the PDF page orientation:

```
wkhtmltopdf --orientation {{Landscape|Portrait}}
{{input.html}} {{output.pdf}}
```

- Generate a greyscale version of the PDF document:

```
wkhtmltopdf --grayscale {{input.html}} {{output.pdf}}
```

wlc

Manage localization projects on a Weblate instance.

More information: https://docs.weblate.org/en/latest/wlc.html#commands.

- List projects using a configuration file:

```
wlc {{[-c|--config]}} {{path/to/file}} list-projects
```

- List components in a project and override API URL and API key:

```
wlc {{[-u|--url]}} {{url}} {{[-k|--key]}} {{key}} ls
{{project}}
```

- List translations from a component in a specific format:

```
wlc {{[-f|--format]}} {{text|csv|json|html}} ls {{project}}/
{{component}}
```

- Print statistics for a project:

```
wlc stats {{project}}
```

- Display help:

```
wlc {{[-h|--help]}}
```

wlsunset

Adjust the color temperature in Wayland compositors depending on the sunset/sunrise times.

More information: https://manned.org/wlsunset.

- Automatically compute sunset/sunrise times based on the specified location:

```
wlsunset -l {{latitude}} -L {{longitude}}
```

- Manually set the sunset/sunrise times (time format: `HH:MM`):

```
wlsunset -s {{sunset_time}} -S {{sunrise_time}}
```

- Set the high and low temperatures (default: high - 6500, low - 4000):

```
wlsunset -T {{high_temp}} -t {{low_temp}}
```

- Set the animation time to `n` seconds (only applicable when using manual sunset/sunrise times):

```
wlsunset -d {{n}} -s {{sunset_time}} -S {{sunrise_time}}
```

- Set the gamma (default: 1.0):

```
wlsunset -g {{gamma_value}}
```

wn

Look up related words in a WordNet database.

More information: https://wordnet.princeton.edu/documentation/wn1wn.

- Show information available for the word "emphatically":

```
wn emphatically
```

- List synonyms of the adverb "emphatically":

```
wn emphatically -synsr
```

- List antonyms of the adjective "slow":

```
wn slow -antsa
```

wondershaper

Allow the user to limit the bandwidth of network adapters.

More information: https://github.com/magnific0/wondershaper#usage.

- Show the current [s]tatus of a specific [a]dapter:

```
wondershaper -s -a {{adapter_name}}
```

- Clear limits from a specific [a]dapter:

```
wondershaper -c -a {{adapter_name}}
```

- Set a specific maximum [d]ownload rate (in Kbps):

```
wondershaper -a {{adapter_name}} -d {{1024}}
```

- Set a specific maximum [u]pload rate (in Kbps):

```
wondershaper -a {{adapter_name}} -u {{512}}
```

- Set a specific maximum [d]ownload rate and [u]pload rate (in Kbps):

```
wondershaper -a {{adapter_name}} -d {{1024}} -u {{512}}
```

- Display [h]elp:

```
wondershaper -h
```

woodpecker-cli

Manage, configure, and inspect Woodpecker CI servers, and run workflows locally.

More information: https://woodpecker-ci.org/docs/cli.

- Lint all workflows in the current project:

```
woodpecker-cli lint
```

- Execute a workflow locally:

```
woodpecker-cli exec {{path/to/workflow.yml}}
```

- Execute a workflow locally with environment variables:

```
woodpecker-cli exec --env {{variable_name}}
={{variable_value}} {{path/to/workflow.yml}}
```

- Execute a workflow locally with secrets:

```
woodpecker-cli exec --secrets {{name}}="{{value}}" {{path/to/
workflow.yml}}
```

- Execute a workflow locally with multiple secrets:

```
woodpecker-cli exec --secrets
{{name1="value1",name2="value2",...}} {{path/to/
workflow.yml}}
```

- Set up the command-line client to manage a Woodpecker CI server:

```
woodpecker-cli setup
```

- Show recent pipelines that have run on the remote Woodpecker CI server:

```
woodpecker-cli pipeline show
```

- Update woodpecker-cli to the latest version:

```
woodpecker-cli update
```

wordgrinder

Word processor.

More information: https://cowlark.com/wordgrinder/.

- Start WordGrinder (loads a blank document by default):

```
wordgrinder
```

- Open a given file:

```
wordgrinder {{path/to/file}}
```

- Show the menu:

```
<Alt m>
```

wormhole

Get things from one computer to another, safely.

More information: https://magic-wormhole.readthedocs.io/en/latest/welcome.html#cli-tool.

- Send a file:

```
wormhole send {{path/to/file}}
```

- Receive a file:

```
wormhole receive {{wormhole_code}}
```

- Send raw text interactively:

```
wormhole send
```

- Send a file with a custom code phrase:

```
wormhole send --code {{custom_code}} {{path/to/file}}
```

wp

The official interface to manage WordPress instances.

More information: https://developer.wordpress.org/cli/commands/.

- Print information about the operating system, shell, PHP, and WP-CLI (`wp`) installation:

```
wp --info
```

- Update WP-CLI:

```
wp cli update
```

- Download a fresh WordPress installation to current directory, optionally specifying the locale:

```
wp core download --locale={{locale}}
```

- Create basic `wpconfig` file (assuming database on `localhost`):

```
wp config create --dbname={{dbname}} --dbuser={{dbuser}} --dbpass={{dbpass}}
```

- Install and activate a WordPress plugin:

```
wp plugin install {{plugin}} --activate
```

- Replace all instances of a string in the database:

```
wp search-replace {{old_string}} {{new_string}}
```

- Import the contents of a WordPress Extended RSS (WXR) file:

```
wp import {{path/to/file.xml}}
```

wpa_supplicant

Manage protected wireless networks.

More information: https://manned.org/wpa_supplicant.1.

- Join a protected wireless network:

```
wpa_supplicant -i {{interface}} -c {{path/to/
wpa_supplicant_conf.conf}}
```

- Join a protected wireless network and run it in a daemon:

```
wpa_supplicant -B -i {{interface}} -c {{path/to/
wpa_supplicant_conf.conf}}
```

wpaclean

Clean capture files to get only the 4-way handshake and a beacon.

Part of Aircrack-ng network software suite.

More information: https://manned.org/wpaclean.

- Clean capture and save only the 4-way handshake and a beacon in the result:

```
wpaclean {{path/to/result.cap}} {{path/to/capture.cap}}
```

- Clean multiple captures and save 4-way handshakes and beacons in the result:

```
wpaclean {{path/to/result.cap}} {{path/to/capture1.cap path/to/capture2.cap ...}}
```

wpm

Typeracer-like console app for measuring your WPM.

More information: https://github.com/cslarsen/wpm.

- Start `wpm`:

  ```
  wpm
  ```

- Start `wpm` with short texts:

  ```
  wpm --short
  ```

- Start `wpm` using a specific text file:

  ```
  wpm --load {{path/to/file.txt}}
  ```

- Tag your race scores:

  ```
  wpm --tag {{tag_name}}
  ```

- Show score statistics grouped by tags:

  ```
  wpm --stats
  ```

- Start `wpm` with monochrome colors:

  ```
  wpm --monochrome
  ```

wpscan

WordPress vulnerability scanner.

More information: https://github.com/wpscanteam/wpscan.

- Update the vulnerability database:

```
wpscan --update
```

- Scan a WordPress website:

```
wpscan --url {{url}}
```

- Scan a WordPress website, using random user agents and passive detection:

```
wpscan --url {{url}} --stealthy
```

- Scan a WordPress website, checking for vulnerable plugins and specifying the path to the `wp-content` directory:

```
wpscan --url {{url}} --enumerate {{vp}} --wp-content-dir {{remote/path/to/wp-content}}
```

- Scan a WordPress website through a proxy:

```
wpscan --url {{url}} --proxy {{protocol://ip:port}} --proxy-auth {{username:password}}
```

- Perform user identifiers enumeration on a WordPress website:

```
wpscan --url {{url}} --enumerate {{u}}
```

- Execute a password guessing attack on a WordPress website:

```
wpscan --url {{url}} --usernames {{username|path/to/usernames.txt}} --passwords {{path/to/passwords.txt}} threads {{20}}
```

- Scan a WordPress website, collecting vulnerability data from the WPVulnDB (https://wpvulndb.com/):

```
wpscan --url {{url}} --api-token {{token}}
```

wrangler

Cloudflare Workers tool.

More information: https://developers.cloudflare.com/workers/wrangler/commands/.

- Initialize a project with a skeleton configuration:

```
wrangler init {{project_name}}
```

- Authenticate with Cloudflare:

```
wrangler login
```

- Start a local development server:

```
wrangler dev --host {{hostname}}
```

- Publish the worker script:

```
wrangler publish
```

- Aggregate logs from the production worker:

```
wrangler tail
```

write

Write a message on the terminal of a specified logged in user (**`<Ctrl c>`** to stop writing messages).

Use the **`who`** command to find out all terminal_ids of all active users active on the system.

See also: **`mesg`**.

More information: https://manned.org/write.1p.

- Send a message to a given user on a given terminal ID:

```
write {{username}} {{terminal_id}}
```

- Send message to "testuser" on terminal `/dev/tty/5`:

```
write {{testuser}} {{tty/5}}
```

- Send message to "johndoe" on pseudo terminal `/dev/pts/5`:

```
write {{johndoe}} {{pts/5}}
```

wrk

HTTP benchmarking tool.

More information: https://github.com/wg/wrk#basic-usage.

- Run a benchmark for 30 seconds, using 12 threads, and keeping 400 HTTP connections open:

```
wrk {{[-t|--threads]}} {{12}} {{[-c|--connections]}} {{400}} {{[-d|--duration]}} {{30s}} "{{http://127.0.0.1:8080/index.html}}"
```

- Run a benchmark with a custom header:

```
wrk {{[-t|--threads]}} {{2}} {{[-c|--connections]}} {{5}} {{[-d|--duration]}} {{5s}} {{[-H|--header]}} "{{Host: example.com}}" "{{http://example.com/index.html}}"
```

- Run a benchmark with a request timeout of 2 seconds:

```
wrk {{[-t|--threads]}} {{2}} {{[-c|--connections]}} {{5}} {{[-d|--duration]}} {{5s}} --timeout {{2s}} "{{http://example.com/index.html}}"
```

wuzz

Interactively inspect HTTP requests and responses.

More information: https://github.com/asciimoo/wuzz#commands.

- Start `wuzz`:

  `wuzz`

- Send an HTTP request:

  `<Ctrl r>`

- Switch to the next view:

  `<Ctrl j><Tab>`

- Switch to the previous view:

  `<Ctrl k><Shift Tab>`

- Display help:

  `<F1>`

x ping

Enhanced modules for ping.

More information: https://x-cmd.com/mod/ping.

- Ping a specific host (defaults to bing.com if omitted):

```
x ping {{host}}
```

- Show ping results as a heatmap:

```
x ping {{[-m|--heatmap]}} {{host}}
```

- Show ping results as a bar graph:

```
x ping {{[-b|--bar]}} {{host}}
```

- Process ping results and display as heatmap:

```
ping {{host}} | x ping vis {{[-m|--heatmap]}}
```

- Display help:

```
x ping {{[-h|--help]}}
```

x tping

Ping a host via TCP to check reachability.

More information: https://x-cmd.com/mod/tping.

- Ping a host on default port 80 with verbose mode:

```
x tping {{host}}
```

- Ping a host with specific port:

```
x tping {{host}}:{{port}}
```

- Show results as a heatmap:

```
x tping {{[-m|--heatmap]}} {{host}}
```

- Show results as a bar graph:

```
x tping {{[-b|--bar]}} {{host}}:{{port}}
```

- Output in raw data mode:

```
x tping {{[-r|--raw]}} {{host}}
```

- Output in a specific format:

```
x tping {{--csv|--tsv}} {{host}}
```

x

Manage modules and packages.

More information: https://x-cmd.com.

- Use a module (e.g., path module):

```
x {{module}}
```

- Install a package globally (e.g., jq):

```
x env use {{package}}
```

- Run a package temporarily in current shell session:

```
x env try {{package}}
```

- Run a package directly without installation:

```
x {{package}}
```

- Initialize OpenAI API keys for AI features:

```
x openai init
```

- Query the package installation method and execute it:

```
x install
```

x11docker

Securely run GUI applications and desktop UIs in Docker containers.

See also: **xephyr**.

More information: https://github.com/mviereck/x11docker#terminal-syntax.

- Launch VLC in a container:

```
x11docker {{[-p|--pulseaudio]}} --share {{$HOME/Videos}}
{{jess/vlc}}
```

- Launch Xfce in a window:

```
x11docker {{[-d|--desktop]}} {{x11docker/xfce}}
```

- Launch GNOME in a window:

```
x11docker {{[-d|--desktop]}} {{[-g|--gpu]}} --
init={{systemd}} {{x11docker/gnome}}
```

- Launch KDE Plasma in a window:

```
x11docker {{[-d|--desktop]}} {{[-g|--gpu]}} --
init={{systemd}} {{x11docker/kde-plasma}}
```

- Display help:

```
x11docker --help
```

x8

A hidden parameters discovery suite for identifying vulnerable or interesting web parameters.

More information: https://github.com/Sh1Yo/x8/blob/main/docs.md.

- Check hidden parameters in a URL query:

```
x8 {{[-u|--url]}} {{https://example.com/}} {{[-w|--wordlist]}} {{path/to/wordlist.txt}}
```

- Check parameters with a custom query injection point (`%s`):

```
x8 {{[-u|--url]}} {{https://example.com/?something=1%26%s}} {{[-w|--wordlist]}} {{path/to/wordlist.txt}}
```

- Send parameters via POST body with JSON format:

```
x8 {{[-u|--url]}} {{https://example.com/}} {{[-X|--method]}} {{POST}} {{[-b|--body]}} '{{{"x":{%s\}\}}}' {{[-w|--wordlist]}} {{path/to/wordlist.txt}}
```

- Check parameters with a custom template (`%k` for key, `%v` for value):

```
x8 {{[-u|--url]}} {{https://example.com/}} {{[-P|--param-template]}} {{user[%k]=%v}} {{[-w|--wordlist]}} {{path/to/wordlist.txt}}
```

- Encode parameters for special characters in queries:

```
x8 {{[-u|--url]}} {{https://example.com/?path=..%2faction.php%3f%s%23}} --encode {{[-w|--wordlist]}} {{path/to/wordlist.txt}}
```

- Discover hidden headers for a URL:

```
x8 {{[-u|--url]}} {{https://example.com/}} --headers {{[-w|--wordlist]}} {{path/to/headers.txt}}
```

- Check multiple URLs in parallel with high concurrency and verify found parameters:

```
x8 {{[-u|--url]}} {{https://example.com/}} {{https://4rt.one/}} {{[-W|--workers]}} {{0}} -c {{3}} --verify
```

- Save request and response data for found parameters to a directory:

```
x8 {{[-u|--url]}} {{https://example.com/}} {{[-w|--
wordlist]}} {{path/to/wordlist.txt}} --save-responses {{path/
to/output_directory}}
```

x_x

View Excel and CSV files.

More information: https://github.com/kristianperkins/x_x.

- View an XLSX or CSV file:

```
x_x {{file.xlsx|file.csv}}
```

- View an XLSX or CSV file, using the first row as table headers:

```
x_x {{[-h|--heading]}} {{0}} {{file.xlsx|file.csv}}
```

- View a CSV file with unconventional delimiters:

```
x_x {{[-d|--delimiter]}} '{{;}}' {{[-q|--quotechar]}}
'{{|}}' {{file.csv}}
```

xar

Manage **`.xar`** archives.

More information: https://manned.org/xar.

- Create a xar archive of all files in a given directory:

```
xar -cf {{archive.xar}} {{path/to/directory}}
```

- List the contents of a given xar archive:

```
xar -tf {{archive.xar}}
```

- Extract the contents of a given xar archive to the current directory:

```
xar -xf {{archive.xar}}
```

xargs

Execute a command with piped arguments coming from another command, a file, etc.

The input is treated as a single block of text and split into separate pieces on spaces, tabs, newlines, and end-of-file.

See also: **`parallel`**.

More information: https://www.gnu.org/software/findutils/manual/find.html#xargs-options.

- Run a command using the input data as arguments:

```
{{arguments_source}} | xargs {{command}}
```

- Run multiple chained commands on the input data:

```
{{arguments_source}} | xargs sh -c "{{command1}} && {{command2}} | {{command3}}"
```

- Execute a new command with each argument:

```
{{arguments_source}} | xargs {{[-n|--max-args]}} 1 {{command}}
```

- Raise the parallel process limit to 10 (default is 1; 0 means as many processes as possible):

```
{{arguments_source}} | xargs {{[-P|--max-procs]}} 10 {{[-n|--max-args]}} {{1}} {{command}}
```

- Execute the command once for each input line, replacing any occurrences of the placeholder (here marked as _) with the input line:

```
{{arguments_source}} | xargs -I _ {{command}} _ {{optional_extra_arguments}}
```

- Prompt user for confirmation before executing command (confirm with `y` or `Y`):

```
{{arguments_source}} | xargs {{[-p|--interactive]}} {{command}}
```

- Read a file for arguments to be given to a command:

```
xargs {{[-a|--arg-file]}} {{path/to/file}} {{command}}
```

- Allow the command to access the terminal for interactive input:

```
{{arguments_source}} | xargs {{[-o|--open-tty]}} {{command}}
```

xbmtopbm

Convert an X11 or X10 bitmap to a PBM image.

More information: https://netpbm.sourceforge.net/doc/xbmtopbm.html.

- Convert an XBM image to a PPM image:

```
xbmtopbm {{path/to/input_file.xbm}} > {{path/to/
output_file.pbm}}
```

xcaddy

The custom build tool for the Caddy Web Server.

More information: https://github.com/caddyserver/xcaddy#command-usage.

- Build Caddy server from source:

```
xcaddy build
```

- Build Caddy server with a specific version (defaults to latest):

```
xcaddy build {{version}}
```

- Build Caddy with a specific module:

```
xcaddy build --with {{module_name}}
```

- Build Caddy and output to a specific file:

```
xcaddy build --output {{path/to/file}}
```

- Build and run Caddy for a development plugin in the current directory:

```
xcaddy run
```

- Build and run Caddy for a development plugin using a specific Caddy config:

```
xcaddy run --config {{path/to/file}}
```

XCV

Cut, copy, and paste in the command-line.

More information: https://github.com/busterc/xcv#xcv.

- Cut a file:

```
xcv x {{input_file}}
```

- Copy a file:

```
xcv c {{input_file}}
```

- Paste a file:

```
xcv v {{output_file}}
```

- List files available for pasting:

```
xcv l
```

xdelta

A delta encoding utility to generate and apply patches to binary files.

For the modern version (v3), see **`xdelta3`**.

More information: https://manned.org/xdelta.

- Generate a patch (delta) between two files:

```
xdelta delta {{path/to/old_file}} {{path/to/new_file}}
{{path/to/patch_file}}
```

- Apply a patch to an old file to reconstruct the new file:

```
xdelta patch {{path/to/patch_file}} {{path/to/old_file}}
{{path/to/new_file}}
```

- Generate a patch with a specific compression level:

```
xdelta delta -{{0..9}} {{path/to/old_file}} {{path/to/
new_file}} {{path/to/patch_file}}
```

xdelta3

A delta compression tool for binary files.

More information: https://github.com/jmacd/xdelta/blob/wiki/CommandLineSyntax.md.

- Create a patch ([e]ncode) based on a [s]ource file:

```
xdelta3 -e -s {{path/to/old_file}} {{path/to/new_file}} {{path/to/patch_file}}
```

- Apply a patch ([d]ecompress) to a [s]ource file:

```
xdelta3 -d -s {{path/to/old_file}} {{path/to/patch_file}} {{path/to/new_file}}
```

- Create a patch with a specific compression level:

```
xdelta3 -{{0..9}} -s {{path/to/old_file}} {{path/to/new_file}} {{path/to/patch_file}}
```

xe

Execute a command once for each line piped from another command or file.

More information: https://github.com/leahneukirchen/xe/blob/master/README.

- Run a command once for each line of input data as arguments:

```
{{arguments_source}} | xe {{command}}
```

- Execute the commands, replacing any occurrence of the placeholder (marked as `{}`) with the input line:

```
{{arguments_source}} | xe {{command}} {}
{{optional_extra_arguments}}
```

- Execute a shellscript, joining every `N` lines into a single call:

```
echo -e 'a\nb' | xe -N{{2}} -s 'echo $2 $1'
```

- Delete all files with a `.backup` extension:

```
find . -name '{{*.backup}}' | xe rm -v
```

- Run up to `max-jobs` processes in parallel; the default is 1. If `max-jobs` is 0, xe will run as many processes as cpu cores:

```
{{arguments_source}} | xe -j {{max_jobs}} {{command}}
```

Xephyr

A nested X server that runs as an X application.

More information: https://manned.org/xserver-xephyr.

- Create a black window with display ID ":2":

```
Xephyr -br -ac -noreset -screen {{800x600}} {{:2}}
```

- Start an X application on the new screen:

```
DISPLAY=:2 {{command_name}}
```

xetex

Compile a PDF document from XeTeX source files.

More information: https://www.tug.org/xetex/.

- Compile a PDF document:

```
xetex {{source.tex}}
```

- Compile a PDF document, specifying an output directory:

```
xetex -output-directory={{path/to/directory}} {{source.tex}}
```

- Compile a PDF document, exiting if errors occur:

```
xetex -halt-on-error {{source.tex}}
```

xev

Print contents of X events.

More information: https://manned.org/xev.

- Monitor all occurring X events:

```
xev
```

- Monitor all X events of the root window instead of creating a new one:

```
xev -root
```

- Monitor all X events of a particular window:

```
xev -id {{window_id}}
```

- Monitor X events from a given category (can be specified multiple times):

```
xev -event {{event_category}}
```

xgettext

Extract gettext strings from code files.

More information: https://www.gnu.org/software/gettext/manual/gettext.html#xgettext-Invocation.

- Scan file and output strings to `messages.po`:

```
xgettext {{path/to/input_file}}
```

- Use a different output filename:

```
xgettext {{[-o|--output]}} {{path/to/output_file}} {{path/to/input_file}}
```

- Append new strings to an existing file:

```
xgettext {{[-j|--join-existing]}} {{[-o|--output]}} {{path/to/output_file}} {{path/to/input_file}}
```

- Don't add a header containing metadata to the output file:

```
xgettext --omit-header {{path/to/input_file}}
```

- Display help:

```
xgettext {{[-h|--help]}}
```

xh

Friendly and fast tool for sending HTTP requests.

Note: **`xh`**, written in rust, serves as an effective drop-in replacement for **`http`**.

See also: **`http`**, **`curl`**.

More information: https://github.com/ducaale/xh#usage.

- Send a GET request (shows response headers and content):

```
xh {{https://postman-echo.com/get}}
```

- Send a POST request with a JSON body (key-value pairs are added to a top-level JSON object - e.g. `{"name": "john", "age": 25}`):

```
xh post {{https://postman-echo.com/post}} {{name=john}} {{age=25}}
```

- Send a GET request with query parameters (e.g. https://postman-echo.com/response-headers?foo1=bar1&foo2=bar2):

```
xh get {{https://postman-echo.com/response-headers}} {{foo1==bar1}} {{foo2==bar2}}
```

- Send a GET request with a custom header:

```
xh get {{https://postman-echo.com}} {{header-name:header-value}}
```

- Make a GET request and save the response body to a file:

```
xh {{[-d|--download]}} {{https://example.com}} {{[-o|--output]}} {{path/to/file}}
```

- Simulate sending a request without actually sending it:

```
xh --offline {{get|delete|...}} {{https://example.com}}
```

- Show equivalent `curl` command (this will not send any request):

```
xh --{{curl|curl-long}} {{--follow --verbose get https://example.com user-agent:curl}}
```

xidel

Download and extract data from HTML/XML pages as well as JSON APIs.

More information: https://www.videlibri.de/xidel.html#examples.

- Print all URLs found by a Google search:

```
xidel {{https://www.google.com/search?q=test}} {{[-e|--
extract]}} "//a/extract(@href, 'url[?]q=([^&]+)&', 1)[. !=
'']"
```

- Print the title of all pages found by a Google search and download them:

```
xidel {{https://www.google.com/search?q=test}} {{[-f|--
follow]}} "{{//a/extract(@href, 'url[?]q=([^&]+)&', 1)[. !=
'']}}" {{[-e|--extract]}} {{//title}} --download
'{{{$host}/}}'
```

- Follow all links on a page and print the titles, with XPath:

```
xidel {{https://example.org}} {{[-f|--follow]}} {{//a}} {{[-
e|--extract]}} {{//title}}
```

- Follow all links on a page and print the titles, with CSS selectors:

```
xidel {{https://example.org}} {{[-f|--follow]}}
"{{css('a')}}" --css {{title}}
```

- Follow all links on a page and print the titles, with pattern matching:

```
xidel {{https://example.org}} {{[-f|--follow]}} "{{<a>{.}</
a>*}}" {{[-e|--extract]}} "{{<title>{.}</title>}}"
```

- Read the pattern from `example.xml` (which will also check if the element containing "ood" is there, and fail otherwise):

```
xidel {{path/to/example.xml}} {{[-e|--extract]}}
"{{<x><foo>ood</foo><bar>{.}</bar></x>}}"
```

- Print all newest Stack Overflow questions with title and URL using pattern matching on their RSS feed:

```
xidel {{http://stackoverflow.com/feeds}} {{[-e|--extract]}}
"{{<entry><title>{title:=.}</title><link>{uri:=@href}</
link></entry>+}}"
```

- Check for unread Reddit mail, Webscraping, combining CSS, XPath, JSONiq, and automatically form evaluation:

```
xidel {{https://reddit.com}} {{[-f|--follow]}}
"{{form(css('form.login-form')[1], {'user': '$your_username',
'passwd': '$your_password'})}}" {{[-e|--extract]}}
"{{css('#mail')/@title}}"
```

ximtoppm

Convert a XIM file to a PPM image.

More information: https://netpbm.sourceforge.net/doc/ximtoppm.html.

- Convert an XIM image to a PPM image:

```
ximtoppm {{path/to/input_file.xim}} > {{path/to/
output_file.ppm}}
```

- Store the transparency mask of the input image in the specified file:

```
ximtoppm {{[-a|-alphaout]}} {{path/to/alpha_file.pbm}}
{{path/to/input_file.xim}} > {{path/to/output_file.ppm}}
```

xkbcli

Interact with X Keyboard keymaps.

More information: https://manned.org/xkbcli.

- Display how to type a key and if it needs modifiers (Note: Does not support compose sequences):

```
xkbcli how-to-type {{A|0x0041}}
```

- Bring up an interactive window that captures keypresses:

```
xkbcli interactive
```

- Compile a list of available compose sequences:

```
xkbcli compile-compose
```

xkcdpass

A flexible and scriptable password generator which generates strong passphrases.

Inspired by XKCD 936.

More information: https://github.com/redacted/XKCD-password-generator.

- Generate one passphrase with the default options:

  ```
  xkcdpass
  ```

- Generate one passphrase whose first letters of each word match the provided argument:

  ```
  xkcdpass {{[-a|--acrostic]}} {{acrostic}}
  ```

- Generate passwords interactively:

  ```
  xkcdpass {{[-i|--interactive]}}
  ```

xkill

Kill a window interactively in a graphical session.

See also: **`kill`**, **`killall`**.

More information: https://www.x.org/releases/current/doc/man/man1/xkill.1.xhtml.

- Display a cursor to kill a window when pressing the left mouse button (press any other mouse button to cancel):

```
xkill
```

- Display a cursor to select a window to kill by pressing any mouse button:

```
xkill -button any
```

- Kill a window with a specific ID (use `xwininfo` to get info about windows):

```
xkill -id {{window_id}}
```

xlsclients

List client applications running on an X11 display.

More information: https://manned.org/xlsclients.

- List clients on the default display:

```
xlsclients
```

- List clients on all screens:

```
xlsclients -a
```

- List clients with detailed information:

```
xlsclients -l
```

- Limit the command output length per client to a specific number of characters:

```
xlsclients -m {{max_command_length}}
```

- Specify a particular display to inspect:

```
xlsclients -display :{{display_number}}
```

- List clients on remote host's display:

```
xlsclients -display {{remote_host}}:0
```

- Display version:

```
xlsclients -version
```

xmake

A cross-platform C & C++ build utility based on Lua.

More information: https://github.com/xmake-io/xmake#command-line-interface-reference.

- Create an Xmake C project, consisting of a hello world and `xmake.lua`:

```
xmake create {{[-l |--language=]}}c {{project_name}}
```

- Build an Xmake project:

```
xmake {{[b|build]}}
```

- Run an Xmake project:

```
xmake {{[r|run]}}
```

- Run a compiled Xmake target directly:

```
xmake {{[r|run]}} {{target_name}}
```

- Configure a project's build targets:

```
xmake {{[f|config]}} {{[-p |--plat=]}}{{macosx|linux|
iphoneos|...}} {{[-a |--arch=]}}{{x86_64|i386|arm64|...}}
{{[-m |--mode=]}}{{debug|release}}
```

- Install the compiled target to a directory:

```
xmake {{[i|install]}} {{[-o |--installdir=]}}{{path/to/
directory}}
```

xml c14n

This command is an alias of **`xml canonic`**.

- View documentation for the original command:

```
tldr xml canonic
```

xml canonic

Make XML documents canonical.

More information: https://xmlstar.sourceforge.net/doc/UG/xmlstarlet-ug.html#idm47077139560880.

- Make an XML document canonical, preserving comments:

```
xml {{[c14n|canonic]}} {{path/to/input.xml|uri}} > {{path/to/output.xml}}
```

- Make an XML document canonical, removing comments:

```
xml {{[c14n|canonic]}} --without-comments {{path/to/input.xml|uri}} > {{path/to/output.xml}}
```

- Make XML exclusively canonical, using an XPATH from a file, preserving comments:

```
xml {{[c14n|canonic]}} --exc-with-comments {{path/to/input.xml|uri}} {{path/to/c14n.xpath}}
```

- Display help:

```
xml {{[c14n|canonic]}} --help
```

xml depyx

Convert a PYX (ESIS - ISO 8879) document to XML format.

More information: https://xmlstar.sourceforge.net/doc/UG/xmlstarlet-ug.html#idm47077139550832.

- Convert a PYX (ESIS - ISO 8879) document to XML format:

```
xml {{[p2x|depyx]}} {{path/to/input.pyx|uri}} > {{path/to/output.xml}}
```

- Convert a PYX document from `stdin` to XML format:

```
cat {{path/to/input.pyx}} | xml {{[p2x|depyx]}} > {{path/to/output.xml}}
```

- Display help:

```
xml {{[p2x|depyx]}} --help
```

xml edit

Edit an XML document.

More information: https://xmlstar.sourceforge.net/doc/UG/xmlstarlet-ug.html#idm47077139594320.

- Delete elements matching an XPATH from an XML document:

```
xml {{[ed|edit]}} {{[-d|--delete]}} "{{XPATH1}}" {{path/to/input.xml|uri}}
```

- Move an element node of an XML document from XPATH1 to XPATH2:

```
xml {{[ed|edit]}} {{[-m|--move]}} "{{XPATH1}}" "{{XPATH2}}" {{path/to/input.xml|uri}}
```

- Rename all attributes named "id" to "ID":

```
xml {{[ed|edit]}} {{[-r|--rename]}} "{{//*/@id}}" -v "{{ID}}" {{path/to/input.xml|uri}}
```

- Rename sub-elements of the element "table" that are named "rec" to "record":

```
xml {{[ed|edit]}} {{[-r|--rename]}} "{{/xml/table/rec}}" -v "{{record}}" {{path/to/input.xml|uri}}
```

- Update the XML table record with "id=3" to the value "id=5":

```
xml {{[ed|edit]}} {{[-u|--update]}} "{{xml/table/rec[@id=3]/@id}}" {{[-v|--value]}} {{5}} {{path/to/input.xml|uri}}
```

- Display help:

```
xml {{[ed|edit]}} {{[-h|--help]}}
```

xml elements

Extract elements and display the structure of an XML document.

More information: https://xmlstar.sourceforge.net/doc/UG/xmlstarlet-ug.html#idm47077139665568.

- Extract elements from an XML document (producing XPATH expressions):

```
xml {{[el|elements]}} {{path/to/input.xml|uri}} > {{path/to/elements.xpath}}
```

- Extract elements and their attributes from an XML document:

```
xml {{[el|elements]}} -a {{path/to/input.xml|uri}} > {{path/to/elements.xpath}}
```

- Extract elements and their attributes and values from an XML document:

```
xml {{[el|elements]}} -v {{path/to/input.xml|uri}} > {{path/to/elements.xpath}}
```

- Print sorted unique elements from an XML document to see its structure:

```
xml {{[el|elements]}} -u {{path/to/input.xml|uri}}
```

- Print sorted unique elements from an XML document up to a depth of 3:

```
xml {{[el|elements]}} -d{{3}} {{path/to/input.xml|uri}}
```

- Display help:

```
xml {{[el|elements]}} --help
```

xml escape

Escape special XML characters, e.g. **`<a1>`** → **`<a1>`**.

More information: https://xmlstar.sourceforge.net/doc/UG/xmlstarlet-ug.html#idm47077139540960.

- Escape special XML characters in a string:

```
xml {{[esc|escape]}} "{{<a1>}}"
```

- Escape special XML characters from `stdin`:

```
echo "{{<a1>}}" | xml {{[esc|escape]}}
```

- Display help:

```
xml {{[esc|escape]}} --help
```

xml format

Format an XML document.

More information: https://xmlstar.sourceforge.net/doc/UG/xmlstarlet-ug.html#idm47077139569312.

- Format an XML document, indenting with tabs:

```
xml {{[fo|format]}} {{[-t|--indent-tab]}} {{path/to/input.xml|uri}} > {{path/to/output.xml}}
```

- Format an HTML document, indenting with 4 spaces:

```
xml {{[fo|format]}} {{[-H|--html]}} {{[-s|--indent-spaces]}} {{4}} {{path/to/input.html|uri}} > {{path/to/output.html}}
```

- Recover parsable parts of a malformed XML document, without indenting:

```
xml {{[fo|format]}} {{[-R|--recover]}} {{[-n|--noindent]}} {{path/to/malformed.xml|uri}} > {{path/to/recovered.xml}}
```

- Format an XML document from `stdin`, removing the `DOCTYPE` declaration:

```
cat {{path/to/input.xml}} | xml {{[fo|format]}} {{[-D|--dropdtd]}} > {{path/to/output.xml}}
```

- Format an XML document, omitting the XML declaration:

```
xml {{[fo|format]}} {{[-o|--omit-decl]}} {{path/to/input.xml|uri}} > {{path/to/output.xml}}
```

- Display help:

```
xml {{[fo|format]}} --help
```

xml list

List a directory's contents (like **`ls`**) in XML format.

More information: https://xmlstar.sourceforge.net/doc/UG/xmlstarlet-ug.html#idm47077139535968.

- Write the current directory's listing to an XML document:

```
xml {{[ls|list]}} > {{path/to/dir_list.xml}}
```

- Write the specified directory's listing to an XML document:

```
xml {{[ls|list]}} {{path/to/directory}} > {{path/to/dir_list.xml}}
```

- Display help:

```
xml {{[ls|list]}} --help
```

xml p2x

This command is an alias of **`xml depyx`**.

- View documentation for the original command:

```
tldr xml depyx
```

xml pyx

Convert an XML document to PYX (ESIS - ISO 8879) format.

More information: https://xmlstar.sourceforge.net/doc/UG/xmlstarlet-ug.html#idm47077139550832.

- Convert an XML document to PYX format:

```
xml pyx {{path/to/input.xml|uri}} > {{path/to/output.pyx}}
```

- Convert an XML document from `stdin` to PYX format:

```
cat {{path/to/input.xml}} | xml pyx > {{path/to/output.pyx}}
```

- Display help:

```
xml pyx --help
```

xml select

Select from XML documents using XPATHs.

Tip: use **`xml elements`** to display the XPATHs of an XML document.

More information: https://xmlstar.sourceforge.net/doc/UG/xmlstarlet-ug.html#idm47077139652416.

- Select all elements matching "XPATH1" and print the value of their sub-element "XPATH2":

```
xml {{[sel|select]}} {{[-t|--template]}} {{[-m|--match]}}
"{{XPATH1}}" {{[-v|--value-of]}} "{{XPATH2}}" {{path/to/
input.xml|uri}}
```

- Match "XPATH1" and print the value of "XPATH2" as text with new-lines:

```
xml {{[sel|select]}} {{[-T|--text]}} {{[-t|--template]}} {{[-
m|--match]}} "{{XPATH1}}" {{[-v|--value-of]}}
"{{XPATH2}}" {{[-n|--nl]}} {{path/to/input.xml|uri}}
```

- Count the elements of "XPATH1":

```
xml {{[sel|select]}} {{[-t|--template]}} {{[-v|--value-of]}}
"count({{XPATH1}})" {{path/to/input.xml|uri}}
```

- Count all nodes in one or more XML documents:

```
xml {{[sel|select]}} {{[-T|--text]}} {{[-t|--template]}} {{[-
f|--inp-name]}} {{[-o|--output]}} " " {{[-v|--value-of]}}
"count(node())" {{[-n|--nl]}} {{path/to/input1.xml|uri}}
{{path/to/input2.xml|uri}}
```

- Display help:

```
xml {{[sel|select]}} --help
```

xml transform

Transform XML documents using XSLT.

More information: https://xmlstar.sourceforge.net/doc/UG/xmlstarlet-ug.html#idm47077139602800.

- Transform an XML document using an XSL stylesheet, passing one XPATH parameter and one literal string parameter:

```
xml {{[tr|transform]}} {{path/to/stylesheet.xsl}} -p "{{Count='count(/xml/table/rec)'}}" -s {{Text="Count="}} {{path/to/input.xml|uri}}
```

- Display help:

```
xml {{[tr|transform]}} --help
```

xml unescape

Unescape special XML characters, e.g. **`<a1>`** → **`<a1>`**.

More information: https://xmlstar.sourceforge.net/doc/UG/xmlstarlet-ug.html#idm47077139540960.

- Unescape special XML characters from a string:

```
xml {{[unesc|unescape]}} "{{&lt;a1&gt;}}"
```

- Unescape special XML characters from `stdin`:

```
echo "{{&lt;a1&gt;}}" | xml {{[unesc|unescape]}}
```

- Display help:

```
xml {{[unesc|unescape]}} --help
```

xml validate

Validate XML documents.

More information: https://xmlstar.sourceforge.net/doc/UG/xmlstarlet-ug.html#idm47077139576400.

- Validate one or more XML documents for well-formedness only:

```
xml {{[val|validate]}} {{path/to/input1.xml|uri1 path/to/input2.xml|uri2 ...}}
```

- Validate one or more XML documents against a Document Type Definition (DTD):

```
xml {{[val|validate]}} {{[-d|--dtd]}} {{path/to/schema.dtd}} {{path/to/input1.xml|uri1 path/to/input2.xml|uri2 ...}}
```

- Validate one or more XML documents against an XML Schema Definition (XSD):

```
xml {{[val|validate]}} {{[-s|--xsd]}} {{path/to/schema.xsd}} {{path/to/input1.xml|uri1 path/to/input2.xml|uri2 ...}}
```

- Validate one or more XML documents against a Relax NG schema (RNG):

```
xml {{[val|validate]}} {{[-r|--relaxng]}} {{path/to/schema.rng}} {{path/to/input1.xml|uri1 path/to/input2.xml|uri2 ...}}
```

- Display help:

```
xml {{[val|validate]}} --help
```

xml xmln

This command is an alias of **`xml pyx`**.

- View documentation for the original command:

```
tldr xml pyx
```

xml

XMLStarlet Toolkit: query, edit, check, convert, and transform XML documents.

Some subcommands such as **`validate`** have their own usage documentation.

More information: https://xmlstar.sourceforge.net/doc/UG/xmlstarlet-ug.html#idm47077139670224.

- Display general help, including the list of subcommands:

```
xml --help
```

- Execute a subcommand with input from a file or URI, printing to `stdout`:

```
xml {{subcommand}} {{options}} {{path/to/input.xml|uri}}
```

- Execute a subcommand using `stdin` and `stdout`:

```
xml {{subcommand}} {{options}}
```

- Execute a subcommand with input from a file or URI and output to a file:

```
xml {{subcommand}} {{options}} {{path/to/input.xml|uri}} > {{path/to/output}}
```

- Display help for a specific subcommand:

```
xml {{subcommand}} --help
```

- Display version:

```
xml --version
```

xmllint

XML parser and linter that supports XPath, a syntax for navigating XML trees.

More information: https://manned.org/xmllint.

- Return all nodes (tags) with a specific name:

```
xmllint --xpath "//{{node_name}}" {{source_file.xml}}
```

- Return the contents of the first node with a specific name as a string:

```
xmllint --xpath "string(//{{node_name}})" {{source_file.xml}}
```

- Return the href attribute of the second anchor element in an HTML file:

```
xmllint --html --xpath "string(//a[2]/@href)" webpage.xhtml
```

- Return human-readable (indented) XML from file:

```
xmllint --format {{source_file.xml}}
```

- Check that an XML file meets the requirements of its DOCTYPE declaration:

```
xmllint --valid {{source_file.xml}}
```

- Validate XML against DTD schema hosted online:

```
xmllint --dtdvalid {{url}} {{source_file.xml}}
```

xmlstarlet

A XML/XSLT toolkit.

Note: You will likely need to know XPath: https://developer.mozilla.org/en-US/docs/Web/XPath.

More information: https://xmlstar.sourceforge.net/docs.php.

- Format an XML document and print to `stdout`:

```
xmlstarlet format {{path/to/file.xml}}
```

- Format an XML document piped from `stdin`:

```
{{cat path/to/file.xml}} | xmlstarlet format
```

- Print all nodes that match a given XPath:

```
xmlstarlet select --template --copy-of {{xpath}} {{path/to/file.xml}}
```

- Insert an attribute to all matching nodes, and print to `stdout` (source file is unchanged):

```
xmlstarlet edit --insert {{xpath}} --type attr --name {{attribute_name}} --value {{attribute_value}} {{path/to/file.xml}}
```

- Update the value of all matching nodes in place (source file is changed):

```
xmlstarlet edit --inplace --update {{xpath}} --value {{new_value}} {{file.xml}}
```

- Delete all matching nodes in place (source file is changed):

```
xmlstarlet edit --inplace --delete {{xpath}} {{file.xml}}
```

- Escape or unescape special XML characters in a given string:

```
xmlstarlet [un]escape {{string}}
```

- List a given directory as XML (omit argument to list current directory):

```
xmlstarlet ls {{path/to/directory}}
```

xmlto

Apply an XSL stylesheet to an XML document.

More information: https://manned.org/xmlto.

- Convert a DocBook XML document to PDF format:

```
xmlto pdf {{document.xml}}
```

- Convert a DocBook XML document to HTML format and store the resulting files in a separate directory:

```
xmlto -o {{path/to/html_files}} html {{document.xml}}
```

- Convert a DocBook XML document to a single HTML file:

```
xmlto {{html-nochunks}} {{document.xml}}
```

- Specify a stylesheet to use while converting a DocBook XML document:

```
xmlto -x {{stylesheet.xsl}} {{output_format}}
{{document.xml}}
```

xo

A pluggable, zero-configuration linting utility for JavaScript.

More information: https://github.com/xojs/xo#usage.

- Lint files in the "src" directory:

```
xo
```

- Lint a given set of files:

```
xo {{path/to/file1.js path/to/file2.js ...}}
```

- Automatically fix any lint issues found:

```
xo --fix
```

- Lint using spaces as indentation instead of tabs:

```
xo --space
```

- Lint using the "prettier" code style:

```
xo --prettier
```

xonsh

Python-powered, cross-platform, Unix-gazing shell.

Write and mix sh/Python code in Xonsh (pronounced conch).

More information: https://xon.sh/contents.html.

- Start an interactive shell session:

```
xonsh
```

- Execute a single command and then exit:

```
xonsh -c "{{command}}"
```

- Run commands from a script file and then exit:

```
xonsh {{path/to/script_file.xonsh}}
```

- Define environment variables for the shell process:

```
xonsh -D{{name1}}={{value1}} -D{{name2}}={{value2}}
```

- Load the specified `.xonsh` or `.json` configuration files:

```
xonsh --rc {{path/to/file1.xonsh}} {{path/to/file2.json}}
```

- Skip loading the `.xonshrc` configuration file:

```
xonsh --no-rc
```

xpdf

Portable Document Format (PDF) file viewer.

More information: https://www.xpdfreader.com/xpdf-man.html.

- Open a PDF file:

```
xpdf {{path/to/file.pdf}}
```

- Open a specific page in a PDF file:

```
xpdf {{path/to/file.pdf}} :{{page_number}}
```

- Open a compressed PDF file:

```
xpdf {{path/to/file.pdf.tar}}
```

- Open a PDF file in fullscreen mode:

```
xpdf -fullscreen {{path/to/file.pdf}}
```

- Specify the initial zoom:

```
xpdf -z {{75}}% {{path/to/file.pdf}}
```

- Specify the initial zoom at page width or full page:

```
xpdf -z {{page|width}} {{path/to/file.pdf}}
```

xplr

Terminal-based filesystem explorer.

More information: https://xplr.dev/.

- Open a directory:

```
xplr {{path/to/directory}}
```

- Focus on a file:

```
xplr {{path/to/file}}
```

- Focus on a directory:

```
xplr --force-focus {{path/to/directory}}
```

- Open a directory with specific files or directories selected:

```
xplr {{path/to/directory}} {{path/to/
selected_file_or_directory1}} {{path/to/
selected_file_or_directory2}}
```

xpmtoppm

Convert an X11 pixmap to a PPM image.

More information: https://netpbm.sourceforge.net/doc/xpmtoppm.html.

- Convert an XPM image to a PPM image:

```
xpmtoppm {{path/to/input_file.xpm}} > {{path/to/
output_file.ppm}}
```

- Store the transparency mask of the input image in the specified file:

```
xpmtoppm {{[-a|--alphaout]}} {{path/to/alpha_file.pbm}}
{{path/to/input_file.xpm}} > {{path/to/output_file.ppm}}
```

xprop

Display window and font properties in an X server.

More information: https://manned.org/xprop.

- Display the name of the root window:

```
xprop -root WM_NAME
```

- Display the window manager hints for a window:

```
xprop -name "{{window_name}}" WM_HINTS
```

- Display the point size of a font:

```
xprop -font "{{font_name}}" POINT_SIZE
```

- Display all the properties of the window with the ID 0x200007:

```
xprop -id {{0x200007}}
```

- Monitor a window for changes:

```
xprop -spy
```

xsp

Mono ASP.NET Web Server.

More information: https://www.mono-project.com/docs/web/aspnet/.

- Listen on all interfaces (`0.0.0.0`) and port `8080`:

```
xsp
```

- Listen on a specific IP address and port:

```
xsp --address {{127.0.0.1}} --port {{8000}}
```

XSV

A CSV toolkit written in Rust.

More information: https://github.com/BurntSushi/xsv.

- Inspect the headers of a file:

```
xsv headers {{path/to/file.csv}}
```

- Count the number of entries:

```
xsv count {{path/to/file.csv}}
```

- Get an overview of the shape of entries:

```
xsv stats {{path/to/file.csv}} | xsv table
```

- Select a few columns:

```
xsv select {{column1,column2}} {{path/to/file.csv}}
```

- Show 10 random entries:

```
xsv sample {{10}} {{path/to/file.csv}}
```

- Join a column from one file to another:

```
xsv join --no-case {{column1}} {{path/to/file1.csv}}
{{column2}} {{path/to/file2.csv}} | xsv table
```

xteddy

A cuddly teddy bear for your X Windows desktop.

More information: https://manned.org/xteddy.

- Display a cuddly teddy bear on your X desktop:

```
xteddy
```

- Use the window manager to display the teddy bear and ignore the "quit" (<q>) command:

```
xteddy -wm -noquit
```

- Make the teddy bear stay on top of all other windows:

```
xteddy -float
```

- Display another image [F]ile instead of the cuddly teddy bear:

```
xteddy -F {{path/to/image}}
```

- Set the initial location of the teddy bear (`width` and `height` are ignored):

```
xteddy -geometry {{width}}x{{height}}+{{x}}+{{y}}
```

xvminitoppm

Convert an XV thumbnail picture to PPM.

More information: https://netpbm.sourceforge.net/doc/xvminitoppm.html.

- Convert an XV thumbnail image file to PPM:

```
xvminitoppm {{path/to/input_file}} > {{path/to/
output_file.ppm}}
```

xwdtopnm

Convert an X11 or X10 window dump file to PNM.

More information: https://netpbm.sourceforge.net/doc/xwdtopnm.html.

- Convert a XWD image file to PBM:

```
xwdtopnm {{path/to/input_file.xwd}} > {{path/to/
output_file.pnm}}
```

- Display information about the conversion process:

```
xwdtopnm {{[-verb|-verbose]}} {{path/to/input_file.xwd}} >
{{path/to/output_file.pnm}}
```

- Display the contents of the X11 header of the input file:

```
xwdtopnm {{[-h|-headerdump]}} {{path/to/input_file.xwd}} >
{{path/to/output_file.pnm}}
```

xwininfo

Display information about windows.

See also: **`xprop`**, **`xkill`**.

More information: https://www.x.org/releases/current/doc/man/man1/xwininfo.1.xhtml.

- Display a cursor to select a window to display its attributes (id, name, size, position, ...):

```
xwininfo
```

- Display the tree of all windows:

```
xwininfo -tree -root
```

- Display the attributes of a window with a specific ID:

```
xwininfo -id {{window_id}}
```

- Display the attributes of a window with a specific name:

```
xwininfo -name {{name}}
```

- Display the ID of a window searching by name:

```
xwininfo -tree -root | grep {{keyword}} | head -1 | perl -ne 'print $1 if /(0x[\da-f]+)/ig;'
```

xxd

Create a hexadecimal representation (hexdump) from a binary file, or vice-versa.

See also: **`hexyl`**, **`od`**, **`hexdump`**.

More information: https://manned.org/xxd.

- Generate a hexdump from a binary file and display the output:

```
xxd {{input_file}}
```

- Generate a hexdump from a binary file and save it as a text file:

```
xxd {{input_file}} {{output_file}}
```

- Display a more compact output, replacing consecutive zeros (if any) with a star:

```
xxd {{[-a|-autoskip]}} {{input_file}}
```

- Display the output with 10 columns of one octet (byte) each:

```
xxd {{[-c|-cols]}} {{10}} {{input_file}}
```

- Display output only up to a length of 32 bytes:

```
xxd {{[-l|-len]}} {{32}} {{input_file}}
```

- Display the output in plain mode, without any gaps between the columns:

```
xxd {{[-p|-postscript]}} {{input_file}}
```

- Revert a plaintext hexdump back into binary, and save it as a binary file:

```
xxd {{[-r|-revert]}} {{[-p|-postscript]}} {{input_file}}
{{output_file}}
```

xxh

Bring your shell with all of your customizations through SSH sessions.

Note: **xxh** does not install anything into system directories on the target machine; removing **~/.xxh** will clear all traces of xxh on the target machine.

More information: https://github.com/xxh/xxh#usage.

- Connect to a host and run the current shell:

```
xxh "{{host}}"
```

- Install the current shell into the target machine without prompting:

```
xxh "{{host}}" ++install
```

- Run the specified shell on the target machine:

```
xxh "{{host}}" ++shell {{xonsh|zsh|fish|bash|osquery}}
```

- Use a specific xxh configuration directory on the target machine:

```
xxh "{{host}}" ++host-xxh-home {{~/.xxh}}
```

- Use the specified configuration file on the host machine:

```
xxh "{{host}}" ++xxh-config {{~/.config/xxh/config.xxhc}}
```

- Specify a password to use for the SSH connection:

```
xxh "{{host}}" ++password "{{password}}"
```

- Install an xxh package on the target machine:

```
xxh "{{host}}" ++install-xxh-packages {{package}}
```

- Set an environment variable for the shell process on the target machine:

```
xxh "{{host}}" ++env {{name}}={{value}}
```

XZ

Compress or decompress XZ and LZMA files.

More information: https://manned.org/xz.

- Compress a file into XZ format:

```
xz {{path/to/file}}
```

- Decompress an XZ file:

```
xz {{[-d|--decompress]}} {{path/to/file.xz}}
```

- Compress a file using lzma:

```
xz {{[-F|--format]}} lzma {{path/to/file}}
```

- Decompress an LZMA file:

```
xz {{[-d|--decompress]}} {{[-F|--format]}} lzma {{path/to/file.lzma}}
```

- Decompress a file and write to `stdout` (implies `--keep`):

```
xz {{[-d|--decompress]}} {{[-c|--stdout]}} {{path/to/file.xz}}
```

- Compress a file, but don't delete the original:

```
xz {{[-k|--keep]}} {{path/to/file}}
```

- Compress a file using the fastest compression:

```
xz -0 {{path/to/file}}
```

- Compress a file using the best compression:

```
xz -9 {{path/to/file}}
```

xzcat

This command is an alias of **`xz --decompress --stdout`**.

- View documentation for the original command:

```
tldr xz
```

xzcmp

Invoke **cmp** on files compressed with **xz**, **lzma**, **gzip**, **bzip2**, **lzop**, or **zstd**.

All options specified are passed directly to **cmp**.

More information: https://manned.org/xzcmp.

- Compare two specific files:

```
xzcmp {{path/to/file1}} {{path/to/file2}}
```

xzdiff

Invoke **diff** on files compressed with **xz**, **lzma**, **gzip**, **bzip2**, **lzop**, or **zstd**.

All options specified are passed directly to **diff**.

More information: https://manned.org/xzdiff.

- Compare two files:

```
xzdiff {{path/to/file1}} {{path/to/file2}}
```

- Compare two files, showing the differences side by side:

```
xzdiff --side-by-side {{path/to/file1}} {{path/to/file2}}
```

- Compare two files and report only that they differ (no details on what is different):

```
xzdiff --brief {{path/to/file1}} {{path/to/file2}}
```

- Compare two files and report when the files are the same:

```
xzdiff --report-identical-files {{path/to/file1}} {{path/to/file2}}
```

- Compare two files using paginated results:

```
xzdiff --paginate {{path/to/file1}} {{path/to/file2}}
```

xzegrep

This command is an alias of **`xzgrep --extended-regexp`**.

- View documentation for the original command:

```
tldr xzgrep
```

xzfgrep

This command is an alias of **`xzgrep --fixed-strings`**.

- View documentation for the original command:

  ```
  tldr xzgrep
  ```

xzgrep

Search files possibly compressed with **xz**, **lzma**, **gzip**, **bzip2**, **lzop**, or **zstd** using **regex**.

See also: **grep**.

More information: https://manned.org/xzgrep.

- Search for a pattern within a file:

```
xzgrep "{{search_pattern}}" {{path/to/file}}
```

- Search for an exact string (disables regex):

```
xzgrep {{[-F|--fixed-strings]}} "{{exact_string}}" {{path/to/file}}
```

- Search for a pattern in all files showing line numbers of matches:

```
xzgrep {{[-n|--line-number]}} "{{search_pattern}}" {{path/to/file}}
```

- Print 3 lines of [C]ontext around, [B]efore, or [A]fter each match:

```
xzgrep {{--context|--before-context|--after-context}} 3 "{{search_pattern}}" {{path/to/file}}
```

- Print file name and line number for each match with color output:

```
xzgrep {{[-H|--with-filename]}} {{[-n|--line-number]}} --color=always "{{search_pattern}}" {{path/to/file}}
```

- Search for lines matching a pattern, printing only the matched text:

```
xzgrep {{[-o|--only-matching]}} "{{search_pattern}}" {{path/to/file}}
```

- Use extended regex (supports ?, +, {}, (), and |), in case-insensitive mode:

```
xzgrep {{[-E|--extended-regexp]}} {{[-i|--ignore-case]}} "{{search_pattern}}" {{path/to/file}}
```

xzless

Display text from **xz** and **lzma** compressed files.

See also: **less**.

More information: https://manned.org/xzless.

- View a compressed file:

```
xzless {{path/to/file}}
```

- View a compressed file and display line numbers:

```
xzless --LINE-NUMBERS {{path/to/file}}
```

- View a compressed file and quit if the entire file can be displayed on the first screen:

```
xzless --quit-if-one-screen {{path/to/file}}
```

xzmore

Display text from **`xz`** or **`lzma`** compressed files.

Almost equivalent to **`xzless`**, except it respects the **`$PAGER`** environment variable, uses **`more`** by default, and you cannot pass options to the pager.

More information: https://manned.org/xzmore.

- View a compressed file:

```
xzmore {{path/to/file}}
```

ya

Manage Yazi plugins and flavors, publish or subscribe to DDS messages.

More information: https://yazi-rs.github.io/docs/cli/.

- Add a package:

```
ya pkg add {{package}}
```

- Delete a package:

```
ya pkg delete {{package}}
```

- Upgrade all packages:

```
ya pkg upgrade
```

- List all packages:

```
ya pkg list
```

- Emit a command to be executed by the current instance:

```
ya emit {{command}} {{arguments}}
```

- Emit commands to a specific remote instance:

```
ya emit-to {{receiver}} {{command}} {{arguments}}
```

- Publish a message to the current instance with string body:

```
ya pub --str {{string_message}}
```

- Subscribe to a specific kind of message from a remote instance:

```
ya sub {{message_kind}}
```

yacas

Yet Another Computer Algebra System.

More information: https://www.yacas.org/.

- Start an interactive `yacas` session:

  ```
  yacas
  ```

- [Interactive] While in a `yacas` session, execute a statement:

  ```
  {{Integrate(x)Cos(x)}};
  ```

- [Interactive] While in a `yacas` session, display an example:

  ```
  Example();
  ```

- [Interactive] Quit from a `yacas` session:

  ```
  quit
  ```

- Execute one or more `yacas` scripts (without terminal or prompts), then exit:

  ```
  yacas -p -c {{path/to/script1 path/to/script2 ...}}
  ```

- Execute and print the result of one statement, then exit:

  ```
  echo "{{Echo( Deriv(x)Cos(1/x) );}}" | yacas -p -c /dev/stdin
  ```

yacc

Generate an LALR parser (in C) with a formal grammar specification file.

See also: **`bison`**.

More information: https://manned.org/yacc.1p.

- Create a file `y.tab.c` containing the C parser code and compile the grammar file with all necessary constant declarations for values. (Constant declarations file `y.tab.h` is created only when the `-d` flag is used):

```
yacc -d {{path/to/grammar_file.y}}
```

- Compile a grammar file containing the description of the parser and a report of conflicts generated by ambiguities in the grammar:

```
yacc -d {{path/to/grammar_file.y}} -v
```

- Compile a grammar file, and prefix output filenames with `prefix` instead of `y`:

```
yacc -d {{path/to/grammar_file.y}} -v -b {{prefix}}
```

yadm alt

Create symbolic links and process templates for any managed files.

Learn more about templates: https://yadm.io/docs/templates.

More information: https://yadm.io/docs/alternates.

- Create symbolic links between alternate files manually:

```
yadm alt
```

yadm bootstrap

Execute Yadm's bootstrap file.

This file should be created in **`$HOME/.config/yadm/bootstrap`**.

More information: https://yadm.io/docs/bootstrap.

- Execute bootstrap executable:

```
yadm bootstrap
```

yadm clone

Works just like **`git clone`**. In addition you can pass extra flags to configure your repository.

If there is a bootstrap file in the repository, you will be prompted to execute it.

See also: **`git clone`**.

More information: https://yadm.io/docs/common_commands.

- Clone an existing repository:

```
yadm clone {{remote_repository_location}}
```

- Clone an existing repository, then execute the bootstrap file:

```
yadm clone {{remote_repository_location}} --bootstrap
```

- Clone an existing repository and after cloning, do not execute the bootstrap file:

```
yadm clone {{remote_repository_location}} --no-bootstrap
```

- Change the worktree that yadm will use during cloning:

```
yadm clone {{remote_repository_location}} --w
{{worktree_file}}
```

- Change the branch that yadm gets files from:

```
yadm clone {{remote_repository_location}} -b {{branch}}
```

- Override an existing repository local branch:

```
yadm clone {{remote_repository_location}} -f
```

yadm config

Pass options to yadm's config file. Change the **`.config`** of the repository managed by yadm.

More information: https://github.com/TheLocehiliosan/yadm/blob/master/yadm.md#configuration.

- Set or update a yadm's Git configuration:

```
yadm config {{key.inner-key}} {{value}}
```

- Get a value from yadm's Git configuration:

```
yadm config --get {{key}}
```

- Unset a value in yadm's Git configuration:

```
yadm config --unset {{key}}
```

- List all values in yadm's Git configuration:

```
yadm config --list
```

yadm decrypt

Decrypt files that were encrypted by yadm.

When activating this command you will be prompted for a password.

More information: https://yadm.io/docs/encryption.

- Decrypt files:

```
yadm decrypt
```

yadm encrypt

Encrypt files listed in the designated encrypt file.

After the files are encrypted they will be save in the designated archive folder.

More information: https://yadm.io/docs/encryption.

- Encrypt files listed in the designated encrypt file:

```
yadm encrypt
```

- Create the necessary files and folders for encryption:

```
touch {{path/to/encrypt_file}} && mkdir {{path/to/
archive_folder}}
```

yadm enter

Run a sub-shell with all Git variables set. This sub-shell can be used to easily interact with the local yadm repository using Git commands.

This could be useful if you are using a tool which uses Git directly.

More information: https://github.com/TheLocehiliosan/yadm/blob/master/yadm.md#commands.

- Run a sub-shell with all Git variables set:

  ```
  yadm enter
  ```

- Exit the sub-shell:

  ```
  exit
  ```

yadm git-crypt

Git Crypt enables transparent encryption and decryption of files in a Git repository.

More information: https://github.com/AGWA/git-crypt.

- Initialize repo to use Git Crypt:

```
yadm git-crypt init
```

- Share the repository using GPG:

```
yadm git-crypt add-gpg-user {{user_id}}
```

- After cloning a repository with encrypted files, unlock them:

```
yadm git-crypt unlock
```

- Export a symmetric secret key:

```
yadm git-crypt export-key {{path/to/key_file}}
```

yadm gitconfig

Pass options to **`git config`**. Change the **`.gitconfig`** of the repository managed by yadm.

See also: **`git config`**.

More information: https://github.com/TheLocehiliosan/yadm/blob/master/yadm.md#commands.

- Update or set a Git configuration value:

```
yadm gitconfig {{key.inner-key}} {{value}}
```

- Get a value from yadm's Git configuration:

```
yadm gitconfig --get {{key}}
```

- Unset a value in yadm's Git configuration:

```
yadm gitconfig --unset {{key}}
```

- List all values in yadm's Git configuration:

```
yadm gitconfig --list
```

yadm init

Initialize a new, empty repository for tracking dotfiles.

The repository is stored in **`$HOME/.local/share/yadm/repo.git`**.

More information: https://yadm.io/docs/getting_started.

- Execute:

  ```
  yadm init
  ```

- Override the worktree:

  ```
  yadm init -w {{path/to/worktree_folder}}
  ```

- Overwrite an existing repository:

  ```
  yadm init -f {{path/to/local_repository}}
  ```

yadm introspect

Look at data that is managed by yadm.

The purpose of introspection is to support command line completion.

More information: https://github.com/TheLocehiliosan/yadm/blob/master/yadm.md#commands.

- Output commands:

```
yadm introspect commands
```

- Output configs:

```
yadm introspect configs
```

- Output switches for the main yadm command:

```
yadm introspect switches
```

- Output repo:

```
yadm introspect repo
```

yadm list

Print a list of files managed by yadm.

More information: https://github.com/TheLocehiliosan/yadm/blob/master/yadm.md#commands.

- Print a list of files managed by yadm in the current directory:

```
yadm list
```

- List all files managed by yadm completely:

```
yadm list -a
```

yadm perms

Update permissions.

It is usually unnecessary to run this command, as yadm automatically processes permissions by default. This automatic behavior can be disabled by setting the configuration **`yadm.auto-perms`** to **`"false"`**.

More information: https://github.com/TheLocehiliosan/yadm/blob/master/yadm.md#permissions.

- Change file permissions:

```
yadm perms
```

yadm transcrypt

If **`transcrypt`** is installed, allows you to pass options directly to **`transcrypt`**.

With the environment configured to use the yadm repository.

Transcrypt enables transparent encryption and decryption of files in a Git repository.

More information: https://github.com/elasticdog/transcrypt#command-line-options.

- Set the symmetric cipher to utilize for encryption:

```
yadm transcrypt {{[-c|--cipher]}} {{cipher}}
```

- Pass the password to derive the key from:

```
yadm transcrypt {{[-p|--password]}} {{password}}
```

- Assume yes and accept defaults for non-specified options:

```
yadm transcrypt {{[-y|--yes]}}
```

- Display the current repository's cipher and password:

```
yadm transcrypt {{[-d|--display]}}
```

- Re-encrypt all encrypted files using new credentials:

```
yadm transcrypt {{[-r|--rekey]}}
```

yadm upgrade

Upgrade yadm to the latest version.

Upgrading will attempt to de-initialize and re-initialize your submodules.

More information: https://github.com/TheLocehiliosan/yadm/blob/master/yadm.md#commands.

- Upgrade yadm to the latest version:

```
yadm upgrade
```

- Force the upgrade regardless of changes:

```
yadm upgrade -f
```

yadm

A dotfiles manager that works by using **`git`**.

Some subcommands such as **`init`**, **`clone`**, etc. have their own usage documentation.

More information: https://yadm.io/docs/overview.

- Override yadm's configuration directory:

  `yadm --yadm-dir`

- Override yadm's data directory. yadm stores its data relative to this directory:

  `yadm --yadm-data`

- Override the location of the yadm repository:

  `yadm --yadm-repo`

- Override the location of yadm's main configuration file:

  `yadm --yadm-config`

- Override the location of the yadm encryption configuration:

  `yadm --yadm-encrypt`

- Override the location of the yadm encrypted files archive:

  `yadm --yadm-archive`

- Override the location of the yadm bootstrap program:

  `yadm --yadm-bootstrap`

yamllint

A linter for YAML files.

More information: https://yamllint.readthedocs.io.

- Lint a file:

```
yamllint {{path/to/file.yaml}}
```

- Lint all YAML files in a directory recursively:

```
yamllint {{path/to/directory}}
```

- Lint a file with a specific config file:

```
yamllint {{[-c|--config-file]}} {{path/to/config.yaml}}
{{path/to/file.yaml}}
```

- Lint a file using a preset config (`default` or `relaxed`):

```
yamllint {{[-d|--config-data]}} "{{extends:
relaxed}}" {{path/to/file.yaml}}
```

- Output in a parsable format (for CI integration):

```
yamllint {{[-f|--format]}} parsable {{path/to/file.yaml}}
```

- Lint a file with strict mode (return 2 for warnings):

```
yamllint {{[-s|--strict]}} {{path/to/file.yaml}}
```

- Read from `stdin`:

```
cat {{path/to/file.yaml}} | yamllint -
```

- Display help:

```
yamllint {{[-h|--help]}}
```

yank

Read input from **`stdin`** and display a selection interface that allows a field to be selected and copied to the clipboard.

More information: https://manned.org/yank.

- Yank using the default delimiters (\f, \n, \r, \s, \t):

```
{{sudo dmesg}} | yank
```

- Yank an entire line:

```
{{sudo dmesg}} | yank -l
```

- Yank using a specific delimiter:

```
{{echo hello=world}} | yank -d {{=}}
```

- Only yank fields matching a specific pattern:

```
{{ps ux}} | yank -g "{{[0-9]+}}"
```

yapf

Python style guide checker.

More information: https://github.com/google/yapf#usage.

- Simulate formatting and display a diff of the changes that would be made:

```
yapf {{[-d|--diff]}} {{path/to/file}}
```

- Recursively format all Python files in a directory, concurrently:

```
yapf {{[-ri|--recursive --in-place]}} --style {{pep8}} {{[-p|--parallel]}} {{path/to/directory}}
```

yara

Pattern matching tool for identifying and classifying malware.

See also: **yarac**.

More information: https://yara.readthedocs.io/en/stable/commandline.html.

- Scan a specific file with a rule file:

```
yara {{path/to/rule.yar}} {{path/to/file}}
```

- Recursively scan a directory and subdirectories containing possible threats:

```
yara {{path/to/rule.yar}} {{[-r|--recursive]}} {{path/to/
directory}}
```

- Scan a running process by its PID using multiple rules:

```
yara {{path/to/rule1.yar path/to/rule2.yar ...}}
{{process_id}}
```

- Print metadata associated with the matching rules:

```
yara {{[-m|--print-meta]}} {{path/to/rule.yar}} {{path/to/
file}}
```

- Print the strings that caused the rule to match:

```
yara {{[-s|--print-strings]}} {{path/to/rule.yar}} {{path/to/
file}}
```

- Use a specific number of threads for parallel scanning:

```
yara {{[-p|--threads]}} {{number_of_threads}} {{path/to/
rule.yar}} {{path/to/directory}}
```

- Use compiled YARA rules file to scan a directory recursively:

```
yara {{[-C|--compiled-rules]}} {{path/to/rules.bin}} {{[-r|--
recursive]}} {{path/to/directory}}
```

yarac

Compile YARA rule source files into a binary format for faster loading.

See also: **`yara`**.

More information: https://manned.org/yarac.

- Compile a specific rule file:

```
yarac {{path/to/rule.yar}} {{path/to/rule.bin}}
```

- Compile multiple rule files into a single binary:

```
yarac {{path/to/rule1.yar path/to/rule2.yar ...}} {{path/to/rules.bin}}
```

- Define an external variable during compilation:

```
yarac -d {{identifier}}={{value}} {{path/to/rule.yar}} {{path/to/rule.bin}}
```

- Disable warnings during compilation:

```
yarac {{[-w|--no-warnings]}} {{path/to/rule.yar}} {{path/to/rule.bin}}
```

- Fail compilation on any warnings (do not use along with `--no-warnings`):

```
yarac --fail-on-warnings {{path/to/rule.yar}} {{path/to/rule.bin}}
```

yard

Documentation tool for Ruby.

More information: https://rubydoc.info/gems/yard/file/docs/GettingStarted.md#using-yard-to-generate-documentation.

- Create the documentation:

  ```
  yard
  ```

- Create the documentation and save it to one file:

  ```
  yard --one-file
  ```

- List all undocumented objects:

  ```
  yard stats --list-undoc
  ```

yarn-why

Identify why a Yarn package has been installed.

More information: https://github.com/amio/yarn-why.

- Show why a Yarn package is installed:

```
yarn-why {{package}}
```

yarn

JavaScript and Node.js package manager alternative.

More information: https://yarnpkg.com/cli.

- Install a module globally:

```
yarn global add {{module_name}}
```

- Install all dependencies referenced in the `package.json` file (the `install` is optional):

```
yarn install
```

- Install a module and save it as a dependency to the `package.json` file (add `--dev` to save as a dev dependency):

```
yarn add {{module_name}}@{{version}}
```

- Uninstall a module and remove it from the `package.json` file:

```
yarn remove {{module_name}}
```

- Interactively create a `package.json` file:

```
yarn init
```

- Identify whether a module is a dependency and list other modules that depend upon it:

```
yarn why {{module_name}}
```

yazi

Blazing fast terminal file manager written in Rust.

Efficient, user-friendly, and customizable file management experience.

More information: https://github.com/sxyazi/yazi.

- Launch Yazi from the current directory:

```
yazi
```

- Print debug information:

```
yazi --debug
```

- Write the current working directory on exit to the file:

```
yazi --cwd-file {{path/to/cwd_file}}
```

- Clear the cache directory:

```
yazi --clear-cache
```

ybacklight

Manage screen backlight brightness.

See also: **`xbacklight`**.

More information: https://github.com/pixelcmtd/ybacklight.

- Print current brightness and maximal brightness, shortened and separated by a slash:

```
ybacklight Sc/Sm
```

- Specify the brightness:

```
ybacklight s{{420}}
```

- Increase the brightness by 42 big steps (4200 by default):

```
ybacklight Si42
```

- Decrease the brightness by 300:

```
ybacklight d300
```

ybmtopbm

Convert a Bennet Yee "face" file to PBM.

More information: https://netpbm.sourceforge.net/doc/ybmtopbm.html.

- Convert a YBM image file to PBM:

```
ybmtopbm {{path/to/input_file.ybm}} > {{path/to/
output_file.pbm}}
```

yek

Serialize a repository or directory into an LLM-friendly single file (fast Rust-based repomapper).

More information: https://github.com/bodo-run/yek#usage.

- Serialize the current directory and write the output to a temp file (prints path):

```
yek
```

- Serialize specific directories and write output to a directory:

```
yek {{path/to/directory1 path/to/directory2 ...}} --output-dir {{path/to/output_directory}}
```

- Process multiple files or use `glob` patterns (quote `glob`s to avoid shell expansion):

```
yek "{{path/to/directory/**/*.rs}}" "{{path/to/directory/**/*.md}}"
```

- Cap the token-based output size to 128k tokens:

```
yek {{path/to/directory}} --tokens 128k
```

- Cap the byte-based max output size and set an explicit output file name:

```
yek {{path/to/directory}} --max-size {{100KB}} --output-name {{yek-output.txt}}
```

- Stream JSON output:

```
yek {{path/to/directory}} --json
```

- Include a directory tree header in the output:

```
yek {{path/to/directory}} --tree-header
```

yes

Output something repeatedly.

This command is commonly used to answer yes to every prompt by install commands (such as **`apt-get`**).

More information: https://www.gnu.org/software/coreutils/manual/html_node/yes-invocation.html.

- Repeatedly output `y`:

```
yes
```

- Repeatedly output a specified value:

```
yes {{value}}
```

- Accept everything prompted by the `apt-get` command:

```
yes | sudo apt-get install {{program}}
```

- Repeatedly output a newline to always accept the default option of a prompt:

```
yes ''
```

yesod

Helper tool for Yesod, a Haskell-based web framework.

All Yesod commands are invoked through the **`stack`** project manager.

More information: https://github.com/yesodweb/yesod.

- Create a new scaffolded site, with SQLite as backend, in the `my-project` directory:

  ```
  stack new {{my-project}} {{yesod-sqlite}}
  ```

- Install the Yesod CLI tool within a Yesod scaffolded site:

  ```
  stack build yesod-bin cabal-install --install-ghc
  ```

- Start development server:

  ```
  stack exec -- yesod devel
  ```

- Touch files with altered Template Haskell dependencies:

  ```
  stack exec -- yesod touch
  ```

- Deploy application using Keter (Yesod's deployment manager):

  ```
  stack exec -- yesod keter
  ```

yj

Convert between YAML, TOML, JSON, and HCL, preserving map order.

More information: https://github.com/sclevine/yj.

- Convert [y]AML to JSON (default) from `stdin` and write the result to `stdout`:

```
yj < {{file.yml}} -y
```

- Convert [t]OML to [y]AML:

```
yj < {{file.toml}} -ty
```

- Convert [j]SON to [t]OML with [i]ndentation:

```
yj < {{file.json}} -jti
```

- Convert H[c]L to [j]SON:

```
yj < {{file.hcl}} -cj
```

- Convert [y]AML to H[c]L ignoring inf/[n]aN conversion:

```
yj < {{file.yml}} -ycn
```

- Display [v]ersion:

```
yj -v
```

ykinfo

Get basic information from a YubiKey.

More information: https://developers.yubico.com/yubikey-personalization/Manuals/ykinfo.1.html.

- Display all information from YubiKey:

```
ykinfo -a
```

- Get only serial in decimal from YubiKey:

```
ykinfo -s -q
```

- Get capabilities from YubiKey:

```
ykinfo -c
```

ykman config

Enable or disable YubiKey applications.

Note: You can use **`ykman info`** to see currently enabled applications.

More information: https://docs.yubico.com/software/yubikey/tools/ykman/Base_Commands.html#ykman-config-options-command-args.

- Enable an application over USB or NFC (`--enable` can be used multiple times to specify more applications):

  ```
  ykman config {{usb|nfc}} {{[-e|--enable]}} {{otp|u2f|fido2|oath|piv|openpgp|hsmauth}}
  ```

- Disable an application over USB or NFC (`--disable` can be used multiple times to specify more applications):

  ```
  ykman config {{usb|nfc}} {{[-d|--disable]}} {{otp|u2f|fido2|oath|piv|openpgp|hsmauth}}
  ```

- Disable all applications over NFC:

  ```
  ykman config nfc {{[-D|--disable-all]}}
  ```

ykman fido

Manage YubiKey FIDO applications.

More information: https://docs.yubico.com/software/yubikey/tools/ykman/FIDO_Commands.html.

- Display general information about the FIDO2 application:

```
ykman fido info
```

- Change the FIDO pin:

```
ykman fido access change-pin
```

- List resident credentials stored on the YubiKey:

```
ykman fido credentials list
```

- Delete a resident credential from the YubiKey:

```
ykman fido credentials delete {{credential_id}}
```

- List fingerprints stored on the YubiKey (requires a key with a fingerprint sensor):

```
ykman fido fingerprints list
```

- Add a new fingerprint to the YubiKey:

```
ykman fido fingerprints add {{name}}
```

- Delete a fingerprint from the YubiKey:

```
ykman fido fingerprints delete {{name}}
```

- Wipe all FIDO credentials (you have to do this after exceeding the number of PIN retry attempts):

```
ykman fido reset
```

ykman oath

Manage the OATH YubiKey application.

A **`keyword`** can be a part of the name or the issuer.

More information: https://docs.yubico.com/software/yubikey/tools/ykman/OATH_Commands.html.

- Display general information about the OATH application:

  ```
  ykman oath info
  ```

- Change the password used to protect OATH accounts (add `--clear` to remove it):

  ```
  ykman oath access change
  ```

- Add a new account (the issuer is optional):

  ```
  ykman oath accounts add {{[-i|--issuer]}} {{issuer}} {{name}}
  ```

- List all accounts (with their issuers):

  ```
  ykman oath accounts list
  ```

- List all accounts with their current TOTP/HOTP codes (optionally filtering the list with a keyword):

  ```
  ykman oath accounts code {{keyword}}
  ```

- Rename an account:

  ```
  ykman oath accounts rename {{keyword}} {{issuer:name|name}}
  ```

- Delete an account:

  ```
  ykman oath accounts delete {{keyword}}
  ```

- Delete all accounts and restore factory settings:

  ```
  ykman oath reset
  ```

ykman openpgp

Manage the OpenPGP YubiKey application.

Note: You need to use **`gpg --card-edit`** for some settings.

More information: https://docs.yubico.com/software/yubikey/tools/ykman/OpenPGP_Commands.html.

- Display general information about the OpenPGP application:

  ```
  ykman openpgp info
  ```

- Set the number of retry attempts for the User PIN, Reset Code, and Admin PIN, respectively:

  ```
  ykman openpgp access set-retries {{3}} {{3}} {{3}}
  ```

- Change the User PIN, Reset Code, or Admin PIN:

  ```
  ykman openpgp access change-{{pin|reset-code|admin-pin}}
  ```

- Factory reset the OpenPGP application (you have to do this after exceeding the number of Admin PIN retry attempts):

  ```
  ykman openpgp reset
  ```

ykman

YubiKey Manager - configure YubiKeys.

If there are multiple YubiKeys connected, you have to add **`--device serial_number`** before a subcommand.

More information: https://docs.yubico.com/software/yubikey/tools/ykman/index.html.

- Display general information about a YubiKey (serial number, firmware version, capabilities, etc.):

```
ykman info
```

- List connected YubiKeys with short, one-line descriptions (including the serial number):

```
ykman list
```

- View documentation for enabling and disabling applications:

```
tldr ykman config
```

- View documentation for managing the FIDO applications:

```
tldr ykman fido
```

- View documentation for managing the OATH application:

```
tldr ykman oath
```

- View documentation for managing the OpenPGP application:

```
tldr ykman openpgp
```

yolo

Train, validate, or infer models on various tasks and versions.

More information: https://docs.ultralytics.com/usage/cli/.

- Create a copy of the default configuration in your current working directory:

  ```
  yolo task=init
  ```

- Train the object detection, instance segment, or classification model with the specified configuration file:

  ```
  yolo task={{detect|segment|classify}} mode=train cfg={{path/to/config.yaml}}
  ```

you-get

Download media contents (videos, audios, images) from the Web.

See also: **`yt-dlp`**, **`youtube-viewer`**, **`instaloader`**.

More information: https://you-get.org/#getting-started.

- Print media information about a specific media on the web:

```
you-get {{[-i|--info]}} {{https://example.com/video?id=value}}
```

- Download a media from a specific URL:

```
you-get {{https://example.com/video?id=value}}
```

- Search on Google Videos and download:

```
you-get {{keywords}}
```

- Download a media to a specific location:

```
you-get {{[-o|--output-dir]}} {{path/to/directory}} {{[-O|--output-filename]}} {{filename}} {{https://example.com/watch?v=value}}
```

- Download a media using a proxy:

```
you-get {{[-x|--http-proxy]}} {{proxy_server}} {{https://example.com/watch?v=value}}
```

youtube-dl

Download videos from YouTube and other websites.

See also: **`yt-dlp`**, **`ytfzf`**, **`you-get`**.

More information: https://rg3.github.io/youtube-dl/.

- Download a video or playlist:

```
youtube-dl '{{https://www.youtube.com/watch?v=oHg5SJYRHA0}}'
```

- List all formats that a video or playlist is available in:

```
youtube-dl {{[-F|--list-formats]}} '{{https://
www.youtube.com/watch?v=Mwa0_nE9H7A}}'
```

- Download a video or playlist at a specific quality:

```
youtube-dl {{[-f|--format]}} "{{best[height<=480]}}"
'{{https://www.youtube.com/watch?v=oHg5SJYRHA0}}'
```

- Download the audio from a video and convert it to an MP3:

```
youtube-dl {{[-x|--extract-audio]}} --audio-format {{mp3}}
'{{url}}'
```

- Download the best quality audio and video and merge them:

```
youtube-dl {{[-f|--format]}} bestvideo+bestaudio '{{url}}'
```

- Download video(s) as MP4 files with custom filenames:

```
youtube-dl {{[-f|--format]}} {{mp4}} {{[-o|--output]}} "{{%
(playlist_index)s-%(title)s by %(uploader)s on %
(upload_date)s in %(playlist)s.%(ext)s}}" '{{url}}'
```

- Download a particular language's subtitles along with the video:

```
youtube-dl --sub-lang {{en}} --write-sub '{{https://
www.youtube.com/watch?v=Mwa0_nE9H7A}}'
```

- Download a playlist and extract MP3s from it:

```
youtube-dl {{[-f|--format]}} "bestaudio" {{[-c|--continue]}}
{{[-w|--no-overwrites]}} {{[-i|--ignore-errors]}} {{[-x|--
extract-audio]}} --audio-format mp3 {{[-o|--output]}} "%
(title)s.%(ext)s" '{{url_to_playlist}}'
```

youtube-viewer

Search and play videos from YouTube.

See also: **`you-get`**, **`ytfzf`**, **`yt-dlp`**.

More information: https://github.com/trizen/youtube-viewer.

- Search for a video:

```
youtube-viewer {{search_term}}
```

- Log in to your YouTube account:

```
youtube-viewer --login
```

- Watch a video with a specific URL in VLC:

```
youtube-viewer --player={{vlc}} {{https://youtube.com/watch?v=dQw4w9WgXcQ}}
```

- Display a search prompt and play the selected video in 720p:

```
youtube-viewer -{{7}}
```

yq

A lightweight and portable YAML processor.

More information: https://mikefarah.gitbook.io/yq/.

- Output a YAML file, in pretty-print format (v4+):

```
yq eval {{path/to/file.yaml}}
```

- Output a YAML file, in pretty-print format (v3):

```
yq read {{path/to/file.yaml}} {{[-C|--colors]}}
```

- Output the first element in a YAML file that contains only an array (v4+):

```
yq eval '.[0]' {{path/to/file.yaml}}
```

- Output the first element in a YAML file that contains only an array (v3):

```
yq read {{path/to/file.yaml}} '[0]'
```

- Set (or overwrite) a key to a value in a file (v4+):

```
yq eval '.{{key}} = "{{value}}"' {{[-i|--inplace]}} {{path/
to/file.yaml}}
```

- Set (or overwrite) a key to a value in a file (v3):

```
yq write {{[-i|--inplace]}} {{path/to/file.yaml}} '{{key}}'
'{{value}}'
```

- Merge two files and print to `stdout` (v4+):

```
yq eval-all 'select(filename == "{{path/to/file1.yaml}}") *
select(filename == "{{path/to/file2.yaml}}")' {{path/to/
file1.yaml}} {{path/to/file2.yaml}}
```

- Merge two files and print to `stdout` (v3):

```
yq merge {{path/to/file1.yaml}} {{path/to/file2.yaml}} {{[-
C|--colors]}}
```

yt-dlp

A youtube-dl fork with additional features and fixes.

Download videos from YouTube and other websites.

See also: **ytfzf**.

More information: https://github.com/yt-dlp/yt-dlp#usage-and-options.

- Download a video or playlist (with the default options from command below):

```
yt-dlp "{{https://www.youtube.com/watch?v=oHg5SJYRHA0}}"
```

- List the available downloadable formats for a video:

```
yt-dlp {{[-F|--list-formats]}} "{{https://www.youtube.com/
watch?v=oHg5SJYRHA0}}"
```

- Download a video or playlist using the best MP4 video available (default is "bv*+ba/b"):

```
yt-dlp {{[-f|--format]}} "{{bv*[ext=mp4]+ba[ext=m4a]/
b[ext=mp4]}}" "{{https://www.youtube.com/watch?
v=oHg5SJYRHA0}}"
```

- Extract audio from a video (requires ffmpeg or ffprobe):

```
yt-dlp {{[-x|--extract-audio]}} "{{https://www.youtube.com/
watch?v=oHg5SJYRHA0}}"
```

- Specify audio format and audio quality of extracted audio (between 0 (best) and 10 (worst), default = 5):

```
yt-dlp {{[-x|--extract-audio]}} --audio-format {{mp3}} --
audio-quality {{0}} "{{https://www.youtube.com/watch?
v=oHg5SJYRHA0}}"
```

- Download only the second, fourth, fifth, sixth, and last items in a playlist (the first item is 1, not 0):

```
yt-dlp {{[-I|--playlist-items]}} 2,4:6,-1 "{{https://
youtube.com/playlist?list=PLbzoR-
pLrL6pTJfLQ3UwtB-3V4fimdqnA}}"
```

- Download all playlists of a YouTube channel/user keeping each playlist in a separate directory:

```
yt-dlp {{[-o|--output]}} "{{%(uploader)s/%(playlist)s/%
(playlist_index)s - %(title)s.%(ext)s}}" "{{https://
www.youtube.com/user/TheLinuxFoundation/playlists}}"
```

- Download a Udemy course keeping each chapter in a separate directory:

```
yt-dlp {{[-u|--username]}} {{user}} {{[-p|--password]}}
{{password}} {{[-P|--paths]}} "{{path/to/directory}}" {{[-
o|--output]}} "{{%(playlist)s/%(chapter_number)s - %
(chapter)s/%(title)s.%(ext)s}}" "{{https://www.udemy.com/
java-tutorial}}"
```

ytmdl

Download songs from YouTube and automatically add metadata.

Fetch song information (artist, album, cover art) from iTunes, Spotify, and other sources.

More information: https://github.com/deepjyoti30/ytmdl#usage.

- Download a song by name (with interactive selection):

```
ytmdl {{song_name}}
```

- Download the first result without prompting:

```
ytmdl {{[-q|--quiet]}} {{song_name}}
```

- Download a song to a specific directory:

```
ytmdl {{[-o|--output-dir]}} {{path/to/directory}}
{{song_name}}
```

- Download a song from a YouTube URL:

```
ytmdl --url https://www.youtube.com/watch?v={{oHg5SJYRHA0}}
```

- Download a song in a specific format (mp3, m4a, or opus):

```
ytmdl --format {{mp3|m4a|opus}} {{song_name}}
```

- Download a song with artist and album information:

```
ytmdl --artist {{artist_name}} --album {{album_name}}
{{song_name}}
```

- Download a list of songs from a text file:

```
ytmdl --list {{path/to/list.txt}}
```

- Display help:

```
ytmdl {{[-h|--help]}}
```

yuvsplittoppm

Convert three subsampled Abekas YUV files to one PPM image.

More information: https://netpbm.sourceforge.net/doc/yuvsplittoppm.html.

- Read Akebas YUV bytes from three files starting with basename, merge them into a single PPM image, and store it in the specified output file:

```
yuvsplittoppm {{basename}} {{width}} {{height}} > {{path/to/output_file.ppm}}
```

yuvtoppm

Convert Abekas YUV bytes to PPM.

More information: https://netpbm.sourceforge.net/doc/yuvtoppm.html.

- Read Akebas YUV bytes from the specified input file, convert them to a PPM image, and store them in the specified output file:

```
yuvtoppm {{width}} {{height}} {{path/to/input_file.yuv}} > {{path/to/output_file.ppm}}
```

yuy2topam

Convert YUY2 bytes to PAM.

More information: https://netpbm.sourceforge.net/doc/yuy2topam.html.

- Convert YUY2 bytes to PAM:

```
yuy2topam {{[-w|-width]}} {{value}} {{[-h|-height]}} {{value}} {{path/to/file.yuy2}} > {{path/to/file.pam}}
```

z

Track the most used (by frequency) directories and enable quickly navigating to them using string patterns or **regex**.

More information: https://github.com/rupa/z.

- Go to a directory that contains `string` in the name:

```
z string
```

- Go to a directory that contains `string1` and then `string2`:

```
z string1 string2
```

- Go to the highest-ranked directory matching `string`:

```
z -r string
```

- Go to the most recently accessed directory matching `string`:

```
z -t string
```

- List all directories in `z`'s database matching `string`:

```
z -l string
```

- Remove the current directory from `z`'s database:

```
z -x
```

- Restrict matches to subdirectories of the current directory:

```
z -c {{string}}
```

zabbix_agent2

Daemon for monitoring server parameters.

More information: https://manned.org/zabbix_agent2.

- Start the agent with the default configuration file:

```
zabbix_agent2
```

- Start the agent with a custom configuration file:

```
zabbix_agent2 {{[-c|--config]}} {{path/to/
zabbix_agent2.conf}}
```

- Test the configuration file and exit:

```
zabbix_agent2 {{[-c|--config]}} {{path/to/
zabbix_agent2.conf}} {{[-T|--test-config]}}
```

- Test a specific item with verbose output:

```
zabbix_agent2 {{[-c|--config]}} {{path/to/
zabbix_agent2.conf}} {{[-t|--test]}} {{item_key}} {{[-v|--
verbose]}}
```

- Reload user parameters from the configuration file (runtime control):

```
zabbix_agent2 {{[-c|--config]}} {{path/to/
zabbix_agent2.conf}} {{[-R|--runtime-control]}}
userparameter_reload
```

- Increase or decrease log level (runtime control):

```
zabbix_agent2 {{[-c|--config]}} {{path/to/
zabbix_agent2.conf}} {{[-R|--runtime-control]}} loglevel
{{increase|decrease}}
```

- Display help:

```
zabbix_agent2 {{[-h|--help]}}
```

zabbix_agentd

Daemon for monitoring server parameters.

More information: https://manned.org/zabbix_agentd.

- Start the agent with the default configuration file:

```
zabbix_agentd
```

- Start the agent with a custom configuration file:

```
zabbix_agentd {{[-c|--config]}} {{path/to/
zabbix_agentd.conf}}
```

- Run the agent in foreground (it stays attached to the current terminal session):

```
zabbix_agentd {{[-c|--config]}} {{path/to/
zabbix_agentd.conf}} {{[-f|--foreground]}}
```

- Test the configuration file:

```
zabbix_agentd {{[-c|--config]}} {{path/to/
zabbix_agentd.conf}} {{[-T|--test-config]}}
```

- Test a specific item with verbose output:

```
zabbix_agentd {{[-c|--config]}} {{path/to/
zabbix_agentd.conf}} {{[-t|--test]}} {{item_key}} {{[-v|--
verbose]}}
```

- Reload user parameters from the configuration file (runtime control):

```
zabbix_agentd {{[-c|--config]}} {{path/to/
zabbix_agentd.conf}} {{[-R|--runtime-control]}}
userparameter_reload
```

- Increase or decrease log level for all processes (runtime control):

```
zabbix_agentd {{[-c|--config]}} {{path/to/
zabbix_agentd.conf}} {{[-R|--runtime-control]}}
log_level_{{increase|decrease}}
```

- Display help:

```
zabbix_agentd {{[-h|--help]}}
```

zabbix_server

Core daemon of Zabbix software.

More information: https://manned.org/zabbix_server.

- Start the server with the default configuration file:

```
zabbix_server
```

- Start the server with a custom configuration file:

```
zabbix_server {{[-c|--config]}} {{path/to/
zabbix_server.conf}}
```

- Run the server in foreground:

```
zabbix_server {{[-c|--config]}} {{path/to/
zabbix_server.conf}} {{[-f|--foreground]}}
```

- Test the configuration file and exit:

```
zabbix_server {{[-c|--config]}} {{path/to/
zabbix_server.conf}} {{[-T|--test-config]}}
```

- Reload configuration cache (runtime control):

```
zabbix_server {{[-c|--config]}} {{path/to/
zabbix_server.conf}} {{[-R|--runtime-control]}}
config_cache_reload
```

- Execute the housekeeper (runtime control):

```
zabbix_server {{[-c|--config]}} {{path/to/
zabbix_server.conf}} {{[-R|--runtime-control]}}
housekeeper_execute
```

- Increase or decrease log level for all processes (runtime control):

```
zabbix_server {{[-c|--config]}} {{path/to/
zabbix_server.conf}} {{[-R|--runtime-control]}}
log_level_{{increase|decrease}}
```

- Display help:

```
zabbix_server {{[-h|--help]}}
```

zapier analytics

Show the status of the analytics that are collected. It is also used to change what is collected.

More information: https://platform.zapier.com/reference/cli#analytics.

- Show the status of collected analytics:

```
zapier analytics
```

- Change how much information is collected:

```
zapier analytics {{[-m|--mode]}} {{enabled|anonymous|
disabled}}
```

- Show extra debugging output:

```
zapier analytics {{[-m|--mode]}} {{enabled|anonymous|
disabled}} {{[-d|--debug]}}
```

zapier build

Build a pushable **`zip`** of a Zapier integration.

More information: https://platform.zapier.com/reference/cli#build.

- Create a build:

  ```
  zapier build
  ```

- Disable smart file inclusion (will only include files required by `index.js`):

  ```
  zapier build --disable-dependency-detection
  ```

- Show extra debugging output:

  ```
  zapier build {{[-d|--debug]}}
  ```

zapier convert

Convert a Visual Builder integration to a CLI integration.

More information: https://platform.zapier.com/reference/cli#convert.

- Convert a visual builder integration:

```
zapier convert {{integration_id}} {{path/to/directory}}
```

- Convert a visual builder integration with a specific version:

```
zapier convert {{integration_id}} {{path/to/directory}} {{[-
v|--version]}}={{version}}
```

- Show extra debugging output:

```
zapier convert --debug
```

zapier history

List the history for a Zapier integration.

More information: https://github.com/zapier/zapier-platform/blob/main/packages/cli/docs/cli.md#history.

- List the history for an integration:

  ```
  zapier history
  ```

- Display additional debug output:

  ```
  zapier history {{[-d|--debug]}}
  ```

- List the history with a different output structure:

  ```
  zapier history {{[-f|--format]}} {{plain|json|raw|row|table}}
  ```

zapier init

Initialize a new Zapier integration.

More information: https://platform.zapier.com/reference/cli#init.

- Initialize a new Zapier integration:

```
zapier init {{path/to/directory}}
```

- Initialize a new Zapier integration with a specific template:

```
zapier init {{path/to/directory}} {{[-t|--template]}}
{{basic-auth|callback|custom-auth|digest-auth|dynamic-
dropdown|files|minimal|oauth1-trello|oauth2|search-or-create|
session-auth|typescript}}
```

- Show extra debugging output:

```
zapier init {{[-d|--debug]}}
```

zapier login

Log in to a Zapier account.

More information: https://github.com/zapier/zapier-platform/blob/main/packages/cli/docs/cli.md#login.

- Log in to a Zapier account:

```
zapier login
```

- Log in to a Zapier account with a deploy key for SSO:

```
zapier login {{[-s|--sso]}}
```

- Display additional debug output:

```
zapier login {{[-d|--debug]}}
```

zapier push

Build and upload a Zapier integration.

More information: https://platform.zapier.com/reference/cli#push.

- Push an integration to Zapier:

  ```
  zapier push
  ```

- Disable smart file inclusion (will only include files required by `index.js`):

  ```
  zapier push --disable-dependency-detection
  ```

- Show extra debugging output:

  ```
  zapier push {{[-d|--debug]}}
  ```

zapier scaffold

Add a starting trigger, create, search, or resource to an integration.

More information: https://platform.zapier.com/reference/cli#scaffold.

- Scaffold a new trigger, create, search, or resource:

```
zapier scaffold {{trigger|search|create|resource}} {{noun}}
```

- Specify a custom destination directory for the scaffolded files:

```
zapier scaffold {{trigger|search|create|resource}} {{noun}}
{{[-d|--dest]}}={{path/to/directory}}
```

- Overwrite existing files when scaffolding:

```
zapier scaffold {{trigger|search|create|resource}} {{noun}}
{{[-f|--force]}}
```

- Exclude comments from the scaffolded files:

```
zapier scaffold {{trigger|search|create|resource}} {{noun}}
--no-help
```

- Show extra debugging output:

```
zapier scaffold {{[-d|--debug]}}
```

zapier test

Test a Zapier integration via the **`test`** script in your **`package.json`**.

More information: https://github.com/zapier/zapier-platform/blob/main/packages/cli/docs/cli.md#test.

- Test an integration:

  ```
  zapier test
  ```

- Test an integration while skipping validation:

  ```
  zapier test --skip-validate
  ```

- Test an integration with additional debug output:

  ```
  zapier test {{[-d|--debug]}}
  ```

zapier validate

Validate a Zapier integration.

More information: https://github.com/zapier/zapier-platform/blob/main/packages/cli/docs/cli.md#validate.

- Validate an integration:

```
zapier validate
```

- Validate an integration without style checks:

```
zapier validate --without-style
```

- Validate an integration without running the build script:

```
zapier validate --skip-build
```

- Validate an integration with additional debug output:

```
zapier validate {{[-d|--debug]}}
```

- Validate an integration with a different output structure:

```
zapier validate {{[-f|--format]}} {{plain|json|raw|row|
table}}
```

zapier versions

List the versions for a Zapier integration.

More information: https://github.com/zapier/zapier-platform/blob/main/packages/cli/docs/cli.md#validate.

- List the versions for an integration:

```
zapier versions
```

- Include deprecated versions:

```
zapier versions {{[-a|--all]}}
```

- Display additional debug output:

```
zapier versions {{[-d|--debug]}}
```

- List the versions with a different output structure:

```
zapier versions {{[-f|--format]}} {{plain|json|raw|row|
table}}
```

zapier

Create, automate, and manage zapier integrations.

Some subcommands such as **`build`**, **`init`**, **`scaffold`**, **`push`**, **`test`**, etc. have their own usage documentation.

More information: https://github.com/zapier/zapier-platform/blob/main/packages/cli/docs/cli.md.

- Connect to a Zapier account:

```
zapier login
```

- Initialize a new Zapier integration with a project template:

```
zapier init {{path/to/directory}}
```

- Add a starting trigger, create, search, or resource to your integration:

```
zapier scaffold {{trigger|create|search|resource}} {{name}}
```

- Test an integration:

```
zapier test
```

- Build and upload an integration to Zapier:

```
zapier push
```

- Display help:

```
zapier help
```

- Display help for a specific command:

```
zapier help {{command}}
```

zbarimg

Scan and decode bar codes from image file(s).

More information: https://manned.org/zbarimg.

- Process an image file:

```
zbarimg {{image_file}}
```

zcat

This command is an alias of **`gzip --stdout --decompress`**.

- View documentation for the original command:

```
tldr gzip
```

zcmp

Compare compressed files.

More information: https://manned.org/zcmp.

- Invoke `cmp` on two files compressed via `gzip`:

```
zcmp {{path/to/file1.gz}} {{path/to/file2.gz}}
```

- Compare a file to its gzipped version (assuming `.gz` exists already):

```
zcmp {{path/to/file}}
```

zdb

ZFS debugger.

More information: https://manned.org/zdb.

- Show detailed configuration of all mounted ZFS zpools:

```
zdb
```

- Show detailed configuration for a specific ZFS pool:

```
zdb {{[-C|--config]}} {{poolname}}
```

- Show statistics about number, size, and deduplication of blocks:

```
zdb {{[-b|--block-stats]}} {{poolname}}
```

zdiff

Invoke **`diff`** on **`gzip`** archives.

More information: https://manned.org/zdiff.

- Compare two files, uncompressing them if necessary:

```
zdiff {{path/to/file1.gz}} {{path/to/file2.gz}}
```

- Compare a file to a `gzip` archive with the same name:

```
zdiff {{path/to/file}}
```

zed

Text editor designed to be fast, efficient, and convenient.

More information: https://zed.dev/docs/reference/cli.

- Open specific paths in Zed:

```
zed {{path/to/file_or_directory1 path/to/
file_or_directory2 ...}}
```

- Open a path in foreground and display logs:

```
zed {{path/to/project}} --foreground
```

- Open a path in new window:

```
zed {{path/to/project}} {{[-n|--new]}}
```

- Open a file at the given line number and column:

```
zed {{path/to/file}}:{{line_number}}:{{column_number}}
```

- Open a diff tab in Zed for two versions of a file:

```
zed --diff {{path/to/old_file}} {{path/to/new_file}}
```

zeditor

This command is an alias of **zed**.

- View documentation for the original command:

```
tldr zed
```

zeek

Passive network traffic analyzer.

Any output and log files will be saved to the current working directory.

More information: https://docs.zeek.org/en/lts/quickstart.html#zeek-as-a-command-line-utility.

- Analyze live traffic from a network interface:

```
sudo zeek --iface {{interface}}
```

- Analyze live traffic from a network interface and load custom scripts:

```
sudo zeek --iface {{interface}} {{script1 script2 ...}}
```

- Analyze live traffic from a network interface, without loading any scripts:

```
sudo zeek --bare-mode --iface {{interface}}
```

- Analyze live traffic from a network interface, applying a `tcpdump` filter:

```
sudo zeek --filter {{path/to/filter}} --iface {{interface}}
```

- Analyze live traffic from a network interface using a watchdog timer:

```
sudo zeek --watchdog --iface {{interface}}
```

- Analyze traffic from a PCAP file:

```
zeek --readfile {{path/to/file.trace}}
```

zegrep

This command is an alias of **`zgrep --extended-regexp`**.

- View documentation for the original command:

  ```
  tldr zgrep
  ```

zeisstopnm

Convert a Zeiss confocal file to Netbpm format.

More information: https://manned.org/zeisstopnm.

- Convert a Zeiss cofocal file into either `.pgm` or `.ppm` format:

```
zeisstopnm {{path/to/file}}
```

- Convert a Zeiss cofocal file to Netbpm format while explicitly specifying the target file type:

```
zeisstopnm -{{pgm|ppm}} {{path/to/file}}
```

zek

Generate a Go struct from XML.

More information: https://github.com/miku/zek#usage.

- Generate a Go struct from a given XML from `stdin` and display output on `stdout`:

```
cat {{path/to/input.xml}} | zek
```

- Generate a Go struct from a given XML from `stdin` and send output to a file:

```
curl {{[-s|--silent]}} {{https://url/to/xml}} | zek -o {{path/to/output.go}}
```

- Generate an example Go program from a given XML from `stdin` and send output to a file:

```
cat {{path/to/input.xml}} | zek -p -o {{path/to/output.go}}
```

zellij

Terminal multiplexer with batteries included.

See also: **`tmux`**, **`screen`**, **`herdr`**.

More information: https://zellij.dev/documentation/.

- Start a new named session:

```
zellij {{[-s|--session]}} {{name}}
```

- List existing sessions:

```
zellij {{[ls|list-sessions]}}
```

- Attach to the most recently used session:

```
zellij {{[a|attach]}}
```

- Open a new pane (inside a zellij session):

```
<Alt n>
```

- Detach from the current session (inside a zellij session):

```
<Ctrl o><d>
```

zeroclaw agent

Start the AI agent loop for interacting with ZeroClaw.

More information: https://github.com/zeroclaw-labs/zeroclaw#quick-start.

- Send a single message to the AI agent:

```
zeroclaw agent {{[-m|--message]}} "{{Hello, ZeroClaw!}}"
```

- Start interactive chat mode:

```
zeroclaw agent
```

- Send a message with a specific provider:

```
zeroclaw agent {{[-m|--message]}} "{{Hello}}" {{[-p|--
provider]}} {{anthropic}}
```

- Send a message with a specific model:

```
zeroclaw agent {{[-m|--message]}} "{{Hello}}" --model
{{anthropic/claude-sonnet-4-20250514}}
```

- Send a message with custom temperature:

```
zeroclaw agent {{[-m|--message]}} "{{Hello}}" {{[-t|--
temperature]}} {{0.5}}
```

- Send a message and attach a hardware peripheral:

```
zeroclaw agent {{[-m|--message]}} "{{Hello}}" --peripheral
{{nucleo-f401re:/dev/ttyACM0}}
```

- Display help:

```
zeroclaw agent {{[-h|--help]}}
```

zeroclaw channel

Manage channels (Telegram, Discord, Slack, etc.) for ZeroClaw.

More information: https://github.com/zeroclaw-labs/zeroclaw#quick-start.

- List all configured channels:

```
zeroclaw channel list
```

- Start all configured channels:

```
zeroclaw channel start
```

- Run health checks for configured channels:

```
zeroclaw channel doctor
```

- Add a new channel:

```
zeroclaw channel add {{telegram|discord|whatsapp|slack|
webhook|...}} '{{json_config}}'
```

- Remove a channel:

```
zeroclaw channel remove {{channel_name}}
```

- Display help:

```
zeroclaw channel {{[-h|--help]}}
```

zeroclaw cron

Manage scheduled tasks for ZeroClaw.

More information: https://github.com/zeroclaw-labs/zeroclaw#quick-start.

- List all scheduled tasks:

```
zeroclaw cron list
```

- Add a new scheduled task with a cron expression:

```
zeroclaw cron add "{{* * * * *}}" "{{command}}"
```

- Add a one-shot delayed task:

```
zeroclaw cron once {{30m|1h|1d|...}} "{{command}}"
```

- Remove a scheduled task:

```
zeroclaw cron remove {{task_id}}
```

- Pause a scheduled task:

```
zeroclaw cron pause {{task_id}}
```

- Resume a paused task:

```
zeroclaw cron resume {{task_id}}
```

- Display help:

```
zeroclaw cron {{[-h|--help]}}
```

zeroclaw daemon

Start the full autonomous runtime for ZeroClaw (gateway + channels + heartbeat).

More information: https://github.com/zeroclaw-labs/zeroclaw#quick-start.

- Start the daemon on default port (8080):

```
zeroclaw daemon
```

- Start the daemon on a specific port:

```
zeroclaw daemon {{[-p|--port]}} {{8080}}
```

- Start the daemon on a random available port:

```
zeroclaw daemon {{[-p|--port]}} 0
```

- Start the daemon on a specific host:

```
zeroclaw daemon --host {{0.0.0.0}} {{[-p|--port]}} {{8080}}
```

- Display help:

```
zeroclaw daemon {{[-h|--help]}}
```

zeroclaw doctor

Run diagnostics for ZeroClaw daemon, scheduler, and channel freshness.

More information: https://github.com/zeroclaw-labs/zeroclaw#quick-start.

- Run diagnostics:

```
zeroclaw doctor
```

- Display help:

```
zeroclaw doctor {{[-h|--help]}}
```

zeroclaw gateway

Start the gateway server for ZeroClaw (webhooks and API).

More information: https://github.com/zeroclaw-labs/zeroclaw#quick-start.

- Start the gateway on default port (8080):

```
zeroclaw gateway
```

- Start the gateway on a specific port:

```
zeroclaw gateway {{[-p|--port]}} {{8080}}
```

- Start the gateway on a random available port:

```
zeroclaw gateway {{[-p|--port]}} 0
```

- Start the gateway on a specific host:

```
zeroclaw gateway --host {{0.0.0.0}} {{[-p|--port]}} {{8080}}
```

- Display help:

```
zeroclaw gateway {{[-h|--help]}}
```

zeroclaw hardware

Discover and introspect USB hardware for ZeroClaw.

More information: https://github.com/zeroclaw-labs/zeroclaw#quick-start.

- List available USB hardware devices:

```
zeroclaw hardware discover
```

- Display help:

```
zeroclaw hardware {{[-h|--help]}}
```

zeroclaw integrations

Browse and manage 50+ integrations for ZeroClaw.

More information: https://github.com/zeroclaw-labs/zeroclaw#quick-start.

- Show details about a specific integration:

```
zeroclaw integrations info {{Telegram|Discord|Slack|WhatsApp|
Matrix|...}}
```

- Display help:

```
zeroclaw integrations {{[-h|--help]}}
```

zeroclaw migrate

Migrate data from other agent runtimes to ZeroClaw.

More information: https://github.com/zeroclaw-labs/zeroclaw#quick-start.

- Simulate migration from OpenClaw without writing data:

```
zeroclaw migrate openclaw --dry-run
```

- Migrate memory from OpenClaw workspace:

```
zeroclaw migrate openclaw
```

- Display help:

```
zeroclaw migrate {{[-h|--help]}}
```

zeroclaw models

Manage provider model catalogs for ZeroClaw.

More information: https://github.com/zeroclaw-labs/zeroclaw#quick-start.

- Refresh and cache models for the default provider:

  ```
  zeroclaw models refresh
  ```

- Refresh models for a specific provider:

  ```
  zeroclaw models refresh --provider {{openrouter}}
  ```

- Force live refresh ignoring cached models:

  ```
  zeroclaw models refresh --force
  ```

- Display help:

  ```
  zeroclaw models {{[-h|--help]}}
  ```

zeroclaw onboard

Initialize workspace and configuration for ZeroClaw.

More information: https://github.com/zeroclaw-labs/zeroclaw#quick-start.

- Quick setup with API key and provider:

```
zeroclaw onboard --api-key {{api_key}} --provider
{{openrouter}}
```

- Run the full interactive wizard:

```
zeroclaw onboard --interactive
```

- Reconfigure channels/allowlists only (fast repair flow):

```
zeroclaw onboard --channels-only
```

- Quick setup with specific memory backend:

```
zeroclaw onboard --api-key {{api_key}} --provider
{{openrouter}} --memory {{sqlite}}
```

- Display help:

```
zeroclaw onboard {{[-h|--help]}}
```

zeroclaw service

Manage the ZeroClaw background service (launchd/systemd user service).

More information: https://github.com/zeroclaw-labs/zeroclaw#quick-start.

- Install the daemon service:

  ```
  zeroclaw service install
  ```

- Start the daemon service:

  ```
  zeroclaw service start
  ```

- Stop the daemon service:

  ```
  zeroclaw service stop
  ```

- Check service status:

  ```
  zeroclaw service status
  ```

- Uninstall the daemon service:

  ```
  zeroclaw service uninstall
  ```

- Display help:

  ```
  zeroclaw service {{[-h|--help]}}
  ```

zeroclaw skills

Manage user-defined skills for ZeroClaw.

More information: https://github.com/zeroclaw-labs/zeroclaw#quick-start.

- List installed skills:

  ```
  zeroclaw skills list
  ```

- Install a skill from a GitHub URL:

  ```
  zeroclaw skills install https://github.com/{{user}}/{{repo}}
  ```

- Install a skill from a local path:

  ```
  zeroclaw skills install {{path/to/skill}}
  ```

- Remove an installed skill:

  ```
  zeroclaw skills remove {{skill_name}}
  ```

- Display help:

  ```
  zeroclaw skills {{[-h|--help]}}
  ```

zeroclaw status

Show the full system status for ZeroClaw.

More information: https://github.com/zeroclaw-labs/zeroclaw#quick-start.

- Show system status:

```
zeroclaw status
```

- Display help:

```
zeroclaw status {{[-h|--help]}}
```

zeroclaw

Fast, small, and fully autonomous AI assistant infrastructure.

Some subcommands such as **`onboard`**, **`models`**, **`service`**, etc. have their own usage documentation.

See also: **`openclaw`**.

More information: https://github.com/zeroclaw-labs/zeroclaw#quick-start.

- Initialize workspace and configuration (quick setup):

```
zeroclaw onboard --api-key {{api_key}} --provider
{{openrouter|anthropic|openai|...}}
```

- Run the full interactive onboarding wizard:

```
zeroclaw onboard --interactive
```

- Send a single message to the AI agent:

```
zeroclaw agent {{[-m|--message]}} "{{Hello, ZeroClaw!}}"
```

- Start interactive chat mode:

```
zeroclaw agent
```

- Start the gateway server (default: 127.0.0.1:8080):

```
zeroclaw gateway
```

- Start full autonomous runtime (gateway + channels + heartbeat):

```
zeroclaw daemon
```

- Check system status:

```
zeroclaw status
```

- Run diagnostics:

```
zeroclaw doctor
```

zerotier-cli

Control the local ZeroTier virtual network service.

See also: **`zerotier-idtool`**, **`zerotier-one`**.

More information: https://github.com/zerotier/ZeroTierOne/blob/main/doc/zerotier-cli.1.md.

- Join a network:

```
sudo zerotier-cli join {{network_id}}
```

- List networks:

```
sudo zerotier-cli listnetworks
```

- List peers in a readable format:

```
sudo zerotier-cli peers
```

- Leave a network:

```
sudo zerotier-cli leave {{network_id}}
```

- Display the status of ZeroTier One:

```
sudo zerotier-cli {{[info|status]}}
```

zerotier-idtool

Create and manipulate ZeroTier identities.

See also: **`zerotier-cli`**, **`zerotier-one`**.

More information: https://github.com/zerotier/ZeroTierOne/blob/dev/doc/zerotier-idtool.1.md.

- Generate a new ZeroTier identity and output the secret part to `stdout`:

```
zerotier-idtool generate
```

- Generate a new ZeroTier identity and save the secret and public parts to files:

```
zerotier-idtool generate {{path/to/identity.secret}} {{path/to/identity.public}}
```

- Generate a new ZeroTier identity with a specific hexadecimal vanity prefix (can take a long time):

```
zerotier-idtool generate {{path/to/identity.secret}} {{path/to/identity.public}} {{vanity_prefix}}
```

- Extract the public portion from a secret identity:

```
zerotier-idtool getpublic {{path/to/identity.secret}}
```

- Sign a file using a secret identity:

```
zerotier-idtool sign {{path/to/identity.secret}} {{path/to/file}}
```

- Verify a signed file using a public identity and a hexadecimal signature:

```
zerotier-idtool verify {{path/to/identity.public}} {{path/to/file}} {{signature_hex}}
```

- Locally validate an identity's key and proof of work:

```
zerotier-idtool validate {{path/to/identity.public}}
```

- Display help:

```
zerotier-idtool help
```

zerotier-one

Start the ZeroTier One daemon.

See also: **`zerotier-cli`**, **`zerotier-idtool`**.

More information: https://github.com/zerotier/ZeroTierOne/blob/main/doc/zerotier-one.8.md.

- Start the ZeroTier One [d]aemon:

```
sudo zerotier-one -d
```

zfgrep

This command is an alias of **`zgrep --fixed-strings`**.

- View documentation for the original command:

```
tldr zgrep
```

zformat

Format strings in Zsh.

This builtin is part of the **`zsh/zutil`** module.

See also: **`zstyle`**.

More information: https://zsh.sourceforge.io/Doc/Release/Zsh-Modules.html.

- Load the zformat module:

```
zmodload zsh/zutil
```

- Format a string by replacing `%c` with a value and store the result in a variable:

```
zformat -f {{variable}} "{{Hello %c}}" {{c:world}}
```

- Format with right-padding (left-align) to a minimum width:

```
zformat -f {{variable}} "{{%10c}}" {{c:hello}}
```

- Format with left-padding (right-align) using negative width:

```
zformat -f {{variable}} "{{%-10c}}" {{c:hello}}
```

- Use ternary expression for conditional text (if value is 3, outputs "yes", otherwise "no"):

```
zformat -f {{variable}} "{{The answer is
'%3(c.yes.no)'.}}" {{c:3}}
```

- Format with left-padding (right-align) using negative minimum width:

```
zformat -f {{variable}} "name: %-15n value:
%-10v" {{n:value1}} {{v:value2}}
```

- Align strings (left:right pairs separated by colon):

```
zformat -a {{array}} {{:}} {{left1:right1}} {{left2:right2}}
```

zfs

Manage ZFS filesystems.

More information: https://manned.org/zfs.

- List all available zfs filesystems:

```
zfs list
```

- Create a new ZFS filesystem:

```
zfs create {{pool_name/filesystem_name}}
```

- Delete a ZFS filesystem:

```
zfs destroy {{pool_name/filesystem_name}}
```

- Create a Snapshot of a ZFS filesystem:

```
zfs snapshot {{pool_name/filesystem_name}}@{{snapshot_name}}
```

- Enable compression on a filesystem:

```
zfs set compression=on {{pool_name/filesystem_name}}
```

- Change mountpoint for a filesystem:

```
zfs set mountpoint=/{{path/to/mount_point}} {{pool_name/
filesystem_name}}
```

zgrep

Grep text patterns from files within compressed files.

More information: https://manned.org/zgrep.

- Grep a pattern in a compressed file (case-sensitive):

```
zgrep {{pattern}} {{path/to/compressed_file}}
```

- Print 3 lines of [C]ontext around, [B]efore, or [A]fter each match:

```
zgrep {{--context|--before-context|--after-context}} 3
{{pattern}} {{path/to/compressed_file}}
```

- Grep a pattern in a compressed file (case-insensitive):

```
zgrep {{[-i|--ignore-case]}} {{pattern}} {{path/to/
compressed_file}}
```

- Output count of lines containing matched pattern in a compressed file:

```
zgrep {{[-c|--count]}} {{pattern}} {{path/to/
compressed_file}}
```

- Display the lines which don't have the pattern present (Invert the search function):

```
zgrep {{[-v|--invert-match]}} {{pattern}} {{path/to/
compressed_file}}
```

- Grep a compressed file for multiple patterns:

```
zgrep {{[-e|--regexp]}} "{{pattern_1}}" {{[-e|--regexp]}}
"{{pattern_2}}" {{path/to/compressed_file}}
```

- Use extended `regex` (supports `?`, `+`, `{}`, `()`, and `|`):

```
zgrep {{[-E|--extended-regexp]}} {{regex}} {{path/to/file}}
```

zig

The Zig compiler and toolchain.

More information: https://ziglang.org/documentation/master/.

- Compile the project in the current directory:

```
zig build
```

- Compile and run the project in the current directory:

```
zig build run
```

- Initialize a `zig build` project with library and executable:

```
zig init
```

- Create and run a test build:

```
zig test {{path/to/file.zig}}
```

- Cross compile, build, and run a project for `x86_64` architecture and `windows` operating system:

```
zig build run -fwine -Dtarget=x86_64-windows
```

- Reformat Zig source into canonical form:

```
zig fmt {{path/to/file.zig}}
```

- Translate a C file to `zig`:

```
zig translate-c -lc {{path/to/file.c}}
```

- Use Zig as a drop-in C++ compiler:

```
zig c++ {{path/to/file.cpp}}
```

zinit

Flexible and blazing fast Zsh plugin manager.

More information: https://github.com/zdharma-continuum/zinit.

- Show all installed plugins:

```
zinit plugins
```

- Go to the directory of a plugin:

```
zinit cd {{repository_owner}}/{{repository_name}}
```

- Fetch the newest version of `zinit` from GitHub:

```
zinit self-update
```

- List status of all installed completions:

```
zinit completions
```

- Install completions for a plugin:

```
zinit creinstall {{repository_owner}}/{{repository_name}}
```

- Delete completion for a plugin:

```
zinit cuninstall {{repository_owner}}/{{repository_name}}
```

zint

Generate barcodes and QR codes.

More information: https://www.zint.org.uk/manual/chapter/4.

- Generate a barcode and save it:

```
zint --data "{{UTF-8 data}}" --output {{path/to/file}}
```

- Specify a code type for generation:

```
zint --barcode {{code_type}} --data "{{UTF-8 data}}" --output
{{path/to/file}}
```

- List all supported code types:

```
zint --types
```

zip

Package and compress (archive) files into a Zip archive.

See also: **`unzip`**.

More information: https://manned.org/zip.

- Add files/directories to a specific archive:

```
zip {{[-r|--recurse-paths]}} {{path/to/compressed.zip}}
{{path/to/file_or_directory1 path/to/file_or_directory2 ...}}
```

- Remove files/directories from a specific archive:

```
zip {{[-d|--delete]}} {{path/to/compressed.zip}} {{path/to/
file_or_directory1 path/to/file_or_directory2 ...}}
```

- Archive files/directories excluding specified ones:

```
zip {{[-r|--recurse-paths]}} {{path/to/compressed.zip}}
{{path/to/file_or_directory1 path/to/file_or_directory2 ...}}
{{[-x|--exclude]}} {{path/to/excluded_files_or_directories}}
```

- Archive files/directories with a specific compression level (`0` - the lowest, `9` - the highest):

```
zip {{[-r|--recurse-paths]}} -{{0..9}} {{path/to/
compressed.zip}} {{path/to/file_or_directory1 path/to/
file_or_directory2 ...}}
```

- Create an encrypted archive with a specific password:

```
zip {{[-re|--recurse-paths --encrypt]}} {{path/to/
compressed.zip}} {{path/to/file_or_directory1 path/to/
file_or_directory2 ...}}
```

- Archive files/directories to a multi-part split Zip archive (e.g. 3 GB parts):

```
zip {{[-rs|--recurse-paths --split-size]}} {{3g}} {{path/to/
compressed.zip}} {{path/to/file_or_directory1 path/to/
file_or_directory2 ...}}
```

- Print a specific archive contents:

```
zip {{[-sf|--split-size --freshen]}} {{path/to/
compressed.zip}}
```

zip2john

Extract password hashes from Zip archives for use with John the Ripper password cracker.

This is a utility tool usually installed as part of the John the Ripper installation.

More information: https://www.openwall.com/john/.

- Extract the password hash from an archive, listing all files in the archive:

```
zip2john {{path/to/file.zip}}
```

- Extract the password hash using [o]nly a specific compressed file:

```
zip2john -o {{path/to/compressed_file}} {{path/to/file.zip}}
```

- Extract the password hash from a compressed file to a specific file (for use with John the Ripper):

```
zip2john -o {{path/to/compressed_file}} {{path/to/file.zip}}
> {{file.hash}}
```

zipalign

Zip archive alignment tool.

Part of the Android SDK build tools.

More information: https://developer.android.com/tools/zipalign.

- Align the data of a Zip file on 4-byte boundaries:

```
zipalign {{4}} {{path/to/input.zip}} {{path/to/output.zip}}
```

- Check that a Zip file is correctly aligned on 4-byte boundaries and display the results in a verbose manner:

```
zipalign -v -c {{4}} {{path/to/input.zip}}
```

zipcloak

Encrypt the contents within a Zip archive.

More information: https://manned.org/zipcloak.

- Encrypt the contents of a Zip archive:

```
zipcloak {{path/to/archive.zip}}
```

- Decrypt the contents of a Zip archive:

```
zipcloak {{[-d|--decrypt]}} {{path/to/archive.zip}}
```

- Output the encrypted contents into a new Zip archive:

```
zipcloak {{path/to/archive.zip}} {{[-O|--output-file]}}
{{path/to/encrypted.zip}}
```

zipgrep

Find patterns in files in a Zip archive using extended **regex** (supports **?**, **+**, **{}**, **()**, and **|**).

More information: https://manned.org/zipgrep.

- Search for a pattern within a Zip archive:

```
zipgrep "{{search_pattern}}" {{path/to/file.zip}}
```

- Print file name and line number for each match:

```
zipgrep {{[-H|--with-filename]}} {{[-n|--line-number]}}
"{{search_pattern}}" {{path/to/file.zip}}
```

- Search for lines that do not match a pattern:

```
zipgrep {{[-v|--invert-match]}} "{{search_pattern}}" {{path/
to/file.zip}}
```

- Specify files inside a Zip archive from search:

```
zipgrep "{{search_pattern}}" {{path/to/file.zip}} {{file/to/
search1}} {{file/to/search2}}
```

- Exclude files inside a Zip archive from search:

```
zipgrep "{{search_pattern}}" {{path/to/file.zip}} {{[-x|--
line-regexp]}} {{file/to/exclude1}} {{file/to/exclude2}}
```

zipinfo

List detailed information about the contents of a Zip file.

More information: https://manned.org/zipinfo.

- List all files in a Zip file in long format (permissions, ownership, size, and modification date):

```
zipinfo {{path/to/archive.zip}}
```

- List all files in a Zip file:

```
zipinfo -1 {{path/to/archive.zip}}
```

zipnote

View, add, or edit a Zip archive's comments.

Files can also be renamed in the Zip archive.

More information: https://manned.org/zipnote.

- View the comments on a Zip archive:

```
zipnote {{path/to/file.zip}}
```

- Extract the comments on a Zip archive to a file:

```
zipnote {{path/to/file.zip}} > {{path/to/file.txt}}
```

- Add/Update comments in a Zip archive from a file:

```
zipnote < {{path/to/file.txt}} -w {{path/to/file.zip}}
```

zizmor

Find security issues in GitHub Actions workflows and action definitions.

More information: https://docs.zizmor.sh/quickstart/.

- Audit all workflows and actions in the current directory:

```
zizmor .
```

- Audit a specific workflow file:

```
zizmor {{path/to/workflow.yml}}
```

- Audit a remote GitHub repository (requires a GitHub token):

```
zizmor --gh-token {{token}} {{username/repository}}
```

- Run only offline audits (no network requests):

```
zizmor {{[-o|--offline]}} {{path/to/workflow.yml}}
```

- Output results in SARIF format:

```
zizmor --format sarif {{path/to/workflow.yml}}
```

- Filter findings by minimum severity:

```
zizmor --min-severity {{informational|low|medium|high}} .
```

- Display help:

```
zizmor {{[-h|--help]}}
```

- Display version:

```
zizmor {{[-v|--version]}}
```

zle

Manage Zsh Line Editor widgets.

Note: Some operations require ZLE to be active (typically inside a user-defined widget).

See also: **`bindkey`**.

More information: https://zsh.sourceforge.io/Doc/Release/Zsh-Line-Editor.html#Zle-Builtins.

- [l]ist user-defined widgets:

```
zle -l
```

- [l]ist [a]ll widgets, including built-in ones:

```
zle -la
```

- Create a [N]ew user-defined widget (function defaults to same name as widget):

```
zle -N {{widget_name}} {{optional_shell_function_name}}
```

- [D]elete a widget:

```
zle -D {{widget_name}}
```

- Create an [A]lias of a widget:

```
zle -A {{original_widget}} {{alias_name}}
```

- Invoke a widget from inside another widget function (requires active ZLE):

```
zle {{widget_name}}
```

- Push text into ZLE's input queue as if it were typed (requires active ZLE):

```
zle -U "{{text}}"
```

zless

View **`gzip`** and **`xz`** compressed files.

More information: https://manned.org/zless.

- Page through a `gzip` compressed file with `less`:

```
zless {{file.txt.gz}}
```

zlib-flate

Raw zlib compression and decompression program.

Part of **qpdf**.

More information: https://manned.org/zlib-flate.

- Compress a file:

```
zlib-flate < {{path/to/input_file}} -compress > {{path/to/compressed.zlib}}
```

- Uncompress a file:

```
zlib-flate < {{path/to/compressed.zlib}} -uncompress > {{path/to/output_file}}
```

- Compress a file with a specified compression level. 0=Fastest (Worst), 9=Slowest (Best):

```
zlib-flate < {{path/to/input_file}} -compress={{compression_level}} > {{path/to/compressed.zlib}}
```

zm

A tool for managing articles of newspapers and blogs.

More information: https://github.com/ZERMZeitung/zm2.

- Make a new draft:

  ```
  zm new
  ```

- Edit a draft:

  ```
  zm edit
  ```

- Publish a draft and commit it with git:

  ```
  zm publish
  ```

zmap

Fast, open-source network scanner for Internet-wide surveys.

See also: **`hping3`**, **`masscan`**, **`naabu`**, **`nmap`**, **`rustscan`**.

More information: https://manned.org/zmap.

- Scan a subnet or full IPv4 space for a specific TCP port (default: 80):

```
sudo zmap {{[-p|--target-ports]}} {{port}} {{subnet}}
```

- Scan specific ports or port ranges across a subnet:

```
sudo zmap {{[-p|--target-ports]}} {{port1,port2-port3,...}}
{{subnet}}
```

- Output results to a CSV file with custom fields:

```
sudo zmap {{[-o|--output-file]}} {{path/to/output_file.csv}}
{{[-f|--output-fields]}}
"{{saddr,daddr,sport,dport}}" {{subnet}}
```

- Limit the scan rate to a specific number of packets per second:

```
sudo zmap {{[-r|--rate]}} {{packets_per_second}} {{subnet}}
```

- Simulate running zmap without sending packets:

```
zmap {{[-d|--dryrun]}} {{subnet}}
```

- Exclude subnets using a blocklist file in CIDR notation:

```
sudo zmap {{[-b|--blocklist-file]}} {{path/to/blocklist.txt}}
{{subnet}}
```

- Set a specific source IP for scan packets:

```
sudo zmap {{[-S|--source-ip]}} {{source_ip}} {{subnet}}
```

- Cap the number/percentage of targets to probe (e.g. 1000 IP/port pairs):

```
sudo zmap {{[-p|--target-ports]}} {{port1,port2-port3}} {{[-
n|--max-targets]}} {{1000}} {{subnet}}
```

zmore

View **gzip** compressed files with **more**.

More information: https://manned.org/zmore.

- Open a compressed file:

  `zmore {{path/to/file.txt.gz}}`

- Display the next page of the file:

  `<Space>`

- Search for a pattern in the file (press `<n>` to go to next match):

  `</>{{regex}}`

- Exit:

  `<q>`

- Display interactive command help:

  `<h>`

zmv

Move or rename files matching a specified extended **glob** pattern.

More information: https://zsh.sourceforge.io/Doc/Release/User-Contributions.html.

- Move files using a regex-like pattern:

```
zmv '{{(*).log}}' '{{$1.txt}}'
```

- Preview the result of a move, without making any actual changes:

```
zmv -n '{{(*).log}}' '{{$1.txt}}'
```

- Interactively move files, with a prompt before every change:

```
zmv -i '{{(*).log}}' '{{$1.txt}}'
```

- Verbosely print each action as it's being executed:

```
zmv -v '{{(*).log}}' '{{$1.txt}}'
```

znew

Recompress files from **`.Z`** to **`gzip`** format.

More information: https://manned.org/znew.

- Recompress a file from `.Z` to `gzip` format:

```
znew {{path/to/file1.Z}}
```

- Recompress multiple files and display the achieved size reduction % per file:

```
znew -v {{path/to/file1.Z path/to/file2.Z ...}}
```

- Recompress a file using the slowest compression method (for optimal compression):

```
znew -9 {{path/to/file1.Z}}
```

- Recompress a file, [K]eeping the `.Z` file if it is smaller than the `gzip` file:

```
znew -K {{path/to/file1.Z}}
```

zola

A static site generator in a single binary with everything built-in.

More information: https://www.getzola.org/documentation/getting-started/cli-usage/.

- Create the directory structure used by Zola at the given directory:

```
zola init {{my_site}}
```

- Build the whole site in the `public` directory after deleting it:

```
zola build
```

- Build the whole site into a different directory:

```
zola build --output-dir {{path/to/output_directory}}/
```

- Build and serve the site using a local server (default is `127.0.0.1:1111`):

```
zola serve
```

- Build all pages just like the build command would, but without writing any of the results to disk:

```
zola check
```

zopflipng

PNG compression utility.

More information: https://github.com/google/zopfli.

- Optimize a PNG:

```
zopflipng {{input.png}} {{output.png}}
```

- Optimize several PNGs and save with given prefix:

```
zopflipng --prefix={{prefix}} {{image1.png image2.png
image3.png ...}}
```

zotero

Manage your bibliographies.

More information: https://www.zotero.org/support/.

- Run with the GUI:

```
zotero
```

- Run in headless mode:

```
zotero --headless
```

- Run with a specific profile:

```
zotero -P {{profile}}
```

- Run the Migration Assistant:

```
zotero --migration
```

zoxide

Keep track of the most frequently used directories.

Uses a ranking algorithm to navigate to the best match.

More information: https://manned.org/zoxide.

- Go to the highest-ranked directory that contains `string` in the name:

```
zoxide query string
```

- Go to the highest-ranked directory that contains `string1` and then `string2`:

```
zoxide query string1 string2
```

- Start an interactive directory search (requires `fzf`):

```
zoxide query {{[-i|--interactive]}}
```

- Add a directory or increment its rank:

```
zoxide add {{path/to/directory}}
```

- Remove a directory from `zoxide`'s database:

```
zoxide remove {{path/to/directory}}
```

- Generate shell configuration for command aliases (`z`, `zi`):

```
zoxide init {{bash|elvish|fish|nushell|posix|powershell|tcsh|xonsh|zsh}}
```

zpaq

Incremental journaling backup utility and archiver.

More information: https://mattmahoney.net/dc/zpaqdoc.html.

- Add a file or directory to a new or existing archive:

```
zpaq {{[a|add]}} {{path/to/archive.zpaq}} {{path/to/file_or_directory}}
```

- Create or add to an encrypted archive:

```
zpaq {{[a|add]}} -k{{password}} {{path/to/archive.zpaq}} {{path/to/file_or_directory}}
```

- Extract the most recent versions of files:

```
zpaq {{[x|extract]}} {{path/to/archive.zpaq}}
```

- List the archive contents:

```
zpaq {{[l|list]}} {{path/to/archive.zpaq}}
```

- Set the level of compression (higher means more compression but slower):

```
zpaq {{[a|add]}} {{path/to/archive.zpaq}} -m{{1..5}} {{path/to/file_or_directory}}
```

- Extract the specified files from the archive that are not newer than the specified date:

```
zpaq {{[x|extract]}} {{path/to/archive.zpaq}} {{path/in/archive/to/extract}} -to {{path/to/output}} -until {{YYYY-MM-DD}}
```

zpool

Manage ZFS pools.

More information: https://manned.org/zpool.

- Show the configuration and status of all ZFS zpools:

```
zpool status
```

- Check a ZFS pool for errors (verifies the checksum of EVERY block). Very CPU and disk intensive:

```
zpool scrub {{pool_name}}
```

- List zpools available for import:

```
zpool import
```

- Import a zpool:

```
zpool import {{pool_name}}
```

- Export a zpool (unmount all filesystems):

```
zpool export {{pool_name}}
```

- Show the history of all pool operations:

```
zpool history {{pool_name}}
```

- Create a mirrored pool:

```
zpool create {{pool_name}} mirror {{disk1}} {{disk2}} mirror {{disk3}} {{disk4}}
```

- Add a cache (L2ARC) device to a zpool:

```
zpool add {{pool_name}} cache {{cache_disk}}
```

zrok

Expose local services and files to the internet.

Part of the OpenZiti project, offering secure, zero-trust sharing.

More information: https://docs.zrok.io/.

- Request an invitation to use the public zrok service (run this first):

  ```
  zrok invite
  ```

- Enable the zrok environment with the token from an invitation email:

  ```
  zrok enable {{your_token}}
  ```

- Create a publicly accessible URL for a local web server:

  ```
  zrok share public {{http://localhost:8080}}
  ```

- Create a secure share accessible only with a unique token:

  ```
  zrok share private {{http://localhost:3000}}
  ```

- Access a private share created by another user:

  ```
  zrok access private {{share_token}}
  ```

- Serve the contents of a local directory as a simple website:

  ```
  zrok share public --backend-mode web {{path/to/directory}}
  ```

- Display the status of the zrok environment and active shares:

  ```
  zrok status
  ```

zrun

Transparently uncompress argument files to a command.

More information: https://manned.org/zrun.

- Run the specified command with uncompressed versions of the compressed argument files:

```
zrun {{cat}} {{path/to/file1.gz path/to/file2.bz2 ...}}
```

zsh

Z SHell, a Bash-compatible command-line interpreter.

See also: **`bash`**, **`!`**, **`^`**.

More information: https://zsh.sourceforge.io/Doc/Release/Invocation.html#Invocation.

- Start an interactive shell session:

```
zsh
```

- Execute specific [c]ommands:

```
zsh -c "{{echo 'zsh is executed'}}"
```

- Execute a specific script:

```
zsh {{path/to/script.zsh}}
```

- Check a specific script for syntax errors without executing it:

```
zsh {{[-n|--no-exec]}} {{path/to/script.zsh}}
```

- Execute specific commands from `stdin`:

```
{{echo "echo 'zsh is executed'"}} | zsh
```

- Execute a specific script, printing each command in the script before executing it:

```
zsh {{[-x|--xtrace]}} {{path/to/script.zsh}}
```

- Start an interactive shell session in verbose mode, printing each command before executing it:

```
zsh {{[-v|--verbose]}}
```

- Start Zsh without loading user level configuration (e.g. `~/.zshrc`):

```
zsh {{[-f|--no-rcs]}}
```

zstd

Compress or decompress files with Zstandard compression.

More information: https://manned.org/zstd.

- Compress a file into a new file with the `.zst` suffix:

```
zstd {{path/to/file}}
```

- Decompress a file:

```
zstd {{[-d|--decompress]}} {{path/to/file.zst}}
```

- Decompress to `stdout`:

```
zstd {{[-d|--decompress]}} {{[-c|--stdout]}} {{path/to/file.zst}}
```

- Compress a file specifying the compression level, where 1=fastest, 19=slowest, and 3=default:

```
zstd -{{1..19}} {{path/to/file}}
```

- Compress a file using an ultra-fast compression level, where 1=default:

```
zstd --fast={{1..131072}} {{path/to/file}}
```

- Unlock higher compression levels (up to 22) using more memory (both for compression and decompression):

```
zstd --ultra -{{1..22}} {{path/to/file}}
```

- Set the number of working threads to the number of physical CPU cores:

```
zstd {{[-T|--threads]}} 0
```

zstdcat

This command is an alias of **`zstd --decompress --stdout --force`**.

- View documentation for the original command:

```
tldr zstd
```

zstdless

Open a **zstd** compressed file for interactive reading, allowing scrolling and search.

See also: **zstd**, **less**.

More information: https://manned.org/zstdless.

- Open a `zstd` compressed file:

```
zstdless {{path/to/file.zst}}
```

zstdmt

This command is an alias of **`zstd --threads 0`**.

- View documentation for the original command:

```
tldr zstd
```

zsteg

Steganography detection tool for PNG and BMP file formats.

It detects LSB steganography, ZLIB-compressed data, OpenStego, Camouflage, and LSB with the Eratosthenes set.

More information: https://github.com/zed-0xff/zsteg.

- Detect embedded data in a PNG:

```
zsteg {{path/to/image.png}}
```

- Detect embedded data in a BMP image, using all known methods:

```
zsteg --all {{path/to/image.bmp}}
```

- Detect embedded data in a PNG, iterating pixels vertically and using MSB first:

```
zsteg --msb --order yx {{path/to/image.png}}
```

- Detect embedded data in a BMP image, specifying the bits to consider:

```
zsteg --bits {{1,2,3|1-3}} {{path/to/image.bmp}}
```

- Detect embedded data in a PNG, extracting only prime pixels and inverting bits:

```
zsteg --prime --invert {{path/to/image.png}}
```

- Detect embedded data in a BMP image, specifying the minimum length of the strings to be found and the find mode:

```
zsteg --min-str-len {{10}} --strings {{first|all|longest|
none}} {{path/to/image.bmp}}
```

zstyle

Define and look up configuration styles in Zsh.

This builtin is part of the **`zsh/zutil`** module.

More information: https://zsh.sourceforge.io/Doc/Release/Zsh-Modules.html.

- List all defined styles:

```
zstyle
```

- List styles as ready-to-paste `zstyle` commands:

```
zstyle -L
```

- Define a style for a specific pattern:

```
zstyle {{pattern}} {{style}} {{value1 value2...}}
```

- Delete a style for a specific pattern:

```
zstyle -d {{pattern}}
```

- Retrieve a style value as a string into a variable:

```
zstyle -s {{context}} {{style}} {{variable_name}}
```

- Retrieve a style value as a boolean into a variable:

```
zstyle -b {{context}} {{style}} {{variable_name}}
```

- Retrieve a style value as an array into a variable:

```
zstyle -a {{context}} {{style}} {{variable_name}}
```

{

Multipurpose shell syntax.

More information: https://www.gnu.org/software/bash/manual/bash.html.

- Isolate variable names:

```
echo ${{{HOME}work}}
```

- Brace expand sequences:

```
echo {{{1..3}}} {{{a..c}}}{{{dir1,dir2,dir3}}}
```

- Check if `variable` is set before returning text:

```
echo ${{{variable:+variable is set and contains $variable}}}
```

- Set default values in case `variable` is unset:

```
echo ${{{variable:-default}}}
```

- Return `variable` length in characters:

```
echo ${{{#variable}}}
```

- Return a string slice:

```
echo ${{{variable:3:7}}}
```

- Recursively expand a `variable`:

```
echo ${{{!variable}}}
```

- Group command output together:

```
{ {{command1; command2; ...}} } | {{another_command}}
```

}

This shell keyword is used to close out **{**.

- View documentation for the { keyword:

```
tldr {
```

~

Expand to a directory.

More information: https://gnu.org/software/bash/manual/bash.html#Tilde-Expansion.

- List the current user's home directory contents:

```
ls ~
```

- List the home directory contents of another user:

```
ls ~{{username}}
```

- List the contents of the previous directory you were in:

```
ls ~-
```

Dos

BOOT

Boot floppy or hard disk images directly, bypassing OS emulation.

More information: https://www.dosbox.com/wiki/BOOT.

- Boot from floppy image:

```
BOOT {{path/to/floppy.img}}
```

- Boot from hard disk image:

```
BOOT {{path/to/hard_disk.img}}
```

- Boot multiple floppy images:

```
BOOT {{path/to/floppy1.img path/to/floppy2.img ...}}
```

CD

Change the current working directory.

More information: https://help.fdos.org/en/hhstndrd/command/cd.htm.

- Go to the specified directory:

```
CD {{PATH\TO\DIRECTORY}}
```

- Go up to the parent of the current directory:

```
CD ..
```

- Go to the root directory of the current drive:

```
CD \
```

CHDIR

This command is an alias of **CD**.

- View documentation for the original command:

```
tldr {{[-p|--platform]}} dos cd
```

CHOICE

Wait for keypress and set **`ERRORLEVEL`** in batch scripts.

More information: https://www.dosbox.com/wiki/Commands#CHOICE.

- Prompt for yes/no:

```
CHOICE "{{prompt}}"
```

CLS

Clear the screen and reset colors.

More information: https://help.fdos.org/en/hhstndrd/batch/cls.htm.

- Clear the screen resetting colors to white on black:

```
CLS
```

CONFIG

Change or query DOSBox settings at runtime; save configs/languages.

More information: https://www.dosbox.com/wiki/CONFIG.

- Write current config to file (local drive):

```
CONFIG -writeconf {{path/to/file.conf}}
```

- Write current language strings to file:

```
CONFIG -writelang {{path/to/file.lang}}
```

- Enable secure mode (disables MOUNT/IMGMOUNT/BOOT):

```
CONFIG -securemode
```

- Set a property (e.g., CPU cycles):

```
CONFIG -set "cpu cycles={{10000}}"
```

- Set a property (e.g., disable EMS):

```
CONFIG -set "dos ems=off"
```

- Get a property's value (stored in `%CONFIG%`):

```
CONFIG -get "cpu core"
```

COPY

Copy files.

More information: https://www.dosbox.com/wiki/Commands#COPY.

- Copy a file:

```
COPY {{path/to/source_file}} {{path/to/destination_file}}
```

DEL

Delete one or more files.

More information: https://www.dosbox.com/wiki/Commands#DEL.

- Delete a file:

```
DEL {{path/to/file}}
```

- Delete all files matching a pattern:

```
DEL {{path/to/*.ext}}
```

DIR

List files and directories.

More information: https://www.dosbox.com/wiki/Commands#DIR.

- List current directory:

```
DIR
```

- Pause per page:

```
DIR /p
```

- List files in wide format:

```
DIR /w
```

EXIT

Exit DOSBox.

More information: https://www.dosbox.com/wiki/Commands#EXIT.

- Exit DOSBox:

```
EXIT
```

IMGMOUNT

Mount disk or CD-ROM images.

More information: https://www.dosbox.com/wiki/IMGMOUNT.

- Mount floppy:

```
IMGMOUNT a {{floppy.img}}
```

- Mount CD-ROM:

```
IMGMOUNT d {{cd.iso}}
```

IPXNET

Emulate IPX networking for multiplayer games (client-server model).

More information: https://www.dosbox.com/wiki/Connectivity.

- Start IPX server (default UDP port 213):

```
IPXNET startserver
```

- Start server on specific port:

```
IPXNET startserver {{19900}}
```

- Connect as a client to a server IP:

```
IPXNET connect {{192.168.2.100}}
```

- Connect with specific port:

```
IPXNET connect {{192.168.2.100}} {{19900}}
```

- Check network status:

```
IPXNET status
```

- Ping to test speed/clients:

```
IPXNET ping
```

- Disconnect client:

```
IPXNET disconnect
```

- Stop server (after clients disconnect):

```
IPXNET stopserver
```

KEYB

Change keyboard layout.

More information: https://www.dosbox.com/wiki/KEYB.

- Set the keyboard layout:

```
KEYB {{us|uk|gr|...}}
```

LOADFIX

Reduce available conventional memory for old programs (default: 64KB).

More information: https://www.dosbox.com/wiki/LOADFIX.

- Start a program with 64KB allocated memory:

```
LOADFIX {{program}}
```

- Load with custom KB reduction (1-1024):

```
LOADFIX -{{32}} {{program}}
```

- Free all previously allocated memory:

```
LOADFIX -f
```

LOADHIGH

Load program into upper memory (requires **`xms=true`** and **`umb=true`**).

More information: https://www.dosbox.com/wiki/Commands#LOADHIGH.

- Load program into upper memory:

```
LOADHIGH {{program}}
```

MD

Make a directory.

More information: https://www.dosbox.com/wiki/Commands#MD.

- Create a directory:

```
MD {{path/to/directory}}
```

MEM

Display free memory info.

More information: https://www.dosbox.com/wiki/Commands#MEM.

- Display free memory:

```
MEM
```

MIXER

Display/set sound levels.

More information: https://www.dosbox.com/wiki/MIXER.

- Display current volumes:

```
MIXER
```

- Set master volume (left:right percentages):

```
MIXER master {{80}}:{{80}}
```

- Set Sound Blaster volume in decibels:

```
MIXER sb d{{10}}:d{{10}}
```

- Set GUS left channel only:

```
MIXER gus {{50}}
```

- Set volumes without displaying result:

```
MIXER gus {{40}}:{{40}} /NOSHOW
```

- List available MIDI devices (Windows only):

```
MIXER /LISTMIDI
```

MOUNT

Mount host directories/drives/images as virtual DOS drives.

More information: https://www.dosbox.com/wiki/MOUNT.

- Mount current directory as C:

```
MOUNT C .
```

- Mount specific directory as C:

```
MOUNT C {{C:\path\to\directory}}
```

- Mount with a free space limit (in MB):

```
MOUNT C {{C:\path\to\directory}} -freesize {{1024}}
```

- Mount floppy drive:

```
MOUNT A {{A:\}} -t floppy
```

- Mount CD-ROM drive:

```
MOUNT D {{D:\}} -t cdrom
```

- Mount CD with extra options:

```
MOUNT D {{D:\}} -t cdrom -usecd {{0}} -ioctl
```

- Unmount drive:

```
MOUNT -u {{C}}
```

PATH

Display or set the search path for executable files.

This command is available in FreeDOS only.

More information: https://help.fdos.org/en/hhstndrd/batch/path.htm.

- Display the current search path:

```
PATH
```

- Set the semicolon-separated list of directories to search in:

```
PATH {{path/to/directory1;path/to/directory2;...}}
```

- Append a directory to the search path:

```
PATH %PATH%;{{path/to/directory}}
```

- Add a directory to the beginning of the search path:

```
PATH {{path/to/directory}};%PATH%
```

- Clear the search path:

```
PATH;
```

- Display help:

```
PATH /?
```

RD

Remove a directory.

More information: https://www.dosbox.com/wiki/Commands#RD.

- Remove a directory:

```
RD {{path\to\directory}}
```

REN

Rename files (use for moving too).

More information: https://www.dosbox.com/wiki/Commands#REN.

- Rename a file:

```
REN {{path/to/file}} {{new_name}}
```

RESCAN

Refresh mounted drives (like **`<Ctrl F4>`**).

More information: https://www.dosbox.com/wiki/RESCAN.

- Refresh mounted drives:

```
RESCAN
```

SET

Set/display environment variables.

More information: https://www.dosbox.com/wiki/Commands#SET.

- Set variable:

```
SET {{VAR}}={{value}}
```

TYPE

Display the contents of a text file.

More information: https://www.dosbox.com/wiki/Commands#TYPE.

- Show a file:

```
TYPE {{path/to/file.txt}}
```

VER

View/set reported DOS version.

More information: https://www.dosbox.com/wiki/Commands#VER.

- Set the reported DOS version:

```
VER set {{major_version}} {{minor_version}}
```

Freebsd

base64

Encode or decode file or **`stdin`** to/from base64, to **`stdout`**.

More information: https://man.freebsd.org/cgi/man.cgi?query=base64.

- Encode a file to `stdout`:

```
base64 {{path/to/file}}
```

- Wrap encoded output at a specific column width (`0` disables wrapping):

```
base64 -w {{0|76|...}} {{path/to/file}}
```

- Decode a file to `stdout`:

```
base64 -d {{path/to/file}}
```

- Encode from `stdin` to `stdout`:

```
{{command}} | base64
```

- Decode from `stdin` to `stdout`:

```
{{command}} | base64 -d
```

cal

Display a calendar with the current day highlighted.

More information: https://man.freebsd.org/cgi/man.cgi?query=cal.

- Display a calendar for the current month:

```
cal
```

- Display a calendar for a specific year:

```
cal {{year}}
```

- Display a calendar for a specific month and year:

```
cal {{month}} {{year}}
```

- Display the whole calendar for the current year:

```
cal -y
```

- Don't [h]ighlight today and display [3] months spanning the date:

```
cal -h -3 {{month}} {{year}}
```

- Display the 2 months [B]efore and 3 [A]fter a specific [m]onth of the current year:

```
cal -A 3 -B 2 {{month}}
```

- Display [j]ulian days (starting from one, numbered from January 1):

```
cal -j
```

chfn

This command is an alias of **chpass**.

- View documentation for the original command:

  ```
  tldr chpass
  ```

chpass

Add or change user database information, including login shell and password.

See also: **passwd**.

More information: https://man.freebsd.org/cgi/man.cgi?query=chpass.

- Add or change user database information for the current user interactively:

```
chpass
```

- Set a specific login [s]hell for the current user:

```
chpass -s {{path/to/shell}}
```

- Set a login [s]hell for a specific user:

```
chpass -s {{path/to/shell}} {{username}}
```

- Change the account [e]xpire time (in seconds from the epoch, UTC):

```
su -c 'chpass -e {{time}} {{username}}'
```

- Change a user's password:

```
su -c 'chpass -p {{encrypted_password}} {{username}}'
```

- Specify the [h]ostname or address of an NIS server to query:

```
su -c 'chpass -h {{hostname}} {{username}}'
```

- Specify a particular NIS [d]omain (system domain name by default):

```
su -c 'chpass -d {{domain}} {{username}}'
```

chsh

This command is an alias of **chpass**.

- View documentation for the original command:

  ```
  tldr chpass
  ```

df

Display an overview of the filesystem disk space usage.

More information: https://man.freebsd.org/cgi/man.cgi?query=df.

- Display all filesystems and their disk usage (using 512-byte units):

```
df
```

- Use [h]uman-readable units (based on powers of 1024) and display a grand total:

```
df -h -c
```

- Use [H]uman-readable units (based on powers of 1000):

```
df -H
```

- Display the filesystem containing the specified file or directory:

```
df {{path/to/file_or_directory}}
```

- Include statistics on the number of free and used [i]nodes, including the filesystem [T]ypes:

```
df -iT
```

- Use [k]ibibyte (1024 byte) units when showing size figures:

```
df -k
```

- Display information in a [P]ortable way:

```
df -P
```

ipmitool

Interface with the Intelligent Platform Management Interface (IPMI).

More information: https://man.freebsd.org/cgi/man.cgi?query=ipmitool.

- Load the IPMI kernel module for local connections:

```
kldload ipmi.ko
```

- Open IPMI shell on the local hardware:

```
ipmitool shell
```

- Open IPMI shell on a remote host:

```
ipmitool -H {{ip_address}} -U {{user_name}} shell
```

look

Display lines beginning with a prefix in a sorted file.

See also: **`grep`**, **`sort`**.

More information: https://man.freebsd.org/cgi/man.cgi?query=look.

- Search for lines beginning with a specific prefix in a specific file:

```
look {{prefix}} {{path/to/file}}
```

- Case-insensitively search only on alphanumeric characters:

```
look {{[-f|--ignore-case]}} {{[-d|--alphanum]}} {{prefix}} {{path/to/file}}
```

- Specify a string termination character (space by default):

```
look {{[-t|--terminate]}} {{,}}
```

- Search in `/usr/share/dict/words` (`--ignore-case` and `--alphanum` are assumed):

```
look {{prefix}}
```

pfctl

Control the packet filter device.

More information: https://man.freebsd.org/cgi/man.cgi?query=pfctl.

- Enable the packet filter:

```
sudo pfctl -e
```

- Disable the packet filter:

```
sudo pfctl -d
```

- Load rules from a configuration file:

```
sudo pfctl -f {{path/to/pf.conf}}
```

- Show all active rules:

```
pfctl -sr
```

- Show packet filter status information:

```
pfctl -s info
```

- Flush all rules:

```
sudo pfctl -F rules
```

pkg

FreeBSD package manager.

More information: https://man.freebsd.org/cgi/man.cgi?query=pkg.

- Install a new package:

```
pkg install {{package}}
```

- Delete a package:

```
pkg delete {{package}}
```

- Upgrade all packages:

```
pkg upgrade
```

- Search for a package:

```
pkg search {{keyword}}
```

- List installed packages:

```
pkg info
```

- Remove unneeded dependencies:

```
pkg autoremove
```

procstat

Display detailed information about processes in FreeBSD.

More information: https://man.freebsd.org/cgi/man.cgi?query=procstat.

- Display file descriptors of a specific process:

```
procstat fds {{process_id}}
```

- Show virtual memory mappings of a process:

```
procstat vm {{process_id}}
```

- Display process arguments:

```
procstat arguments {{process_id}}
```

- Show resource limits of a process:

```
procstat rlimit {{process_id}}
```

sed

Edit text in a scriptable manner.

See also: **awk**, **ed**.

More information: https://man.freebsd.org/cgi/man.cgi?query=sed.

- Replace all `apple` (basic `regex`) occurrences with `mango` (basic `regex`) in all input lines and print the result to `stdout`:

```
{{command}} | sed 's/apple/mango/g'
```

- Execute a specific script [f]ile and print the result to `stdout`:

```
{{command}} | sed -f {{path/to/script.sed}}
```

- Delay opening each file until a command containing the related `w` function or flag is applied to a line of input:

```
{{command}} | sed -af {{path/to/script.sed}}
```

- Replace all `apple` (extended `regex`) occurrences with `APPLE` (extended `regex`) in all input lines and print the result to `stdout`:

```
{{command}} | sed -E 's/(apple)/\U\1/g'
```

- Print just a first line to `stdout`:

```
{{command}} | sed -n '1p'
```

- Replace all `apple` (basic `regex`) occurrences with `mango` (basic `regex`) in a specific file and overwrite the original file in place:

```
sed -i 's/apple/mango/g' {{path/to/file}}
```

sockstat

List open Internet or UNIX domain sockets.

More information: https://man.freebsd.org/cgi/man.cgi?query=sockstat.

- View which users/processes are [l]istening on which ports:

```
sockstat -l
```

- Show information for IPv[4]/IPv[6] sockets [l]istening on specific [p]orts using a specific [P]rotocol:

```
sockstat -{{4|6}} -l -P {{tcp|udp|sctp|divert}} -p {{port1,port2...}}
```

- Also show [c]onnected sockets, not resolving [n]umeric UIDs to user names and using a [w]ider field size:

```
sockstat -cnw
```

- Only show sockets that belong to a specific [j]ail ID or name in [v]erbose mode:

```
sockstat -jv
```

- Display the protocol [s]tate and the remote [U]DP encapsulation port number, if applicable (these are currently only implemented for SCTP and TCP):

```
sockstat -sU
```

- Display the [C]ongestion control module and the protocol [S]tack, if applicable (these are currently only implemented for TCP):

```
sockstat -CS
```

- Only show Internet sockets if the local and foreign addresses are not in the loopback network prefix 127.0.0.0/8, or do not contain the IPv6 loopback address ::1:

```
sockstat -L
```

- Do not show the header ([q]uiet mode), showing [u]nix sockets and displaying the `inp_gencnt`:

```
sockstat -qui
```

ypchfn

This command is an alias of **chpass**.

- View documentation for the original command:

```
tldr chpass
```

ypchpass

This command is an alias of **chpass**.

- View documentation for the original command:

  ```
  tldr chpass
  ```

ypchsh

This command is an alias of **chpass**.

- View documentation for the original command:

```
tldr chpass
```

Linux

a2disconf

Disable an Apache configuration file on Debian-based OSes.

More information: https://manned.org/a2disconf.

- Disable a configuration file:

```
sudo a2disconf {{configuration_file}}
```

- Don't show informative messages:

```
sudo a2disconf {{[-q|--quiet]}} {{configuration_file}}
```

a2dismod

Disable an Apache module on Debian-based OSes.

More information: https://manned.org/a2dismod.

- Disable a module:

```
sudo a2dismod {{module}}
```

- Don't show informative messages:

```
sudo a2dismod {{[-q|--quiet]}} {{module}}
```

a2dissite

Disable an Apache virtual host on Debian-based OSes.

More information: https://manned.org/a2dissite.

- Disable a virtual host:

```
sudo a2dissite {{virtual_host}}
```

- Don't show informative messages:

```
sudo a2dissite {{[-q|--quiet]}} {{virtual_host}}
```

a2enconf

Enable an Apache configuration file on Debian-based OSes.

More information: https://manned.org/a2enconf.

- Enable a configuration file:

```
sudo a2enconf {{configuration_file}}
```

- Don't show informative messages:

```
sudo a2enconf {{[-q|--quiet]}} {{configuration_file}}
```

a2enmod

Enable an Apache module on Debian-based OSes.

More information: https://manned.org/a2enmod.

- Enable a module:

```
sudo a2enmod {{module}}
```

- Don't show informative messages:

```
sudo a2enmod {{[-q|--quiet]}} {{module}}
```

a2ensite

Enable an Apache virtual host on Debian-based OSes.

More information: https://manned.org/a2ensite.

- Enable a virtual host:

```
sudo a2ensite {{virtual_host}}
```

- Don't show informative messages:

```
sudo a2ensite {{[-q|--quiet]}} {{virtual_host}}
```

a2query

Retrieve runtime configuration from Apache on Debian-based OSes.

More information: https://manned.org/a2query.

- List enabled Apache modules:

```
sudo a2query -m
```

- Check if a specific module is installed:

```
sudo a2query -m {{module_name}}
```

- List enabled virtual hosts:

```
sudo a2query -s
```

- Display the currently enabled Multi Processing Module:

```
sudo a2query -M
```

- Display Apache version:

```
sudo a2query -v
```

aa-audit

Set AppArmor security profiles to audit mode.

More information: https://gitlab.com/apparmor/apparmor/-/wikis/manpage_aa-audit.8.

- Set a profile to audit mode:

```
sudo aa-audit {{profile_name}}
```

- Set multiple profiles to audit mode:

```
sudo aa-audit {{profile1 profile2 ...}}
```

- Set a profile to audit mode from a specific directory:

```
sudo aa-audit {{[-d|--dir]}} /{{path/to/profiles}} {{profile_name}}
```

- Force audit mode even if already applied:

```
sudo aa-audit --force {{profile_name}}
```

- Set a profile to audit mode without reloading it:

```
sudo aa-audit --no-reload {{profile_name}}
```

- Remove audit mode for a profile:

```
sudo aa-audit {{[-r|--remove]}} {{profile_name}}
```

- Display help:

```
aa-audit {{[-h|--help]}}
```

aa-cleanprof

Clean AppArmor security profiles by removing unused rules.

More information: https://gitlab.com/apparmor/apparmor/-/wikis/manpage_aa-cleanprof.8.

- Clean a profile to remove unused rules:

```
sudo aa-cleanprof {{profile_name}}
```

- Clean multiple profiles at once:

```
sudo aa-cleanprof {{profile1 profile2 ...}}
```

- Specify the directory containing profiles:

```
sudo aa-cleanprof {{[-d|--dir]}} /{{path/to/profiles}} {{profile_name}}
```

- Run silently without prompts:

```
sudo aa-cleanprof {{[-s|--silent]}} {{profile_name}}
```

- Prevent profile reload after cleaning:

```
sudo aa-cleanprof --no-reload {{profile_name}}
```

- Display help:

```
aa-cleanprof {{[-h|--help]}}
```

aa-complain

Set an AppArmor policy to complain mode.

See also: **`aa-disable`**, **`aa-enforce`**, **`aa-status`**.

More information: https://gitlab.com/apparmor/apparmor/-/wikis/manpage_aa-complain.8.

- Set policy to complain mode:

```
sudo aa-complain {{path/to/profile1 path/to/profile2 ...}}
```

- Set policies to complain mode:

```
sudo aa-complain {{[-d|--dir]}} {{path/to/profiles}}
```

aa-decode

Decode AppArmor audit logs into a human-readable format.

More information: https://gitlab.com/apparmor/apparmor/-/wikis/manpage_aa-decode.8.

- Decode a hex string:

```
aa-decode {{hexstring}}
```

- Decode a log file:

```
sudo aa-decode {{logfile}}
```

- Decode logs from `stdin` (e.g., redirected file):

```
sudo aa-decode - < {{logfile}}
```

- Display help:

```
aa-decode {{[-h|--help]}}
```

aa-disable

Disable AppArmor security policies.

See also: **`aa-complain`**, **`aa-enforce`**, **`aa-status`**.

More information: https://gitlab.com/apparmor/apparmor/-/wikis/manpage_aa-disable.8.

- Disable profile:

```
sudo aa-disable {{path/to/profile1 path/to/profile2 ...}}
```

- Disable profiles in a directory (defaults to `/etc/apparmor.d`):

```
sudo aa-disable --dir {{path/to/profiles}}
```

aa-enforce

Set an AppArmor profile to enforce mode.

See also: **`aa-complain`**, **`aa-disable`**, **`aa-status`**.

More information: https://gitlab.com/apparmor/apparmor/-/wikis/manpage_aa-enforce.8.

- Enable profile:

```
sudo aa-enforce {{[-d|--dir]}} {{path/to/profile}}
```

- Enable profiles:

```
sudo aa-enforce {{path/to/profile1 path/to/profile2 ...}}
```

aa-genprof

Generate AppArmor security profiles by monitoring program behavior.

More information: https://gitlab.com/apparmor/apparmor/-/wikis/manpage_aa-genprof.8.

- Start generating a profile for a program:

```
sudo aa-genprof {{program_path}}
```

- Specify a custom directory for profiles:

```
sudo aa-genprof {{[-d|--dir]}} /{{path/to/profiles}} {{program_path}}
```

- Specify a custom logfile for profiling:

```
sudo aa-genprof {{[-f|--file]}} /{{path/to/logfile}} {{program_path}}
```

- Display help:

```
aa-genprof {{[-h|--help]}}
```

aa-logprof

Interactively update AppArmor security profiles based on logged violations.

More information: https://gitlab.com/apparmor/apparmor/-/wikis/manpage_aa-logprof.8.

- Interactively review and update profiles based on system logs:

```
sudo aa-logprof
```

- Use a specific directory for AppArmor profiles:

```
sudo aa-logprof {{[-d|--dir]}} /{{path/to/profiles}}
```

- Use a specific log file instead of the default:

```
sudo aa-logprof {{[-f|--file]}} /{{path/to/logfile}}
```

- Ignore all log entries before the specified mark:

```
sudo aa-logprof {{[-m|--logmark]}} "{{log_marker_text}}"
```

- Display help:

```
aa-logprof {{[-h|--help]}}
```

aa-mergeprof

Merge AppArmor security profile files into the profile directory.

More information: https://gitlab.com/apparmor/apparmor/-/wikis/manpage_aa-mergeprof.8.

- Merge one or more profile files into the default profile directory:

```
sudo aa-mergeprof {{file1 file2 ...}}
```

- Merge profile files into a specific directory:

```
sudo aa-mergeprof {{[-d|--dir]}} /{{path/to/profiles}}
{{file1 file2 ...}}
```

- Display help:

```
aa-mergeprof {{[-h|--help]}}
```

aa-remove-unknown

Remove AppArmor profiles that are no longer present in the configuration directory.

More information: https://gitlab.com/apparmor/apparmor/-/wikis/manpage_aa-remove-unknown.8.

- Simulate removing profiles and display which ones would be removed:

```
sudo aa-remove-unknown -n
```

- Actually remove the profiles:

```
sudo aa-remove-unknown
```

- Display help:

```
aa-remove-unknown {{[-h|--help]}}
```

aa-status

List currently loaded AppArmor modules.

See also: **`aa-complain`**, **`aa-disable`**, **`aa-enforce`**.

More information: https://gitlab.com/apparmor/apparmor/-/wikis/manpage_aa-status.8.

- Check status:

```
sudo aa-status
```

- Display status in JSON format:

```
sudo aa-status --json
```

- Display status in pretty JSON format:

```
sudo aa-status --pretty-json
```

- Display the number of loaded policies:

```
sudo aa-status --profiled
```

- Display the number of loaded enforcing policies:

```
sudo aa-status --enforced
```

- Display the number of loaded non-enforcing policies:

```
sudo aa-status --complaining
```

- Display the number of loaded enforcing policies that kill tasks:

```
sudo aa-status --kill
```

aa-teardown

Tear down all AppArmor profiles and disable AppArmor enforcement.

More information: https://gitlab.com/apparmor/apparmor/-/wikis/manpage_aa-teardown.8.

- Disable all AppArmor profiles and stop enforcement:

```
sudo aa-teardown
```

- Display help:

```
aa-teardown {{[-h|--help]}}
```

aa-unconfined

List processes with open TCP/UDP ports that do not have AppArmor profiles loaded.

More information: https://gitlab.com/apparmor/apparmor/-/wikis/manpage_aa-unconfined.8.

- List unconfined processes using the `ss` command (default):

```
sudo aa-unconfined
```

- Use `netstat` instead of `ss` to detect open network sockets:

```
sudo aa-unconfined --with-netstat
```

- Show all processes from `/proc` with TCP/UDP ports and no AppArmor profiles (more detailed):

```
sudo aa-unconfined --paranoid
```

- Display help:

```
aa-unconfined {{[-h|--help]}}
```

aa-update-browser

Update AppArmor browser profiles to use supported abstractions.

Part of the AppArmor suite.

More information: https://manned.org/aa-update-browser.

- [l]ist available browser abstraction profiles:

```
sudo aa-update-browser -l
```

- Show what changes would be made to a profile without applying them ([d]ry-run):

```
sudo aa-update-browser -d {{path/to/profile}}
```

- [u]pdate a profile with specific abstractions:

```
sudo aa-update-browser -u {{abstraction1,abstraction2,...}} {{path/to/profile}}
```

- Remove all abstractions from a profile:

```
sudo aa-update-browser -u '' {{path/to/profile}}
```

- Display help:

```
aa-update-browser -h
```

abbr

Manage abbreviations for the fish shell.

User-defined words are replaced with longer phrases after they are entered.

More information: https://fishshell.com/docs/current/cmds/abbr.html.

- Add a new abbreviation:

```
abbr {{[-a|--add]}} {{abbreviation_name}} {{command}} {{command_arguments}}
```

- Rename an existing abbreviation:

```
abbr --rename {{old_name}} {{new_name}}
```

- Erase an existing abbreviation:

```
abbr {{[-e|--erase]}} {{abbreviation_name}}
```

- Import the abbreviations defined on another host over SSH:

```
ssh {{host_name}} abbr {{[-s|--show]}} | source
```

abroot

Utility providing full immutability and atomicity by transacting between 2 root partition states (A⟺B).

Updates are performed using OCI images, to ensure that the system is always in a consistent state.

More information: https://docs.vanillaos.org/docs/en/abroot-manpage.

- Add packages to the local image (Note: After executing this command, you need to apply these changes.):

```
sudo abroot pkg add {{package}}
```

- Remove packages from the local image (Note: After executing this command, you need to apply these changes.):

```
sudo abroot pkg remove {{package}}
```

- List packages in the local image:

```
sudo abroot pkg list
```

- Apply changes in the local image (Note: You need to reboot your system for these changes to be applied):

```
sudo abroot pkg apply
```

- Roll back your system to previous state:

```
sudo abroot rollback
```

- Edit/View kernel parameters:

```
sudo abroot kargs {{edit|show}}
```

- Display status:

```
sudo abroot status
```

- Display help:

```
abroot {{[-h|--help]}}
```

abrt-action-analyze-backtrace

Analyze C/C++ backtrace.

Generate duplication hash, backtrace rating, and identify crash function.

Save the data as new elements **`duphash`**, **`rating`**, **`crash_function`** in the problem directory.

More information: https://manned.org/abrt-action-analyze-backtrace.

- Analyze backtrace for the current working directory:

```
abrt-action-analyze-backtrace
```

- Analyze backtrace for a specific directory:

```
abrt-action-analyze-backtrace -d {{path/to/directory}}
```

- Analyze backtrace verbosely:

```
abrt-action-analyze-backtrace -v
```

abrt-action-analyze-c

Calculate UUID for a problem data directory with **`coredump`**.

More information: https://manned.org/abrt-action-analyze-c.

- Calculate and save the UUID for the current working directory:

```
abrt-action-analyze-c
```

- Calculate and save the UUID for a specific directory:

```
abrt-action-analyze-c -d {{path/to/directory}}
```

- Calculate and save the UUID verbosely:

```
abrt-action-analyze-c -v
```

abrt-cli

Automatic Bug Reporting Tool for Fedora-based systems.

Used to detect, analyze, and report application crashes.

More information: https://abrt.readthedocs.io/en/latest/usage.html.

- List detected problems:

```
abrt-cli list
```

- Show details of a specific problem:

```
abrt-cli info {{problem_id}}
```

- Remove a crash report:

```
abrt-cli remove {{problem_id}}
```

- Report a problem to the configured bug tracker (e.g. Bugzilla):

```
abrt-cli report {{problem_id}}
```

- Monitor a log file and trigger a program when a match is found:

```
abrt-watch-log -F {{error_string}} {{/var/log/myapp.log}}
{{notify-send "Crash detected"}}
```

- Generate a report for debugging manually:

```
abrt-cli report {{[-a|--analyze]}} {{problem_id}}
```

abrt

This command is an alias of **`abrt-cli`**.

- View documentation for the original command:

  ```
  tldr abrt-cli
  ```

ac

Print statistics on how long users have been connected.

More information: https://www.gnu.org/software/acct/manual/accounting.html#ac.

- Print how long the current user has been connected in hours:

```
ac
```

- Print how long users have been connected in hours:

```
ac {{[-p|--individual-totals]}}
```

- Print how long a particular user has been connected in hours:

```
ac {{[-p|--individual-totals]}} {{username}}
```

- Print how long a particular user has been connected in hours per day (with total):

```
ac {{[-d|--daily-totals]}} {{[-p|--individual-totals]}} {{username}}
```

- Also display additional details:

```
ac --compatibility
```

acountry

Print the country where an IPv4 address or hostname is located.

More information: https://manned.org/acountry.

- Print a country where an IPv4 address or host is located:

```
acountry {{example.com}}
```

- Print extra [d]ebugging output:

```
acountry -d {{example.com}}
```

- Print more [v]erbose information:

```
acountry -v {{example.com}}
```

acpi

Show battery status or thermal information.

More information: https://manned.org/acpi.

- Show battery information:

```
acpi
```

- Show thermal information:

```
acpi {{[-t|--thermal]}}
```

- Show cooling device information:

```
acpi {{[-c|--cooling]}}
```

- Show thermal information in Fahrenheit:

```
acpi {{[-tf|--thermal --fahrenheit]}}
```

- Show all information:

```
acpi {{[-V|--everything]}}
```

- Extract information from `/proc` instead of `/sys`:

```
acpi {{[-p|--proc]}}
```

acpi_listen

Listen to ACPI events.

More information: https://manned.org/acpi_listen.

- Listen to any ACPI event while the daemon is running:

```
acpi_listen
```

- Display help:

```
acpi_listen {{[-h|--help]}}
```

add-apt-repository

Manage **apt** repository definitions.

More information: https://manned.org/add-apt-repository.

- Add a new apt repository:

```
add-apt-repository {{repository_spec}}
```

- Remove an apt repository:

```
add-apt-repository {{[-r|--remove]}} {{repository_spec}}
```

- Update the package cache after adding a repository:

```
add-apt-repository --update {{repository_spec}}
```

- Allow source packages to be downloaded from the repository:

```
add-apt-repository {{[-s|--enable-source]}}
{{repository_spec}}
```

addpart

Tell the Linux kernel about the existence of the specified partition.

A simple wrapper around the **`add partition`** ioctl.

More information: https://manned.org/addpart.

- Tell the kernel about the existence of the specified partition:

```
addpart {{device}} {{partition}} {{start}} {{length}}
```

addr2line

Convert addresses of a binary into file names and line numbers.

More information: https://manned.org/addr2line.

- Display the filename and line number of the source code from an instruction address of an executable:

```
addr2line {{[-e|--exe]}} {{path/to/executable}} {{address}}
```

- Display the function name, filename, and line number:

```
addr2line {{[-e|--exe]}} {{path/to/executable}} {{[-f|--
functions]}} {{address}}
```

- Demangle the function name for C++ code:

```
addr2line {{[-e|--exe]}} {{path/to/executable}} {{[-f|--
functions]}} {{[-C|--demangle]}} {{address}}
```

adduser

User addition utility.

More information: https://manned.org/adduser.

- Create a new user with a default home directory and prompt the user to set a password:

```
adduser {{username}}
```

- Create a new user without a home directory:

```
adduser --no-create-home {{username}}
```

- Create a new user with a home directory at the specified path:

```
adduser --home {{path/to/home}} {{username}}
```

- Create a new user with the specified shell set as the login shell:

```
adduser --shell {{path/to/shell}} {{username}}
```

- Create a new user belonging to the specified group:

```
adduser --ingroup {{group}} {{username}}
```

adig

Print information received from Domain Name System (DNS) servers.

More information: https://manned.org/adig.

- Display A (default) record from DNS for hostname(s):

```
adig {{example.com}}
```

- Display extra [d]ebugging output:

```
adig -d {{example.com}}
```

- Connect to a specific DNS [s]erver:

```
adig -s {{1.2.3.4}} {{example.com}}
```

- Use a specific TCP port to connect to a DNS server:

```
adig -T {{port}} {{example.com}}
```

- Use a specific UDP port to connect to a DNS server:

```
adig -U {{port}} {{example.com}}
```

agetty

Alternative **`getty`**: Open a **`tty`** port, prompt for a login name, and invoke the **`/bin/login`** command.

It is normally invoked by **`init`**.

Note: The baud rate is the speed of data transfer between a terminal and a device over a serial connection.

More information: https://manned.org/agetty.

- Connect `stdin` to a port (relative to `/dev`) and optionally specify a baud rate (defaults to 9600):

```
agetty {{tty}} {{115200}}
```

- Assume `stdin` is already connected to a `tty` and set a timeout for the login:

```
agetty {{[-t|--timeout]}} {{timeout_in_seconds}} -
```

- Assume the `tty` is 8-bit, overriding the `$TERM` environment variable set by `init`:

```
agetty {{[-8|--8bits]}} - {{term_var}}
```

- Skip the login (no login) and invoke, as root, another login program instead of `/bin/login`:

```
agetty {{[-n|--skip-login]}} {{[-l|--login-program]}} {{login_program}} {{tty}}
```

- Do not display the pre-login (issue) file (`/etc/issue` by default) before writing the login prompt:

```
agetty {{[-i|--noissue]}} -
```

- Change the root directory and write a specific fake host into the `utmp` file:

```
agetty {{[-r|--chroot]}} /{{path/to/root_directory}} {{[-H|--host]}} {{fake_host}} -
```

ahost

DNS lookup utility to display the A or AAAA record linked with a hostname or IP address.

More information: https://manned.org/ahost.

- Print an A or AAAA record associated with a hostname or IP address:

```
ahost {{example.com}}
```

- Display some extra debugging output:

```
ahost -d {{example.com}}
```

- Display the record with a specified type:

```
ahost -t {{a|aaaa|u}} {{example.com}}
```

aide

Advanced Intrusion Detection Environment to validate file integrity.

More information: https://manned.org/aide.

- Initialize the database:

```
sudo aide {{[-i|--init]}}
```

- Check the database for inconsistencies:

```
sudo aide {{[-C|--check]}}
```

- Compare two databases according to definitions in the config file:

```
sudo aide {{[-E|--compare]}}
```

- Check and update the database non-interactively:

```
sudo aide {{[-u|--update]}}
```

- Define a config file to override the default `aide.conf`:

```
sudo aide {{[-c|--config]}} {{path/to/config_file}}
```

- Use `regex` to limit AIDE to a specific string:

```
sudo aide {{[-l|--limit]}} {{regex}}
```

- Send reporter results to a URL:

```
sudo aide {{[-r|--report]}} {{reporterurl}}
```

akmods

Automatic Kernel Module management system for Fedora/RHEL-based distributions.

Rebuilds out-of-tree kernel modules (like NVIDIA drivers) dynamically when kernels update.

More information: https://manned.org/akmods.

- Rebuild all missing or outdated kernel modules for the currently running kernel:

```
sudo akmods
```

- Forcefully rebuild all kernel modules regardless of current status:

```
sudo akmods --rebuild --force
```

- Rebuild modules specifically for a targeted kernel version:

```
sudo akmods --kernel {{kernel_version}}
```

- Display the current status and log details of the background akmods service:

```
systemctl status akmods
```

alien

Convert different installation packages to other formats.

See also: **debtap**.

More information: https://manned.org/alien.

- Convert a specific installation file to Debian format (`.deb` extension):

```
sudo alien {{[-d|--to-deb]}} {{path/to/file}}
```

- Convert a specific installation file to Red Hat format (`.rpm` extension):

```
sudo alien {{[-r|--to-rpm]}} {{path/to/file}}
```

- Convert a specific installation file to a Slackware installation file (`.tgz` extension):

```
sudo alien {{[-t|--to-tgz]}} {{path/to/file}}
```

- Convert a specific installation file to Debian format and install on the system:

```
sudo alien {{[-d|--to-deb]}} {{[-i|--install]}} {{path/to/file}}
```

alpaca

A graphical frontend to chat with Ollama models.

See also: **`ollama`**.

More information: https://jeffser.com/alpaca/launch-options.html.

- Launch Alpaca and start a new chat:

```
alpaca --new-chat "{{chat_title}}"
```

- Open Quick Ask with a message:

```
alpaca --ask "{{message}}"
```

- List all activities that can be launched with `--activity`:

```
alpaca --list-activities
```

- Open an activity:

```
alpaca --activity {{activity}}
```

- List all current chats:

```
alpaca --list-chats
```

alpine

An email client and Usenet newsgroup program with a pico/nano-inspired interface.

Supports most modern email services through IMAP.

More information: https://manned.org/alpine.

- Open alpine normally:

```
alpine
```

- Open alpine directly to the message composition screen to send an email to a given email address:

```
alpine {{email@example.net}}
```

- Quit alpine:

```
<q><y>
```

alsamixer

Graphical mixer for ALSA soundcard driver.

More information: https://manned.org/alsamixer.

- Select the soundcard to use:

```
alsamixer {{[-c|--card]}} {{soundcard_number}}
```

- Select mixer device to control:

```
alsamixer {{[-D|--device]}} {{device_name}}
```

- Increase volume:

```
<w>
```

- Decrease volume:

```
<x>
```

- Quit alsamixer:

```
<Esc>
```

alternatives

This command is an alias of **`update-alternatives`**.

- View documentation for the original command:

  ```
  tldr update-alternatives
  ```

amdgpu_top

Tool to display AMD GPU utilization and hardware metrics using the AMDGPU driver.

See also: **`nvtop`**, **`radeontop`**.

More information: https://github.com/Umio-Yasuno/amdgpu_top#usage.

- Display a list of AMDGPU devices:

```
amdgpu_top --list
```

- Dump all GPU processes and per-process memory usage:

```
amdgpu_top {{[-p|--process]}}
```

- Select a specific GPU by PCI bus:

```
amdgpu_top --pci "{{0000:01:00.0}}"
```

- Launch the interactive TUI monitor:

```
amdgpu_top
```

- Launch the GUI monitor:

```
amdgpu_top --gui
```

- Launch a simple SMI-like TUI view:

```
amdgpu_top --smi
```

amixer

Mixer for ALSA soundcard driver.

More information: https://manned.org/amixer.

- Turn up the master volume by 10%:

```
amixer -D pulse sset Master {{10%+}}
```

- Turn down the master volume by 10%:

```
amixer -D pulse sset Master {{10%-}}
```

ananicy-cpp

Feature-rich C++ rewrite of the Ananicy auto-nice daemon for Linux.

More information: https://gitlab.com/ananicy-cpp/ananicy-cpp.

- Output all currently parsed rules and rule files:

```
ananicy-cpp dump rules
```

- Output all configured process types:

```
ananicy-cpp dump types
```

- Output all current rules in JSON format:

```
ananicy-cpp dump rules --json
```

- Parse and validate custom rule files without applying them:

```
ananicy-cpp parse {{path/to/file.rules}}
```

anbox

Run Android applications on any Linux operating system.

More information: https://manned.org/anbox.

- Launch Anbox into the app manager:

```
anbox launch --package={{org.anbox.appmgr}} --
component={{org.anbox.appmgr.AppViewActivity}}
```

apache2ctl

Administrate the Apache HTTP web server.

This command comes with Debian based OSes, for RHEL based ones see **`httpd`**.

More information: https://manned.org/apache2ctl.

- Start the Apache daemon. Throw a message if it is already running:

```
sudo apache2ctl start
```

- Stop the Apache daemon:

```
sudo apache2ctl stop
```

- Restart the Apache daemon:

```
sudo apache2ctl restart
```

- Test syntax of the configuration file:

```
sudo apache2ctl -t
```

- List loaded modules:

```
sudo apache2ctl -M
```

apachectl

Control an Apache HTTP server.

More information: https://manned.org/apachectl.

- Start the server:

```
sudo apachectl start
```

- Restart the server:

```
sudo apachectl restart
```

- Stop the server:

```
sudo apachectl stop
```

- Test configuration file validity:

```
apachectl configtest
```

- Check server status (requires the lynx browser):

```
apachectl status
```

- Reload configuration without dropping connections:

```
sudo apachectl graceful
```

- Print full Apache configuration (not always supported):

```
apachectl -S
```

- Display help:

```
apachectl -h
```

apk

Alpine Linux package management tool.

More information: https://wiki.alpinelinux.org/wiki/Alpine_Package_Keeper.

- Update repository indexes and upgrade all packages:

```
apk upgrade {{[-U|--update-cache]}}
```

- Only update repository indexes:

```
apk update
```

- Install a new package:

```
apk add {{package}}
```

- Remove a package:

```
apk del {{package}}
```

- Repair/Reinstall a package without modifying main dependencies:

```
apk fix {{package}}
```

- Search for packages with a keyword in their name and list results with descriptions:

```
apk search {{[-v|--verbose]}} {{keyword}}
```

- Search for packages with a keyword in their description:

```
apk search {{[-d|--description]}} {{keyword}}
```

- Display information about a specific package:

```
apk info {{package}}
```

aplay

Sound player for ALSA soundcard driver.

More information: https://manned.org/aplay.

- Play a specific file (sampling rate, bit depth, etc. will be automatically determined for the file format):

```
aplay {{path/to/file}}
```

- Play the first 10 seconds of a specific file at 2500 Hz:

```
aplay {{[-d|--duration]}} 10 {{[-r|--rate]}} 2500 {{path/to/file}}
```

- Play the raw file as a 22050 Hz, mono, 8-bit, Mu-Law `.au` file:

```
aplay {{[-c|--channels]}} 1 {{[-t|--file-type]}} raw {{[-r|--rate]}} 22050 {{[-f|--format]}} mu_law {{path/to/file}}
```

- List available audio devices:

```
aplay {{[-l|--list-devices]}}
```

apparmor_parser

Load, compile, and manage AppArmor security profiles.

More information: https://gitlab.com/apparmor/apparmor/-/wikis/manpage_apparmor_parser.8.

- Load a profile into the kernel:

```
sudo apparmor_parser {{[-a|--add]}} {{profile_file}}
```

- Replace an existing profile:

```
sudo apparmor_parser {{[-r|--replace]}} {{profile_file}}
```

- Remove a profile from the kernel:

```
sudo apparmor_parser {{[-R|--remove]}} {{profile_name}}
```

- Load a profile in complain mode (logs violations but doesn't block):

```
sudo apparmor_parser {{[-C|--complain]}} {{[-r|--replace]}} {{path/to/profile}}
```

- Preprocess a profile (resolve includes) and write binary cache to file:

```
apparmor_parser {{[-p|--preprocess]}} {{[-o|--ofile]}} {{path/to/output.cache}} {{[-Q|--skip-kernel-load]}} {{path/to/profile}}
```

- Preprocess and print binary profile to `stdout` without loading:

```
apparmor_parser {{[-p|--preprocess]}} {{[-S|--stdout]}} {{[-Q|--skip-kernel-load]}} {{path/to/profile}}
```

- Replace a profile while skipping cache reads:

```
sudo apparmor_parser {{[-r|--replace]}} {{[-T|--skip-read-cache]}} {{path/to/profile}}
```

- Replace a profile, rebuild cache, and write it to a custom directory:

```
sudo apparmor_parser {{[-r|--replace]}} {{[-W|--write-cache]}} {{[-L|--cache-loc]}} /{{path/to/cache}} {{path/to/profile}}
```

apparmor_status

This command is an alias of **aa-status**.

- View documentation for the original command:

  ```
  tldr aa-status
  ```

appman

Package manager for AppImages.

More information: https://github.com/ivan-hc/AppMan.

- Update all packages to the latest available versions:

```
appman {{[-u|update]}}
```

- Search packages via keywords:

```
appman {{[-q|query]}} {{package}}
```

- Install a new package:

```
appman {{[-i|install]}} {{package}}
```

- Remove a package:

```
appman {{[-r|remove]}} {{package}}
```

- List all available packages:

```
appman {{[-l|list]}}
```

- Update AppMan to the latest version available:

```
appman {{[-s|sync]}}
```

apport-bug

File a bug report on Ubuntu.

More information: https://ubuntu.com/project/docs/contributors/debugging/apport/.

- Report a bug about the whole system:

```
apport-bug
```

- Report a bug about a specific package:

```
apport-bug {{package}}
```

- Report a bug about a specific executable:

```
apport-bug {{path/to/executable}}
```

- Report a bug about a specific process:

```
apport-bug {{process_id}}
```

apptainer build

Build Apptainer container images.

More information: https://apptainer.org/docs/user/main/cli/apptainer_build.html.

- Build a container from a definition file:

```
apptainer build {{path/to/image.sif}} {{path/to/
definition.def}}
```

- Build a container from Docker Hub:

```
apptainer build {{path/to/image.sif}} docker://{{image}}:
{{tag}}
```

- Build a container from the Container Library:

```
apptainer build {{path/to/image.sif}} library://{{user/
collection/container}}:{{tag}}
```

- Build a writable sandbox directory instead of an image file:

```
apptainer build {{[-s|--sandbox]}} {{path/to/directory}}
docker://{{image}}:{{tag}}
```

- Build a container without using the cache:

```
apptainer build --disable-cache {{path/to/image.sif}}
docker://{{image}}:{{tag}}
```

- Force overwrite an existing image file:

```
apptainer build {{[-F|--force]}} {{path/to/image.sif}}
{{path/to/definition.def}}
```

- Build using fakeroot for unprivileged builds:

```
apptainer build {{[-f|--fakeroot]}} {{path/to/image.sif}}
{{path/to/definition.def}}
```

- Display help:

```
apptainer build {{[-h|--help]}}
```

apptainer cache

Manage the local Apptainer cache.

More information: https://apptainer.org/docs/user/main/cli/apptainer_cache.html.

- List all cached container images:

```
apptainer cache list
```

- List cached container images with detailed information:

```
apptainer cache list {{[-v|--verbose]}}
```

- List only a specific cache type:

```
apptainer cache list {{[-T|--type]}} {{library|oci|shub|
blob|...}}
```

- Clean the entire cache:

```
apptainer cache clean
```

- Clean only a specific cache type:

```
apptainer cache clean {{[-T|--type]}} {{library|oci|shub|
blob|...}}
```

- Clean cache entries older than a specific number of days:

```
apptainer cache clean {{[-D|--days]}} {{days}}
```

- Simulate cleaning the cache, showing what would be removed:

```
apptainer cache clean {{[-n|--dry-run]}}
```

- Force clean without confirmation:

```
apptainer cache clean {{[-f|--force]}}
```

apptainer capability

Manage Linux capabilities for users and groups.

More information: https://apptainer.org/docs/user/main/cli/apptainer_capability.html.

- Show all available Linux capabilities:

```
apptainer capability avail
```

- Show descriptions for specific capabilities:

```
apptainer capability avail {{cap_chown,cap_net_raw,...}}
```

- List capabilities for all users and groups:

```
apptainer capability list
```

- List capabilities for a specific user or group:

```
apptainer capability list {{username|groupname}}
```

- Add capabilities to a user:

```
sudo apptainer capability add {{[-u|--user]}} {{username}} {{cap_net_raw,cap_chown,...}}
```

- Add capabilities to a group:

```
sudo apptainer capability add {{[-g|--group]}} {{groupname}} {{cap_net_raw,cap_chown,...}}
```

- Remove capabilities from a user:

```
sudo apptainer capability drop {{[-u|--user]}} {{username}} {{cap_net_raw,cap_chown,...}}
```

- Remove all capabilities from a user:

```
sudo apptainer capability drop {{[-u|--user]}} {{username}} all
```

apptainer config

Manage various Apptainer configurations.

More information: https://apptainer.org/docs/user/main/cli/apptainer_config.html.

- Add a fakeroot user mapping:

```
sudo apptainer config fakeroot {{[-a|--add]}} {{username}}
```

- Remove a fakeroot user mapping:

```
sudo apptainer config fakeroot {{[-r|--remove]}} {{username}}
```

- Enable a fakeroot user mapping:

```
sudo apptainer config fakeroot {{[-e|--enable]}} {{username}}
```

- Disable a fakeroot user mapping:

```
sudo apptainer config fakeroot {{[-d|--disable]}}
{{username}}
```

- Get the current value of a global configuration directive:

```
sudo apptainer config global {{[-g|--get]}} {{directive}}
```

- Set a global configuration directive value:

```
sudo apptainer config global {{[-s|--set]}} {{directive}}
{{value}}
```

- Unset a global configuration directive value:

```
sudo apptainer config global {{[-u|--unset]}} {{directive}}
{{value}}
```

- Reset a global configuration directive to its default value:

```
sudo apptainer config global {{[-r|--reset]}} {{directive}}
```

apptainer delete

Delete container images from a remote library.

More information: https://apptainer.org/docs/user/main/cli/apptainer_delete.html.

- Delete an image from the Container Library:

```
apptainer delete library://{{user/collection/container}}:
{{tag}}
```

- Delete an image for a specific architecture:

```
apptainer delete {{[-A|--arch]}} {{amd64|arm64|ppc64le}}
library://{{user/collection/container}}:{{tag}}
```

- Force delete an image without confirmation:

```
apptainer delete {{[-F|--force]}} library://{{user/
collection/container}}:{{tag}}
```

- Delete an image from a specific library server:

```
apptainer delete --library {{https://library.example.com}}
library://{{user/collection/container}}:{{tag}}
```

- Delete an image using HTTP instead of HTTPS:

```
apptainer delete --no-https library://{{hostname/user/
collection/container}}:{{tag}}
```

- Display help:

```
apptainer delete {{[-h|--help]}}
```

apptainer exec

Execute a command within an Apptainer container.

See also: **`apptainer run`**, **`apptainer shell`**.

More information: https://apptainer.org/docs/user/main/cli/apptainer_exec.html.

- Execute a command inside a container:

```
apptainer exec {{path/to/image.sif}} {{command}}
```

- Execute a command with arguments:

```
apptainer exec {{path/to/image.sif}} {{command}} {{arg1
arg2 ...}}
```

- Execute a command with a bind mount from host to container:

```
apptainer exec {{[-B|--bind]}} {{path/to/source}}:{{path/to/
destination}} {{path/to/image.sif}} {{command}}
```

- Execute a command with environment variables:

```
apptainer exec --env {{variable}}={{value}} {{path/to/
image.sif}} {{command}}
```

- Execute a command in fully isolated mode (contained filesystem, PID, IPC, and clean environment):

```
apptainer exec {{[-C|--containall]}} {{path/to/image.sif}}
{{command}}
```

- Execute a command with a writable temporary filesystem overlay:

```
apptainer exec --writable-tmpfs {{path/to/image.sif}}
{{command}}
```

- Execute a command with NVIDIA GPU support:

```
apptainer exec --nv {{path/to/image.sif}} {{command}}
```

- Display help:

```
apptainer exec {{[-h|--help]}}
```

apptainer inspect

Display metadata of Apptainer container images.

More information: https://apptainer.org/docs/user/main/cli/apptainer_inspect.html.

- Show the labels of an image (default):

```
apptainer inspect {{path/to/image.sif}}
```

- Show the definition file used to build the image:

```
apptainer inspect {{[-d|--deffile]}} {{path/to/image.sif}}
```

- Show the runscript for the image:

```
apptainer inspect {{[-r|--runscript]}} {{path/to/image.sif}}
```

- Show the environment variables of the image:

```
apptainer inspect {{[-e|--environment]}} {{path/to/
image.sif}}
```

- List all apps in the container:

```
apptainer inspect --list-apps {{path/to/image.sif}}
```

- Show all available data in JSON format:

```
apptainer inspect --all {{path/to/image.sif}}
```

- Display help:

```
apptainer inspect {{[-h|--help]}}
```

apptainer overlay

Manage EXT3 writable overlay images for Apptainer containers.

More information: https://apptainer.org/docs/user/main/cli/apptainer_overlay.html.

- Add a writable overlay to an existing SIF image:

```
apptainer overlay create {{[-s|--size]}} {{size}} {{path/to/image.sif}}
```

- Create a standalone EXT3 writable overlay image:

```
apptainer overlay create {{[-s|--size]}} {{size}} {{path/to/overlay.img}}
```

- Create a sparse overlay image:

```
apptainer overlay create {{[-s|--size]}} {{size}} {{[-S|--sparse]}} {{path/to/overlay.img}}
```

- Create an overlay for use with fakeroot:

```
apptainer overlay create {{[-f|--fakeroot]}} {{[-s|--size]}} {{size}} {{path/to/overlay.img}}
```

- Create an overlay with a specific directory in the layout:

```
apptainer overlay create --create-dir {{path/to/directory}} {{path/to/overlay.img}}
```

- Display help:

```
apptainer overlay {{[-h|--help]}}
```

apptainer pull

Pull container images from remote sources.

See also: **apptainer-push**.

More information: https://apptainer.org/docs/user/main/cli/apptainer_pull.html.

- Pull a container from Docker Hub:

```
apptainer pull {{path/to/image.sif}} docker://{{image}}:
{{tag}}
```

- Pull a container from the Container Library:

```
apptainer pull {{path/to/image.sif}} library://{{user/
collection/container}}:{{tag}}
```

- Pull a container from an OCI registry:

```
apptainer pull {{path/to/image.sif}} oras://{{registry/
namespace/image}}:{{tag}}
```

- Pull a container for a specific architecture:

```
apptainer pull --arch {{amd64|arm64|ppc64le}} {{path/to/
image.sif}} library://{{image}}:{{tag}}
```

- Force overwrite an existing image file:

```
apptainer pull {{[-F|--force]}} {{path/to/image.sif}}
docker://{{image}}:{{tag}}
```

- Pull a container as a writable sandbox directory:

```
apptainer pull --sandbox {{path/to/directory}} docker://
{{image}}:{{tag}}
```

- Pull a container without using the cache:

```
apptainer pull --disable-cache {{path/to/image.sif}}
docker://{{image}}:{{tag}}
```

- Display help:

```
apptainer pull {{[-h|--help]}}
```

apptainer push

Push container images to remote registries.

See also: **apptainer-pull**.

More information: https://apptainer.org/docs/user/main/cli/apptainer_push.html.

- Push a container to the Container Library:

```
apptainer push {{path/to/image.sif}} library://{{user/collection/container}}:{{tag}}
```

- Push a container to an OCI registry:

```
apptainer push {{path/to/image.sif}} oras://{{registry/namespace/image}}:{{tag}}
```

- Push an unsigned container (skip signature verification):

```
apptainer push {{[-U|--allow-unsigned]}} {{path/to/image.sif}} library://{{user/collection/container}}:{{tag}}
```

- Push a container with a description (library only):

```
apptainer push {{[-D|--description]}} "{{description}}" {{path/to/image.sif}} library://{{user/collection/container}}:{{tag}}
```

- Display help:

```
apptainer push {{[-h|--help]}}
```

apptainer registry

Manage authentication to OCI/Docker registries.

See also: **`apptainer pull`**, **`apptainer push`**.

More information: https://apptainer.org/docs/user/main/cli/apptainer_registry.html.

- List all configured registry credentials:

```
apptainer registry list
```

- Log in to a registry with a username (password will be prompted):

```
apptainer registry login {{[-u|--username]}} {{username}} docker://{{registry}}
```

- Log in to a custom OCI registry:

```
apptainer registry login {{[-u|--username]}} {{username}} oras://{{registry}}
```

- Log in with username and password:

```
apptainer registry login {{[-u|--username]}} {{username}} {{[-p|--password]}} {{password}} docker://{{registry}}
```

- Log in with a password from `stdin`:

```
echo "{{password}}" | apptainer registry login {{[-u|--username]}} {{username}} --password-stdin docker://{{registry}}
```

- Log in using a custom authentication file:

```
apptainer registry login --authfile {{path/to/auth.json}} {{[-u|--username]}} {{username}} docker://{{registry}}
```

- Log out from a registry:

```
apptainer registry logout docker://{{registry}}
```

- Log out using a custom authentication file:

```
apptainer registry logout --authfile {{path/to/auth.json}} docker://{{registry}}
```

apptainer run-help

Display user-defined help for an Apptainer container image.

Help text is defined in the **`%help`** section of the container's definition file.

More information: https://apptainer.org/docs/user/main/cli/apptainer_run-help.html.

- Display help for a container:

```
apptainer run-help {{path/to/image.sif}}
```

- Display help for a specific app within a container:

```
apptainer run-help --app {{app_name}} {{path/to/image.sif}}
```

- Display help:

```
apptainer run-help {{[-h|--help]}}
```

apptainer run

Run the default runscript of an Apptainer container.

The runscript is defined in the **`%runscript`** section of the container's definition file.

See also: **`apptainer exec`**, **`apptainer shell`**.

More information: https://apptainer.org/docs/user/main/cli/apptainer_run.html.

- Run the default runscript of a container:

```
apptainer run {{path/to/image.sif}}
```

- Run with arguments passed to the runscript:

```
apptainer run {{path/to/image.sif}} {{arg1 arg2 ...}}
```

- Run with a bind mount from host to container:

```
apptainer run {{[-B|--bind]}} {{path/to/source}}:{{path/to/
destination}} {{path/to/image.sif}}
```

- Run with environment variables:

```
apptainer run --env {{variable}}={{value}} {{path/to/
image.sif}}
```

- Run in fully isolated mode (contained filesystem, PID, IPC, and clean environment):

```
apptainer run {{[-C|--containall]}} {{path/to/image.sif}}
```

- Run with a writable temporary filesystem overlay:

```
apptainer run --writable-tmpfs {{path/to/image.sif}}
```

- Run with NVIDIA GPU support:

```
apptainer run --nv {{path/to/image.sif}}
```

- Display help:

```
apptainer run {{[-h|--help]}}
```

apptainer search

Search a Container Library for container images.

More information: https://apptainer.org/docs/user/main/cli/apptainer_search.html.

- Search for container images matching a query:

```
apptainer search {{query}}
```

- Search for container images for a specific architecture:

```
apptainer search --arch {{amd64|arm64|386|ppc64le|s390x}} {{query}}
```

- Search for only signed container images:

```
apptainer search --signed {{query}}
```

- Search in a specific Container Library:

```
apptainer search --library {{library_url}} {{query}}
```

- Display help:

```
apptainer search {{[-h|--help]}}
```

apptainer shell

Start an interactive shell within an Apptainer container.

See also: **`apptainer exec`**, **`apptainer run`**.

More information: https://apptainer.org/docs/user/main/cli/apptainer_shell.html.

- Start an interactive shell inside a container:

```
apptainer shell {{path/to/image.sif}}
```

- Start a shell with a bind mount from host to container:

```
apptainer shell {{[-B|--bind]}} {{path/to/source}}:{{path/to/destination}} {{path/to/image.sif}}
```

- Start a shell with environment variables:

```
apptainer shell --env {{variable}}={{value}} {{path/to/image.sif}}
```

- Start a shell in fully isolated mode (contained filesystem, PID, IPC, and clean environment):

```
apptainer shell {{[-C|--containall]}} {{path/to/image.sif}}
```

- Start a shell with a writable temporary filesystem overlay:

```
apptainer shell --writable-tmpfs {{path/to/image.sif}}
```

- Start a shell with NVIDIA GPU support:

```
apptainer shell --nv {{path/to/image.sif}}
```

- Start a shell using a specific shell program:

```
apptainer shell {{[-s|--shell]}} {{path/to/shell}} {{path/to/image.sif}}
```

- Display help:

```
apptainer shell {{[-h|--help]}}
```

apptainer sign

Add digital signatures to a SIF container image.

See also: **apptainer-verify**.

More information: https://apptainer.org/docs/user/main/cli/apptainer_sign.html.

- Sign a container image using the default PGP key:

```
apptainer sign {{path/to/image.sif}}
```

- Sign a container image using a specific private key file:

```
apptainer sign --key {{path/to/private.pem}} {{path/to/
image.sif}}
```

- Sign a container image using a specific PGP key index:

```
apptainer sign {{[-k|--keyidx]}} {{key_index}} {{path/to/
image.sif}}
```

- Sign a specific object group within the image:

```
apptainer sign {{[-g|--group-id]}} {{group_id}} {{path/to/
image.sif}}
```

- Sign a specific object by ID within the image:

```
apptainer sign {{[-i|--sif-id]}} {{object_id}} {{path/to/
image.sif}}
```

- Display help:

```
apptainer sign {{[-h|--help]}}
```

apptainer test

Run the testscript defined in an Apptainer container image.

The testscript is defined in the **`%test`** section of the container's definition file.

More information: https://apptainer.org/docs/user/main/cli/apptainer_test.html.

- Run the testscript of a container:

```
apptainer test {{path/to/image.sif}}
```

- Run the testscript with a bind mount from host to container:

```
apptainer test {{[-B|--bind]}} {{path/to/source}}:{{path/to/destination}} {{path/to/image.sif}}
```

- Run the testscript in fully isolated mode (contained filesystem, PID, IPC, and clean environment):

```
apptainer test {{[-C|--containall]}} {{path/to/image.sif}}
```

- Run the testscript with a writable temporary filesystem overlay:

```
apptainer test --writable-tmpfs {{path/to/image.sif}}
```

- Run the testscript for a specific app within a container:

```
apptainer test --app {{app_name}} {{path/to/image.sif}}
```

- Display help:

```
apptainer test {{[-h|--help]}}
```

apptainer verify

Verify digital signatures of SIF container images.

See also: **apptainer-sign**.

More information: https://apptainer.org/docs/user/main/cli/apptainer_verify.html.

- Verify a container image using the default PGP keyring:

```
apptainer verify {{path/to/image.sif}}
```

- Verify a container image using a specific public key file:

```
apptainer verify --key {{path/to/public.pem}} {{path/to/image.sif}}
```

- Verify a container image using a certificate file:

```
apptainer verify --certificate {{path/to/certificate.pem}} {{path/to/image.sif}}
```

- Verify all objects in the image:

```
apptainer verify {{[-a|--all]}} {{path/to/image.sif}}
```

- Verify a specific object group within the image:

```
apptainer verify {{[-g|--group-id]}} {{group_id}} {{path/to/image.sif}}
```

- Verify a specific object by ID within the image:

```
apptainer verify {{[-i|--sif-id]}} {{object_id}} {{path/to/image.sif}}
```

- Output verification results in JSON format:

```
apptainer verify {{[-j|--json]}} {{path/to/image.sif}}
```

- Display help:

```
apptainer verify {{[-h|--help]}}
```

apptainer

Manage containers for HPC and scientific computing.

Some subcommands such as **`build`**, **`pull`**, **`push`**, etc. have their own usage documentation.

More information: https://apptainer.org/docs/user/main/cli.html.

- Download a container from Docker Hub:

```
apptainer pull {{path/to/image.sif}} docker://{{image}}:{{tag}}
```

- Download a container from the Container Library:

```
apptainer pull {{path/to/image.sif}} library://{{user/collection/container}}:{{tag}}
```

- Build a container from a definition file:

```
apptainer build {{path/to/image.sif}} {{path/to/definition.def}}
```

- Start an interactive shell inside a container:

```
apptainer shell {{path/to/image.sif}}
```

- Execute a command inside a container:

```
apptainer exec {{path/to/image.sif}} {{command}}
```

- Run the default runscript of a container:

```
apptainer run {{path/to/image.sif}}
```

- Inspect a container's metadata:

```
apptainer inspect {{path/to/image.sif}}
```

- Display help:

```
apptainer {{[-h|--help]}}
```

apt-add-repository

This command is an alias of **`add-apt-repository`**.

- View documentation for the original command:

  ```
  tldr add-apt-repository
  ```

apt-cache

Debian and Ubuntu package query tool.

More information: https://manned.org/apt-cache.

- Search for a package in your current sources:

```
apt-cache search {{query}}
```

- Show information about a package:

```
apt-cache show {{package}}
```

- Show whether a package is installed and up to date:

```
apt-cache policy {{package}}
```

- Show dependencies for a package:

```
apt-cache depends {{package}}
```

- Show packages that depend on a particular package:

```
apt-cache rdepends {{package}}
```

apt-clone

Clone/back up/restore the package state of a Debian-based system.

More information: https://github.com/mvo5/apt-clone.

- Clone the package state of the current system into a specified directory:

```
apt-clone clone {{path/to/directory}}
```

- Create a clone file (`.tar.gz`) for backup purposes:

```
apt-clone clone --destination {{path/to/backup.tar.gz}}
```

- Restore the package state from a clone file:

```
apt-clone restore {{path/to/backup.tar.gz}}
```

- Show information about a clone file (e.g., the release, architecture):

```
apt-clone info {{path/to/backup.tar.gz}}
```

- Check if the clone file can be restored on the current system:

```
apt-clone restore {{path/to/backup.tar.gz}} --destination
{{path/to/restore}}
```

apt-file

Search for files in **`apt`** packages, including ones not yet installed.

More information: https://manned.org/apt-file.

- Update the metadata database:

```
sudo apt update
```

- Search for packages that contain the specified file or path:

```
apt-file {{[find|search]}} {{path/to/file}}
```

- List the contents of a specific package:

```
apt-file list {{package}}
```

- Search for packages that match the `regex`:

```
apt-file {{[find|search]}} {{[-x|--regexp]}} {{regex}}
```

apt-get

Debian and Ubuntu package management utility.

Search for packages using **`apt-cache`**.

It is recommended to use **`apt`** when used interactively in Ubuntu versions 16.04 and later.

More information: https://manned.org/apt-get.8.

- Update the list of available packages and versions (it's recommended to run this before other `apt-get` commands):

```
sudo apt-get update
```

- Install a package, or update it to the latest available version:

```
sudo apt-get install {{package}}
```

- Remove a package:

```
sudo apt-get remove {{package}}
```

- Remove a package and its configuration files:

```
sudo apt-get purge {{package}}
```

- Upgrade all installed packages to their newest available versions:

```
sudo apt-get upgrade
```

- Clean the local repository - removing package files (`.deb`) from interrupted downloads that can no longer be downloaded:

```
sudo apt-get autoclean
```

- Remove all packages that are no longer needed:

```
sudo apt-get autoremove
```

- Upgrade installed packages (like `upgrade`), but remove obsolete packages and install additional packages to meet new dependencies:

```
sudo apt-get dist-upgrade
```

apt install

Install packages for Debian-based distributions.

More information: https://manned.org/apt.8.

- Install a package, or update it to the latest version:

```
sudo apt install {{package}}
```

- Display verbose package version information during installation or update:

```
sudo apt install {{[-V|--verbose-versions]}} {{package}}
```

apt-key

Key management utility for the APT Package Manager on Debian and Ubuntu.

Note: This command is deprecated (except for the use of **`apt-key del`** in maintainer scripts).

More information: https://manned.org/apt-key.

- List trusted keys:

```
apt-key list
```

- Add a key to the trusted keystore:

```
apt-key add {{public_key_file.asc}}
```

- Delete a key from the trusted keystore:

```
apt-key del {{key_id}}
```

- Add a remote key to the trusted keystore:

```
wget {{[-qO|--quiet --output-document]}} - {{https://
host.tld/filename.key}} | apt-key add -
```

- Add a key from keyserver with only key ID:

```
apt-key adv --keyserver {{pgp.mit.edu}} --recv {{key_id}}
```

apt list

List packages.

Note: Recommended to run **`apt update`** first to refresh local package index files.

More information: https://manned.org/apt.8.

- List all available packages:

```
apt list
```

- List packages by name only (supports wildcards like *):

```
apt list {{package}}
```

- List installed packages:

```
apt list {{[-i|--installed]}}
```

- List upgradable packages:

```
apt list {{[-u|--upgradable]}}
```

apt-mark

Utility to change the status of installed packages.

More information: https://manned.org/apt-mark.

- Mark a package as automatically installed:

```
sudo apt-mark auto {{package}}
```

- Hold a package at its current version and prevent updates to it:

```
sudo apt-mark hold {{package}}
```

- Allow a package to be updated again:

```
sudo apt-mark unhold {{package}}
```

- Show manually installed packages:

```
apt-mark showmanual
```

- Show held packages that aren't being updated:

```
apt-mark showhold
```

apt moo

An **APT** easter egg.

More information: https://manned.org/apt.8.

- Print a cow easter egg:

```
apt moo
```

apt

Package manager for Debian-based distributions.

Intended as a user-friendly alternative to **`apt-get`** for interactive use.

For equivalent commands in other package managers, see https://wiki.archlinux.org/title/Pacman/Rosetta.

More information: https://manned.org/apt.8.

- Update the list of available packages and versions (recommended before running other `apt` commands):

```
sudo apt update
```

- Search packages by name or description:

```
apt search {{package}}
```

- Search packages by name only (supports wildcards like `*`):

```
apt list {{package}}
```

- Show detailed information about a package:

```
apt show {{package}}
```

- Install a package, or update it to the latest version:

```
sudo apt install {{package}}
```

- Remove a package (use `purge` instead to also remove configuration files):

```
sudo apt remove {{package}}
```

- Upgrade all installed packages to their latest versions:

```
sudo apt upgrade
```

- List all installed packages:

```
apt list {{[-i|--installed]}}
```

aptitude

Debian and Ubuntu package management utility.

More information: https://manned.org/aptitude.

- Synchronize list of packages and versions available. This should be run first, before running subsequent `aptitude` commands:

```
sudo aptitude update
```

- Install a new package and its dependencies:

```
sudo aptitude install {{package}}
```

- Search for a package:

```
aptitude search {{package}}
```

- Search for an installed package (`?installed` is an `aptitude` search term):

```
aptitude search '?installed({{package}})'
```

- Remove a package and all packages depending on it:

```
sudo aptitude remove {{package}}
```

- Upgrade installed packages to the newest available versions:

```
sudo aptitude upgrade
```

- Upgrade installed packages (like `aptitude upgrade`) including removing obsolete packages and installing additional packages to meet new package dependencies:

```
sudo aptitude full-upgrade
```

- Put an installed package on hold to prevent it from being automatically upgraded:

```
sudo aptitude hold '?installed({{package}})'
```

apx pkgmanagers

Manage package managers in **apx**.

Note: User-created package manager configurations are stored in **~/.local/share/apx/pkgmanagers**.

More information: https://docs.vanillaos.org/docs/en/apx-manpage#pkgmanagers.

- Interactively create a new package manager configuration:

```
apx pkgmanagers create
```

- List all available package manager configurations:

```
apx pkgmanagers list
```

- Remove a package manager configuration:

```
apx pkgmanagers rm --name {{string}}
```

- Display information about a specific package manager:

```
apx pkgmanagers show {{name}}
```

apx stacks

Manage stacks in **apx**.

Note: User-created stack configurations are stored in **~/.local/share/apx/stacks**.

More information: https://docs.vanillaos.org/docs/en/apx-manpage#stacks.

- Interactively create a new stack configuration:

```
apx stacks new
```

- Interactively update a stack configuration:

```
apx stacks update {{name}}
```

- List all available stack configurations:

```
apx stacks list
```

- Remove a specified stack configuration:

```
apx stacks rm --name {{string}}
```

- Import a stack configuration:

```
apx stacks import --input {{path/to/stack.yml}}
```

- Export the stack configuration (Note: The output flag is optional, it is exported to the current working directory by default):

```
apx stacks export --name {{string}} --output {{path/to/output_file}}
```

apx subsystems

Manage subsystems in **apx**.

Subsystems are containers that can be created based on pre-existing stacks.

More information: https://docs.vanillaos.org/docs/en/apx-manpage#subsystems.

- Interactively create a new subsystem:

```
apx subsystems new
```

- List all available subsystems:

```
apx subsystems list
```

- Reset a specific subsystem to its initial state:

```
apx subsystems reset {{[-n|--name]}} {{string}}
```

- Force reset a specific subsystem:

```
apx subsystems reset {{[-n|--name]}} {{string}} {{[-f|--
force]}}
```

- Remove a specific subsystem:

```
apx subsystems rm {{[-n|--name]}} {{string}}
```

- Force remove a specific subsystem:

```
apx subsystems rm {{[-n|--name]}} {{string}} {{[-f|--force]}}
```

apx

Package management utility with support for multiple sources, allowing you to install packages in subsystems.

More information: https://docs.vanillaos.org/docs/en/apx-manpage.

- View documentation for managing package managers:

```
tldr apx pkgmanagers
```

- View documentation for managing stacks:

```
tldr apx stacks
```

- View documentation for managing subsystems:

```
tldr apx subsystems
```

arch-chroot

Enhanced **`chroot`** command to help in the Arch Linux installation process.

More information: https://manned.org/arch-chroot.

- Start an interactive shell (Bash, by default) in a new root directory:

```
arch-chroot {{path/to/new_root}}
```

- Specify the user (other than the current user) to run the shell as:

```
arch-chroot -u {{user}} {{path/to/new_root}}
```

- Run a custom command (instead of the default Bash) in the new root directory:

```
arch-chroot {{path/to/new_root}} {{command}} {{command_arguments}}
```

- Specify the shell, other than the default Bash (in this case, the `zsh` package should have been installed in the target system):

```
arch-chroot {{path/to/new_root}} {{zsh}}
```

arch-update

Interactively check for, notify, and apply updates on Arch Linux.

More information: https://github.com/Antiz96/arch-update.

- Start the system update:

```
arch-update
```

- List pending updates:

```
arch-update {{[-l|--list]}}
```

- Start the systray applet and enable it automatically at boot:

```
arch-update --tray --enable
```

- List the last 10 Arch Linux news posts:

```
arch-update {{[-n|--news]}} 10
```

archey

Simple tool for stylishly displaying system information.

More information: https://lclarkmichalek.github.io/archey3/.

- Show system information:

```
archey
```

archinstall

Guided Arch Linux installer.

More information: https://archinstall.archlinux.page/installing/guided.html.

- Start the interactive installer:

```
archinstall
```

- Simulate an installation, going through the interactive installer, and generating a configuration file without installing:

```
archinstall --dry-run
```

- Enable advanced options:

```
archinstall --advanced
```

- Install using the specified configuration files:

```
archinstall --config {{path/to/config.json}} --creds {{path/to/credentials.json}}
```

- Install using configuration files from a remote server:

```
archinstall --config-url {{https://example.com/config.json}} --creds-url {{https://example.com/credentials.json}}
```

- Install using the specified script:

```
archinstall --script {{minimal|only_hd}}
```

archivemount

Mount an archive for access as a filesystem.

More information: https://manned.org/archivemount.

- Mount an archive to a specific mountpoint:

```
archivemount {{path/to/archive}} {{path/to/mount_point}}
```

archlinux-java

Switch between installed Java environments.

More information: https://wiki.archlinux.org/title/Java#Switching_between_JVM.

- List installed Java environments:

```
archlinux-java status
```

- Return the short name of the current default Java environment:

```
archlinux-java get
```

- Set the default Java environment:

```
archlinux-java set {{java_environment}}
```

- Unset the default Java environment:

```
archlinux-java unset
```

- Fix an invalid/broken default Java environment configuration:

```
archlinux-java fix
```

arecord

Sound recorder for ALSA soundcard driver.

More information: https://manned.org/arecord.

- Record a snippet in "CD" quality (finish with <Ctrl c> when done):

```
arecord {{[-vv|--verbose --verbose]}} {{[-f|--format]}} cd
{{path/to/file.wav}}
```

- Record a snippet in "CD" quality, with a fixed duration of 10 seconds:

```
arecord {{[-vv|--verbose --verbose]}} {{[-f|--format]}} cd
{{[-d|--duration]}} {{10}} {{path/to/file.wav}}
```

- Record a snippet and save it as an MP3 (finish with <Ctrl c> when done):

```
arecord {{[-vv|--verbose --verbose]}} {{[-f|--format]}} cd
{{[-t|--file-type]}} raw | lame -r - {{path/to/file.mp3}}
```

- List all sound cards and digital audio devices:

```
arecord {{[-l|--list-devices]}}
```

- Allow interactive interface (e.g. use <Space> or <Enter> to play or pause):

```
arecord {{[-i|--interactive]}}
```

- Test your microphone by recording a 5 second sample and playing it back:

```
arecord {{[-d|--duration]}} 5 test-mic.wav && aplay test-
mic.wav && rm test-mic.wav
```

arithmetic

Quiz on simple arithmetic problems.

More information: https://manned.org/arithmetic.

- Start an arithmetic quiz:

  ```
  arithmetic
  ```

- Specify one or more arithmetic [o]peration symbols to get problems on them:

  ```
  arithmetic -o {{+|-|x|/}}
  ```

- Specify a [r]ange. Addition and multiplication problems would feature numbers between 0 and range, inclusive. Subtraction and division problems would have required result and number to be operated on, between 0 and range:

  ```
  arithmetic -r {{7}}
  ```

ARK: Survival Ascended

Create and start a headless ARK: Survival Ascended server.

More information: https://ark.wiki.gg/wiki/Server_configuration.

- Start the server with a specific map:

```
{{path/to}}/ArkAscendedServer {{TheIsland_WP}}
```

- Start the server with a specific session name, server password, and admin password:

```
{{path/to}}/ArkAscendedServer {{TheIsland_WP}}?
SessionName={{session_name}}?
ServerPassword={{server_password}}?
ServerAdminPassword={{admin_password}}
```

- Start the server with a specific port and set a maximum player count:

```
{{path/to}}/ArkAscendedServer {{TheIsland_WP}} -port={{7777}}
-WinLiveMaxPlayers={{1..70}}
```

- Enable PvE and disabling PvP:

```
{{path/to}}/ArkAscendedServer {{TheIsland_WP}}?ServerPVE=true
```

- Set a multiplier to scale the server difficulty, affecting the maximum level of wild creatures:

```
{{path/to}}/ArkAscendedServer {{TheIsland_WP}}?
DifficultyOffset={{1.0}}
```

- Disable creature animation optimization to prevent collision issues:

```
{{path/to}}/ArkAscendedServer {{TheIsland_WP}} -
AlwaysTickDedicatedSkeletalMeshes
```

- Enable specific mods by their ID (comma-separated):

```
{{path/to}}/ArkAscendedServer {{TheIsland_WP}} -
mods={{mod_id1,mod_id2,...}}
```

- Allow connections from specific platforms:

```
{{path/to}}/ArkAscendedServer {{TheIsland_WP}} -
ServerPlatform={{PC+XSX+PS5}}
```

ARK: Survival Evolved

Create and start a headless ARK: Survival Evolved server.

More information: https://ark.wiki.gg/wiki/Server_configuration.

- Start the server with a specific map:

```
{{path/to}}/ShooterGameServer {{TheIsland}}
```

- Start the server with a specific session name, server password, and admin password:

```
{{path/to}}/ShooterGameServer {{TheIsland}}?
SessionName={{session_name}}?
ServerPassword={{server_password}}?
ServerAdminPassword={{admin_password}}
```

- Start the server with a specific port and set a maximum player count:

```
{{path/to}}/ShooterGameServer {{TheIsland}}?Port={{7777}}?
MaxPlayers={{1..70}}
```

- Enable PvE and disabling PvP:

```
{{path/to}}/ShooterGameServer {{TheIsland}}?ServerPVE=true
```

- Set a multiplier to scale the server difficulty, affecting the maximum level of wild creatures:

```
{{path/to}}/ShooterGameServer {{TheIsland}}?
DifficultyOffset={{1.0}}
```

- Enable a specific event:

```
{{path/to}}/ShooterGameServer {{TheIsland}} -
ActiveEvent={{Summer}}
```

- Enable automatic mod downloading, installation, and updating (Steam only):

```
{{path/to}}/ShooterGameServer {{TheIsland}} -automanagedmods
```

- Enable crossplay between Steam and Epic Games Store:

```
{{path/to}}/ShooterGameServer {{TheIsland}} -crossplay -
PublicIPForEpic={{ip_address}}
```

ark

KDE's archiving tool.

More information: https://docs.kde.org/stable_kf6/en/ark/ark/.

- Extract a specific archive into the current directory:

```
ark {{[-b|--batch]}} {{path/to/archive}}
```

- Extract an archive into a specific directory:

```
ark {{[-b|--batch]}} {{[-o|--destination]}} {{path/to/
directory}} {{path/to/archive}}
```

- Create an archive if it does not exist and add specific files to it:

```
ark {{[-t|--add-to]}} {{path/to/archive}} {{path/to/file1
path/to/file2 ...}}
```

arpaname

Get the corresponding ARPA name for an IP address.

More information: https://manned.org/arpaname.

- Translate IP addresses (IPv4 and IPv6) to the corresponding ARPA name:

```
arpaname {{ip_address}}
```

arpspoof

Forge ARP replies to intercept packets.

More information: https://manned.org/arpspoof.

- Poison all hosts to intercept packets on [i]nterface for the host:

```
sudo arpspoof -i {{wlan0}} {{host_ip}}
```

- Poison [t]arget to intercept packets on [i]nterface for the host:

```
sudo arpspoof -i {{wlan0}} -t {{target_ip}} {{host_ip}}
```

- Poison both [t]arget and host to intercept packets on [i]nterface for the host:

```
sudo arpspoof -i {{wlan0}} -r -t {{target_ip}} {{host_ip}}
```

arptables

Manage ARP filtering rules using the **nftables** backend.

Part of the **xtables-nft** suite for ARP packet filtering.

More information: https://manned.org/arptables.

- List all ARP rules in the filter table:

```
sudo arptables {{[-L|--list]}}
```

- Append a rule to drop ARP packets from a specific IP address:

```
sudo arptables {{[-A|--append]}} INPUT {{[-s|--source-ip]}} {{192.168.0.1}} {{[-j|--jump]}} DROP
```

- Delete a specific rule from the INPUT chain by its rule number:

```
sudo arptables {{[-D|--delete]}} INPUT {{rule_number}}
```

- Flush all rules in the filter table:

```
sudo arptables {{[-F|--flush]}}
```

- Set the default policy of the OUTPUT chain to ACCEPT:

```
sudo arptables {{[-P|--policy]}} OUTPUT ACCEPT
```

- Save the current ARP rules to a file:

```
sudo arptables-save > {{path/to/file}}
```

as

Portable GNU assembler.

Primarily intended to assemble output from **`gcc`** to be used by **`ld`**.

More information: https://manned.org/as.

- Assemble a file, writing the output to `a.out`:

```
as {{path/to/file.s}}
```

- Assemble the output to a given file:

```
as {{path/to/file.s}} -o {{path/to/output_file.o}}
```

- Generate output faster by skipping whitespace and comment preprocessing. (Should only be used for trusted compilers):

```
as -f {{path/to/file.s}}
```

- Include a given path to the list of directories to search for files specified in `.include` directives:

```
as -I {{path/to/directory}} {{path/to/file.s}}
```

ascii-xfr

Transfer files using the ASCII protocol.

Part of **minicom**.

More information: https://manned.org/ascii-xfr.

- Send a file:

```
ascii-xfr -s {{path/to/file}}
```

- Receive a file:

```
ascii-xfr -r {{path/to/file}}
```

ascii

Show ASCII character aliases.

More information: http://www.catb.org/~esr/ascii/ascii.html.

- Show ASCII aliases of a character:

```
ascii {{a}}
```

- Show ASCII aliases in short, script-friendly mode:

```
ascii -t {{a}}
```

- Show ASCII aliases of multiple characters:

```
ascii -s {{tldr}}
```

- Show ASCII table in decimal:

```
ascii -d
```

- Show ASCII table in hexadecimal:

```
ascii -x
```

- Show ASCII table in octal:

```
ascii -o
```

- Show ASCII table in binary:

```
ascii -b
```

- Show options summary and complete ASCII table:

```
ascii
```

asciiart

Convert images to ASCII.

More information: https://github.com/nodanaonlyzuul/asciiart#in-the-command-line.

- Read an image from a file and print in ASCII:

```
asciiart {{path/to/image.jpg}}
```

- Read an image from a URL and print in ASCII:

```
asciiart {{www.example.com/image.jpg}}
```

- Choose the output width (default is 100):

```
asciiart {{[-w|--width]}} {{50}} {{path/to/image.jpg}}
```

- Colorize the ASCII output:

```
asciiart {{[-c|--color]}} {{path/to/image.jpg}}
```

- Choose the output format (default format is text):

```
asciiart {{[-f|--format]}} {{text|html}} {{path/to/
image.jpg}}
```

- Invert the character map:

```
asciiart {{[-i|--invert-chars]}} {{path/to/image.jpg}}
```

asterisk

Run and manage telephone and exchange (phone) server instances.

More information: https://docs.asterisk.org/Operation/.

- [r]econnect to a running server, and turn on logging 3 levels of [v]erbosity:

```
asterisk -r -vvv
```

- [r]econnect to a running server, run a single command, and return:

```
asterisk -r -x "{{command}}"
```

- Show chan_SIP clients (phones):

```
asterisk -r -x "sip show peers"
```

- Show active calls and channels:

```
asterisk -r -x "core show channels"
```

- Show voicemail mailboxes:

```
asterisk -r -x "voicemail show users"
```

- Terminate a channel:

```
asterisk -r -x "hangup request {{channel_id}}"
```

- Reload chan_SIP configuration:

```
asterisk -r -x "sip reload"
```

asusctl

Control various features of ASUS laptops on Linux.

More information: https://github.com/OpenGamingCollective/asusctl.

- Show the current profile:

```
asusctl profile get
```

- List available profiles:

```
asusctl profile list
```

- Set the active performance profile:

```
asusctl profile set performance
```

- Set the keyboard LED brightness:

```
asusctl leds set {{off|low|med|high}}
```

- Set the battery charge limit:

```
asusctl battery limit {{80}}
```

- Show the current battery charge limit:

```
asusctl battery info
```

- Get enabled fan profiles:

```
asusctl fan-curve --get-enabled
```

- Show system and supported-feature information:

```
asusctl info --show-supported
```

at

Execute commands once at a later time.

Results will be sent to the users mail.

More information: https://manned.org/at.

- Start the `atd` daemon:

```
systemctl start atd
```

- Create commands interactively and execute them in 5 minutes (press `<Ctrl d>` when done):

```
at now + 5 minutes
```

- Create commands interactively and execute them at a specific time:

```
at {{hh:mm}}
```

- Execute a command from `stdin` at 10:00 AM today:

```
echo "{{command}}" | at 1000
```

- Execute commands from a given file next Tuesday:

```
at -f {{path/to/file}} 9:30 PM Tue
```

- List all queued jobs for the current user (same as `atq`):

```
at -l
```

- View a specified job:

```
at -c {{job_number}}
```

atomupd-manager

Manage SteamOS updates.

More information: https://github.com/evlaV/atomupd-daemon.

- Check for available updates:

```
sudo atomupd-manager check
```

- Update to a specific image:

```
sudo atomupd-manager update {{version_id}}
```

- Print the current tracked update channel:

```
atomupd-manager tracked-branch
```

- List available update channels:

```
atomupd-manager list-branches
```

- Switch to a specific update channel:

```
sudo atomupd-manager switch-branch {{stable|beta|preview|rc|bc|pc|main}}
```

atop

Linux system and process monitor.

See also: **`htop`**, **`top`**, **`btop`**, **`btm`**, **`glances`**.

More information: https://manned.org/atop.

- Start:

```
atop
```

- Start and display memory consumption for each process:

```
atop -m
```

- Start and display disk information:

```
atop -d
```

- Start and display background process information:

```
atop -c
```

- Start and display thread-specific resource utilization information:

```
atop -y
```

- Start and display the number of processes for each user:

```
atop -au
```

- Display help about interactive commands:

```
<?>
```

audit2allow

Generate SELinux policy allow rules from audit logs.

Part of the **`policycoreutils-python-utils`** package.

See also: **`audit2why`**, **`ausearch`**, **`semodule`**.

More information: https://manned.org/audit2allow.

- Generate allow rules from recent audit denials and display them:

```
sudo audit2allow {{[-a|--all]}}
```

- Generate allow rules from a specific audit log file:

```
sudo audit2allow {{[-i|--input]}} {{path/to/audit.log}}
```

- Generate a policy module from recent audit denials:

```
sudo audit2allow {{[-a|--all]}} {{[-M|--module]}}
{{module_name}}
```

- Explain why SELinux denials occurred (same as `audit2why`):

```
sudo audit2allow {{[-a|--all]}} --why
```

- Display detailed information around generated messages:

```
sudo audit2allow {{[-a|--all]}} {{[-e|--explain]}}
```

- Use installed macros to generate a reference policy:

```
sudo audit2allow {{[-a|--all]}} {{[-R|--reference]}}
```

- Generate allow rules for a specific service:

```
sudo ausearch {{[-m|--message]}} avc {{[-c|--comm]}}
{{service_name}} | audit2allow {{[-M|--module]}}
{{policy_name}}
```

- Enable verbose output mode:

```
sudo audit2allow {{[-a|--all]}} {{[-v|--verbose]}}
```

audit2why

Explain SELinux denials from audit logs.

Part of the **policycoreutils-python-utils** package.

See also: **audit2allow**, **ausearch**, **sealert**.

More information: https://manned.org/audit2why.

- Explain the most recent SELinux denial:

```
sudo audit2why
```

- Explain SELinux denials from a specific audit log file:

```
sudo audit2why {{[-i|--input]}} {{path/to/audit.log}}
```

- Explain all SELinux denials from the audit log:

```
sudo ausearch {{[-m|--message]}} avc | audit2why
```

- Explain denials for a specific service:

```
sudo ausearch {{[-m|--message]}} avc {{[-c|--comm]}}
{{service_name}} | audit2why
```

auditctl

Utility to control the behavior, get status, and manage rules of the Linux Auditing System.

More information: https://manned.org/auditctl.

- Display the [s]tatus of the audit system:

```
sudo auditctl -s
```

- [l]ist all currently loaded audit rules:

```
sudo auditctl -l
```

- [D]elete all audit rules:

```
sudo auditctl -D
```

- [e]nable/disable the audit system:

```
sudo auditctl -e {{1|0}}
```

- Watch a file for changes:

```
sudo auditctl -a always,exit -F arch=b64 -F path=/{{path/to/file}} -F perm=wa
```

- Recursively watch a directory for changes:

```
sudo auditctl -a always,exit -F arch=b64 -F dir=/{{path/to/directory}}/ -F perm=wa
```

- Display [h]elp:

```
auditctl -h
```

aur sync

Download and build AUR packages automatically.

Note: A local repository needs to be defined in **`/etc/pacman.conf`** and **`vifm`** needs to be installed for this to fully function.

More information: https://github.com/aurutils/aurutils.

- Download one or more packages and their dependencies from the AUR, build them, and add them to a local repository:

```
aur sync {{package1 package2 ...}}
```

- Upgrade local repository packages:

```
aur sync {{[-u|--upgrades]}}
```

- Ignore specific packages when upgrading:

```
aur sync {{[-u|--upgrades]}} --ignore
{{package1,package2,...}}
```

- Clean build files after install:

```
aur sync {{[-C|--clean]}} {{package}}
```

- Install a package without viewing changes in Vim and do not confirm dependency installation:

```
aur sync --noview {{[-n|--noconfirm]}} {{package}}
```

aur

Build packages from the AUR and manage local repositories.

Note: A local repository needs to be defined in **`/etc/pacman.conf`** and **`vifm`** needs to be installed for this to fully function.

More information: https://github.com/aurutils/aurutils.

- Initialize the repository that matches the path in `/etc/pacman.conf`:

```
repo-add {{path/to/database.db.tar.gz}}
```

- Search the AUR database for a package:

```
aur search {{keyword}}
```

- Download one or more packages and their dependencies from the AUR, build them, and add them to a local repository:

```
aur sync {{package1 package2 ...}}
```

- List packages available in your local repository:

```
aur repo {{[-l|--list]}}
```

- Upgrade local repository packages:

```
aur sync {{[-u|--upgrades]}}
```

- Clean build files after install:

```
aur sync {{[-C|--clean]}} {{package}}
```

- Install a package without viewing changes in Vim and do not confirm dependency installation:

```
aur sync --noview {{[-n|--noconfirm]}} {{package}}
```

- Remove a package form the repository metadata (does not remove the package file itself):

```
repo-remove {{path/to/database.db.tar.gz}} {{package}}
```

aura

The Aura Package Manager: a secure, multilingual package manager for Arch Linux and the AUR.

More information: https://github.com/fosskers/aura.

- Search for packages from the AUR:

```
aura -As {{keyword|regex}}
```

- Install a package from the AUR:

```
aura -A {{package}}
```

- Update all AUR packages in a verbose mode and remove all make dependencies:

```
aura -Akua
```

- Install a package from the official repositories:

```
aura -S {{package}}
```

- Synchronize and update all packages from the official repositories:

```
aura -Syu
```

- Remove a package and its dependencies:

```
aura -Rsu {{package}}
```

- Remove orphan packages (installed as dependencies but not required by any package):

```
aura -Oj
```

auracle

Interact with Arch Linux's User Repository, commonly referred to as the AUR.

More information: https://github.com/falconindy/auracle/blob/master/man/auracle.1.pod.

- Display AUR packages that match a `regex`:

```
auracle search '{{regex}}'
```

- Display information about one or more AUR packages:

```
auracle info {{package1 package2 ...}}
```

- Display the `PKGBUILD` file (build information) of one or more AUR packages:

```
auracle show {{package1 package2 ...}}
```

- Display updates for installed AUR packages:

```
auracle outdated
```

aureport

Generate summary reports of auditd logs.

More information: https://manned.org/aureport.

- Display a summary of auditd events:

```
sudo aureport
```

- Generate a summary of login events:

```
sudo aureport {{[-l|--login]}}
```

- List all syscall reports:

```
sudo aureport {{[-s|--syscall]}}
```

- Generate a summary of executable events:

```
sudo aureport {{[-x|--executable]}}
```

- Show a summary of events for a specific time range:

```
sudo aureport {{[-ts|--start]}} {{start_time}} {{[-te|--
end]}} {{end_time}}
```

- List all audit files and the time range of events they cover:

```
sudo aureport {{[-t|--log-time]}}
```

- Display help:

```
aureport --help
```

aurman

An Arch Linux utility to build and install packages from the Arch User Repository.

See also: **`pacman`**.

More information: https://github.com/polygamma/aurman#syntax.

- Synchronize and update all packages:

```
aurman {{[-S|--sync]}} {{[-y|--refresh]}} {{[-u|--sysupgrade]}}
```

- Synchronize and update all packages without show changes of `PKGBUILD` files:

```
aurman {{[-S|--sync]}} {{[-y|--refresh]}} {{[-u|--sysupgrade]}} --noedit
```

- Install a new package:

```
aurman {{[-S|--sync]}} {{package}}
```

- Install a new package without show changes of `PKGBUILD` files:

```
aurman {{[-S|--sync]}} --noedit {{package}}
```

- Install a new package without prompting:

```
aurman {{[-S|--sync]}} --noedit --noconfirm {{package}}
```

- Search the package database for a keyword from the official repositories and AUR:

```
aurman {{[-S|--sync]}} {{[-s|--search]}} {{keyword}}
```

- Remove a package and its dependencies:

```
aurman --remove --recursive --nosave {{package}}
```

- Clear the package cache (use two `--clean` flags to clean all packages):

```
aurman {{[-S|--sync]}} {{[-c|--clean]}}
```

aurpublish

Publish Arch User Repository packages.

More information: https://github.com/eli-schwartz/aurpublish/blob/master/doc/aurpublish.1.asciidoc.

- Verify `PKGBUILD` integrity, generate `.SRCINFO`, create a commit message template, and publish the package to the AUR:

  ```
  aurpublish {{package_name}}
  ```

- Add githooks to the current repository:

  ```
  aurpublish setup
  ```

- Display help:

  ```
  aurpublish {{[-h|--help]}}
  ```

aurvote

Vote for packages in the Arch User Repository.

To be able to vote, the file **`~/.config/aurvote`** must exist and contain your AUR credentials.

More information: https://github.com/archlinuxfr/aurvote#name.

- Interactively create the file `~/.config/aurvote` containing your AUR username and password:

```
aurvote --configure
```

- Vote for one or more AUR packages:

```
aurvote {{package1 package2 ...}}
```

- Unvote one or more AUR packages:

```
aurvote {{[-u|--unvote]}} {{package1 package2 ...}}
```

- Check if one or more AUR packages have already been voted:

```
aurvote {{[-c|--check]}} {{package1 package2 ...}}
```

- Display help:

```
aurvote {{[-h|--help]}}
```

ausearch

Query the Linux audit log for events.

Part of the **audit** package.

See also: **audit2why**, **audit2allow**, **aureport**.

More information: https://manned.org/ausearch.

- Search for all SELinux AVC denial events:

```
sudo ausearch {{[-m|--message]}} avc
```

- Search for events related to a specific executable:

```
sudo ausearch {{[-c|--comm]}} {{httpd}}
```

- Search for events from a specific user:

```
sudo ausearch {{[-ui|--uid]}} {{1000}}
```

- Search for events in the last 10 minutes:

```
sudo ausearch {{[-ts|--start]}} recent
```

- Search for failed login attempts:

```
sudo ausearch {{[-m|--message]}} user_login {{[-sv|--
success]}} no
```

- Search for events related to a specific file:

```
sudo ausearch {{[-f|--file]}} {{path/to/file}}
```

- Display results in raw format for further processing:

```
sudo ausearch {{[-m|--message]}} avc --raw
```

ausyscall

Map syscall names and numbers.

More information: https://manned.org/ausyscall.

- Display syscall number of a specific system call:

```
ausyscall {{search_pattern}}
```

- Display name of a specific system call number:

```
ausyscall {{system_call_number}}
```

- Display all system calls for a specific architecture:

```
ausyscall {{architecture}} --dump
```

authconfig

Configure system authentication resources.

More information: https://manned.org/authconfig.

- Display the current configuration:

```
authconfig --test
```

- Configure the server to use a different password hashing algorithm:

```
authconfig --update --passalgo={{algorithm}}
```

- Enable LDAP authentication:

```
authconfig --update --enableldapauth
```

- Disable LDAP authentication:

```
authconfig --update --disableldapauth
```

- Enable Network Information Service (NIS):

```
authconfig --update --enablenis
```

- Enable Kerberos:

```
authconfig --update --enablekrb5
```

- Enable Winbind (Active Directory) authentication:

```
authconfig --update --enablewinbindauth
```

- Enable local authorization:

```
authconfig --update --enablelocauthorize
```

auto-cpufreq

Automatic CPU speed & power optimizer.

More information: https://github.com/AdnanHodzic/auto-cpufreq#auto-cpufreq-modes-and-options.

- Run `auto-cpufreq` in a specific mode:

```
sudo auto-cpufreq --{{monitor|live|update|remove|stats|force=governor}}
```

autoexpect

Generate a script from watching a session.

More information: https://manned.org/autoexpect.

- Spawn a shell and generate a script from it:

```
autoexpect
```

- Run a command and generate a script from it:

```
autoexpect {{command}}
```

- Run a command, generate a script, and save the script to a specified file:

```
autoexpect -f {{path/to/file}} {{command}}
```

autopkgtest

Run tests on Debian packages.

More information: https://manned.org/autopkgtest.

- Build the package in the current directory and run all tests directly on the system:

```
autopkgtest -- {{null}}
```

- Run a specific test for the package in the current directory:

```
autopkgtest --test-name={{test_name}} -- {{null}}
```

- Download and build a specific package with `apt-get`, then run all tests:

```
autopkgtest {{package}} -- {{null}}
```

- Test the package in the current directory using a new root directory:

```
autopkgtest -- {{chroot}} {{path/to/new_root}}
```

- Test the package in the current directory without rebuilding it:

```
autopkgtest {{[-B|--no-built-binaries]}} -- {{null}}
```

autorandr

Automatically change screen layout.

More information: https://manned.org/autorandr.

- Save the current screen layout:

```
autorandr {{[-s|--save]}} {{profile_name}}
```

- Show the saved profiles:

```
autorandr
```

- Load the first detected profile:

```
autorandr {{[-c|--change]}}
```

- Load a specific profile:

```
autorandr {{[-l|--load]}} {{profile_name}}
```

- Set the default profile:

```
autorandr {{[-d|--default]}} {{profile_name}}
```

autorecon

A multi-threaded network reconnaissance tool which performs automated enumeration of services.

More information: https://github.com/AutoRecon/AutoRecon.

- Perform reconnaissance on target host(s) (detailed scan results will be dumped in `results`):

```
sudo autorecon {{host_or_ip1,host_or_ip2,...}}
```

- Perform reconnaissance on target(s) from a file:

```
sudo autorecon {{[-t|--target-file]}} {{path/to/file}}
```

- Output results to a different directory:

```
sudo autorecon {{[-o|--output]}} {{path/to/results}}
{{host_or_ip1,host_or_ip2,...}}
```

- Limit scanning to specific ports and protocols (`T` for TCP, `U` for UDP, `B` for both):

```
sudo autorecon {{[-p|--ports]}} {{T:21-25,80,443,U:53,B:123}}
{{host_or_ip1,host_or_ip2,...}}
```

avahi-browse

Display services and hosts exposed on the local network via mDNS/DNS-SD.

Avahi is compatible with Bonjour (Zeroconf) found in Apple devices.

More information: https://manned.org/avahi-browse.

- List services available on the local network along with their addresses and ports, ignoring ones on the local machine:

```
avahi-browse {{[-a|--all]}} {{[-r|--resolve]}} {{[-l|--ignore-local]}}
```

- Quickly list services in the local network in SSV format for scripts:

```
avahi-browse {{[-a|--all]}} {{[-t|--terminate]}} {{[-p|--parsable]}}
```

- List domains in the neighborhood:

```
avahi-browse {{[-D|--browse-domains]}}
```

- Limit the search to a particular domain:

```
avahi-browse {{[-a|--all]}} --domain={{domain}}
```

avahi-resolve-address

This command is an alias of **`avahi-resolve --address`**.

- View documentation for the original command:

  `tldr avahi-resolve`

avahi-resolve-host-name

This command is an alias of **`avahi-resolve --name`**.

- View documentation for the original command:

  ```
  tldr avahi-resolve
  ```

avahi-resolve

Translate between host names and IP Addresses.

More information: https://manned.org/avahi-resolve.

- Resolve a local service to its IPv4:

```
avahi-resolve -4 {{[-n|--name]}} {{service.local}}
```

- Resolve an IP to a hostname, verbosely:

```
avahi-resolve {{[-v|--verbose]}} {{[-a|--address]}}
{{ip_address}}
```

avifenc

AV1 Image File Format (AVIF) encoder.

More information: https://aomediacodec.github.io/av1-avif/.

- Convert a specific PNG image to AVIF:

```
avifenc {{path/to/input.png}} {{path/to/output.avif}}
```

- Encode with a specific speed (6=default, 0=slowest, and 10=fastest):

```
avifenc --speed {{2}} {{path/to/input.png}} {{path/to/
output.avif}}
```

away

Lock terminal with an away message.

More information: https://manned.org/away.

- Lock terminal and set away message:

```
away {{message}}
```

- Lock terminal and enable mail check:

```
away {{[-c|--mail]}} {{message}}
```

- Lock terminal and disable mail check:

```
away {{[-C|--nomail]}} {{message}}
```

- Lock terminal and sleep background tasks for number of seconds:

```
away {{[-t|--time]}} {{seconds}} {{message}}
```

- Lock terminal and check mail if at least one inbox hasn't received new mail:

```
away {{[-p|--persist]}} {{message}}
```

- Lock terminal and check mail until at least one inbox has received new mail:

```
away {{[-P|--nopersist]}} {{message}}
```

- Display help:

```
away {{[-h|--help]}}
```

- Display version:

```
away {{[-v|--version]}}
```

awww

Efficient animated wallpaper daemon for Wayland.

More information: https://codeberg.org/LGFae/awww.

- Set wallpaper:

```
awww img {{path/to/image}}
```

- Set wallpaper to specified outputs:

```
awww img {{[-o|--outputs]}} {{output1,output2,...}} {{path/to/image}}
```

- Restore last wallpaper:

```
awww restore
```

- Kill daemon:

```
awww kill
```

- Display output information:

```
awww query
```

b4 am

Retrieve and prepare patches from a public-inbox archive for applying with **`git am`**.

More information: https://b4.docs.kernel.org/en/latest/maintainer/am-shazam.html.

- Retrieve patches from a thread and prepare them for `git am`:

```
b4 am {{message_id}}
```

- Retrieve patches and add your own `Signed-off-by` trailer as well as a `Link:` trailer to every commit:

```
b4 am {{[-sl|--add-my-sob --add-link]}} {{message_id}}
```

- Retrieve patches and prepare with 3-way merge support for conflict resolution:

```
b4 am {{[-3|--prep-3way]}} {{message_id}}
```

- Cherry-pick a subset of patches (e.g., patches 1-3 and 5) from a series:

```
b4 am {{[-P|--cherry-pick]}} {{1-3,5}} {{message_id}}
```

- Retrieve patches and run local checks on each patch:

```
b4 am --check {{message_id}}
```

- Save the output mailbox to a specific directory:

```
b4 am {{[-o|--outdir]}} {{path/to/directory}} {{message_id}}
```

b4 prep

Prepare a new patch series for submission to a mailing list.

More information: https://b4.docs.kernel.org/en/latest/contributor/prep.html.

- Start a new patch series branch forked from a specific point:

```
b4 prep {{[-n|--new]}} {{series_name}} {{[-f|--fork-point]}} {{fork_point}}
```

- Edit the cover letter for the current series:

```
b4 prep --edit-cover
```

- Automatically populate the cover letter with recipients from commit trailers and maintainer files:

```
b4 prep {{[-c|--auto-to-cc]}}
```

- Run local checks (e.g., `checkpatch.pl`) on the series:

```
b4 prep --check
```

- Enroll an existing branch as a b4-prep-managed branch:

```
b4 prep {{[-e|--enroll]}} {{base_branch}}
```

- Archive and clean up an obsolete prep-managed branch:

```
b4 prep --cleanup {{branch_name}}
```

b4 send

Send a patch series prepared with **`b4 prep`** to a mailing list.

More information: https://b4.docs.kernel.org/en/latest/contributor/send.html.

- Send patches from the current prep-tracked branch:

```
b4 send
```

- Generate the messages to review without sending them:

```
b4 send {{[-o|--output-dir]}} {{path/to/directory}}
```

- Send patches to specific recipients for preview without rerolling the series version:

```
b4 send --preview-to {{email_address1 email_address2 ...}}
```

- Send a previously sent version of the series again:

```
b4 send --resend {{version_number}}
```

- Simulate sending the path series without sending any mail:

```
b4 send {{[-d|--dry-run]}}
```

b4 shazam

Retrieve and apply patches from a public-inbox archive directly to the current Git tree.

More information: https://b4.docs.kernel.org/en/latest/maintainer/am-shazam.html.

- Retrieve patches from a thread and apply them directly to the current branch:

```
b4 shazam {{message_id}}
```

- Retrieve patches and create a `FETCH_HEAD` for merging (like a pull request):

```
b4 shazam {{[-H|--make-fetch-head]}} {{message_id}}
```

- Retrieve patches and automatically merge using the cover letter as the merge commit message:

```
b4 shazam {{[-M|--merge]}} {{message_id}}
```

- Retrieve patches, add your `Signed-off-by` and `Link:` trailers, then merge:

```
b4 shazam {{[-slM|--add-my-sob --add-link --merge]}} {{message_id}}
```

- Retrieve patches and start interactive conflict resolution when applicable:

```
b4 shazam {{[-H|--make-fetch-head]}} --resolve {{message_id}}
```

b4

A tool for working with patches and pull requests in a public-inbox archive.

Some subcommands such as **`am`**, **`shazam`**, **`prep`**, and **`send`** have their own usage documentation.

More information: https://manned.org/b4.

- Retrieve a thread from a public-inbox archive and save as an mbox file:

```
b4 mbox {{message_id}}
```

- Retrieve patches from a thread and prepare them for applying with `git am`:

```
b4 am {{message_id}}
```

- Retrieve and apply patches directly to the current Git tree:

```
b4 shazam {{message_id}}
```

- Start a new patch series branch forked from a specific point:

```
b4 prep {{[-n|--new]}} {{series_name}} {{[-f|--fork-point]}} {{fork_point}}
```

- Send patches from the current branch to the mailing list:

```
b4 send
```

- Update the current branch with new code-review trailers:

```
b4 trailers {{[-u|--update]}}
```

- Display help:

```
b4 {{[-h|--help]}}
```

- Display version:

```
b4 --version
```

backlight_control

Control a linux machine's backlight using percentage values.

More information: https://github.com/Hendrikto/backlight_control#usage.

- Increase/decrease the backlight by a specific percent count:

```
backlight_control {{+|-}}{{5}}
```

- Set the backlight strength to a specific percent count:

```
backlight_control {{90}}
```

- Display help:

```
backlight_control
```

balooctl

File indexing and searching framework for KDE Plasma.

More information: https://wiki.archlinux.org/title/Baloo.

- Display the status of the indexer:

```
balooctl status
```

- Enable/Disable the file indexer:

```
balooctl {{enable|disable}}
```

- Clean the index database:

```
balooctl purge
```

- Suspend the file indexer:

```
balooctl suspend
```

- Resume the file indexer:

```
balooctl resume
```

- Display the disk space used by Baloo:

```
balooctl indexSize
```

- Check for any unindexed files and index them:

```
balooctl check
```

- Display help:

```
balooctl {{[-h|--help]}}
```

Barotrauma

Start a headless Barotrauma server.

Note: The server is configured by editing the **`serversettings.xml`** file in the game directory.

More information: https://barotraumagame.com/wiki/Hosting_a_Dedicated_Server.

- Start the server:

  ```
  {{path/to}}/DedicatedServer
  ```

batcat

This command is an alias of **bat**.

- View documentation for the original command:

  ```
  tldr bat
  ```

batch

Execute commands at a later time when the system load levels permit.

Results will be sent to the user's mail.

See also: **`at`**, **`atq`**, **`atrm`**, **`mail`**.

More information: https://manned.org/batch.

- Start the `atd` daemon:

  `systemctl start atd`

- Execute commands from `stdin` (press `<Ctrl d>` when done):

  `batch`

- Execute a command from `stdin`:

  `echo "{{./make_db_backup.sh}}" | batch`

battop

An interactive viewer for the batteries installed in your notebook.

More information: https://github.com/svartalf/rust-battop.

- Display battery information:

```
battop
```

- Change battery information measurement [u]nit (default: human):

```
battop -u {{human|si}}
```

bcachefs device

Manage devices within a running **`bcachefs`** filesystem.

More information: https://bcachefs-docs.readthedocs.io/en/latest/mgmt-devicemanagement.html.

- Format and add a new device to an existing filesystem:

```
sudo bcachefs device add --label {{group}}.{{name}} {{path/to/mount_point}} {{path/to/device}}
```

- Migrate data off a device to prepare for removal:

```
bcachefs device evacuate {{path/to/device}}
```

- Permanently remove a device from a filesystem:

```
bcachefs device remove {{path/to/device}}
```

bcachefs

Manage **`bcachefs`** filesystems/devices.

Some subcommands such as **`device`** have their own usage documentation.

More information: https://bcachefs-docs.readthedocs.io/en/latest/index.html.

- Format a partition with `bcachefs`:

```
sudo bcachefs format {{path/to/partition}}
```

- Mount a `bcachefs` filesystem:

```
sudo bcachefs mount {{path/to/partition}} {{path/to/
mount_point}}
```

- Create a RAID 0 filesystem where an SSD acts as a cache and an HDD acts as a long-term storage:

```
sudo bcachefs format {{[-l|--label]}} {{ssd.ssd1}} {{path/to/
ssd_partition}} {{[-l|--label]}} {{hdd.hdd1}} {{path/to/
hdd_partition}} --replicas 1 --foreground_target {{ssd}} --
promote_target {{ssd}} --background_target {{hdd}}
```

- Mount a multidevice filesystem:

```
sudo bcachefs mount {{path/to/partition1}}:{{path/to/
partition2}} {{path/to/mount_point}}
```

- Display disk usage:

```
bcachefs fs usage {{[-h|--human-readable]}} {{path/to/
mount_point}}
```

- Set replicas after formatting and mounting:

```
sudo bcachefs set-fs-option --metadata_replicas {{2}} --
data_replicas {{2}} {{path/to/partition}}
```

- Force `bcachefs` to ensure all files are replicated:

```
sudo bcachefs data rereplicate {{path/to/mount_point}}
```

- Create a snapshot of a particular directory:

```
bcachefs subvolume snapshot {{path/to/directory}} {{path/to/
snapshot}}
```

bchunk

Convert CD images to a set of **`.iso`** and **`.cdr`** tracks.

More information: https://manned.org/bchunk.

- Convert binary CD into a standard iso9960 image file:

```
bchunk {{path/to/image.bin}} {{path/to/image.cue}} {{path/to/output}}
```

- Convert with verbose mode:

```
bchunk -v {{path/to/image.bin}} {{path/to/image.cue}} {{path/to/output}}
```

- Output audio files in WAV format:

```
bchunk -w {{path/to/image.bin}} {{path/to/image.cue}} {{path/to/output}}
```

beep

A utility to beep the PC speaker.

More information: https://manned.org/beep.

- Play a beep:

```
beep
```

- Play a beep that repeats:

```
beep -r {{repetitions}}
```

- Play a beep at a specified frequency (Hz) and duration (milliseconds):

```
beep -f {{frequency}} -l {{duration}}
```

- Play each new frequency and duration as a distinct beep:

```
beep -f {{frequency}} -l {{duration}} {{[-n|--new]}} -f
{{frequency}} -l {{duration}}
```

- Play the C major scale:

```
beep -f {{262}} {{[-n|--new]}} -f {{294}} {{[-n|--new]}} -f
{{330}} {{[-n|--new]}} -f {{349}} {{[-n|--new]}} -f {{392}}
{{[-n|--new]}} -f {{440}} {{[-n|--new]}} -f {{494}} {{[-n|--
new]}} -f {{523}}
```

beet

Manage the beets media library.

More information: https://beets.readthedocs.io/en/stable/reference/cli.html.

- Add music from a specific directory to the library, attempting to get correct tags for it from MusicBrainz:

```
beet import {{path/to/directory}}
```

- Add a single song to the library, attempting to get correct tags for it from MusicBrainz:

```
beet import {{[-s|--singletons]}} {{path/to/file}}
```

- Query library:

```
beet list {{query}}
```

- Show entire library statistics:

```
beet stats
```

- Show statistics for a specific query:

```
beet stats {{query}}
```

betterdiscordctl

Manage BetterDiscord on Linux.

More information: https://github.com/bb010g/betterdiscordctl#manual.

- Install BetterDiscord on Discord Stable:

```
sudo betterdiscordctl install
```

- Install BetterDiscord on Discord Canary:

```
sudo betterdiscordctl {{[-f|--d-flavors]}} canary install
```

- Install BetterDiscord on Discord PTB:

```
sudo betterdiscordctl {{[-f|--d-flavors]}} ptb install
```

- Install BetterDiscord on Discord installed with Flatpak:

```
sudo betterdiscordctl {{[-i|--d-install]}} flatpak install
```

- Install BetterDiscord on Discord installed with Snap:

```
sudo betterdiscordctl {{[-i|--d-install]}} snap install
```

betterlockscreen

Simple, minimal lock screen.

More information: https://github.com/betterlockscreen/betterlockscreen#usage.

- Lock the screen:

```
betterlockscreen {{[-l|--lock]}}
```

- Change the lock screen background:

```
betterlockscreen {{[-u|--update]}} {{path/to/image.png}}
```

- Lock the screen, showing some custom text:

```
betterlockscreen {{[-l|--lock]}} pixel --text "{{custom lock screen text}}"
```

- Lock the screen, with a custom monitor off timeout in seconds:

```
betterlockscreen --off {{5}} {{[-l|--lock]}}
```

bindfs

Mount a directory elsewhere with different permissions.

More information: https://bindfs.org/docs/bindfs.1.html.

- Mount a directory with same permissions:

```
sudo bindfs {{path/to/directory}} {{path/to/mount_point}}
```

- Map filesystem objects owned by `user1` to be owned by `user2` (also applies in reverse to newly created files):

```
sudo bindfs --map={{user1}}/{{user2}} {{path/to/directory}} {{path/to/mount_point}}
```

- Unmount a directory:

```
sudo umount {{path/to/mount_point}}
```

bitwise

Multi base interactive calculator supporting dynamic base conversion and bit manipulation.

More information: https://github.com/mellowcandle/bitwise.

- Run using interactive mode:

```
bitwise
```

- Convert from decimal:

```
bitwise {{12345}}
```

- Convert from hexadecimal:

```
bitwise {{0x563d}}
```

- Convert a C-style calculation:

```
bitwise "{{0x123 + 0x20 - 30 / 50}}"
```

blastn

Nucleotide-Nucleotide BLAST.

More information: https://www.ncbi.nlm.nih.gov/books/NBK279684/table/appendices.T.blastn_application_options/.

- Align two or more sequences using megablast (default), with the e-value threshold of 1e-9, pairwise output format (default):

```
blastn -query {{query.fa}} -subject {{subject.fa}} -evalue {{1e-9}}
```

- Align two or more sequences using blastn:

```
blastn -task blastn -query {{query.fa}} -subject {{subject.fa}}
```

- Align two or more sequences, custom tabular output format, output to file:

```
blastn -query {{query.fa}} -subject {{subject.fa}} -outfmt '{{6 qseqid qlen qstart qend sseqid slen sstart send bitscore evalue pident}}' -out {{output.tsv}}
```

- Search nucleotide databases using a nucleotide query, 16 threads (CPUs) to use in the BLAST search, with a maximum number of 10 aligned sequences to keep:

```
blastn -query {{query.fa}} -db {{path/to/blast_db}} -num_threads {{16}} -max_target_seqs {{10}}
```

- Search the remote non-redundant nucleotide database using a nucleotide query:

```
blastn -query {{query.fa}} -db {{nt}} -remote
```

- Display help (use `-help` for detailed help):

```
blastn -h
```

blastp

Protein-Protein BLAST.

More information: https://www.ncbi.nlm.nih.gov/books/NBK279684/table/appendices.T.blastp_application_options/.

- Align two or more sequences using blastp, with the e-value threshold of 1e-9, pairwise output format, output to screen:

```
blastp -query {{query.fa}} -subject {{subject.fa}} -evalue {{1e-9}}
```

- Align two or more sequences using blastp-fast:

```
blastp -task blastp-fast -query {{query.fa}} -subject {{subject.fa}}
```

- Align two or more sequences, custom tabular output format, output to file:

```
blastp -query {{query.fa}} -subject {{subject.fa}} -outfmt '{{6 qseqid qlen qstart qend sseqid slen sstart send bitscore evalue pident}}' -out {{output.tsv}}
```

- Search protein databases using a protein query, 16 threads to use in the BLAST search, with a maximum number of 10 aligned sequences to keep:

```
blastp -query {{query.fa}} -db {{blast_database_name}} -num_threads {{16}} -max_target_seqs {{10}}
```

- Search the remote non-redundant protein database using a protein query:

```
blastp -query {{query.fa}} -db {{nr}} -remote
```

- Display help (use `-help` for detailed help):

```
blastp -h
```

bleachbit

Clean junk files on the filesystem.

More information: https://docs.bleachbit.org/doc/command-line-interface.html.

- Start the graphical user interface (GUI) version of Bleachbit:

```
bleachbit --gui
```

- Shred a file:

```
bleachbit {{[-s|--shred]}} {{path/to/file}}
```

- List available cleaner options:

```
bleachbit {{[-l|--list-cleaners]}}
```

- Preview the files that will be deleted and other changes that will be made before actually performing the clean-up operation:

```
bleachbit {{[-p|--preview]}} --preset {{cleaner1.option1
cleaner2.option2 ...}}
```

- Perform the clean-up operation and delete files:

```
bleachbit {{[-c|--clean]}} --preset {{cleaner1.option1
cleaner2.option2 ...}}
```

blight

Utility for changing the display brightness.

More information: https://github.com/gutjuri/blight#usage.

- Set display brightness to 50%:

```
blight set {{50}} {{[-r|--relative]}}
```

- Show current display brightness:

```
blight show
```

- Print maximum display brightness:

```
blight max
```

- Increase display brightness in %:

```
blight inc {{number}} {{[-r|--relative]}}
```

- Decrease display brightness with internal units:

```
blight dec {{number}}
```

blkdiscard

Discard device sectors on storage devices.

Useful for SSDs.

More information: https://manned.org/blkdiscard.

- Discard all sectors on a device, removing all data:

```
blkdiscard {{/dev/device}}
```

- Securely discard all blocks on a device, removing all data:

```
blkdiscard {{[-s|--secure]}} {{/dev/device}}
```

- Discard the first 100 MB of a device:

```
blkdiscard {{[-l|--length]}} {{100MB}} {{/dev/device}}
```

blkid

List all recognized partitions and their Universally Unique Identifier (UUID).

More information: https://manned.org/blkid.

- List all partitions:

```
sudo blkid
```

- List all partitions in a table, including current mountpoints:

```
sudo blkid {{[-o|--output]}} list
```

- Get the UUID of the filesystem on a partition:

```
sudo blkid {{[-s|--match-tag]}} UUID {{[-o|--output]}} value
{{/dev/sdXY}}
```

blkpr

Register, reserve, release, preempt, and clear persistent reservations on a block device that supports Persistent Reservations.

More information: https://manned.org/blkpr.

- Register (command) a new reservation with a given key on a given device:

```
blkpr {{[-c|--command]}} register {{[-k|--key]}} {{reservation_key}} {{path/to/device}}
```

- Set the type of an existing reservation to exclusive access:

```
blkpr {{[-c|--command]}} reserve {{[-k|--key]}} {{reservation_key}} {{[-t|--type]}} exclusive-access {{path/to/device}}
```

- Preempt the existing reservation with a given key and replace it with a new reservation:

```
blkpr {{[-c|--command]}} preempt {{[-K|--oldkey]}} {{old_key}} {{[-k|--key]}} {{new_key}} {{[-t|--type]}} write-exclusive {{path/to/device}}
```

- Release a reservation with a given key and type on a given device:

```
blkpr {{[-c|--command]}} release {{[-k|--key]}} {{reservation_key}} {{[-t|--type]}} {{reservation_type}} {{path/to/device}}
```

- Clear all reservations from a given device:

```
blkpr {{[-c|--command]}} clear {{[-k|--key]}} {{key}} {{path/to/device}}
```

blockdev

Manage, query, and manipulate block devices.

More information: https://manned.org/blockdev.

- Print a report for all devices:

```
sudo blockdev --report
```

- Print a report for a specific device:

```
sudo blockdev --report {{/dev/sdXY}}
```

- Get the size of a device in 512-byte sectors:

```
sudo blockdev --getsz {{/dev/sdXY}}
```

- Set read-only:

```
sudo blockdev --setro {{/dev/sdXY}}
```

- Set read-write:

```
sudo blockdev --setrw {{/dev/sdXY}}
```

- Flush buffers:

```
sudo blockdev --flushbufs {{/dev/sdXY}}
```

- Get the physical block size:

```
sudo blockdev --getpbsz {{/dev/sdXY}}
```

- Set the read-ahead value to 128 sectors:

```
sudo blockdev --setra 128 {{/dev/sdXY}}
```

bluebuild

Build Containerfiles and custom images based on your **`recipe.yml`**.

More information: https://github.com/blue-build/cli#how-to-use.

- Build a recipe:

```
bluebuild build {{path/to/recipe.yml}}
```

- Validate a recipe:

```
bluebuild validate {{path/to/recipe.yml}}
```

- Generate a Containerfile:

```
bluebuild generate {{[-o|--output]}} {{Containerfile}}
{{path/to/recipe.yml}}
```

- Generate an ISO from a recipe:

```
bluebuild generate-iso --output-dir {{path/to/
output_directory}} --iso-name {{iso_name.iso}} recipe {{path/
to/recipe.yml}}
```

- Display help:

```
bluebuild {{[-h|--help]}}
```

bluetoothctl

Manage Bluetooth devices.

See also: **`bluetui`**.

More information: https://manned.org/bluetoothctl.

- Enter the `bluetoothctl` interactive shell:

```
bluetoothctl
```

- List all known devices:

```
bluetoothctl devices
```

- Power the Bluetooth controller on or off:

```
bluetoothctl power {{on|off}}
```

- Scan for available devices for 10 seconds:

```
bluetoothctl {{[-t|--timeout]}} 10 scan on
```

- Pair with a device:

```
bluetoothctl pair {{mac_address}}
```

- Connect to or disconnect from a paired device:

```
bluetoothctl {{connect|disconnect}} {{mac_address}}
```

- Allow the device to connect back:

```
bluetoothctl trust {{mac_address}}
```

- Remove a device:

```
bluetoothctl remove {{mac_address}}
```

bluetoothd

Daemon to manage bluetooth devices.

More information: https://manned.org/bluetoothd.

- Start the daemon:

```
bluetoothd
```

- Start the daemon, logging to `stdout`:

```
bluetoothd {{[-n|--nodetach]}}
```

- Start the daemon with a specific configuration file (defaults to `/etc/bluetooth/main.conf`):

```
bluetoothd {{[-f|--configfile]}} {{path/to/file}}
```

- Start the daemon with verbose output to `stderr`:

```
bluetoothd {{[-d|--debug]}}
```

- Start the daemon with verbose output coming from specific files in the bluetoothd or plugins source:

```
bluetoothd {{[-d|--debug=]}}{{path/to/file1:path/to/file2:...}}
```

bluetui

Manage Bluetooth devices with a terminal UI.

See also: **`bluetoothctl`**.

More information: https://github.com/pythops/bluetui#-usage.

- Start the program:

```
bluetui
```

- Display help:

```
bluetui {{[-h|--help]}}
```

blurlock

A simple wrapper around the i3 screen locker **`i3lock`**, which blurs the screen.

See also: **`i3lock`**.

More information: https://gitlab.manjaro.org/packages/extra/i3exit/-/blob/master/blurlock.

- Lock the screen to a blurred screenshot of the current screen:

```
blurlock
```

- Lock the screen and disable the unlock indicator (removes feedback on keypress):

```
blurlock {{[-u|--no-unlock-indicator]}}
```

- Lock the screen and don't hide the mouse pointer:

```
blurlock {{[-p|--pointer]}} {{default}}
```

- Lock the screen and show the number of failed login attempts:

```
blurlock {{[-f|--show-failed-attempts]}}
```

bmon

Monitor bandwidth and capture network related statistics.

More information: https://manned.org/bmon.

- Display the list of all the interfaces:

```
bmon {{[-a|--show-all]}}
```

- Display data transfer rates in bits per second:

```
bmon {{[-b|--use-bit]}}
```

- Specify the policy to define which network interface(s) is/are displayed:

```
bmon {{[-p|--policy]}}
{{interface_1,interface_2,interface_3,...}}
```

- Specify the interval (in seconds) in which rate per counter is calculated:

```
bmon {{[-R|--rate-interval]}} {{2.0}}
```

boltctl

Control thunderbolt devices.

More information: https://manned.org/boltctl.

- List connected (and authorized) devices:

```
boltctl
```

- List connected devices, including unauthorized ones:

```
boltctl list
```

- Authorize a device temporarily:

```
boltctl authorize {{device_uuid}}
```

- Authorize and remember a device:

```
boltctl enroll {{device_uuid}}
```

- Revoke a previously authorized device:

```
boltctl forget {{device_uuid}}
```

- Show more information about a device:

```
boltctl info {{device_uuid}}
```

bootc switch

Target a new container image reference to boot.

More information: https://manned.org/bootc-switch.

- Change the base OS to a new container image from a registry:

```
sudo bootc switch {{image}}
```

- Change the base OS to a new container image from the local image storage of the root user:

```
sudo bootc switch --transport containers-storage {{image}}
```

- Change the base OS to a new container image stored in a tarball:

```
sudo bootc switch --transport oci-archive {{path/to/image.tar.gz}}
```

bootc

Boot and upgrade via container images.

Manage transactional, in-place operating system updates using OCI/Docker container images.

More information: https://manned.org/bootc.

- Show deployments in the order they will appear in the bootloader:

```
bootc status
```

- Check if any updates are available:

```
bootc upgrade --check
```

- Prepare a new update and reboot into it:

```
bootc upgrade --apply
```

- Change OS base to new container image:

```
bootc switch {{image}}
```

- Reboot into the previous ostree deployment:

```
bootc rollback
```

- Apply transactional changes to the system configuration:

```
bootc edit
```

bootctl

Control EFI firmware boot settings and manage boot loader.

See also: **`kernel-install`**.

More information: https://www.freedesktop.org/software/systemd/man/latest/bootctl.html.

- Show information about the system firmware and the bootloaders:

```
bootctl
```

- Show all available bootloader entries:

```
bootctl list
```

- Set a boot entry as the default to boot to:

```
sudo bootctl set-default {{entry_id}}
```

- Set a flag to boot into the system firmware on the next boot (similar to `sudo systemctl reboot --firmware-setup`):

```
sudo bootctl reboot-to-firmware true
```

- Specify the path to the EFI system partition (defaults to `/efi/`, `/boot/`, or `/boot/efi`):

```
bootctl --esp-path /{{path/to/efi_system_partition}}/
```

- Install `systemd-boot` into the EFI system partition:

```
sudo bootctl install
```

- Remove all installed versions of `systemd-boot` from the EFI system partition:

```
sudo bootctl remove
```

bore local

Start a local proxy to a remote server using Bore.

More information: https://github.com/ekzhang/bore#detailed-usage.

- Expose a local port to a remote Bore server:

```
bore local {{[-t|--to]}} {{remote_server_address}} {{local_port}}
```

- Expose a specific local host instead of `localhost`:

```
bore local {{[-l|--local-host]}} {{host}} {{[-t|--to]}} {{remote_server_address}} {{local_port}}
```

- Specify a remote server port explicitly:

```
bore local {{[-t|--to]}} {{remote_server_address}} {{[-p|--port]}} {{remote_port}} {{local_port}}
```

- Use a secret for authentication:

```
bore local {{[-t|--to]}} {{remote_server_address}} {{[-s|--secret]}} {{your_secret}} {{local_port}}
```

- Display help:

```
bore local {{[-h|--help]}}
```

bore

Start a local proxy to a remote server using Bore.

Some subcommands such as **`local`** have their own usage documentation.

More information: https://github.com/ekzhang/bore#detailed-usage.

- Expose a local port to a remote Bore server:

```
bore local {{[-t|--to]}} {{remote_server_address}} {{local_port}}
```

- Start a Bore server:

```
bore server
```

- Display help:

```
bore {{[-h|--help]}}
```

bpftool

Inspect and manipulate eBPF programs and maps in a simple way.

More information: https://manned.org/bpftool.

- List information about loaded eBPF programs:

```
bpftool prog list
```

- List eBPF program attachments in the kernel networking subsystem:

```
bpftool net list
```

- List all active links:

```
bpftool link list
```

- List all raw_tracepoint, tracepoint, kprobe attachments in the system:

```
bpftool perf list
```

- List BPF Type Format (BTF) data:

```
bpftool btf list
```

- List information about loaded maps:

```
bpftool map list
```

- Probe a network device "eth0" for supported eBPF features:

```
bpftool feature probe dev {{eth0}}
```

- Run commands in batch mode from a file:

```
bpftool batch file {{myfile}}
```

bpftrace

High-level tracing language for Linux eBPF.

More information: https://github.com/bpftrace/bpftrace/blob/master/man/adoc/bpftrace.adoc.

- List all available probes:

```
sudo bpftrace -l
```

- Run a one-liner program (e.g. syscall count by program):

```
sudo bpftrace -e '{{tracepoint:raw_syscalls:sys_enter
{ @[comm] = count(); }}}'
```

- Run a program from a file:

```
sudo bpftrace {{path/to/file}}
```

- Trace a program by PID:

```
sudo bpftrace -e '{{tracepoint:raw_syscalls:sys_enter /pid ==
123/ { @[comm] = count(); }}}'
```

- Simulate running the program and display the output in eBPF format:

```
sudo bpftrace -d -e '{{one_line_program}}'
```

- Display version:

```
bpftrace {{[-V|--version]}}
```

br

This command is an alias of **broot**.

- View documentation for the original command:

```
tldr broot
```

braa

Ultra-fast mass SNMP scanner allowing multiple hosts simultaneously.

More information: https://manned.org/braa.

- Walk the SNMP tree of host with public string querying all OIDs under `.1.3.6`:

```
braa public@{{ip_address}}:{{.1.3.6.*}}
```

- Query the whole subnet `ip_range` for `system.sysLocation.0`:

```
braa public@{{ip_range}}:{{.1.3.6.1.2.1.1.6.0}}
```

- Attempt to set the value of `system.sysLocation.0` to a specific workgroup:

```
braa private@{{ip_address}}:{{.1.3.6.1.2.1.1.6.0}}
=s'{{workgroup}}'
```

brctl

Ethernet bridge administration.

More information: https://manned.org/brctl.

- Show a list with information about currently existing Ethernet bridges:

```
sudo brctl show
```

- Create a new Ethernet bridge interface:

```
sudo brctl add {{bridge_name}}
```

- Delete an existing Ethernet bridge interface:

```
sudo brctl del {{bridge_name}}
```

- Add an interface to an existing bridge:

```
sudo brctl addif {{bridge_name}} {{interface_name}}
```

- Remove an interface from an existing bridge:

```
sudo brctl delif {{bridge_name}} {{interface_name}}
```

bridge

Show and manipulate network bridge addresses and devices.

More information: https://manned.org/bridge.

- List all bridges and their interfaces:

```
bridge {{[l|link]}}
```

- Show port vlan information:

```
bridge {{[v|vlan]}}
```

- Assign a VLAN to a port:

```
sudo bridge {{[v|vlan]}} {{[a|add]}} dev {{lanX}} vid
{{vlan_id}} pvid {{tagged|untagged}}
```

- Remove a VLAN from a port:

```
sudo bridge {{[v|vlan]}} {{[d|delete]}} dev {{lanX}} vid
{{vlan_id}}
```

- Watch for changes in bridge interfaces:

```
bridge {{[mo|monitor]}}
```

- Display help:

```
bridge {{[h|help]}}
```

brightnessctl

Utility for reading and controlling device brightness for Linux operating systems.

More information: https://github.com/Hummer12007/brightnessctl#usage.

- List devices with changeable brightness:

```
brightnessctl {{[-l|--list]}}
```

- Print the current brightness of the default device:

```
brightnessctl {{[g|get]}}
```

- Print the current brightness of a specific device (can be a wildcard):

```
brightnessctl {{[g|get]}} {{[-d|--device]}} '{{device_name}}'
```

- Set the brightness to a specified percentage:

```
brightnessctl {{[s|set]}} {{50}}%
```

- Increase brightness by a specified percentage:

```
brightnessctl {{[s|set]}} +{{10}}%
```

- Decrease brightness by a specified percentage:

```
brightnessctl {{[s|set]}} {{10}}%-
```

broot

Navigate directory trees interactively.

More information: https://github.com/Canop/broot.

- Install or reinstall the `br` shell function:

```
broot --install
```

- Start and navigate the current directory tree interactively:

```
broot
```

- Start displaying the size of files and directories:

```
broot {{[-s|--sizes]}}
```

- Start sorting by size, showing ignored and hidden files:

```
broot {{[-w|--whale-spotting]}}
```

- Start displaying permissions:

```
broot {{[-p|--permissions]}}
```

- Start displaying directories only:

```
broot {{[-f|--only-folders]}}
```

- Start displaying hidden files and directories:

```
broot {{[-h|--hidden]}}
```

bspc

Configure and control **bspwm**, managing nodes, desktops, monitors, and more.

See also: **bspwm**.

More information: https://github.com/baskerville/bspwm/blob/master/doc/bspwm.1.asciidoc.

- Define two virtual desktops:

```
bspc monitor {{[-d|--reset-desktops]}} {{desktop_name1}} {{desktop_name2}}
```

- Focus the given desktop:

```
bspc desktop {{[-f|--focus]}} {{number}}
```

- Close the windows rooted at the selected node:

```
bspc node {{[-c|--close]}}
```

- Send the selected node to the given desktop:

```
bspc node {{[-d|--to-desktop]}} {{number}}
```

- Toggle full screen mode for the selected node:

```
bspc node {{[-t|--state]}} ~fullscreen
```

- Set the value of a specific setting:

```
bspc config {{setting_name}} {{value}}
```

bspwm

A tiling window manager based on binary space partitioning.

See also: **`bspc`**.

More information: https://github.com/baskerville/bspwm/blob/master/doc/bspwm.1.asciidoc.

- Start `bspwm` (note that a pre-existing window manager must not be open when this command is run):

```
bspwm -c {{path/to/config}}
```

bsub

Submit batch jobs to LSF (Load Sharing Facility) scheduler.

More information: https://www.ibm.com/docs/spectrum-lsf/latest?topic=reference-bsub.

- Submit a script file as a job:

```
bsub {{path/to/script.sh}}
```

- Submit a job to a specific queue:

```
bsub -q {{queue_name}} make all
```

- Submit a job with a name and redirect output and error:

```
bsub -J {{job_name}} --output {{path/to/output.log}} --error {{path/to/error.log}} {{path/to/script.sh}}
```

- Request 8 CPU cores and 16GB memory for a command:

```
bsub -n 8 -M 16G cargo build --release
```

- Run an interactive shell in the current session:

```
bsub -I bash
```

- Submit a job with a runtime limit of 45 minutes:

```
bsub -W 45 {{path/to/script.sh}}
```

btrbk

Create snapshots and remote backups of btrfs subvolumes.

More information: https://digint.ch/btrbk/doc/readme.html.

- Print statistics about configured subvolumes and snapshots:

```
sudo btrbk stats
```

- List configured subvolumes and snapshots:

```
sudo btrbk list
```

- Print what would happen in a run without making the displayed changes:

```
sudo btrbk {{[-v|--verbose]}} dryrun
```

- Run backup routines verbosely, show progress bar:

```
sudo btrbk --progress {{[-v|--verbose]}} run
```

- Only create snapshots for configured subvolumes:

```
sudo btrbk snapshot
```

btrfs balance

Balance block groups on a btrfs filesystem.

More information: https://btrfs.readthedocs.io/en/latest/btrfs-balance.html.

- Show the status of a running or paused balance operation:

```
sudo btrfs {{[b|balance]}} status {{path/to/btrfs_filesystem}}
```

- Balance all block groups (slow; rewrites all blocks in filesystem):

```
sudo btrfs {{[b|balance]}} start {{path/to/btrfs_filesystem}}
```

- Balance data block groups which are less than 15% utilized, running the operation in the background:

```
sudo btrfs {{[b|balance]}} start {{[--bg|--background]}} -dusage={{15}} {{path/to/btrfs_filesystem}}
```

- Balance a max of 10 metadata chunks with less than 20% utilization and at least 1 chunk on a given device `devid` (see `btrfs filesystem show`):

```
sudo btrfs {{[b|balance]}} start -musage={{20}},limit={{10}},devid={{devid}} {{path/to/btrfs_filesystem}}
```

- Convert data blocks to the raid6 and metadata to raid1c3 (see mkfs.btrfs(8) for profiles):

```
sudo btrfs {{[b|balance]}} start -dconvert={{raid6}} -mconvert={{raid1c3}} {{path/to/btrfs_filesystem}}
```

- Convert data blocks to raid1, skipping already converted chunks (e.g. after a previous cancelled conversion operation):

```
sudo btrfs {{[b|balance]}} start -dconvert={{raid1}},soft {{path/to/btrfs_filesystem}}
```

- Cancel, pause, or resume a running or paused balance operation:

```
sudo btrfs {{[b|balance]}} {{cancel|pause|resume}} {{path/to/btrfs_filesystem}}
```

btrfs check

Check or repair a btrfs filesystem.

More information: https://btrfs.readthedocs.io/en/latest/btrfs-check.html.

- Check a btrfs filesystem:

```
sudo btrfs {{[c|check]}} {{path/to/partition}}
```

- Check and repair a btrfs filesystem (dangerous):

```
sudo btrfs {{[c|check]}} --repair {{path/to/partition}}
```

- Show the progress of the check:

```
sudo btrfs {{[c|check]}} {{[-p|--progress]}} {{path/to/partition}}
```

- Verify the checksum of each data block (if the filesystem is good):

```
sudo btrfs {{[c|check]}} --check-data-csum {{path/to/partition}}
```

- Use the n-th superblock (n can be 0, 1, or 2):

```
sudo btrfs {{[c|check]}} {{[-s|--super]}} {{n}} {{path/to/partition}}
```

- Rebuild the checksum tree:

```
sudo btrfs {{[c|check]}} --repair --init-csum-tree {{path/to/partition}}
```

- Rebuild the extent tree:

```
sudo btrfs {{[c|check]}} --repair --init-extent-tree {{path/to/partition}}
```

btrfs device

Manage devices in a btrfs filesystem.

More information: https://btrfs.readthedocs.io/en/latest/btrfs-device.html.

- Add one or more devices to a btrfs filesystem:

```
sudo btrfs {{[d|device]}} {{[a|add]}} {{path/to/block_device1 path/to/block_device2 ...}} {{path/to/btrfs_filesystem}}
```

- Remove a device from a btrfs filesystem:

```
sudo btrfs {{[d|device]}} {{[rem|remove]}} {{path/to/device1|device_id1 path/to/device2|device_id2 ...}}
```

- Display error statistics:

```
sudo btrfs {{[d|device]}} {{[st|stats]}} {{path/to/btrfs_filesystem}}
```

- Scan all disks and inform the kernel of all detected btrfs filesystems:

```
sudo btrfs {{[d|device]}} {{[sc|scan]}} {{[-d|--all-devices]}}
```

- Display detailed per-disk allocation statistics:

```
sudo btrfs {{[d|device]}} {{[u|usage]}} {{path/to/btrfs_filesystem}}
```

btrfs filesystem

Manage btrfs filesystems.

More information: https://btrfs.readthedocs.io/en/latest/btrfs-filesystem.html.

- Show filesystem usage (optionally run as root to show detailed information):

```
btrfs {{[f|filesystem]}} {{[u|usage]}} {{path/to/btrfs_mount}}
```

- Show usage by individual devices:

```
sudo btrfs {{[f|filesystem]}} {{[sh|show]}} {{path/to/btrfs_mount}}
```

- Defragment a single file on a btrfs filesystem (avoid while a deduplication agent is running):

```
sudo btrfs {{[f|filesystem]}} {{[de|defragment]}} {{[-v|--verbose]}} {{path/to/file}}
```

- Defragment a directory recursively (does not cross subvolume boundaries):

```
sudo btrfs {{[f|filesystem]}} {{[de|defragment]}} {{[-v|--verbose]}} -r {{path/to/directory}}
```

- Force syncing unwritten data blocks to disk(s):

```
sudo btrfs {{[f|filesystem]}} {{[sy|sync]}} {{path/to/btrfs_mount}}
```

- Summarize disk usage for the files in a directory recursively:

```
sudo btrfs {{[f|filesystem]}} du {{[-s|--summarize]}} {{path/to/directory}}
```

- Create a swap file:

```
sudo btrfs {{[f|filesystem]}} {{[m|mkswapfile]}} --size {{8g}} --uuid {{clear|random|time|uuid_value}} {{path/to/swapfile}}
```

btrfs inspect-internal

Query internal information of a btrfs filesystem.

More information: https://btrfs.readthedocs.io/en/latest/btrfs-inspect-internal.html.

- Print superblock's information:

```
sudo btrfs {{[i|inspect-internal]}} {{[dump-s|dump-super]}} {{path/to/partition}}
```

- Print superblock's and all of its copies' information:

```
sudo btrfs {{[i|inspect-internal]}} {{[dump-s|dump-super]}} {{[-a|--all]}} {{path/to/partition}}
```

- Print filesystem's metadata information:

```
sudo btrfs {{[i|inspect-internal]}} {{[dump-t|dump-tree]}} {{path/to/partition}}
```

- Print list of files in inode n-th:

```
sudo btrfs {{[i|inspect-internal]}} {{[i|inode-resolve]}} {{n}} {{path/to/btrfs_mount}}
```

- Print list of files at a given logical address:

```
sudo btrfs {{[i|inspect-internal]}} {{[lo|logical-resolve]}} {{logical_address}} {{path/to/btrfs_mount}}
```

- Print stats of root, extent, csum, and fs trees:

```
sudo btrfs {{[i|inspect-internal]}} {{[t|tree-stats]}} {{path/to/partition}}
```

btrfs property

Get, set, or list properties for a BTRFS filesystem object (files, directories, subvolumes, filesystems, or devices).

More information: https://btrfs.readthedocs.io/en/latest/btrfs-property.html.

- List available properties (and descriptions) for the given btrfs object:

```
sudo btrfs {{[p|property]}} {{[l|list]}} {{path/to/btrfs_object}}
```

- Get all properties for the given btrfs object:

```
sudo btrfs {{[p|property]}} {{[g|get]}} {{path/to/btrfs_object}}
```

- Get the `label` property for the given btrfs filesystem or device:

```
sudo btrfs {{[p|property]}} {{[g|get]}} {{path/to/btrfs_filesystem}} label
```

- Get all object type-specific properties for the given btrfs filesystem or device:

```
sudo btrfs {{[p|property]}} {{[g|get]}} -t {{subvol|filesystem|inode|device}} {{path/to/btrfs_filesystem}}
```

- Set the `compression` property for a given btrfs inode (either a file or directory):

```
sudo btrfs {{[p|property]}} {{[s|set]}} {{path/to/btrfs_inode}} compression {{zstd|zlib|lzo|none}}
```

btrfs receive

The examples for this command have been moved together with **`btrfs send`**.

- View documentation for `btrfs receive`:

```
tldr btrfs send
```

btrfs rescue

Try to recover a damaged btrfs filesystem.

More information: https://btrfs.readthedocs.io/en/latest/btrfs-rescue.html.

- Rebuild the filesystem metadata tree (very slow):

```
sudo btrfs {{[resc|rescue]}} {{[ch|chunk-recover]}} {{path/to/partition}}
```

- Fix device size alignment related problems (e.g. unable to mount the filesystem with super total bytes mismatch):

```
sudo btrfs {{[resc|rescue]}} {{[fix-de|fix-device-size]}} {{path/to/partition}}
```

- Recover a corrupted superblock from correct copies (recover the root of filesystem tree):

```
sudo btrfs {{[resc|rescue]}} {{[s|super-recover]}} {{path/to/partition}}
```

- Recover from an interrupted transactions (fixes log replay problems):

```
sudo btrfs {{[resc|rescue]}} {{[z|zero-log]}} {{path/to/partition}}
```

- Create a `/dev/btrfs-control` control device when `mknod` is not installed:

```
sudo btrfs {{[resc|rescue]}} {{[c|create-control-device]}}
```

btrfs restore

Try to salvage files from a damaged btrfs filesystem.

More information: https://btrfs.readthedocs.io/en/latest/btrfs-restore.html.

- Restore all files from a btrfs filesystem to a given directory:

```
sudo btrfs {{[rest|restore]}} {{path/to/btrfs_device}} {{path/to/target_directory}}
```

- Simulate a restore, listing the files that would be restored from a btrfs filesystem:

```
sudo btrfs {{[rest|restore]}} {{[-D|--dry-run]}} {{path/to/btrfs_device}} {{path/to/target_directory}}
```

- Restore files matching a given `regex` ([c]ase-insensitive) files to be restored from a btrfs filesystem (all parent directories of target file(s) must match as well):

```
sudo btrfs {{[rest|restore]}} --path-regex {{regex}} -c {{path/to/btrfs_device}} {{path/to/target_directory}}
```

- Restore files from a btrfs filesystem using a specific root [t]ree `bytenr` (see `btrfs-find-root`):

```
sudo btrfs {{[rest|restore]}} -t {{bytenr}} {{path/to/btrfs_device}} {{path/to/target_directory}}
```

- Restore files from a btrfs filesystem (along with metadata, extended attributes, and Symlinks), overwriting files in the target:

```
sudo btrfs {{[rest|restore]}} {{[-m|--metadata]}} {{[-x|--xattr]}} {{[-S|--symlinks]}} {{[-o|--overwrite]}} {{path/to/btrfs_device}} {{path/to/target_directory}}
```

btrfs scrub

Scrub btrfs filesystems to verify data integrity.

It is recommended to run a scrub once a month.

More information: https://btrfs.readthedocs.io/en/latest/btrfs-scrub.html.

- Start a scrub:

```
sudo btrfs {{[sc|scrub]}} start {{path/to/btrfs_mount}}
```

- Show the status of an ongoing or last completed scrub:

```
sudo btrfs {{[sc|scrub]}} status {{path/to/btrfs_mount}}
```

- Cancel an ongoing scrub:

```
sudo btrfs {{[sc|scrub]}} {{[c|cancel]}} {{path/to/
btrfs_mount}}
```

- Resume a previously cancelled scrub:

```
sudo btrfs {{[sc|scrub]}} {{[r|resume]}} {{path/to/
btrfs_mount}}
```

- Start a scrub, but do not put the program in the [B]ackground:

```
sudo btrfs {{[sc|scrub]}} start -B {{path/to/btrfs_mount}}
```

- Start a scrub in quiet mode (does not print errors or statistics):

```
sudo btrfs {{[sc|scrub]}} start {{[-q|--quiet]}} {{path/to/
btrfs_mount}}
```

btrfs send

Transfer data (subvolume/snapshot) from one filesystem to another in a streamable format.

Note: **`send`** requires the snapshot be read-only.

See also: **`btrfs-subvolume`**, **`btrfs-property`**.

More information: https://btrfs.readthedocs.io/en/latest/Send-receive.html.

- Send a subvolume snapshot to a file instead of `stdout`:

```
sudo btrfs send -f {{path/to/file.btrfs}} {{path/to/source_snapshot}}
```

- Restore a subvolume snapshot from a file instead of `stdin`:

```
sudo btrfs receive -f {{path/to/file.btrfs}} {{path/to/destination_directory}}
```

- Send a subvolume snapshot stream and pipe it to a receiving destination:

```
sudo btrfs send {{path/to/source_snapshot}} | sudo btrfs receive {{path/to/destination_directory}}
```

- Send an incremental update (differences between parent and new snapshot) to a file:

```
sudo btrfs send -p {{path/to/parent_snapshot}} -f {{path/to/incremental.btrfs}} {{path/to/new_snapshot}}
```

- Send an incremental update stream and pipe it to a receiving destination:

```
sudo btrfs send -p {{path/to/parent_snapshot}} {{path/to/new_snapshot}} | sudo btrfs receive {{path/to/destination_directory}}
```

- Send a subvolume snapshot over SSH (the receiving `sudo` must be configured for passwordless execution):

```
sudo btrfs send {{path/to/source_snapshot}} | ssh {{user}}@{{host}} "sudo btrfs receive {{path/to/destination_directory}}"
```

- Dump stream metadata from a file without modifying the filesystem:

```
sudo btrfs receive --dump -f {{path/to/file.btrfs}}
```

btrfs subvolume

Manage btrfs subvolumes and snapshots.

More information: https://btrfs.readthedocs.io/en/latest/btrfs-subvolume.html.

- Create a new empty subvolume:

```
sudo btrfs {{[su|subvolume]}} {{[c|create]}} {{path/to/new_subvolume}}
```

- List all subvolumes and snapshots in the specified filesystem:

```
sudo btrfs {{[su|subvolume]}} {{[l|list]}} {{path/to/btrfs_filesystem}}
```

- Delete a subvolume:

```
sudo btrfs {{[su|subvolume]}} {{[d|delete]}} {{path/to/subvolume}}
```

- Create a [r]ead-only snapshot of an existing subvolume:

```
sudo btrfs {{[su|subvolume]}} {{[sn|snapshot]}} -r {{path/to/source_subvolume}} {{path/to/target}}
```

- Create a read-write snapshot of an existing subvolume:

```
sudo btrfs {{[su|subvolume]}} {{[sn|snapshot]}} {{path/to/source_subvolume}} {{path/to/target}}
```

- Show detailed information about a subvolume:

```
sudo btrfs {{[su|subvolume]}} {{[sh|show]}} {{path/to/subvolume}}
```

btrfs version

Display btrfs-progs version.

More information: https://btrfs.readthedocs.io/en/latest/btrfs.html.

- Display help:

```
btrfs {{[v|version]}} --help
```

- Display version:

```
btrfs {{[v|version]}}
```

btrfs

A filesystem based on the copy-on-write (COW) principle for Linux.

Some subcommands such as **`device`** have their own usage documentation.

More information: https://btrfs.readthedocs.io/en/latest/btrfs.html.

- Create subvolume:

```
sudo btrfs {{[su|subvolume]}} {{[c|create]}} {{path/to/subvolume}}
```

- List subvolumes:

```
sudo btrfs {{[su|subvolume]}} {{[l|list]}} {{path/to/mount_point}}
```

- Show space usage information:

```
sudo btrfs {{[f|filesystem]}} df {{path/to/mount_point}}
```

- Enable quota:

```
sudo btrfs {{[qu|quota]}} {{[e|enable]}} {{path/to/subvolume}}
```

- Show quota:

```
sudo btrfs {{[qg|qgroup]}} {{[s|show]}} {{path/to/subvolume}}
```

bully

Brute-force the WPS pin of a wireless access point.

Necessary information must be gathered with **`airmon-ng`** and **`airodump-ng`** before using **`bully`**.

More information: https://salsa.debian.org/pkg-security-team/bully.

- Crack the password:

```
bully {{[-b|--bssid]}} "{{mac}}" {{[-c|--channel]}}
"{{channel}}" {{[-B|--bruteforce]}} "{{interface}}"
```

- Display help:

```
bully {{[-h|--help]}}
```

burpsuite

A GUI based application mainly used in web application penetration testing.

More information: https://portswigger.net/burp/documentation/desktop/troubleshooting/launch-from-command-line.

- Start Burp Suite:

```
burpsuite
```

- Start Burp Suite using the default configuration:

```
burpsuite --use-defaults
```

- Open a specific project file:

```
burpsuite --project-file={{path/to/file}}
```

- Load a specific configuration file:

```
burpsuite --config-file={{path/to/file}}
```

- Start without extensions:

```
burpsuite --disable-extensions
```

busctl

Introspect and monitor the D-Bus bus.

More information: https://www.freedesktop.org/software/systemd/man/latest/busctl.html.

- Show all peers on the bus by their service names:

```
busctl
```

- Show process information and credentials of a bus service, a process, or the owner of the bus (if no parameter is specified):

```
busctl status {{service|pid}}
```

- Dump messages being exchanged. If no service is specified, show all messages on the bus:

```
busctl monitor {{service1 service2 ...}}
```

- Show an object tree of one or more services (or all services if no service is specified):

```
busctl tree {{service1 service2 ...}}
```

- Show interfaces, methods, properties, and signals of the specified object on the specified service:

```
busctl introspect {{service}} {{path/to/object}}
```

- Retrieve the current value of one or more object properties:

```
busctl get-property {{service}} {{path/to/object}} {{interface_name}} {{property_name}}
```

- Invoke a method and show the response:

```
busctl call {{service}} {{path/to/object}} {{interface_name}} {{method_name}}
```

bwa

Burrows-Wheeler Alignment tool.

Short, low-divergent DNA sequences mapper against a large reference genome, such as the human genome.

More information: https://manned.org/bwa.

- Index the reference genome:

```
bwa index {{path/to/reference.fa}}
```

- Map single-end reads (sequences) to indexed genome using 32 [t]hreads and compress the result to save space:

```
bwa mem -t 32 {{path/to/reference.fa}} {{path/to/
read_single_end.fq.gz}} | gzip > {{path/to/
alignment_single_end.sam.gz}}
```

- Map pair-end reads (sequences) to the indexed genome using 32 [t]hreads and compress the result to save space:

```
bwa mem -t 32 {{path/to/reference.fa}} {{path/to/
read_pair_end_1.fq.gz}} {{path/to/read_pair_end_2.fq.gz}} |
gzip > {{path/to/alignment_pair_end.sam.gz}}
```

- Map pair-end reads (sequences) to the indexed genome using 32 [t]hreads with [M]arking shorter split hits as secondary for output SAM file compatibility in Picard software and compress the result:

```
bwa mem -M -t 32 {{path/to/reference.fa}} {{path/to/
read_pair_end_1.fq.gz}} {{path/to/read_pair_end_2.fq.gz}} |
gzip > {{path/to/alignment_pair_end.sam.gz}}
```

- Map pair-end reads (sequences) to indexed genome using 32 [t]hreads with FASTA/Q [C]omments (e.g. BC:Z:CGTAC) appending to a compressed result:

```
bwa mem -C -t 32 {{path/to/reference.fa}} {{path/to/
read_pair_end_1.fq.gz}} {{path/to/read_pair_end_2.fq.gz}} |
gzip > {{path/to/alignment_pair_end.sam.gz}}
```

bwrap

Run programs in a lightweight sandbox.

More information: https://manned.org/bwrap.

- Run a program in a read-only environment:

```
bwrap --ro-bind / / {{/bin/bash}}
```

- Give the environment access to devices, process information, and create a `tmpfs` for it:

```
bwrap --dev-bind /dev /dev --proc /proc --ro-bind / / --
tmpfs /tmp {{/bin/bash}}
```

byzanz-record

Record the screen.

More information: https://manned.org/byzanz-record.

- Record the screen and write the recording to a file (by default, `byzanz-record` will only record for 10 seconds):

```
byzanz-record {{path/to/file.ext}}
```

- Show information while and after recording:

```
byzanz-record {{[-v|--verbose]}} {{path/to/file.ext}}
```

- Record the screen for a minute:

```
byzanz-record {{[-d|--duration]}} 60 {{path/to/file.ext}}
```

- Delay recording for 10 seconds:

```
byzanz-record --delay 10 {{path/to/file.ext}}
```

cacaclock

Display the current time as ASCII art.

More information: https://packages.debian.org/sid/caca-utils.

- Display the time:

```
cacaclock
```

- Change the font:

```
cacaclock {{[-f|--font]}} {{font}}
```

- Change the format using an `strftime` format specification:

```
cacaclock {{[-d|--dateformat]}} {{strftime_arguments}}
```

cacademo

Display a random ASCII art animation.

More information: https://manned.org/cacademo.

- View an animation:

```
cacademo
```

cacafire

Display an animated ASCII fire.

More information: https://manned.org/cacafire.

- Display the ASCII fire:

```
cacafire
```

cacaview

Display an image in PMN format.

More information: https://manned.org/cacaview.

- Display an image:

```
cacaview {{path/to/image}}
```

caffeinate

Prevent desktop from sleeping.

More information: https://manned.org/caffeinate.

- Prevent desktop from sleeping (use <Ctrl c> to exit):

```
caffeinate
```

caffeine-indicator

Manually inhibit desktop idleness with a toggle.

More information: https://manned.org/caffeine-indicator.

- Manually inhibit desktop idleness with a toggle:

```
caffeine-indicator
```

caffeine

Prevent desktop idleness in full-screen mode.

More information: https://manned.org/caffeine.

- Start a caffeine server:

```
caffeine
```

- Display help:

```
caffeine {{[-h|--help]}}
```

- Display version:

```
caffeine {{[-V|--version]}}
```

cage

Open applications in a kiosk mode.

See also: **`gamescope`**.

More information: https://github.com/cage-kiosk/cage/blob/master/cage.1.scd.

- Run an application:

```
cage {{application}}
```

- Give the application arguments:

```
cage -- {{application}} {{arguments}}
```

- Hide window [d]ecorations (this can lock you from accessing the terminal):

```
cage -d {{application}}
```

- Allow [s]witching terminals with `<Ctrl Alt F2>`:

```
cage -s {{application}}
```

- Run a specific file:

```
cage /{{path/to/file}}
```

- Display help:

```
cage -h
```

caja

Manage files and directories in the MATE desktop environment.

See also: **`nautilus`**, **`dolphin`**, **`thunar`**, **`ranger`**.

More information: https://manned.org/caja.

- Open the current user home directory:

```
caja
```

- Open specific directories in separate windows:

```
caja {{path/to/directory1 path/to/directory2 ...}}
```

- Open specific directories in tabs:

```
caja {{[-t|--tabs]}} {{path/to/directory1 path/to/
directory2 ...}}
```

- Open a directory with a specific window size:

```
caja {{[-g|--geometry]}} {{600}}x{{400}} {{path/to/
directory}}
```

- Close all windows:

```
caja {{[-q|--quit]}}
```

cal

Display a calendar with the current day highlighted.

More information: https://manned.org/cal.

- Display a calendar for the current month:

```
cal
```

- Display 3 months spanning the date:

```
cal {{[-3|--three]}}
```

- Display the whole calendar for the current year:

```
cal {{[-y|--year]}}
```

- Display the next twelve months:

```
cal {{[-Y|--twelve]}}
```

- Use Monday as the first day of the week:

```
cal {{[-m|--monday]}}
```

- Display a calendar for a specific year (4 digits):

```
cal {{year}}
```

- Display a calendar for a specific month and year:

```
cal {{month}} {{year}}
```

calcurse

A text-based calendar and scheduling application.

More information: https://github.com/lfos/calcurse/blob/pu/doc/calcurse.1.txt.

- Start `calcurse` on interactive mode:

  `calcurse`

- Print the appointments and events for the current day and exit:

  `calcurse {{[-a|--appointment]}}`

- Remove all local calcurse items and import remote objects:

  `calcurse-caldav --init=keep-remote`

- Remove all remote objects and push local calcurse items:

  `calcurse-caldav --init=keep-local`

- Copy local objects to the CalDAV server and vice versa:

  `calcurse-caldav --init=two-way`

caligula

A user-friendly, lightweight TUI for disk imaging.

See also: **dd**.

More information: https://github.com/ifd3f/caligula.

- Flash an ISO to a drive:

```
caligula burn {{path/to/image.iso}}
```

- Flash an ISO to a drive without entering the hash interactively:

```
caligula burn {{path/to/image.iso}} {{[-s|--hash]}} {{hash}}
```

cam

Frontend tool for **`libcamera`**.

See also: **`v4l2-ctl`**.

More information: https://docs.libcamera.org/.

- List available cameras:

```
cam {{[-l|--list]}}
```

- List controls of a camera:

```
cam {{[-c|--camera]}} {{camera_index}} --list-controls
```

- Write frames to a folder:

```
cam {{[-c|--camera]}} {{camera_index}} {{[-C|--capture=]}}
{{frames_to_capture}} {{[-F|--file]}}
```

- Display camera feed in a window:

```
cam {{[-c|--camera]}} {{camera_index}} {{[-C|--capture]}}
{{[-S|--sdl]}}
```

cat

Print and concatenate files.

See also: **`bat`**.

More information: https://www.gnu.org/software/coreutils/manual/html_node/cat-invocation.html.

- Print the contents of a file to `stdout`:

```
cat {{path/to/file}}
```

- Concatenate several files into an output file:

```
cat {{path/to/file1 path/to/file2 ...}} > {{path/to/output_file}}
```

- Append several files to an output file:

```
cat {{path/to/file1 path/to/file2 ...}} >> {{path/to/output_file}}
```

- Write to a file interactively:

```
cat > {{path/to/file}}
```

- Number all output lines:

```
cat {{[-n|--number]}} {{path/to/file}}
```

- Display all characters, including tabs, line endings, and non-printing characters:

```
cat {{[-A|--show-all]}} {{path/to/file}}
```

- Omit repeating empty lines:

```
cat {{[-s|--squeeze-blank]}} {{path/to/file}}
```

- Pass file contents to another program through `stdin`:

```
cat {{path/to/file}} | {{program}}
```

cbatticon

A lightweight and fast battery icon that sits in your system tray.

More information: https://github.com/valr/cbatticon.

- Show the battery icon in the system tray:

```
cbatticon
```

- Show the battery icon and set the update interval to 20 seconds:

```
cbatticon {{[-u|--update-interval]}} {{20}}
```

- List available icon types:

```
cbatticon {{[-t|--list-icon-types]}}
```

- Show the battery icon with a specific icon type:

```
cbatticon {{[-i|--icon-type]}} {{standard|notification|
symbolic}}
```

- List available power supplies:

```
cbatticon {{[-p|--list-power-supplies]}}
```

- Show the battery icon for a specific battery:

```
cbatticon {{BAT0}}
```

- Show the battery icon and which command to execute when the battery level reaches the set critical level:

```
cbatticon {{[-r|--critical-level]}} {{5}} {{[-c|--command-
critical-level]}} {{poweroff}}
```

cc

This command is an alias of **gcc**.

- View documentation for the original command:

```
tldr gcc
```

cdrdao

Read and write CDs in disc-at-once mode.

More information: https://manned.org/cdrdao.

- Read a CD and write its contents to a file:

```
cdrdao read-cd --device {{/dev/cdrom}} --read-raw
{{image.toc}}
```

cdrecord

Record data to CDs or DVDs.

Some invocations of cdrecord can cause destructive actions, such as erasing all the data on a disc.

More information: https://manned.org/cdrecord.

- Display optical drives available to `cdrecord`:

```
cdrecord --devices
```

- Record ("burn") an audio-only disc:

```
cdrecord dev={{/dev/optical_drive}} -audio {{track*.cdaudio}}
```

- Burn a file to a disc, ejecting the disc once done (some recorders require this):

```
cdrecord -eject dev={{/dev/optical_drive}} -data {{file.iso}}
```

- Burn a file to the disc in an optical drive, potentially writing to multiple discs in succession:

```
cdrecord -tao dev={{/dev/optical_drive}} -data {{file.iso}}
```

cec-client

Manage serial bus CEC connections.

See also: **`cec-ctl`**.

More information: https://manned.org/cec-client.

- List all CEC adapters:

```
cec-client {{[-l|--list-devices]}}
```

- Start an interactive CEC session:

```
sudo cec-client
```

- Set the On-Screen Display name:

```
sudo cec-client {{[-o|--osd-name]}} {{name}}
```

- Send a single command:

```
echo {{on 0}} | sudo cec-client {{[-s|--single-command]}}
```

- Set a device to standby in interactive mode:

```
standby {{0}}
```

- Turn a device on in interactive mode:

```
on {{0}}
```

cec-ctl

Control kernel CEC devices.

See also: **`cec-client`**.

More information: https://manned.org/cec-ctl.

- List CEC devices:

```
cec-ctl --list-devices
```

- Monitor CEC traffic:

```
sudo cec-ctl {{[-m|--monitor]}}
```

- Show CEC topology:

```
cec-ctl {{[-S|--show-topology]}}
```

ceph

A unified storage system.

More information: https://docs.ceph.com/en/latest/man/8/ceph/.

- Check cluster health status:

  ```
  ceph status
  ```

- Check cluster usage stats:

  ```
  ceph df
  ```

- Get the statistics for the placement groups in a cluster:

  ```
  ceph pg dump --format {{plain}}
  ```

- Create a storage pool:

  ```
  ceph osd pool create {{pool_name}} {{page_number}}
  ```

- Delete a storage pool:

  ```
  ceph osd pool delete {{pool_name}}
  ```

- Rename a storage pool:

  ```
  ceph osd pool rename {{current_name}} {{new_name}}
  ```

- Self-repair pool storage:

  ```
  ceph pg repair {{pool_name}}
  ```

cephadm

Deploy and manage a Ceph cluster using containers.

Part of the Ceph orchestrator framework.

More information: https://docs.ceph.com/en/latest/man/8/cephadm/.

- Bootstrap a new Ceph cluster on the current host:

  ```
  sudo cephadm bootstrap --mon-ip {{monitor_ip}}
  ```

- Add a new host to the cluster:

  ```
  sudo cephadm add-host {{hostname}} {{ip_address}}
  ```

- Deploy a specific service (e.g., mgr, mon, osd):

  ```
  sudo cephadm deploy {{service_type}} --name {{service_name}}
  ```

- Check the status of cluster services:

  ```
  sudo cephadm shell -- ceph {{[-s|--status]}}
  ```

- Enter a shell environment inside the Ceph container:

  ```
  sudo cephadm shell
  ```

- Remove a service from the cluster:

  ```
  sudo cephadm rm-service {{service_type}} --name
  {{service_name}}
  ```

certbot

The Let's Encrypt Agent for automatically obtaining and renewing TLS certificates.

Successor to **`letsencrypt`**.

More information: https://eff-certbot.readthedocs.io/en/latest/using.html.

- Obtain a new certificate via webroot authorization, but do not install it automatically:

```
sudo certbot certonly --webroot {{[-w|--webroot-path]}}
{{path/to/webroot}} {{[-d|--domain]}}
{{subdomain.example.com}}
```

- Obtain a new certificate via `nginx` authorization, installing the new certificate automatically:

```
sudo certbot --nginx {{[-d|--domain]}}
{{subdomain.example.com}}
```

- Obtain a new certificate via apache authorization, installing the new certificate automatically:

```
sudo certbot --apache {{[-d|--domain]}}
{{subdomain.example.com}}
```

- Renew all Let's Encrypt certificates that expire in 30 days or less (don't forget to restart any servers that use them afterwards):

```
sudo certbot renew
```

- Simulate the obtaining of a new certificate without actually saving any new certificates to disk:

```
sudo certbot --webroot {{[-w|--webroot-path]}} {{path/to/
webroot}} {{[-d|--domain]}} {{subdomain.example.com}} --dry-
run
```

- Obtain an untrusted test certificate instead:

```
sudo certbot --webroot {{[-w|--webroot-path]}} {{path/to/
webroot}} {{[-d|--domain]}} {{subdomain.example.com}} --test-
cert
```

certtool

Generate and manage X.509 certificates, keys, and PKI structures using GnuTLS.

More information: https://gnutls.org/manual/gnutls.html#certtool-Invocation.

- Generate a private key and save it to a file:

```
certtool {{[-p|--generate-privkey]}} --outfile {{path/to/private.key}}
```

- Generate a self-signed certificate using a private key and a template file:

```
certtool {{[-s|--generate-self-signed]}} --load-privkey {{path/to/private.key}} --template {{path/to/info.template}} --outfile {{path/to/certificate.crt}}
```

- Generate a certificate signing request (CSR):

```
certtool {{[-q|--generate-request]}} --load-privkey {{path/to/private.key}} --template {{path/to/info.template}} --outfile {{path/to/request.csr}}
```

- Generate a certificate authority (CA) certificate:

```
certtool {{[-s|--generate-self-signed]}} --load-privkey {{path/to/ca.key}} --template {{path/to/ca.template}} --outfile {{path/to/ca.crt}}
```

- Verify a certificate against a CA certificate:

```
certtool --verify --infile {{path/to/certificate.crt}} --load-ca-certificate {{path/to/ca.crt}}
```

cewl

URL spidering tool for making a cracking wordlist from web content.

More information: https://digi.ninja/projects/cewl.php#usage.

- Create a wordlist file from the given URL up to 2 links depth:

```
cewl {{[-d|--depth]}} 2 {{[-w|--write]}} {{path/to/wordlist.txt}} {{url}}
```

- Output an alphanumeric wordlist from the given URL with words of minimum 5 characters:

```
cewl --with-numbers {{[-m|--min_word_length]}} 5 {{url}}
```

- Output a wordlist from the given URL in debug mode including email addresses:

```
cewl --debug {{[-e|--email]}} {{url}}
```

- Output a wordlist from the given URL using HTTP Basic or Digest authentication:

```
cewl --auth_type {{basic|digest}} --auth_user {{username}} --auth_pass {{password}} {{url}}
```

- Output a wordlist from the given URL through a proxy:

```
cewl --proxy_host {{host}} --proxy_port {{port}} {{url}}
```

cfdisk

Manage partition tables and partitions on a hard disk using a curses UI.

See also: **`parted`**.

More information: https://manned.org/cfdisk.

- Start the partition manipulator with a specific device:

```
sudo cfdisk {{/dev/sdX}}
```

- Create a new partition table for a specific device and manage it:

```
sudo cfdisk {{[-z|--zero]}} {{/dev/sdX}}
```

cgclassify

Move running tasks to **`cgroups`**.

More information: https://manned.org/cgclassify.

- Move the process with a specific PID to the control [g]roup student in the CPU hierarchy:

  ```
  cgclassify -g {{cpu:student}} {{1234}}
  ```

- Move the process with a specific PID to control groups based on the `/etc/cgrules.conf` configuration file:

  ```
  cgclassify {{1234}}
  ```

- Move the process with a specific PID to the control [g]roup student in the CPU hierarchy. Note: The daemon of the service `cgred` does not change `cgroups` of the specific PID and its children (based on `/etc/cgrules.conf`):

  ```
  cgclassify --sticky -g {{cpu:/student}} {{1234}}
  ```

cgcreate

Create cgroups, used to limit, measure, and control resources used by processes.

`cgroups` types can be **`memory`**, **`cpu`**, **`net_cls`**, etc.

More information: https://manned.org/cgcreate.

- Create a new [g]roup:

```
cgcreate -g {{group_type}}:{{group_name}}
```

- Create a new [g]roup with multiple cgroup types:

```
cgcreate -g {{group_type1}},{{group_type2}}:{{group_name}}
```

- Create a subgroup:

```
mkdir /sys/fs/cgroup/{{group_type}}/{{group_name}}/
{{subgroup_name}}
```

cgexec

Limit, measure, and control resources used by processes.

Multiple cgroup types (aka controllers) exist, such as **`cpu`**, **`memory`**, etc.

More information: https://manned.org/cgexec.

- Execute a process in a given c[g]roup with given controller:

```
cgexec -g {{controller}}:{{cgroup_name}} {{process_name}}
```

cgroups

Linux kernel feature for limiting, measuring, and controlling resource usage by processes.

Cgroups (control groups) however is not a command, but rather a collection of commands, see the relevant pages below.

More information: https://www.kernel.org/doc/Documentation/cgroup-v2.txt.

- View documentation for `cgclassify`:

```
tldr cgclassify
```

- View documentation for `cgcreate`:

```
tldr cgcreate
```

- View documentation for `cgexec`:

```
tldr cgexec
```

chage

Change user account and password expiry information.

More information: https://manned.org/chage.

- List password information for the user:

```
chage {{[-l|--list]}} {{username}}
```

- Enable password expiration in 10 days:

```
sudo chage {{[-M|--maxdays]}} 10 {{username}}
```

- Disable password expiration:

```
sudo chage {{[-M|--maxdays]}} -1 {{username}}
```

- Set account expiration date:

```
sudo chage {{[-E|--expiredate]}} {{YYYY-MM-DD}} {{username}}
```

- Force user to change password on next log in:

```
sudo chage {{[-d|--lastday]}} 0 {{username}}
```

- Re-enable an account:

```
sudo chage {{[-E|--expiredate]}} -1 {{username}}
```

chat

Automate conversations with a modem or serial device.

Commonly used to establish PPP (Point-to-Point Protocol) connections.

More information: https://manned.org/chat.

- Execute a chat script directly:

```
chat '{{expect_send_pairs}}'
```

- Execute a chat script from a file:

```
chat -f '{{path/to/chat_script}}'
```

- Set a custom timeout (in seconds) for expecting a response:

```
chat -t {{timeout_in_seconds}} '{{expect_send_pairs}}'
```

- Enable verbose output to log the conversation to `syslog`:

```
chat -v '{{expect_send_pairs}}'
```

- Use a report file to log specific strings received during the conversation:

```
chat -r {{path/to/report_file}} '{{expect_send_pairs}}'
```

- Dial a phone number using a variable, substituting `\T` in the script:

```
chat -T '{{phone_number}}' '{{"ATDT\\T CONNECT"}}'
```

- Include an abort condition if a specific string is received:

```
chat 'ABORT "{{error_string}}" {{expect_send_pairs}}'
```

chattr

Change attributes of files or directories.

See also: **`lsattr`**.

More information: https://manned.org/chattr.

- Make a file or directory [i]mmutable to changes and deletion, even by superuser:

```
sudo chattr +i {{path/to/file_or_directory}}
```

- Make a file or directory mutable:

```
sudo chattr -i {{path/to/file_or_directory}}
```

- [R]ecursively make an entire directory and contents immutable:

```
sudo chattr -R +i {{path/to/directory}}
```

- Mark a directory and its files to be interpreted in a case-insensitive manner (case-[F]olding):

```
chattr +F {{path/to/directory}}
```

- Set a file to only allow [a]ppending:

```
sudo chattr +a {{path/to/file}}
```

chcat

Change SELinux security category for files.

Categories provide an additional level of access control based on MCS (Multi-Category Security).

See also: **chcon**, **semanage**.

More information: https://manned.org/chcat.

- List all available categories:

```
sudo chcat {{[-L|--list]}}
```

- Add a category to a file:

```
sudo chcat +{{CategoryName}} {{path/to/file}}
```

- Remove a category from a file:

```
sudo chcat -- -{{CategoryName}} {{path/to/file}}
```

- Set specific categories for a file (replacing existing ones):

```
sudo chcat {{CategoryName1,CategoryName2,...}} {{path/to/file}}
```

- Display the categories of a file:

```
ls {{[-Z|--context]}} {{path/to/file}}
```

- Remove all categories from a file:

```
sudo chcat {{[-d|--delete]}} {{path/to/file}}
```

chcon

Change SELinux security context of a file or files/directories.

See also: **`secon`**, **`restorecon`**, **`semanage fcontext`**.

More information: https://www.gnu.org/software/coreutils/manual/html_node/chcon-invocation.html.

- View security context of a file:

```
ls {{[-lZ|-l --context]}} {{path/to/file}}
```

- Change the security context of a target file, using a reference file:

```
chcon --reference {{reference_file}} {{target_file}}
```

- Change the full SELinux security context of a file:

```
chcon {{user}}:{{role}}:{{type}}:{{range/level}} {{filename}}
```

- Change only the user part of SELinux security context:

```
chcon {{[-u|--user]}} {{user}} {{filename}}
```

- Change only the role part of SELinux security context:

```
chcon {{[-r|--role]}} {{role}} {{filename}}
```

- Change only the type part of SELinux security context:

```
chcon {{[-t|--type]}} {{type}} {{filename}}
```

- Change only the range/level part of SELinux security context:

```
chcon {{[-l|--range]}} {{range/level}} {{filename}}
```

chcpu

Enable/disable a system's CPUs.

More information: https://manned.org/chcpu.

- Disable one or more CPUs by their IDs:

```
chcpu {{[-d|--disable]}} {{1,3,...}}
```

- Enable one or more ranges of CPUs by their IDs:

```
chcpu {{[-e|--enable]}} {{1-3,5-7,...}}
```

check-dfsg-status

Report non-free packages installed on Debian-based OSes.

This command was formerly known as **`vrms`**.

More information: https://salsa.debian.org/debian/check-dfsg-status.

- List non-free and contrib packages (and their description):

```
check-dfsg-status
```

- Only output the package names:

```
check-dfsg-status {{[-s|--sparse]}}
```

check-language-support

Display a list of missing language packages on Ubuntu.

More information: https://manned.org/check-language-support.

- Display a list of missing language packages based on installed software and enabled locales:

```
check-language-support
```

- List packages for a specific locale:

```
check-language-support {{[-l|--language]}} {{en}}
```

- Display installed packages as well as missing ones:

```
check-language-support --show-installed
```

check-support-status

Identify installed Debian packages for which support has had to be limited or prematurely ended.

More information: https://manned.org/check-support-status.

- Display packages whose support is limited, has already ended, or will end earlier than the distribution's end of life:

```
check-support-status
```

- Display only packages whose support has ended:

```
check-support-status --type {{ended}}
```

- Skip printing a headline:

```
check-support-status --no-heading
```

checkinstall

Track the local installation of a software package, and produce a binary package which can be used with a system's native package manager.

More information: https://checkinstall.izto.org/docs.php.

- Create and install a package with default settings:

```
sudo checkinstall {{[-y|--default]}}
```

- Create a package but don't install it:

```
sudo checkinstall --install={{no}}
```

- Create a package without documentation:

```
sudo checkinstall --nodoc
```

- Create a package and set the name:

```
sudo checkinstall --pkgname {{package}}
```

- Create a package and specify where to save it:

```
sudo checkinstall --pakdir {{path/to/directory}}
```

checkupdates-aur

Check pending updates from the Arch User Repository (AUR).

More information: https://metacpan.org/dist/OS-CheckUpdates-AUR.

- List pending updates for AUR packages:

```
checkupdates-aur
```

- List pending updates for AUR packages in debug mode:

```
CHECKUPDATES_DEBUG=1 checkupdates-aur
```

- Display help:

```
checkupdates-aur --help
```

checkupdates

Check pending updates in Arch Linux.

More information: https://manned.org/checkupdates.

- Synchronize the database and list pending updates:

```
checkupdates
```

- List pending updates without syncing the database:

```
checkupdates {{[-n|--nosync]}}
```

- Display the list of pending updates if it differs from the last time this option was used:

```
checkupdates {{[-c|--change]}}
```

- List pending updates and download the packages to the `pacman` cache (`/var/cache/pacman/pkg`):

```
checkupdates {{[-d|--download]}}
```

- List pending updates using a specific `pacman` database:

```
CHECKUPDATES_DB={{path/to/directory}} checkupdates
```

- Display help:

```
checkupdates {{[-h|--help]}}
```

chfn

Update **`finger`** info for a user.

More information: https://manned.org/chfn.

- Update a user's "Name" field in the output of `finger`:

```
chfn {{[-f|--full-name]}} {{new_display_name}} {{username}}
```

- Update a user's "Office Room Number" field for the output of `finger`:

```
chfn {{[-o|--office]}} {{new_office_room_number}}
{{username}}
```

- Update a user's "Office Phone Number" field for the output of `finger`:

```
chfn {{[-p|--office-phone]}} {{new_office_telephone_number}}
{{username}}
```

- Update a user's "Home Phone Number" field for the output of `finger`:

```
chfn {{[-h|--home-phone]}} {{new_home_telephone_number}}
{{username}}
```

chkconfig

Manage the runlevel of services on CentOS 6.

More information: https://manned.org/chkconfig.

- List services with runlevel:

```
chkconfig --list
```

- Show a service's runlevel:

```
chkconfig --list {{ntpd}}
```

- Enable service at boot:

```
chkconfig {{sshd}} on
```

- Enable service at boot for runlevels 2, 3, 4, and 5:

```
chkconfig --level {{2345}} {{sshd}} on
```

- Disable service at boot:

```
chkconfig {{ntpd}} off
```

- Disable service at boot for runlevel 3:

```
chkconfig --level {{3}} {{ntpd}} off
```

chmem

Modify the state of memory blocks (online or offline) in a Linux system.

Typically used in virtualized environments to manage memory hotplug.

More information: https://manned.org/chmem.

- Set a memory block offline:

```
sudo chmem {{[-b|--block]}} {{[-d|--disable]}}
{{block_number}}
```

- Set a memory block online:

```
sudo chmem {{[-b|--block]}} {{[-e|--enable]}}
{{block_number}}
```

- Set a memory range offline using hexadecimal addresses:

```
sudo chmem {{[-d|--disable]}}
0x{{start_address}}-0x{{end_address}}
```

- Set a memory range online using hexadecimal addresses:

```
sudo chmem {{[-e|--enable]}}
0x{{start_address}}-0x{{end_address}}
```

- Set memory online and assign it to a specific zone (e.g., Movable):

```
sudo chmem {{[-e|--enable]}} 0x{{start_address}} {{[-z|--
zone]}} {{Movable}}
```

- Display help:

```
chmem {{[-h|--help]}}
```

chntpw

A utility that can edit windows registry, reset user password, promote users to administrator by modifying the Windows SAM.

Boot target machine with live cd like Kali Linux and run with elevated privileges.

More information: https://pogostick.net/~pnh/ntpasswd/MANUAL.txt.

- List all users in the SAM file:

```
chntpw -l {{path/to/sam_file}}
```

- Edit user interactively:

```
chntpw -u {{username}} {{path/to/sam_file}}
```

- Use chntpw interactively:

```
chntpw -i {{path/to/sam_file}}
```

choom

Display and change the adjust out-of-memory killer score.

More information: https://manned.org/choom.

- Display the OOM-killer score of the process with a specific ID:

```
choom {{[-p|--pid]}} {{process_id}}
```

- Change the adjust OOM-killer score of a specific process:

```
choom {{[-p|--pid]}} {{process_id}} {{[-n|--adjust]}}
{{-1000..+1000}}
```

- Run a command with a specific adjust OOM-killer score:

```
choom {{[-n|--adjust]}} {{-1000..+1000}} {{command}}
{{argument1 argument2 ...}}
```

chpasswd

Change the passwords for multiple users by using **`stdin`**.

See also: **`passwd`**.

More information: https://manned.org/chpasswd.

- Change the password for a specific user:

```
printf "{{username}}:{{new_password}}" | sudo chpasswd
```

- Change the passwords for multiple users (The input text must not contain any spaces.):

```
printf "{{username_1}}:{{new_password_1}}\n{{username_2}}:
{{new_password_2}}" | sudo chpasswd
```

- Change the password for a specific user, and specify it in encrypted form:

```
printf "{{username}}:{{new_encrypted_password}}" | sudo
chpasswd {{[-e|--encrypted]}}
```

- Change the password for a specific user, and use a specific encryption for the stored password:

```
printf "{{username}}:{{new_password}}" | sudo chpasswd {{[-
c|--crypt-method]}} {{NONE|DES|MD5|SHA256|SHA512}}
```

chrt

Manipulate the real-time attributes of a process.

More information: https://manned.org/chrt.

- Display attributes of a process:

```
chrt {{[-p|--pid]}} {{process_id}}
```

- Display attributes of all threads of a process:

```
chrt {{[-a|--all-tasks]}} {{[-p|--pid]}} {{process_id}}
```

- Display the min/max priority values that can be used with `chrt`:

```
chrt {{[-m|--max]}}
```

- Set the scheduling priority of a process:

```
chrt {{[-p|--pid]}} {{priority}} {{process_id}}
```

- Set the scheduling policy of a process:

```
chrt --{{deadline|idle|batch|rr|fifo|other}} {{[-p|--pid]}}
{{priority}} {{process_id}}
```

chsh

Change user's login shell.

Part of **`util-linux`**.

More information: https://manned.org/chsh.

- Set a specific login shell for the current user interactively:

```
chsh
```

- List available shells:

```
chsh {{[-l|--list-shells]}}
```

- Set a specific login shell for the current user:

```
chsh {{[-s|--shell]}} {{path/to/shell}}
```

- Set a login shell for a specific user:

```
sudo chsh {{[-s|--shell]}} {{path/to/shell}} {{username}}
```

chvt

Change foreground virtual terminal.

See also: **`fgconsole`**.

More information: https://manned.org/chvt.

- Change to a specific TTY:

```
sudo chvt {{3}}
```

cliphist

Manage clipboard history for Wayland compositors.

Works with **`wl-copy`** and **`wl-paste`**.

More information: https://github.com/sentriz/cliphist#usage.

- List clipboard history entries:

```
cliphist list
```

- Select and copy a previous clipboard entry (using `fzf`):

```
cliphist list | fzf | cliphist decode | wl-copy
```

- Delete all stored clipboard entries:

```
cliphist wipe
```

- Delete a specific clipboard entry by ID:

```
echo {{entry_id}} | cliphist delete
```

- Save the current clipboard content manually:

```
wl-paste | cliphist store
```

cloud-init

Manage cloud instance initialization.

More information: https://cloudinit.readthedocs.io/en/latest/reference/cli.html.

- Display the status of the most recent cloud-init run:

```
cloud-init status
```

- Wait for cloud-init to finish running and then report status:

```
cloud-init status --wait
```

- List available top-level metadata keys to query:

```
cloud-init query --list-keys
```

- Query cached instance metadata for data:

```
cloud-init query {{dot_delimited_variable_path}}
```

- Clean logs and artifacts to allow cloud-init to rerun:

```
cloud-init clean
```

cockpit-bridge

Relay messages and commands between the front end and server in the cockpit suite.

More information: https://cockpit-project.org/guide/latest/cockpit-bridge.1.html.

- List all cockpit packages:

```
cockpit-bridge --packages
```

- Display help:

```
cockpit-bridge --help
```

cockpit-desktop

Securely access Cockpit pages in a running session.

It starts **`cockpit-ws`** and a web browser in an isolated network space and a **`cockpit-bridge`** in a running user session.

More information: https://cockpit-project.org/guide/latest/cockpit-desktop.1.html.

- Open a page:

```
cockpit-desktop {{url}} {{ssh_host}}
```

- Open storage page:

```
cockpit-desktop {{/cockpit/@localhost/storage/index.html}}
```

cockpit-tls

TLS terminating HTTP proxy to encrypt traffic between a client and **`cockpit-ws`**.

More information: https://cockpit-project.org/guide/latest/cockpit-tls.8.html.

- Serve HTTP requests to a specific port instead of port `9090`:

  ```
  cockpit-tls --port {{port}}
  ```

- Display help:

  ```
  cockpit-tls --help
  ```

cockpit-ws

Communicate between the browser application and various configuration tools and services like **`cockpit-bridge`**.

More information: https://cockpit-project.org/guide/latest/cockpit-ws.8.html.

- Start with authentication via SSH at `127.0.0.1` with port `22` enabled:

  ```
  cockpit-ws --local-ssh
  ```

- Start an HTTP server on a specific port:

  ```
  cockpit-ws --port {{port}}
  ```

- Start and bind to a specific IP address (defaults to `0.0.0.0`):

  ```
  cockpit-ws --address {{ip_address}}
  ```

- Start without TLS:

  ```
  cockpit-ws --no-tls
  ```

- Display help:

  ```
  cockpit-ws --help
  ```

cointop

Track and monitor cryptocurrencies in the terminal.

More information: https://github.com/cointop-sh/cointop.

- Open TUI:

```
cointop
```

- Clear the cache:

```
cointop clean
```

- Display current holdings legibly:

```
cointop holdings --human
```

- Check price of coin(s):

```
cointop price --coins {{coin_name1,coin_name2,...}}
```

- Display version:

```
cointop version
```

col

Filter reverse line feeds from input.

More information: https://manned.org/col.

- Filter reverse line feeds from input:

```
{{command}} | col
```

- Filter reverse line feeds and output with spaces instead of tabs:

```
{{command}} | col {{[-x|--spaces]}}
```

- Remove backspaces, output only the last character written to each position:

```
{{command}} | col {{[-b|--no-backspaces]}}
```

- Specify a buffer size with a specific number of lines:

```
{{command}} | col {{[-l|--lines]}} {{num}}
```

- Format a manual page for viewing with `less`:

```
man ls | col {{[-b|--no-backspaces]}} | less
```

- Process a file with reverse line feeds and save the cleaned output:

```
cat {{path/to/input_file}} | col {{[-x|--spaces]}} >
{{output_file}}
```

collectd

System statistics collection daemon.

More information: https://manned.org/collectd.

- Test the configuration file and then exit:

  `collectd -t`

- Test plugin data collection functionality and then exit:

  `collectd -T`

- Start `collectd`:

  `collectd`

- Specify a custom configuration file location:

  `collectd -C {{path/to/file}}`

- Specify a custom PID file location:

  `collectd -P {{path/to/file}}`

- Don't fork into the background:

  `collectd -f`

- Display help and version:

  `collectd -h`

colrm

Remove columns from **`stdin`**.

More information: https://manned.org/colrm.

- Remove first column of `stdin`:

  `colrm {{1 1}}`

- Remove from 3rd column till the end of each line:

  `colrm {{3}}`

- Remove from the 3rd column till the 5th column of each line:

  `colrm {{3 5}}`

column

Format **`stdin`** or a file into multiple columns.

Columns are filled before rows; the default separator is a whitespace.

More information: https://manned.org/column.

- Format the output of a command for a 30 characters wide display:

```
printf "header1 header2\nbar foo\n" | column {{[-c|--output-width]}} {{30}}
```

- Split columns automatically and auto-align them in a tabular format:

```
printf "header1 header2\nbar foo\n" | column {{[-t|--table]}}
```

- Specify the column delimiter character for the `--table` option (e.g. "," for CSV) (defaults to whitespace):

```
printf "header1,header2\nbar,foo\n" | column {{[-t|--table]}} {{[-s|--separator]}} {{,}}
```

- Fill rows before filling columns:

```
printf "header1\nbar\nfoobar\n" | column {{[-c|--output-width]}} {{30}} {{[-x|--fillrows]}}
```

compose

This command is an alias of **`run-mailcap --action=compose`**.

- View documentation for the original command:

  ```
  tldr run-mailcap
  ```

compress

Compress files using the Unix **`compress`** command.

More information: https://manned.org/compress.

- Compress specific files:

```
compress {{path/to/file1 path/to/file2 ...}}
```

- Compress specific files, ignore non-existent ones:

```
compress -f {{path/to/file1 path/to/file2 ...}}
```

- Specify the maximum compression bits (9-16 bits):

```
compress -b {{bits}}
```

- Write to `stdout` (no files are changed):

```
compress -c {{path/to/file}}
```

- Decompress files (functions like `uncompress`):

```
compress -d {{path/to/file}}
```

- Display compression percentage:

```
compress -v {{path/to/file}}
```

compseq

Calculate the composition of unique words in sequences.

More information: https://www.bioinformatics.nl/cgi-bin/emboss/help/compseq/.

- Count observed frequencies of words in a FASTA file, providing parameter values with interactive prompt:

```
compseq {{path/to/file.fasta}}
```

- Count observed frequencies of amino acid pairs from a FASTA file, save output to a text file:

```
compseq {{path/to/input_protein.fasta}} -word 2 {{path/to/output_file.comp}}
```

- Count observed frequencies of hexanucleotides from a FASTA file, save output to a text file, and ignore zero counts:

```
compseq {{path/to/input_dna.fasta}} -word 6 {{path/to/output_file.comp}} -nozero
```

- Count observed frequencies of codons in a particular reading frame; ignoring any overlapping counts (i.e. move window across by word-length 3):

```
compseq -sequence {{path/to/input_rna.fasta}} -word 3 {{path/to/output_file.comp}} -nozero -frame {{1}}
```

- Count observed frequencies of codons frame-shifted by 3 positions; ignoring any overlapping counts (should report all codons except the first one):

```
compseq -sequence {{path/to/input_rna.fasta}} -word 3 {{path/to/output_file.comp}} -nozero -frame 3
```

- Count amino acid triplets in a FASTA file and compare to a previous run of `compseq` to calculate expected and normalized frequency values:

```
compseq -sequence {{path/to/human_proteome.fasta}} -word 3 {{path/to/output_file1.comp}} -nozero -infile {{path/to/output_file2.comp}}
```

- Approximate the above command without a previously prepared file, by calculating expected frequencies using the single base/residue frequencies in the supplied input sequence(s):

```
compseq -sequence {{path/to/human_proteome.fasta}} -word 3
{{path/to/output_file.comp}} -nozero -calcfreq
```

- Display help (use `-help -verbose` for more information on associated and general qualifiers):

```
compseq -help
```

compsize

Calculate the compression ratio of a set of files on a btrfs filesystem.

See also: **`btrfs filesystem`**.

More information: https://manned.org/compsize.

- Calculate the current compression ratio for a file or directory:

```
sudo compsize {{path/to/file_or_directory}}
```

- Don't traverse filesystem boundaries:

```
sudo compsize {{[-x|--one-file-system]}} {{path/to/
file_or_directory}}
```

- Show raw byte counts instead of human-readable sizes:

```
sudo compsize {{[-b|--bytes]}} {{path/to/file_or_directory}}
```

con2fbmap

Show and manage terminal to framebuffer mapping.

More information: https://manned.org/con2fbmap.

- Display the framebuffer mapping of a console:

```
sudo con2fbmap {{console_number}}
```

- Map a console to a specific framebuffer:

```
sudo con2fbmap {{console_number}} {{framebuffer_number}}
```

conky

Light-weight system monitor for X.

More information: https://github.com/brndnmtthws/conky.

- Launch with default, built-in config:

```
conky
```

- Create a new default config:

```
conky {{[-C|--print-config]}} > ~/.conkyrc
```

- Launch Conky with a given configuration file:

```
conky {{[-c|--config]}} {{path/to/config}}
```

- Start in the background (daemonize):

```
conky {{[-d|--daemonize]}}
```

- Align Conky on the desktop:

```
conky {{[-a|--alignment]}} {{top|bottom|middle}}_{{left|
right|middle}}
```

- Pause for 5 seconds at startup before launching:

```
conky {{[-p|--pause]}} {{5}}
```

conntrack

Interact with the Netfilter connection tracking system.

Search, list, inspect, modify, and delete connection flows.

More information: https://manned.org/conntrack.

- List all currently tracked connections:

```
conntrack {{[-L|--dump]}}
```

- Display a real-time event log of connection changes:

```
conntrack {{[-E|--event]}}
```

- Display a real-time event log of connection changes and associated timestamps:

```
conntrack {{[-E|--event]}} {{[-o|--output]}} timestamp
```

- Display a real-time event log of connection changes for a specific IP address:

```
conntrack {{[-E|--event]}} {{[-s|--orig-src]}} {{ip_address}}
```

- Delete all flows for a specific source IP address:

```
conntrack {{[-D|--delete]}} {{[-s|--orig-src]}}
{{ip_address}}
```

coredumpctl

Retrieve and process saved core dumps and metadata.

More information: https://www.freedesktop.org/software/systemd/man/latest/coredumpctl.html.

- List all captured core dumps:

```
coredumpctl
```

- List captured core dumps for a program:

```
coredumpctl list {{program_name}}
```

- Filter core dumps based on a specific signal:

```
coredumpctl list COREDUMP_SIGNAL={{1..64}}
```

- Show information about the core dumps matching a program with PID:

```
coredumpctl info {{process_id}}
```

- Invoke debugger using the last core dump:

```
coredumpctl debug
```

- Invoke debugger using the last core dump of a program:

```
coredumpctl debug {{program_name}}
```

- Extract the last core dump of a program to a file:

```
coredumpctl dump {{program_name}} {{[-o|--output]}} {{path/to/file}}
```

- Skip debuginfod and pagination prompts and then print the backtrace when using `gdb`:

```
coredumpctl debug {{[-A|--debugger-arguments]}} "-iex 'set debuginfod enabled on' -iex 'set pagination off' -ex bt"
```

Counter Strike 2

Host a headless Counter Strike 2 server.

More information: https://developer.valvesoftware.com/wiki/Counter-Strike_2/Dedicated_Servers.

- Run a game with one map:

```
{{path/to}}/cs2 -dedicated +map {{de_dust2}}
```

- Run a game with specified maximum number of players:

```
{{path/to}}/cs2 -dedicated +map {{de_dust2}} -maxplayers {{64}}
```

- Run a game with specified server IP and port:

```
{{path/to}}/cs2 -dedicated +map {{de_dust2}} -ip {{1.2.3.4}} -port {{27015}}
```

- [Interactive] Shut the server down:

```
quit
```

cpufreq-aperf

Calculate the average CPU frequency over a time period.

More information: https://manned.org/cpufreq-aperf.

- Start calculating, defaulting to all CPU cores and 1 second refresh interval:

```
sudo cpufreq-aperf
```

- Start calculating for CPU 1 only:

```
sudo cpufreq-aperf {{[-c|--cpu]}} {{1}}
```

- Start calculating with a 3 second refresh interval for all CPU cores:

```
sudo cpufreq-aperf {{[-i|--interval]}} {{3}}
```

- Calculate only once:

```
sudo cpufreq-aperf {{[-o|--once]}}
```

cpufreq-info

Show CPU frequency information.

More information: https://manned.org/cpufreq-info.

- Show CPU frequency information for all CPUs:

```
cpufreq-info
```

- Show CPU frequency information for the specified CPU:

```
cpufreq-info {{[-c|--cpu]}} {{cpu_number}}
```

- Show the allowed minimum and maximum CPU frequency:

```
cpufreq-info {{[-l|--hwlimits]}}
```

- Show the current minimum and maximum CPU frequency and policy in table format:

```
cpufreq-info {{[-o|--proc]}}
```

- Show available CPU frequency policies:

```
cpufreq-info {{[-g|--governors]}}
```

- Show current CPU work frequency in a human-readable format, according to the cpufreq kernel module:

```
cpufreq-info {{[-f|--freq]}} {{[-m|--human]}}
```

- Show current CPU work frequency in a human-readable format, by reading it from hardware (only available to root):

```
sudo cpufreq-info {{[-w|--hwfreq]}} {{[-m|--human]}}
```

cpufreq-set

A tool to modify CPU frequency settings.

The frequency value should range between the output of command **`cpufreq-info -l`**.

More information: https://manned.org/cpufreq-set.

- Set the CPU frequency policy of CPU 1 to "userspace":

```
sudo cpufreq-set {{[-c|--cpu]}} {{1}} {{[-g|--governor]}} {{userspace}}
```

- Set the current minimum CPU frequency of CPU 1:

```
sudo cpufreq-set {{[-c|--cpu]}} {{1}} {{[-d|--min]}} {{min_frequency}}
```

- Set the current maximum CPU frequency of CPU 1:

```
sudo cpufreq-set {{[-c|--cpu]}} {{1}} {{[-u|--max]}} {{max_frequency}}
```

- Set the current work frequency of CPU 1:

```
sudo cpufreq-set {{[-c|--cpu]}} {{1}} {{[-f|--freq]}} {{work_frequency}}
```

cpuid

Display detailed information about all CPUs.

More information: https://manned.org/cpuid.1.

- Display information for all CPUs:

  ```
  cpuid
  ```

- Display information only for the current CPU:

  ```
  cpuid {{[-1|--one-cpu]}}
  ```

- Display raw hex information with no decoding:

  ```
  cpuid {{[-r|--raw]}}
  ```

cpulimit

A tool to throttle the CPU usage of other processes.

More information: https://manned.org/cpulimit.

- Limit an existing process with PID 1234 to only use 25% of the CPU:

```
cpulimit {{[-p|--pid]}} 1234 {{[-l|--limit]}} 25%
```

- Limit an existing program by its executable name:

```
cpulimit {{[-e|--exe]}} {{program}} {{[-l|--limit]}} {{25}}
```

- Launch a given program and limit it to only use 50% of the CPU:

```
cpulimit {{[-l|--limit]}} 50 -- {{program argument1 argument2 ...}}
```

- Launch a program, limit its CPU usage to 50% and run cpulimit in the background:

```
cpulimit {{[-l|--limit]}} 50 {{[-b|--background]}} -- {{program}}
```

- Kill its process if the program's CPU usage goes over 50%:

```
cpulimit {{[-l|--limit]}} 50 {{[-k|--kill]}} -- {{program}}
```

- Throttle both it and its child processes so that none go about 25% CPU:

```
cpulimit {{[-l|--limit]}} 25 {{[-m|--monitor-forks]}} -- {{program}}
```

cpupower

Tools regarding CPU power and tuning options.

More information: https://manned.org/cpupower.

- Print information about all cores:

```
sudo cpupower {{[-c|--cpu]}} {{all}} info
```

- Set all CPUs to a power-saving frequency governor:

```
sudo cpupower {{[-c|--cpu]}} {{all}} frequency-set --governor
{{powersave}}
```

- Print CPU 0's available frequency governors:

```
sudo cpupower {{[-c|--cpu]}} {{0}} frequency-info {{[-g|--
governors]}} | grep "analyzing\|governors"
```

- Print CPU 4's frequency from the hardware, in a human-readable format:

```
sudo cpupower {{[-c|--cpu]}} {{4}} frequency-info {{[-w|--
hwfreq]}} {{[-m|--human]}}
```

create-image

Create CPIO images.

More information: https://git.kernel.org/pub/scm/bluetooth/bluez.git/tree/tools/create-image.c.

- Create a CPIO archive from the current directory:

```
create-image {{[-o|--output]}} {{path/to/output.cpio}}
```

- Display help:

```
create-image {{[-h|--help]}}
```

create_ap

Create an AP (Access Point) at any channel.

More information: https://github.com/oblique/create_ap.

- Create an open network with no passphrase:

```
create_ap {{wlan0}} {{eth0}} {{access_point_ssid}}
```

- Use a WPA + WPA2 passphrase:

```
create_ap {{wlan0}} {{eth0}} {{access_point_ssid}} {{passphrase}}
```

- Create an access point without Internet sharing:

```
create_ap -n {{wlan0}} {{access_point_ssid}} {{passphrase}}
```

- Create a bridged network with Internet sharing:

```
create_ap -m bridge {{wlan0}} {{eth0}} {{access_point_ssid}} {{passphrase}}
```

- Create a bridged network with Internet sharing and a pre-configured bridge interface:

```
create_ap -m bridge {{wlan0}} {{br0}} {{access_point_ssid}} {{passphrase}}
```

- Create an access port for Internet sharing from the same Wi-Fi interface:

```
create_ap {{wlan0}} {{wlan0}} {{access_point_ssid}} {{passphrase}}
```

- Choose a different Wi-Fi adapter driver:

```
create_ap --driver {{wifi_adapter}} {{wlan0}} {{eth0}} {{access_point_ssid}} {{passphrase}}
```

createrepo

Initialize an RPM repository in a directory, including all XML and SQLite files.

More information: https://manned.org/createrepo.

- Initialize a basic repository in a directory:

```
createrepo {{path/to/directory}}
```

- Initialize a repository, exclude test RPMs, and display verbose logs:

```
createrepo {{[-v|--verbose]}} {{[-x|--excludes]}}
{{test_*.rpm}} {{path/to/directory}}
```

- Initialize a repository, using SHA1 as the checksum algorithm, and ignoring symbolic links:

```
createrepo {{[-S|--skip-symlinks]}} {{[-s|--checksum]}}
{{sha1}} {{path/to/directory}}
```

criu

Freeze a running application or a process tree and restore it later.

More information: https://manned.org/criu.

- Check if the current kernel has support for the necessary CRIU features:

```
sudo criu check
```

- Checkpoint a process with a specific ID, saving the state to a specific directory:

```
sudo criu dump {{[-t|--tree]}} {{process_id}} {{[-D|--images-dir]}} {{path/to/directory}}
```

- Restore a process from previously saved image files:

```
sudo criu restore {{[-D|--images-dir]}} {{path/to/directory}}
```

- Dump a process and allow it to continue running instead of terminating it:

```
sudo criu dump {{[-t|--tree]}} {{process_id}} {{[-D|--images-dir]}} {{path/to/directory}} {{[-R|--leave-running]}}
```

crond

Daemon to execute scheduled commands from crontab files.

More information: https://manned.org/crond.

- Start daemon in the background and check for scheduled commands:

```
crond
```

- Start daemon in the foreground and check for scheduled commands:

```
crond -n
```

- Send job output from the daemon to the [s]ystem log:

```
crond -s
```

- Override default limitations and accept custom crontables:

```
crond -p
```

- Inherit crontab file path from environment settings:

```
crond -P
```

cryptcat

Netcat fork with encryption capabilities.

More information: https://manned.org/cryptcat.

- [l]isten on a specified [p]ort and print any data received:

```
cryptcat -k {{password}} -l -p {{port}}
```

- Connect to a certain port:

```
cryptcat -k {{password}} {{ip_address}} {{port}}
```

- Specify the timeout ([w]):

```
cryptcat -k {{password}} -w {{timeout_in_seconds}}
{{ip_address}} {{port}}
```

- Scan ([z]) the open ports of a specified host:

```
cryptcat -v -z {{ip_address}} {{port}}
```

- Act as proxy and forward data from a local TCP port to the given remote host:

```
cryptcat -k {{password}} -l -p {{local_port}} | cryptcat -k
{{password}} {{hostname}} {{remote_port}}
```

cryptsetup luksFormat

Initialize a LUKS partition and the initial key slot (0) with a passphrase or keyfile.

Note: This operation overwrites all data on the partition.

More information: https://manned.org/cryptsetup-luksFormat.

- Initialize a LUKS volume with a passphrase:

```
cryptsetup luksFormat {{/dev/sdXY}}
```

- Initialize a LUKS volume with a keyfile:

```
cryptsetup luksFormat {{/dev/sdXY}} {{path/to/keyfile}}
```

- Initialize a LUKS volume with a passphrase and set its label:

```
cryptsetup luksFormat --label {{label}} {{/dev/sdXY}}
```

cryptsetup open

Create a decrypted mapping of an encrypted volume.

Note: Enabling TRIM may leak minimal information (freed blocks, possibly revealing the filesystem in use), but is still recommended since the data stays safe and SSDs without TRIM wear out faster.

More information: https://manned.org/cryptsetup-open.

- Open a LUKS volume and create a decrypted mapping at `/dev/mapper/mapping_name`:

```
cryptsetup open {{/dev/sdXY}} {{mapping_name}}
```

- Use a keyfile instead of a passphrase:

```
cryptsetup open {{[-k|--key-file]}} {{path/to/file}} {{/dev/sdXY}} {{mapping_name}}
```

- Allow the use of TRIM on the device:

```
cryptsetup open --allow-discards {{/dev/sdXY}} {{mapping_name}}
```

- Write the `--allow-discards` option into the LUKS header (the option will then always be used when you open the device):

```
cryptsetup open --allow-discards --persistent {{/dev/sdXY}} {{mapping_name}}
```

- Open a LUKS volume and make the decrypted mapping read-only:

```
cryptsetup open {{[-r|--readonly]}} {{/dev/sdXY}} {{mapping_name}}
```

cryptsetup

Manage plain **dm-crypt** and LUKS (Linux Unified Key Setup) encrypted volumes.

Some subcommands such as **luksFormat** have their own usage documentation.

More information: https://manned.org/cryptsetup.

- Initialize a LUKS volume with a passphrase (overwrites all data on the partition):

```
cryptsetup luksFormat {{/dev/sdXY}}
```

- Open a LUKS volume and create a decrypted mapping at `/dev/mapper/mapping_name`:

```
cryptsetup open {{/dev/sdXY}} {{mapping_name}}
```

- Display information about a mapping:

```
cryptsetup status {{mapping_name}}
```

- Remove an existing mapping:

```
cryptsetup close {{mapping_name}}
```

- Change a LUKS volume's passphrase:

```
cryptsetup luksChangeKey {{/dev/sdXY}}
```

- Display LUKS header information and key slot metadata of an encrypted device:

```
cryptsetup luksDump {{/dev/sdXY}}
```

cs2

This command is an alias of **`counter strike 2`**.

- View documentation for the original command:

```
tldr counter strike 2
```

csplit

Split a file into pieces.

This generates files named **`xx00`**, **`xx01`**, and so on.

More information: https://www.gnu.org/software/coreutils/manual/html_node/csplit-invocation.html.

- Split a file in two parts, starting the second one at line 10:

```
csplit {{path/to/file}} 10
```

- Split a file in three parts, starting the latter parts in lines 7 and 23:

```
csplit {{path/to/file}} 7 23
```

- Start a new part at every 5th line (will fail if number of lines is not divisible by 5):

```
csplit {{path/to/file}} 5 {*}
```

- Start a new part at every 5th line, ignoring exact-division error:

```
csplit {{[-k|--keep-files]}} {{path/to/file}} 5 {*}
```

- Split a file above line 5 and use a custom prefix for the output files (default is `xx`):

```
csplit {{path/to/file}} 5 {{[-f|--prefix]}} {{prefix}}
```

- Split a file above the first line matching a `regex` pattern:

```
csplit {{path/to/file}} /{{regex}}/
```

ctop

Instantly visualize container performance and health with real-time metrics on CPU, memory, and block IO usage.

More information: https://github.com/bcicen/ctop#usage.

- Show only [a]ctive containers:

```
ctop -a
```

- [r]everse the container sort order:

```
ctop -r
```

- [i]nvert the default colors:

```
ctop -i
```

- Display [h]elp:

```
ctop -h
```

ctr

Manage **containerd** containers and images.

More information: https://manned.org/ctr.

- List all containers (running and stopped):

```
ctr containers list
```

- List all images:

```
ctr images list
```

- Pull an image:

```
ctr images pull {{image}}
```

- Tag an image:

```
ctr images tag {{source_image}}:{{source_tag}}
{{target_image}}:{{target_tag}}
```

ctrlaltdel

Utility to control what happens when **`<Ctrl Alt Del>`** is pressed.

More information: https://manned.org/ctrlaltdel.

- Get current setting:

  `ctrlaltdel`

- Set `<Ctrl Alt Del>` to reboot immediately, without any preparation:

  `sudo ctrlaltdel hard`

- Set `<Ctrl Alt Del>` to reboot "normally", giving processes a chance to exit first (send `SIGINT` to PID1):

  `sudo ctrlaltdel soft`

cu

Call Up another system and act as a dial-in/serial terminal or perform file transfers with no error checking.

See also: **`picocom`**, **`minicom`**, **`tio`**.

More information: https://manned.org/cu.

- Open a given serial port:

```
sudo cu {{[-l|--line]}} {{/dev/ttyXYZ}}
```

- Open a given serial port with a given baud rate:

```
sudo cu {{[-l|--line]}} {{/dev/ttyXYZ}} {{[-s|--speed]}} {{115200}}
```

- Open a given serial port with a given baud rate and echo characters locally (half-duplex mode):

```
sudo cu {{[-l|--line]}} {{/dev/ttyXYZ}} {{[-s|--speed]}} {{115200}} {{[-h|--halfduplex]}}
```

- Open a given serial port with a given baud rate, parity, and no hardware or software flow control:

```
sudo cu {{[-l|--line]}} {{/dev/ttyXYZ}} {{[-s|--speed]}} {{115200}} --parity={{even|odd|none}} {{[-f|--nortscts]}} --nostop
```

- Exit the cu session when in connection:

```
<Enter><~><.>
```

- Display help:

```
cu --help
```

curlie

A frontend to **`curl`** that adds the ease of use of **`httpie`**.

More information: https://github.com/rs/curlie#usage.

- Send a GET request:

```
curlie {{httpbin.org/get}}
```

- Send a POST request:

```
curlie post {{httpbin.org/post}} {{name=john}} {{age:=25}}
```

- Send a GET request with query parameters (e.g. `first_param=5&second_param=true`):

```
curlie get {{httpbin.org/get}} {{first_param==5}}
{{second_param==true}}
```

- Send a GET request with a custom header:

```
curlie get {{httpbin.org/get}} {{header-name:header-value}}
```

cuyo

Tetris like game.

More information: https://www.karimmi.de/cuyo/.

- Start a new game:

  ```
  cuyo
  ```

- Navigate the piece horizontally:

  ```
  {{<a>|<d>|<ArrowLeft>|<ArrowRight>}}
  ```

- Turn the piece:

  ```
  {{<w>|<ArrowUp>}}
  ```

- Hard drop the piece:

  ```
  {{<s>|<ArrowDown>}}
  ```

daemon

Turn other processes into daemons.

More information: https://manned.org/daemon.1.

- Run a command as a daemon:

```
daemon {{[-n|--name]}} "{{name}}" {{command}}
```

- Run a command as a daemon which will restart if the command crashes:

```
daemon {{[-n|--name]}} "{{name}}" {{[-r|--respawn]}}
{{command}}
```

- Run a command as a daemon which will restart if it crashes, with two attempts every 10 seconds:

```
daemon {{[-n|--name]}} "{{name}}" {{[-r|--respawn]}} {{[-A|--
attempts]}} 2 {{[-L|--delay]}} 10 {{command}}
```

- Run a command as a daemon, writing logs to a specific file:

```
daemon {{[-n|--name]}} "{{name}}" {{[-l|--errlog]}} {{path/
to/file.log}} {{command}}
```

- Kill a daemon (SIGTERM):

```
daemon {{[-n|--name]}} "{{name}}" --stop
```

- List daemons:

```
daemon --list
```

daemonize

Run a command (that does not daemonize itself) as a Unix daemon.

More information: https://software.clapper.org/daemonize/.

- Run a command as a daemon:

```
daemonize {{command}} {{command_arguments}}
```

- Write the PID to the specified file:

```
daemonize -p {{path/to/pidfile}} {{command}}
{{command_arguments}}
```

- Use a lock file to ensure that only one instance runs at a time:

```
daemonize -l {{path/to/lockfile}} {{command}}
{{command_arguments}}
```

- Use the specified user account:

```
sudo daemonize -u {{user}} {{command}} {{command_arguments}}
```

darling

Run macOS software on Linux.

More information: https://docs.darlinghq.org/darling-shell.html.

- Run a builtin command:

```
darling shell {{uname}}
```

- Run a specific program with arguments:

```
darling shell {{path/to/program}} {{program_argument_1 program_argument_2 ...}}
```

- Open a macOS shell:

```
darling shell
```

- Shut down the service:

```
darling shutdown
```

datamash

Perform basic numeric, textual, and statistical operations on input textual data files.

More information: https://www.gnu.org/software/datamash/manual/datamash.html#Invoking-datamash.

- Get max, min, mean, and median of a single column of numbers:

```
seq 3 | datamash max 1 min 1 mean 1 median 1
```

- Get the mean of a single column of float numbers (floats must use "," and not "."):

```
echo -e '1.0\n2.5\n3.1\n4.3\n5.6\n5.7' | tr '.' ',' |
datamash mean 1
```

- Get the mean of a single column of numbers with a given decimal precision:

```
echo -e '1\n2\n3\n4\n5\n5' | datamash {{[-R|--round]}}
{{number_of_decimals_wanted}} mean 1
```

- Get the mean of a single column of numbers ignoring "Na" and "NaN" (literal) strings:

```
echo -e '1\n2\nNa\n3\nNaN' | datamash --narm mean 1
```

dbclient

Lightweight Dropbear Secure Shell client.

More information: https://manned.org/dbclient.

- Connect to a remote host:

```
dbclient {{user}}@{{host}}
```

- Connect to a remote host on [p]ort 2222:

```
dbclient {{user}}@{{host}} -p 2222
```

- Connect to a remote host using a specific [i]dentity key in dropbear format:

```
dbclient -i {{path/to/key_file}} {{user}}@{{host}}
```

- Run a command on the remote host with a [t]ty allocation allowing interaction with the remote command:

```
dbclient {{user}}@{{host}} -t {{command}} {{argument1 argument2 ...}}
```

- Connect and forward [A]gent connections to remote host:

```
dbclient -A {{user}}@{{host}}
```

dbus-daemon

The D-Bus message daemon, allowing multiple programs to exchange messages.

More information: https://dbus.freedesktop.org/doc/dbus-daemon.1.html.

- Run the daemon with a configuration file:

```
dbus-daemon --config-file {{path/to/file}}
```

- Run the daemon with the standard per-login-session message bus configuration:

```
dbus-daemon --session
```

- Run the daemon with the standard systemwide message bus configuration:

```
dbus-daemon --system
```

- Set the address to listen on and override the configuration value for it:

```
dbus-daemon --address {{address}}
```

- Output the process ID to `stdout`:

```
dbus-daemon --print-pid
```

- Force the message bus to write to the system log for messages:

```
dbus-daemon --syslog
```

dconf read

Read key values from dconf databases.

More information: https://manned.org/dconf.

- Print a specific key value:

```
dconf read /{{path/to/key}}
```

- Print a specific key [d]efault value:

```
dconf read -d /{{path/to/key}}
```

dconf reset

Reset key values in dconf databases.

More information: https://manned.org/dconf.

- Reset a specific key value:

```
dconf reset /{{path/to/key}}
```

- Reset a specific directory:

```
dconf reset -f /{{path/to/directory}}/
```

dconf write

Write key values in dconf databases.

More information: https://manned.org/dconf.

- Write a specific key value:

```
dconf write /{{path/to/key}} "{{value}}"
```

- Write a specific string key value:

```
dconf write /{{path/to/key}} "'{{string}}'"
```

- Write a specific integer key value:

```
dconf write /{{path/to/key}} "{{5}}"
```

- Write a specific boolean key value:

```
dconf write /{{path/to/key}} "{{true|false}}"
```

- Write a specific array key value:

```
dconf write /{{path/to/key}} "[{{'first', 'second', ...}}]"
```

- Write a specific empty array key value:

```
dconf write /{{path/to/key}} "@as []"
```

dconf

Manage dconf databases.

See also: **`dconf read`**, **`dconf reset`**, **`dconf write`**, **`gsettings`**.

More information: https://manned.org/dconf.

- Print a specific key value:

```
dconf read /{{path/to/key}}
```

- Print a specific path sub-directories and sub-keys:

```
dconf list /{{path/to/directory}}/
```

- Write a specific key value:

```
dconf write /{{path/to/key}} "{{value}}"
```

- Reset a specific key value:

```
dconf reset /{{path/to/key}}
```

- Watch a specific key/directory for changes:

```
dconf watch /{{path/to/key|/path/to/directory}}/
```

- Dump a specific directory in INI file format:

```
dconf dump /{{path/to/directory}}/
```

dd

Convert and copy a file.

See also: **`caligula`**.

More information: https://www.gnu.org/software/coreutils/manual/html_node/dd-invocation.html.

- Make a bootable USB drive from an isohybrid file (such as `archlinux-xxx.iso`) and show the progress:

```
sudo dd status=progress if={{path/to/file.iso}} of={{/dev/usb_drive}}
```

- Clone a drive to another drive with 4 MiB block size and flush writes before the command terminates:

```
sudo dd bs=4M conv=fsync if={{/dev/source_drive}} of={{/dev/dest_drive}}
```

- Generate a file with a specific number of random bytes by using kernel random driver:

```
dd bs={{100}} count={{1}} if=/dev/urandom of={{path/to/random_file}}
```

- Benchmark the write performance of a disk:

```
dd bs={{1M}} count={{1024}} if=/dev/zero of={{path/to/file_1GB}}
```

- Create a system backup, save it into an IMG file (can be restored later by swapping `if` and `of`), and show the progress:

```
sudo dd status=progress if={{/dev/drive_device}} of={{path/to/file.img}}
```

- Check the progress of an ongoing `dd` operation (run this command from another shell):

```
progress
```

ddcutil

Control the settings of connected displays via DDC/CI.

This command requires the kernel module **`i2c-dev`** to be loaded.

See also: **`modprobe`**.

More information: https://www.ddcutil.com/commands/.

- List all compatible displays:

```
ddcutil {{[det|detect]}}
```

- Query the first compatible display for capabilities:

```
ddcutil {{[cap|capabilities]}}
```

- Change the brightness (option `10`) of display 1 to 50%:

```
ddcutil {{[-d|--display]}} 1 {{[set|setvcp]}} 10 50
```

- Increase the contrast (option `12`) of display 1 by 5%:

```
ddcutil {{[-d|--display]}} 1 {{[set|setvcp]}} 12 + 5
```

- Change the display source (option `60`) of a display:

```
ddcutil {{[-d|--display]}} {{1}} {{[set|setvcp]}} 60 0x{{0f}}
```

- Read the settings of display 1:

```
ddcutil {{[-d|--display]}} 1 {{[get|getvcp]}} ALL
```

ddrescue

Data recovery tool that reads data from damaged block devices.

More information: https://www.gnu.org/software/ddrescue/manual/ddrescue_manual.html#Invoking-ddrescue.

- Take an image of a device:

```
sudo ddrescue {{/dev/sdX}} {{path/to/image.img}}
```

- Take an image of a device, creating a log file:

```
sudo ddrescue {{/dev/sdX}} {{path/to/image.img}} {{path/to/log.txt}}
```

- Clone Disk A to Disk B, creating a log file:

```
sudo ddrescue {{[-f|--force]}} {{[-n|--no-scrape]}} {{/dev/sdX}} {{/dev/sdY}} {{path/to/log.txt}}
```

deb-get

`apt-get` functionality for **`.deb`** packages published in third party repositories or via direct download.

Works with Linux distributions which use **`apt-get`**.

More information: https://github.com/wimpysworld/deb-get.

- Update the list of available packages and versions:

```
deb-get update
```

- Search for a given package:

```
deb-get search {{package}}
```

- Show information about a package:

```
deb-get show {{package}}
```

- Install a package, or update it to the latest available version:

```
deb-get install {{package}}
```

- Remove a package (using `purge` instead also removes its configuration files):

```
deb-get remove {{package}}
```

- Upgrade all installed packages to their newest available versions:

```
deb-get upgrade
```

- List all available packages:

```
deb-get list
```

debchange

Maintain the debian/changelog file of a Debian source package.

More information: https://manned.org/debchange.

- Add a new version for a non-maintainer upload to the changelog:

```
debchange {{[-n|--nmu]}}
```

- Add a changelog entry to the current version:

```
debchange {{[-a|--append]}}
```

- Add a changelog entry to close the bug with specified ID:

```
debchange --closes {{bug_id}}
```

debman

Read man pages from uninstalled packages.

More information: https://manned.org/debman.

- Read a man page for a command that is provided by a specified [p]ackage:

```
debman -p {{package}} {{command}}
```

- Specify a [p]ackage version to download:

```
debman -p {{package}}={{version}} {{command}}
```

- Read a man page in a `.deb` [f]ile:

```
debman -f {{path/to/file.deb}} {{command}}
```

debootstrap

Create a basic Debian system.

More information: https://wiki.debian.org/Debootstrap.

- Create a Debian stable release system inside the `debian-root` directory:

```
sudo debootstrap stable {{path/to/debian-root}}/ http://deb.debian.org/debian
```

- Create a minimal system including only required packages:

```
sudo debootstrap --variant=minbase stable {{path/to/debian-root}}/
```

- Create a Debian Unstable system inside the `sid-root` directory with a local mirror:

```
sudo debootstrap sid {{path/to/sid-root}}/ {{file:///path/to/mirror}}/
```

- Switch to a bootstrapped system:

```
sudo chroot {{path/to/root}}
```

- List available releases:

```
ls /usr/share/debootstrap/scripts/
```

deborphan

Display orphan packages on operating systems using the APT package manager.

More information: https://manned.org/deborphan.

- Display library packages (from the "libs" section of the package repository) which are not required by another package:

```
deborphan
```

- List orphan packages from the "libs" section as well as orphan packages that have a name that looks like a library name:

```
deborphan --guess-all
```

- Find packages which are only recommended or suggested (but not required) by another package:

```
deborphan {{[-n|--nice-mode]}}
```

debsecan

Debian Security Analyzer, a tool to list vulnerabilities on a particular Debian installation.

More information: https://manned.org/debsecan.

- List vulnerable installed packages on the current host:

```
debsecan
```

- List vulnerable installed packages of a specific suite:

```
debsecan --suite {{release_code_name}}
```

- List only fixed vulnerabilities:

```
debsecan --suite {{release_code_name}} --only-fixed
```

- List only fixed vulnerabilities of unstable ("sid") and mail to root:

```
debsecan --suite {{sid}} --only-fixed --format {{report}} --
mailto {{root}} --update-history
```

- Upgrade vulnerable installed packages:

```
sudo apt upgrade $(debsecan --only-fixed --format
{{packages}})
```

debtap

Convert Debian packages into Arch Linux packages.

See also: **`pacman-upgrade`**.

More information: https://github.com/helixarch/debtap#available-options.

- Update debtap database (before the first run):

```
sudo debtap {{[-u|--update]}}
```

- Convert the specified package:

```
debtap {{path/to/package.deb}}
```

- Convert the specified package bypassing all questions, except for editing metadata files:

```
debtap {{[-q|--quiet]}} {{path/to/package.deb}}
```

- Generate a PKGBUILD file:

```
debtap {{[-p|--pkgbuild]}} {{path/to/package.deb}}
```

debugfs

An interactive ext2/ext3/ext4 filesystem debugger.

More information: https://manned.org/debugfs.

- Open the filesystem in read only mode:

```
debugfs {{/dev/sdXN}}
```

- Open the filesystem in read write mode:

```
debugfs -w {{/dev/sdXN}}
```

- Read commands from a specified file, execute them, and then exit:

```
debugfs -f {{path/to/cmd_file}} {{/dev/sdXN}}
```

- [Interactive] View the filesystem stats in debugfs console:

```
stats
```

- [Interactive] Close the filesystem:

```
close -a
```

- [Interactive] List all available commands:

```
lr
```

debuginfod-find

Request debuginfo-related data.

More information: https://manned.org/debuginfod-find.

- Request data based on the `build_id`:

```
debuginfod-find -vv debuginfo {{build_id}}
```

debuild

Build a Debian package from source.

More information: https://manned.org/debuild.

- Build the package in the current directory:

```
debuild
```

- Build a binary package only:

```
debuild -b
```

- Do not run lintian after building the package:

```
debuild --no-lintian
```

decode-dimms

Decode RAM data.

More information: https://manned.org/decode-dimms.

- Display DIMM information:

```
decode-dimms
```

- Display help:

```
decode-dimms {{[-h|--help]}}
```

deepseek-r1

The examples for this command have been moved together with **`inference-snap`**.

More information: https://github.com/canonical/deepseek-r1-snap.

- View documentation for `inference-snap`:

```
tldr inference-snap
```

delpart

Ask the Linux kernel to forget about a partition.

More information: https://manned.org/delpart.

- Tell the kernel to forget about the first partition of `/dev/sda`:

```
sudo delpart {{/dev/sda}} {{1}}
```

deluser

Delete a user from the system.

More information: https://manned.org/deluser.

- Remove a user:

```
sudo deluser {{username}}
```

- Remove a user and their home directory:

```
sudo deluser --remove-home {{username}}
```

- Remove a user and their home, but backup their files into a `.tar.gz` file in the specified directory:

```
sudo deluser --backup-to {{path/to/backup_directory}} --remove-home {{username}}
```

- Remove a user, and all files owned by them:

```
sudo deluser --remove-all-files {{username}}
```

- Remove a user from a group, without deleting the user:

```
sudo deluser {{username}} {{group}}
```

depmod

Generate **`modules.dep`** and map files for Linux kernel modules.

See also: **`modprobe`**.

More information: https://manned.org/depmod.

- Generate dependency and map files for the current kernel:

  `depmod`

- Generate dependency and map files in a specified directory:

  `depmod {{[-o|--outdir]}} {{path/to/directory}}`

- Generate dependency and map files for a specific kernel version:

  `depmod {{kernel_version}}`

- Examine a specific module instead of all modules:

  `depmod {{kernel_version}} /{{path/to/module.ko}}`

- Use an alternative root filesystem directory:

  `depmod {{[-b|--basedir]}} {{path/to/root_directory}}`

- Write dependency information to `stdout` instead of writing to files:

  `depmod {{[-n|--dry-run]}}`

dex

DesktopEntry Execution is a program to generate and execute DesktopEntry files of the Application type.

More information: https://github.com/jceb/dex#dex.

- Execute all programs in the autostart folders:

```
dex {{[-a|--autostart]}}
```

- Execute all programs in the specified folders:

```
dex {{[-a|--autostart]}} {{[-s|--search-paths]}} {{path/to/directory1}}:{{path/to/directory2}}:{{path/to/directory3}}:
```

- Preview the programs would be executed in a GNOME specific autostart:

```
dex {{[-a|--autostart]}} {{[-e|--environment]}} {{GNOME}}
```

- Simulate a regular autostart, showing the programs that would be executed:

```
dex {{[-a|--autostart]}} {{[-d|--dry-run]}}
```

- Preview the value of the DesktopEntry property `Name`:

```
dex {{[-p|--property]}} {{Name}} {{path/to/file.desktop}}
```

- Create a DesktopEntry for a program in the current directory:

```
dex {{[-c|--create]}} {{path/to/file.desktop}}
```

- Execute a single program (with `Terminal=true` in the `.desktop` file) in the given terminal:

```
dex --term {{terminal}} {{path/to/file.desktop}}
```

df

Display an overview of the filesystem disk space usage.

See also: **`ncdu`**, **`duf`**.

More information: https://www.gnu.org/software/coreutils/manual/html_node/df-invocation.html.

- Display all filesystems and their disk usage:

```
df
```

- Display all filesystems in human-readable form:

```
df {{[-h|--human-readable]}}
```

- Display the filesystem containing the specified file or directory:

```
df {{path/to/file_or_directory}}
```

- Include statistics on the number of free inodes:

```
df {{[-i|--inodes]}}
```

- Display filesystems but exclude the specified types:

```
df {{[-x|--exclude-type]}} {{squashfs}} {{[-x|--exclude-type]}} {{tmpfs}}
```

- Display filesystem types:

```
df {{[-T|--print-type]}}
```

dget

Download Debian packages.

More information: https://manned.org/dget.

- Download a binary package:

```
dget {{package}}
```

- Download and extract a package source from its `.dsc` file:

```
dget {{http://deb.debian.org/debian/pool/main/h/haskell-tldr/haskell-tldr_0.4.0-2.dsc}}
```

- Download a package source tarball from its `.dsc` file but don't extract it:

```
dget {{[-d|--download-only]}} {{http://deb.debian.org/debian/pool/main/h/haskell-tldr/haskell-tldr_0.4.0-2.dsc}}
```

dhcpcd

DHCP client.

More information: https://roy.marples.name/projects/dhcpcd.

- Release all address leases:

```
sudo dhcpcd {{[-k|--release]}}
```

- Request the DHCP server for new leases:

```
sudo dhcpcd {{[-n|--rebind]}}
```

- Print (dump) the last acquired lease for a given interface:

```
sudo dhcpcd {{[-U|--dumplease]}} {{interface_name}}
```

- Print the last acquired lease for all interfaces:

```
sudo dhcpcd {{[-U|--dumplease]}}
```

dialog

Display dialog boxes on the terminal.

See also: **`gum`**, **`whiptail`**.

More information: https://manned.org/dialog.

- Display a message:

```
dialog --msgbox "{{Message}}" {{height}} {{width}}
```

- Prompt the user for text:

```
dialog --inputbox "{{Enter text:}}" {{8}} {{40}}
2>{{output.txt}}
```

- Prompt the user for a yes/no question:

```
dialog --yesno "{{Continue?}}" {{7}} {{40}}
```

- Display help:

```
dialog
```

diff3

Compare three files line by line.

More information: https://www.gnu.org/software/diffutils/manual/diffutils.html#Invoking-diff3.

- Compare files:

```
diff3 {{path/to/file1}} {{path/to/file2}} {{path/to/file3}}
```

- Show all changes, outlining conflicts:

```
diff3 {{[-A|--show-all]}} {{path/to/file1}} {{path/to/file2}} {{path/to/file3}}
```

diffimg

Calculate intersection between two images.

Note: The supported extensions are **`.png`**, **`.gif`**, **`.jpg`**, **`.ps`**.

More information: https://manned.org/diffimg.

- Calculate the intersection between images and output an image where each pixel is the difference between corresponding pixels in input images:

```
diffimg {{path/to/input_image1.ext}} {{path/to/
input_image2.ext}} {{path/to/output_image.ext}}
```

dir

This command is an alias of **`ls -C --escape`**.

- View documentation for the original command:

  ```
  tldr ls
  ```

dirb

Scan HTTP-based webservers for directories and files.

More information: https://manned.org/dirb.

- Scan a webserver using the default wordlist:

```
dirb {{https://example.org}}
```

- Scan a webserver using a custom wordlist:

```
dirb {{https://example.org}} {{path/to/wordlist.txt}}
```

- Scan a webserver non-recursively:

```
dirb {{https://example.org}} -r
```

- Scan a webserver using a specified user-agent and cookie for HTTP-requests:

```
dirb {{https://example.org}} -a {{user_agent_string}} -c
{{cookie_string}}
```

dirbuster

Brute force directories and filenames on servers.

More information: https://www.kali.org/tools/dirbuster/.

- Start in GUI mode:

```
dirbuster -u {{http://example.com}}
```

- Start in headless (no GUI) mode:

```
dirbuster -H -u {{http://example.com}}
```

- Set the file extension list:

```
dirbuster -e {{txt,html}}
```

- Enable verbose output:

```
dirbuster -v
```

- Set the report location:

```
dirbuster -r {{path/to/report.txt}}
```

distrobox-create

Create a Distrobox container.

The container created will be tightly integrated with the host, allowing sharing of the user's **`$HOME`** directory, external storage, external USB devices, graphical apps (X11/Wayland), and audio.

See also: **`distrobox`**.

More information: https://distrobox.it/usage/distrobox-create/.

- Create a Distrobox container using the Ubuntu image:

```
distrobox-create {{container_name}} {{[-i|--image]}} {{ubuntu:latest}}
```

- Clone a Distrobox container:

```
distrobox-create {{[-c|--clone]}} {{container_name}} {{cloned_container_name}}
```

distrobox-enter

Enter a Distrobox container.

Default command executed is your **`$SHELL`**, but you can specify different shells or entire commands to execute. If used inside a script, an application, or a service, you can use the **`--headless`** mode to disable the tty and interactivity.

See also: **`distrobox`**.

More information: https://distrobox.it/usage/distrobox-enter/.

- Enter a Distrobox container:

```
distrobox-enter {{container_name}}
```

- Enter a Distrobox container and run a command at login:

```
distrobox-enter {{container_name}} -- {{sh -l}}
```

- Enter a Distrobox container without instantiating a tty:

```
distrobox-enter {{[-n|--name]}} {{container_name}} --
{{uptime --pretty}}
```

distrobox-export

Export app/service/binary from container to host OS.

See also: **`distrobox`**.

More information: https://distrobox.it/usage/distrobox-export/.

- Export an app from the container to the host (the desktop entry/icon will show up in your host system's application list):

```
distrobox-export {{[-a|--app]}} {{package}} {{[-ef|--extra-flags]}} "--foreground"
```

- Export a binary from the container to the host:

```
distrobox-export {{[-b|--bin]}} {{path/to/binary}} {{[-ep|--export-path]}} {{path/to/binary_on_host}}
```

- Export a binary from the container to the host (i.e.`$HOME/.local/bin`):

```
distrobox-export {{[-b|--bin]}} {{path/to/binary}} {{[-ep|--export-path]}} {{path/to/export}}
```

- Export a service from the container to the host (`--sudo` will run the service as root inside the container):

```
distrobox-export --service {{package}} {{[-ef|--extra-flags]}} "--allow-newer-config" {{[-S|--sudo]}}
```

- Unexport/delete an exported application:

```
distrobox-export {{[-a|--app]}} {{package}} {{[-d|--delete]}}
```

distrobox-host-exec

Execute a command on the host from inside a Distrobox container.

See also: **`distrobox`**.

More information: https://distrobox.it/usage/distrobox-host-exec/.

- Execute command on the host system from inside the Distrobox container:

```
distrobox-host-exec "{{command}}"
```

- Execute the `ls` command on the host system from inside the container:

```
distrobox-host-exec ls
```

distrobox-list

List all Distrobox containers.

Distrobox containers are listed separately from the rest of normal Podman or Docker containers.

See also: **`distrobox`**.

More information: https://distrobox.it/usage/distrobox-list/.

- List all Distrobox containers:

```
distrobox-list
```

- List all Distrobox containers with verbose information:

```
distrobox-list {{[-v|--verbose]}}
```

distrobox-rm

Remove a Distrobox container.

See also: **`distrobox`**.

More information: https://distrobox.it/usage/distrobox-rm/.

- Remove a Distrobox container (Tip: Stop the container before removing it):

```
distrobox-rm {{container_name}}
```

- Remove a Distrobox container forcefully:

```
distrobox-rm {{container_name}} {{[-f|--force]}}
```

distrobox-stop

Stop a Distrobox container.

See also: **`distrobox`**.

More information: https://distrobox.it/usage/distrobox-stop/.

- Stop a Distrobox container:

```
distrobox-stop {{container_name}}
```

- Stop a Distrobox container non-interactively (without confirmation):

```
distrobox-stop {{container_name}} {{[-Y|--yes]}}
```

distrobox-upgrade

Upgrade one or multiple Distrobox containers.

See also: **`distrobox`**.

More information: https://distrobox.it/usage/distrobox-upgrade/.

- Upgrade a container using the container's native package manager:

```
distrobox-upgrade {{container_name}}
```

- Upgrade all containers using the container's native package managers:

```
distrobox-upgrade {{[-a|--all]}}
```

- Upgrade specific containers via the container's native package manager:

```
distrobox-upgrade {{container1 container2 ...}}
```

distrobox

Use any Linux distribution inside your terminal in a container. Install & use packages inside it while tightly integrating with the host OS, sharing storage (**`home`** directory) and hardware.

Note: **`distrobox`** isn't a command, but a set of commands.

More information: https://github.com/89luca89/distrobox.

- View documentation for creating containers:

```
tldr distrobox-create
```

- View documentation for listing container's information:

```
tldr distrobox-list
```

- View documentation for entering the container:

```
tldr distrobox-enter
```

- View documentation for executing a command on the host from inside a container:

```
tldr distrobox-host-exec
```

- View documentation for exporting app/service/binary from the container to the host:

```
tldr distrobox-export
```

- View documentation for upgrading containers:

```
tldr distrobox-upgrade
```

- View documentation for stopping the containers:

```
tldr distrobox-stop
```

- View documentation for removing the containers:

```
tldr distrobox-rm
```

dkms

A framework that allows for dynamic building of kernel modules.

More information: https://manned.org/dkms.

- List currently installed modules:

```
dkms status
```

- Rebuild all modules for the currently running kernel:

```
sudo dkms autoinstall
```

- Install version 1.2.1 of the acpi_call module for the currently running kernel:

```
sudo dkms install -m {{acpi_call}} -v {{1.2.1}}
```

- Remove version 1.2.1 of the acpi_call module from all kernels:

```
sudo dkms remove -m {{acpi_call}} -v {{1.2.1}} --all
```

dm-tool

A tool to communicate with the display manager.

More information: https://manned.org/dm-tool.

- Show the greeter while keeping current desktop session open and waiting to be restored upon authentication by logged in user:

```
dm-tool switch-to-greeter
```

- Lock the current session:

```
dm-tool lock
```

- Switch to a specific user, showing an authentication prompt if required:

```
dm-tool switch-to-user {{username}} {{session}}
```

- Add a dynamic seat from within a running LightDM session:

```
dm-tool add-seat {{xlocal}} {{name}}={{value}}
```

dmenu

Dynamic menu.

Create a menu from a text input with each item on a new line.

More information: https://manned.org/dmenu.

- Display a menu of the output of the `ls` command:

```
{{ls}} | dmenu
```

- Display a menu with custom items separated by a new line (`\n`):

```
echo -e "{{red}}\n{{green}}\n{{blue}}" | dmenu
```

- Let the user choose between multiple items and save the selected one to a file:

```
echo -e "{{red}}\n{{green}}\n{{blue}}" | dmenu >
{{color.txt}}
```

- Launch dmenu on a specific monitor:

```
ls | dmenu -m {{1}}
```

- Display dmenu at the bottom of the screen:

```
ls | dmenu -b
```

dmesg

Write the kernel messages to **`stdout`**.

See also: **`journalctl`**.

More information: https://manned.org/dmesg.

- Show kernel messages:

```
sudo dmesg
```

- Show kernel messages in human-readable format (equivalent of `dmesg --color --reltime` piped to a pager):

```
sudo dmesg {{[-H|--human]}}
```

- Show kernel error messages:

```
sudo dmesg {{[-l|--level]}} err
```

- Show kernel messages and keep [w]aiting for new ones (similar to `tail --follow`):

```
sudo dmesg {{[-w|--follow]}}
```

- Show kernel messages emitted in the last hour:

```
sudo dmesg --since "1 hour ago"
```

- Show kernel messages with timestamps as differences from local time:

```
sudo dmesg {{[-e|--reltime]}}
```

- Show kernel messages with a timestamp for each message:

```
sudo dmesg {{[-T|--ctime]}}
```

- Colorize output:

```
sudo dmesg {{[-L|--color]}}
```

dmidecode

Display the DMI (alternatively known as SMBIOS) table contents in a human-readable format.

See also: **`inxi`**, **`lshw`**, **`hwinfo`**.

More information: https://manned.org/dmidecode.

- Show all DMI table contents:

```
sudo dmidecode
```

- Show the BIOS version:

```
sudo dmidecode {{[-s|--string]}} bios-version
```

- Show the system's serial number:

```
sudo dmidecode {{[-s|--string]}} system-serial-number
```

- Show BIOS information:

```
sudo dmidecode {{[-t|--type]}} bios
```

- Show CPU information:

```
sudo dmidecode {{[-t|--type]}} processor
```

- Show memory information:

```
sudo dmidecode {{[-t|--type]}} memory
```

dnf builddep

Install dependencies to build a given package.

Not default to **`dnf`** but supported via **`dnf-plugins-core`**.

More information: https://dnf-plugins-core.readthedocs.io/en/latest/builddep.html.

- Install dependencies for a given package:

```
dnf builddep {{path/to/specification.spec}}
```

- Install dependencies for a given package but ignore unavailable:

```
dnf builddep --skip-unavailable {{path/to/
specification.spec}}
```

- Define the RPM macro to a given expression:

```
dnf builddep {{[-D|--define]}} '{{expression}}'
```

- Define an argument for a `.spec` file path:

```
dnf builddep --spec {{argument}}
```

- Define an argument for a `.rpm` file path:

```
dnf builddep --srpm {{argument}}
```

- Display help:

```
dnf builddep --help-cmd
```

dnf changelog

View the changelogs for a given package.

Not default to **`dnf`** but supported via **`dnf-plugins-core`**.

More information: https://dnf-plugins-core.readthedocs.io/en/latest/changelog.html.

- View all changelogs for a given package:

```
dnf changelog {{package}}
```

- View all changelogs for a given package after a specified date:

```
dnf changelog --since {{date}} {{package}}
```

- View the last n number of changelogs for a given package:

```
dnf changelog --count {{number}} {{package}}
```

- Show only new items for upgradeable packages:

```
dnf changelog --upgrades {{package}}
```

- Display help:

```
dnf changelog --help-cmd
```

dnf clean

Perform cleanup of temporary files kept for Red Hat-based repositories.

More information: https://dnf.readthedocs.io/en/latest/command_ref.html#clean-command.

- Remove cache files generated from the repository metadata:

```
dnf clean dbcache
```

- Mark the repository metadata as expired:

```
dnf clean expire-cache
```

- Remove repository metadata:

```
dnf clean metadata
```

- Remove any cached packages from the system:

```
dnf clean packages
```

- Clean up all DNF repository specific metadata and cached files (all of the above):

```
dnf clean all
```

dnf config-manager

Manage DNF configuration options and repositories on Fedora-based systems.

Not default to **`dnf`** but supported via **`dnf-plugins-core`**.

More information: https://dnf-plugins-core.readthedocs.io/en/latest/config_manager.html.

- Add (and enable) a repository from a URL:

```
dnf config-manager --add-repo={{repository_url}}
```

- Print current configuration values:

```
dnf config-manager --dump
```

- Enable a specific repository:

```
dnf config-manager {{[--enable|--set-enabled]}} {{repository_id}}
```

- Disable specified repositories:

```
dnf config-manager {{[--disable|--set-disabled]}} {{repository_id1 repository_id2 ...}}
```

- Set a configuration option for a repository:

```
dnf config-manager --setopt={{option}}={{value}}
```

- Display help:

```
dnf config-manager --help-cmd
```

dnf deplist

This command is an alias of **`dnf repoquery --deplist`**.

- View documentation for the original command:

  ```
  tldr dnf repoquery
  ```

dnf download

Download RPM packages from the DNF repositories.

Not default to **`dnf`** but supported via **`dnf-plugins-core`**.

More information: https://dnf-plugins-core.readthedocs.io/en/latest/download.html.

- Download the latest version of a package to the current directory:

```
dnf download {{package}}
```

- Download a package to a specific directory (the directory must exist):

```
dnf download {{package}} --destdir {{path/to/directory}}
```

- Print the URL where the RPM package can be downloaded from:

```
dnf download --url {{package}}
```

dnf group

Manage virtual collections of packages on Fedora-based systems.

More information: https://dnf.readthedocs.io/en/latest/command_ref.html#group-command.

- List DNF groups, showing installed and uninstalled status in a table:

```
dnf {{[grp|group]}} list
```

- Show DNF group info, including repository and optional packages:

```
dnf {{[grp|group]}} info {{group_name}}
```

- Install DNF group:

```
dnf {{[grp|group]}} install {{group_name}}
```

- Remove DNF group:

```
dnf {{[grp|group]}} remove {{group_name}}
```

- Upgrade DNF group:

```
dnf {{[grp|group]}} upgrade {{group_name}}
```

dnf install

Install packages on Red Hat-based distributions.

More information: https://dnf.readthedocs.io/en/latest/command_ref.html#install-examples.

- Install packages by name:

```
sudo dnf {{[in|install]}} {{package1 package2 ...}}
```

- Install a package from a local file:

```
sudo dnf {{[in|install]}} {{path/to/file}}
```

- Install a package from the internet:

```
sudo dnf {{[in|install]}} {{https://example.com/package.rpm}}
```

- Add the Fedora non-free packages repository:

```
sudo dnf {{[in|install]}} https://mirrors.rpmfusion.org/
nonfree/fedora/rpmfusion-nonfree-release-$(rpm -E
%fedora).noarch.rpm
```

- Add the Extra Packages for Enterprise Linux (EPEL) repositories:

```
sudo dnf {{[in|install]}} epel-release
```

- Add Remi's RPM repository:

```
sudo dnf {{[in|install]}} https://rpms.remirepo.net/
enterprise/remi-release-{{8}}.rpm
```

dnf module

Manage package modularity.

More information: https://dnf.readthedocs.io/en/latest/command_ref.html#module-command.

- View the modularity overview:

```
dnf module list
```

- View modularity of a specific program:

```
dnf module list {{package_name}}
```

- Set a package to be enabled:

```
sudo dnf module enable {{package_name}}:{{stream}}
```

- Enable and install a specific version:

```
dnf module install {{package_name}}:{{stream}}
```

dnf repoquery

Query packages for information.

More information: https://dnf.readthedocs.io/en/latest/command_ref.html#repoquery-command.

- Query a package for its dependencies:

```
dnf {{[rq|repoquery]}} --deplist {{package}}
```

dnf reposync

Synchronize packages and metadata of a remote DNF repository to a local directory.

Not default to **`dnf`** but supported via **`dnf-plugins-core`**.

More information: https://dnf-plugins-core.readthedocs.io/en/latest/reposync.html.

- Synchronize all packages from the repository with id `repo_name` to a subdirectory `repo_name` of the current working directory:

```
dnf reposync --repoid {{repo_name}}
```

- Synchronize all packages and define a custom save location:

```
dnf reposync --repoid {{repo_name}} {{[-p|--download-path]}} {{path/to/directory}}
```

- Synchronize all packages and metadata:

```
dnf reposync --repoid {{repo_name}} --download-metadata
```

- Download only newest packages per-repo:

```
dnf reposync --repoid {{repo_name}} {{[-n|--newest-only]}}
```

- Just print URLs of what would be downloaded, don't download:

```
dnf reposync --repoid {{repo_name}} {{[-u|--urls]}}
```

- Try to set the timestamps of the downloaded files to those on the remote side:

```
dnf reposync --repoid {{repo_name}} --remote-time
```

dnf system-upgrade

Upgrade Fedora to a new major release.

More information: https://dnf5.readthedocs.io/en/latest/commands/system-upgrade.8.html.

- Prepare the system by upgrading all installed packages:

```
sudo dnf upgrade --refresh
```

- Download packages required for the new release version:

```
sudo dnf system-upgrade download --releasever
{{release_version}}
```

- Reboot and start the upgrade process:

```
sudo dnf system-upgrade reboot
```

- Display the status of the current upgrade transaction:

```
sudo dnf system-upgrade status
```

- Display logs from previous upgrade attempts:

```
sudo dnf system-upgrade log
```

- Remove cached upgrade data and packages:

```
sudo dnf system-upgrade clean
```

dnf versionlock

Protect packages from updates to newer versions.

Not default to **`dnf`** but supported via **`dnf-plugins-core`**.

More information: https://dnf-plugins-core.readthedocs.io/en/latest/versionlock.html.

- List the current versionlock entries:

  ```
  dnf versionlock
  ```

- Add a versionlock for all available packages matching the spec:

  ```
  dnf versionlock add {{package}}
  ```

- Add an exclude (within versionlock) for the available packages matching the spec:

  ```
  dnf versionlock exclude {{package}}
  ```

- Remove any matching versionlock entries:

  ```
  dnf versionlock delete {{package}}
  ```

- Remove all versionlock entries:

  ```
  dnf versionlock clear
  ```

dnf

Package manager for Fedora 41+ and RHEL 10.

For equivalent commands in other package managers, see https://wiki.archlinux.org/title/Pacman/Rosetta.

More information: https://dnf5.readthedocs.io/en/latest/commands/index.html.

- Upgrade installed packages to the newest available versions:

```
sudo dnf {{[up|upgrade]}}
```

- Search packages via keywords:

```
dnf {{[se|search]}} {{keyword1 keyword2 ...}}
```

- Display details about a package:

```
dnf {{[if|info]}} {{package}}
```

- Install new packages (use `--assumeyes` to confirm all prompts automatically):

```
sudo dnf {{[in|install]}} {{package1 package2 ...}}
```

- Remove packages:

```
sudo dnf {{[rm|remove]}} {{package1 package2 ...}}
```

- List installed packages:

```
dnf {{[ls|list]}} --installed
```

- Find which packages provide a given command:

```
dnf provides {{command}}
```

- Clean cached data:

```
sudo dnf clean {{all|dbcache|expire-cache|metadata|packages}}
```

dnf4

Package manager for RHEL 8/9 and older Fedora versions (pre-41).

For equivalent commands in other package managers, see https://wiki.archlinux.org/title/Pacman/Rosetta.

More information: https://dnf.readthedocs.io/en/latest/command_ref.html.

- Upgrade installed packages to the newest available versions:

```
sudo dnf4 {{[up|upgrade]}}
```

- Search packages via keywords:

```
dnf4 {{[se|search]}} {{keyword1 keyword2 ...}}
```

- Display details about a package:

```
dnf4 {{[if|info]}} {{package}}
```

- Install a new package (use `--assumeyes` to confirm all prompts automatically):

```
sudo dnf4 {{[in|install]}} {{package1 package2 ...}}
```

- Remove a package:

```
sudo dnf4 {{[rm|remove]}} {{package1 package2 ...}}
```

- List installed packages:

```
dnf4 {{[ls|list]}} --installed
```

- Find which packages provide a given command:

```
dnf4 {{[wp|provides]}} {{command}}
```

- View all past operations:

```
dnf4 {{[hist|history]}}
```

dnf5 copr

Manage Copr repositories on Fedora-based systems.

More information: https://dnf5.readthedocs.io/en/latest/dnf5_plugins/copr.8.html.

- Enable a Copr repository:

```
sudo dnf5 copr enable {{owner}}/{{project}}
```

- Enable a Copr repository for a specific chroot:

```
sudo dnf5 copr enable {{owner}}/{{project}} {{fedora-rawhide-ppc64le}}
```

- Enable a Copr repository from a specific hub:

```
sudo dnf5 copr enable {{hub}}/{{owner}}/{{project}}
```

- Disable a Copr repository:

```
sudo dnf5 copr disable {{owner}}/{{project}}
```

- Remove a Copr repository:

```
sudo dnf5 copr remove {{owner}}/{{project}}
```

- List Copr repositories:

```
dnf5 copr list
```

- Print debug information about the system:

```
dnf5 copr debug
```

dnf5 group

This command is an alias of **`dnf group`**.

Note: From Fedora 37 to 40 (inclusive), **`dnf`** runs DNF v4 while **`dnf5`** runs DNF v5.

- View documentation for the original command:

  ```
  tldr dnf group
  ```

dnf5

This command is an alias of **`dnf`**.

- View documentation for the original command:

  ```
  tldr dnf
  ```

dnsdomainname

Show the system's DNS domain name.

Note: The tool uses **`gethostname`** to get the hostname of the system and then **`getaddrinfo`** to resolve it into a canonical name.

More information: https://www.gnu.org/software/inetutils/manual/inetutils.html#dnsdomainname-invocation.

- Show the system's DNS domain name:

```
dnsdomainname
```

dnsmap

Scan a domain for common subdomains e.g. smtp.domain.org.

More information: https://github.com/resurrecting-open-source-projects/dnsmap.

- Scan for subdomains using the internal wordlist:

```
dnsmap {{example.com}}
```

- Specify a list of subdomains to check for:

```
dnsmap {{example.com}} -w {{path/to/wordlist.txt}}
```

- Store results to a CSV file:

```
dnsmap {{example.com}} -c {{path/to/file.csv}}
```

- Ignore 2 IPs that are false positives (up to 5 possible):

```
dnsmap {{example.com}} -i {{123.45.67.89,98.76.54.32}}
```

dnsrecon

DNS enumeration tool.

More information: https://manned.org/dnsrecon.

- Scan a domain and save the results to an SQLite database:

```
dnsrecon {{[-d|--domain]}} {{example.com}} --db {{path/to/database.sqlite}}
```

- Scan a domain, specifying the nameserver and performing a zone transfer:

```
dnsrecon {{[-d|--domain]}} {{example.com}} {{[-n|--name_server]}} {{nameserver.example.com}} {{[-t|--type]}} axfr
```

- Scan a domain, using a brute-force attack and a dictionary of subdomains and hostnames:

```
dnsrecon {{[-d|--domain]}} {{example.com}} {{[-D|--dictionary]}} {{path/to/dictionary.txt}} {{[-t|--type]}} brt
```

- Scan a domain, performing a reverse lookup of IP ranges from the SPF record and saving the results to a JSON file:

```
dnsrecon {{[-d|--domain]}} {{example.com}} -s {{[-j|--json]}}
```

- Scan a domain, performing a Google enumeration and saving the results to a CSV file:

```
dnsrecon {{[-d|--domain]}} {{example.com}} -g {{[-c|--csv]}}
```

- Scan a domain, performing DNS cache snooping:

```
dnsrecon {{[-d|--domain]}} {{example.com}} {{[-t|--type]}} snoop {{[-n|--name_server]}} {{nameserver.example.com}} {{[-D|--dictionary]}} {{path/to/dictionary.txt}}
```

- Scan a domain, performing zone walking:

```
dnsrecon {{[-d|--domain]}} {{example.com}} {{[-t|--type]}} zonewalk
```

dnstracer

Determine where a DNS gets its information from.

More information: https://manned.org/dnstracer.

- Find out where your local DNS got the information on www.example.com:

```
dnstracer {{www.example.com}}
```

- Start with a [s]pecific DNS that you already know:

```
dnstracer -s {{dns.example.org}} {{www.example.com}}
```

- Only query IPv[4] servers:

```
dnstracer -4 {{www.example.com}}
```

- [r]etry each request 5 times on failure:

```
dnstracer -r {{5}} {{www.example.com}}
```

- Display all steps during execution:

```
dnstracer -v {{www.example.com}}
```

- Display an [o]verview of all received answers after execution:

```
dnstracer -o {{www.example.com}}
```

do-release-upgrade

The Ubuntu release upgrader.

More information: https://manned.org/do-release-upgrade.

- Upgrade to the latest release:

```
sudo do-release-upgrade
```

- Upgrade to the latest development release:

```
sudo do-release-upgrade {{[-d|--devel-release]}}
```

- Upgrade to the latest proposed release:

```
sudo do-release-upgrade {{[-p|--proposed]}}
```

dockerd

A persistent process to start and manage Docker containers.

More information: https://docs.docker.com/reference/cli/dockerd/.

- Run Docker daemon:

```
dockerd
```

- Run Docker daemon and configure it to listen to specific sockets (UNIX and TCP):

```
dockerd {{[-H|--host]}} unix://{{path/to/tmp.sock}} {{[-H|--host]}} tcp://{{ip_address}}
```

- Run with specific daemon PID file:

```
dockerd {{[-p|--pidfile]}} {{path/to/pid_file}}
```

- Run in debug mode:

```
dockerd {{[-D|--debug]}}
```

- Run and set a specific log level:

```
dockerd {{[-l|--log-level]}} {{debug|info|warn|error|fatal}}
```

dolphin

KDE's file manager to manage files and directories.

See also: **`nautilus`**, **`caja`**, **`thunar`**, **`ranger`**.

More information: https://apps.kde.org/dolphin/.

- Launch the file manager:

```
dolphin
```

- Open specific directories:

```
dolphin {{path/to/directory1 path/to/directory2 ...}}
```

- Open with specific files or directories selected:

```
dolphin --select {{path/to/file_or_directory1 path/to/
file_or_directory2 ...}}
```

- Open a new window:

```
dolphin --new-window
```

- Open specific directories in split view:

```
dolphin --split {{path/to/directory1}} {{path/to/directory2}}
```

- Launch the daemon (only required to use the D-Bus interface):

```
dolphin --daemon
```

- Display help:

```
dolphin {{[-h|--help]}}
```

dos2unix

Change DOS-style line endings to Unix-style.

Replaces CRLF with LF.

See also: **`unix2dos`**, **`unix2mac`**, **`mac2unix`**.

More information: https://manned.org/dos2unix.

- Change the line endings of a file:

```
dos2unix {{path/to/file}}
```

- Create a copy with Unix-style line endings:

```
dos2unix {{[-n|--newfile]}} {{path/to/file}} {{path/to/new_file}}
```

- Display file information:

```
dos2unix {{[-i|--info]}} {{path/to/file}}
```

- Keep/add/remove Byte Order Mark:

```
dos2unix --{{keep-bom|add-bom|remove-bom}} {{path/to/file}}
```

dphys-swapfile

Manage the swap file on Debian-based Linux systems.

More information: https://manned.org/dphys-swapfile.

- Disable the swap file:

```
dphys-swapfile swapoff
```

- Enable the swap file:

```
dphys-swapfile swapon
```

- Create a new swap file:

```
dphys-swapfile setup
```

dpigs

Show which installed packages occupy the most space on **apt** based systems.

More information: https://manned.org/dpigs.

- Display the n largest packages on the system:

```
dpigs {{[-n|--lines]}} {{n}}
```

- Use the specified file instead of the default dpkg status file:

```
dpigs {{[-s|--status]}} {{path/to/file}}
```

- Display the largest source packages of binary packages installed on the system:

```
dpigs {{[-S|--source]}}
```

- Display package sizes in human-readable format:

```
dpigs {{[-H|--human-readable]}}
```

- Display help:

```
dpigs {{[-h|--help]}}
```

dpkg-buildpackage

Compile binary and/or source Debian packages from source code.

Normally executed inside a source tree that contains a **`debian/`** directory.

Also handles build dependencies, creates files like **`.buildinfo`** and **`.changes`**, and signs the result if applicable.

More information: https://manned.org/dpkg-buildpackage.

- Generate source and binary packages:

```
dpkg-buildpackage
```

- Generate only binary packages (no source package):

```
dpkg-buildpackage {{[-b|--build=binary]}}
```

- Generate only the source package (without compiling binaries):

```
dpkg-buildpackage {{[-S|--build=source]}}
```

- Do not sign the `.dsc` and `.changes` files:

```
dpkg-buildpackage {{[-us|--unsigned-source]}} {{[-uc|--
unsigned-changes]}}
```

- Do not run `clean` before compiling:

```
dpkg-buildpackage {{[-nc|--no-pre-clean]}}
```

- Use `fakeroot` as the command to gain root privileges during the build:

```
dpkg-buildpackage {{[-r|--root-command=]}}fakeroot
```

- Run a specific `debian/rules` target:

```
dpkg-buildpackage {{[-T|--rules-target=]}}{{clean}}
```

dpkg-deb

Pack, unpack, and provide information about Debian archives.

More information: https://manned.org/dpkg-deb.

- Display information about a package:

```
dpkg-deb {{[-I|--info]}} {{path/to/file.deb}}
```

- Display the package's name and version on one line:

```
dpkg-deb {{[-W|--show]}} {{path/to/file.deb}}
```

- List the package's contents:

```
dpkg-deb {{[-c|--contents]}} {{path/to/file.deb}}
```

- Extract package's contents into a directory:

```
dpkg-deb {{[-x|--extract]}} {{path/to/file.deb}} {{path/to/
directory}}
```

- Create a package from a specified directory:

```
dpkg-deb {{[-b|--build]}} {{path/to/directory}}
```

dpkg-query

Display information about installed packages.

More information: https://manned.org/dpkg-query.

- List all installed packages:

```
dpkg-query {{[-l|--list]}}
```

- List installed packages matching a pattern:

```
dpkg-query {{[-l|--list]}} '{{libc6*}}'
```

- List all files installed by a package:

```
dpkg-query {{[-L|--listfiles]}} {{libc6}}
```

- Show information about a package:

```
dpkg-query {{[-s|--status]}} {{libc6}}
```

- Search for packages that own files matching a pattern:

```
dpkg-query {{[-S|--search]}} {{/etc/ld.so.conf.d}}
```

dpkg-reconfigure

Reconfigure an already installed package.

More information: https://manned.org/dpkg-reconfigure.

- Reconfigure one or more packages:

```
dpkg-reconfigure {{package1 package2 ...}}
```

- Reconfigure console font setup:

```
dpkg-reconfigure console-setup
```

- Reconfigure the timezone:

```
dpkg-reconfigure tzdata
```

dpkg

Debian package manager.

For equivalent commands in other package managers, see https://wiki.archlinux.org/title/Pacman/Rosetta.

Some subcommands such as **deb** have their own usage documentation.

More information: https://manned.org/dpkg.

- Install a package:

```
sudo dpkg {{[-i|--install]}} {{path/to/file.deb}}
```

- Remove a package:

```
sudo dpkg {{[-r|--remove]}} {{package}}
```

- List installed packages:

```
dpkg {{[-l|--list]}} {{pattern}}
```

- List a package's contents:

```
dpkg {{[-L|--listfiles]}} {{package}}
```

- List contents of a local package file:

```
dpkg {{[-c|--contents]}} {{path/to/file.deb}}
```

- Find out which package owns a file:

```
dpkg {{[-S|--search]}} {{path/to/file}}
```

- Purge an installed or already removed package, including configuration:

```
sudo dpkg {{[-P|--purge]}} {{package}}
```

dracut

Generate initramfs images to boot the Linux kernel.

Dracut uses options from configuration files in **`/etc/dracut.conf`**, **`/etc/dracut.conf.d/*.conf`**, and **`/usr/lib/dracut/dracut.conf.d/*.conf`** by default.

More information: https://github.com/dracut-ng/dracut-ng/blob/main/man/dracut.8.adoc.

- Generate an initramfs image for the current kernel without overriding any options:

```
dracut
```

- Generate an initramfs image for the current kernel and overwrite the existing one:

```
dracut {{[-f|--force]}}
```

- Generate an initramfs image for a specific kernel:

```
dracut --kver {{kernel_version}}
```

- List available modules:

```
dracut --list-modules
```

drawing

Free basic raster image editor in GNOME desktop environment.

More information: https://maoschanz.github.io/drawing/.

- Start Drawing:

```
drawing
```

- Open specific files:

```
drawing {{path/to/image1 path/to/image2 ...}}
```

- Open specific files in a new window:

```
drawing --new-window {{path/to/image1 path/to/image2 ...}}
```

drm_info

Dump information about Direct Rendering Manager devices.

More information: https://manned.org/drm_info.

- Dump DRM information:

```
drm_info
```

- Dump DRM information in [j]SON format:

```
drm_info -j
```

dropbearconvert

Convert between Dropbear and OpenSSH private key formats.

More information: https://manned.org/dropbearconvert.

- Convert an OpenSSH private key to the Dropbear format:

```
dropbearconvert openssh dropbear {{path/to/input_key}}
{{path/to/output_key}}
```

- Convert a Dropbear private key to the OpenSSH format:

```
dropbearconvert dropbear openssh {{path/to/input_key}}
{{path/to/output_key}}
```

dropbearkey

Generate SSH keys in Dropbear format.

More information: https://manned.org/dropbearkey.

- Generate an SSH key of [t]ype ed25519 and write it to key [f]ile:

```
dropbearkey -t {{ed25519}} -f {{path/to/key_file}}
```

- Generate an SSH key of [t]ype ecdsa and write it to key [f]ile:

```
dropbearkey -t {{ecdsa}} -f {{path/to/key_file}}
```

- Generate an SSH key of [t]ype RSA with 4096-bit key [s]ize and write it to key [f]ile:

```
dropbearkey -t {{rsa}} -s {{4096}} -f {{path/to/key_file}}
```

- Print the private key fingerprint and public key in key [f]ile:

```
dropbearkey -y -f {{path/to/key_file}}
```

dstat

Versatile tool for generating system resource statistics.

Note: This command is deprecated and no longer maintained.

More information: https://github.com/dstat-real/dstat.

- Display CPU, disk, net, paging, and system statistics:

```
dstat
```

- Display statistics every 5 seconds and 4 updates only:

```
dstat {{5}} {{4}}
```

- Display CPU and memory statistics only:

```
dstat {{[-c|--cpu]}} {{[-m|--mem]}}
```

- List all available dstat plugins:

```
dstat --list
```

- Display the process using the most memory and most CPU:

```
dstat --top-mem --top-cpu
```

- Display battery percentage and remaining battery time:

```
dstat --battery --battery-remain
```

duff

Duplicate file finder.

More information: https://github.com/elmindreda/duff.

- Find duplicate files recursively:

```
duff -r {{path/to/directory}}
```

- List all but one file from each cluster of duplicates:

```
duff -er {{path/to/directory}}
```

- List unique files:

```
duff -ur {{path/to/directory}}
```

- Use SHA-256 instead of SHA-1:

```
duff -d sha256 {{path/to/directory}}
```

- Compare files byte by byte instead of using digests:

```
duff -t {{path/to/directory}}
```

- Include hidden files and directories when searching recursively:

```
duff -ar {{path/to/directory}}
```

dump.exfat

Show on-disk information of an exFAT filesystem.

More information: https://manned.org/dump.exfat.

- Print on-disk information for a given filesystem:

```
dump.exfat {{/dev/sdXY}}
```

dumpe2fs

Print the super block and blocks group information for ext2/ext3/ext4 filesystems.

Unmount the partition before running this command using **`umount device`**.

More information: https://manned.org/dumpe2fs.

- Display ext2, ext3, and ext4 filesystem information:

```
dumpe2fs {{/dev/sdXN}}
```

- Display the blocks which are reserved as bad in the filesystem:

```
dumpe2fs -b {{/dev/sdXN}}
```

- Force display filesystem information even with unrecognizable feature flags:

```
dumpe2fs -f {{/dev/sdXN}}
```

- Only display the superblock information and not any of the block group descriptor detail information:

```
dumpe2fs -h {{/dev/sdXN}}
```

- Print the detailed group information block numbers in hexadecimal format:

```
dumpe2fs -x {{/dev/sdXN}}
```

duperemove

Find duplicate filesystem extents and optionally schedule them for deduplication.

An extent is small part of a file inside the filesystem.

On some filesystems one extent can be referenced multiple times, when parts of the content of the files are identical.

More information: https://markfasheh.github.io/duperemove/.

- Search for duplicate extents in a directory and show them:

```
duperemove -r {{path/to/directory}}
```

- Deduplicate duplicate extents on a Btrfs or XFS (experimental) filesystem:

```
duperemove -r -d {{path/to/directory}}
```

- Use a hash file to store extent hashes (less memory usage and can be reused on subsequent runs):

```
duperemove -r -d --hashfile={{path/to/hashfile}} {{path/to/directory}}
```

- Limit I/O threads (for hashing and dedupe stage) and CPU threads (for duplicate extent finding stage):

```
duperemove -r -d --hashfile={{path/to/hashfile}} --io-threads={{n}} --cpu-threads={{n}} {{path/to/directory}}
```

dutree

Analyze filesystem usage with colorful text-based trees.

More information: https://github.com/nachoparker/dutree#usage.

- Show a graphical tree of the current directory:

```
dutree
```

- Show a specific directory:

```
dutree {{path/to/directory}}
```

- Aggregate items smaller than a number of KB (or M for MB, or G for GB):

```
dutree --aggr {{number}}K
```

- Show subdirectories up to the specified depth (default is 1):

```
dutree --depth {{depth}}
```

- Skip directories for a fast local overview:

```
dutree --files-only
```

- Exclude hidden files:

```
dutree --no-hidden
```

dysk

Display filesystem information in a table.

More information: https://manned.org/dysk.

- Get a standard overview of your usual disks:

```
dysk
```

- Sort by free size:

```
dysk {{[-s|--sort]}} free
```

- Include only HDD disks:

```
dysk {{[-f|--filter]}} 'disk = HDD'
```

- Exclude SSD disks:

```
dysk {{[-f|--filter]}} 'disk <> SSD'
```

- Display disks with high utilization or low free space:

```
dysk {{[-f|--filter]}} 'use > 65% | free < 50G'
```

e2freefrag

Print the free space fragmentation information for ext2/ext3/ext4 filesystems.

More information: https://manned.org/e2freefrag.

- Check how many free blocks are present as contiguous and aligned free space:

```
e2freefrag {{/dev/sdXN}}
```

- Specify [c]hunk size in kilobytes to print how many free chunks are available:

```
e2freefrag -c {{chunk_size_in_kb}} {{/dev/sdXN}}
```

e2fsck

Check a Linux ext2/ext3/ext4 filesystem. The partition should be unmounted.

More information: https://manned.org/e2fsck.

- Check filesystem, reporting any damaged blocks:

```
sudo e2fsck {{/dev/sdXN}}
```

- Check filesystem and automatically repair ([p]reen) any damaged blocks:

```
sudo e2fsck -p {{/dev/sdXN}}
```

- Check filesystem in read only mode:

```
sudo e2fsck -c {{/dev/sdXN}}
```

- [f]orce checking even if the filesystem seems clean:

```
sudo e2fsck -f {{/dev/sdXN}}
```

- Perform an exhaustive, non-destructive read-write test for bad blocks and blacklist them:

```
sudo e2fsck -fccky {{/dev/sdXN}}
```

e2image

Save critical ext2/ext3/ext4 filesystem metadata to a file.

More information: https://manned.org/e2image.

- Write metadata located on device to a specific file:

```
e2image {{/dev/sdXN}} {{path/to/image_file}}
```

- Print metadata located on device to `stdout`:

```
e2image {{/dev/sdXN}} -
```

- Restore the filesystem metadata back to the device:

```
e2image -I {{/dev/sdXN}} {{path/to/image_file}}
```

- Create a large [r]aw sparse file with metadata at proper offsets:

```
e2image -r {{/dev/sdXN}} {{path/to/image_file}}
```

- Create a [Q]COW2 image file instead of a normal or raw image file:

```
e2image -Q {{/dev/sdXN}} {{path/to/image_file}}
```

e2label

Change the label on an ext2/ext3/ext4 filesystem.

More information: https://manned.org/e2label.

- Change the volume label on a specific ext partition:

```
sudo e2label {{/dev/sda1}} "{{label_name}}"
```

e2undo

Replay undo logs for an ext2/ext3/ext4 filesystem.

This can be used to undo a failed operation by an e2fsprogs program.

More information: https://manned.org/e2undo.

- Display information about a specific undo file:

```
e2undo -h {{path/to/undo_file}} {{/dev/sdXN}}
```

- Simulate replaying the undo file and display the candidate blocks:

```
e2undo -nv {{path/to/undo_file}} {{/dev/sdXN}}
```

- Perform an undo operation:

```
e2undo {{path/to/undo_file}} {{/dev/sdXN}}
```

- Perform an undo operation and display [v]erbose information:

```
e2undo -v {{path/to/undo_file}} {{/dev/sdXN}}
```

- Write the old contents of the block to an undo file before overwriting a filesystem block:

```
e2undo -z {{path/to/file.e2undo}} {{path/to/undo_file}} {{/dev/sdXN}}
```

e4defrag

Defragment an ext4 filesystem.

More information: https://manned.org/e4defrag.

- Defragment the filesystem:

```
e4defrag {{/dev/sdXN}}
```

- See how fragmented a filesystem is:

```
e4defrag -c {{/dev/sdXN}}
```

- Print errors and the fragmentation count before and after each file:

```
e4defrag -v {{/dev/sdXN}}
```

ebuild

A low level interface to the Gentoo Portage system.

More information: https://wiki.gentoo.org/wiki/Ebuild.

- Create or update the package manifest:

```
ebuild {{path/to/file.ebuild}} manifest
```

- Clean the temporary build directories for the build file:

```
ebuild {{path/to/file.ebuild}} clean
```

- Fetch sources if they do not exist:

```
ebuild {{path/to/file.ebuild}} fetch
```

- Extract the sources to a temporary build directory:

```
ebuild {{path/to/file.ebuild}} unpack
```

- Compile the extracted sources:

```
ebuild {{path/to/file.ebuild}} compile
```

- Install the package to a temporary install directory:

```
ebuild {{path/to/file.ebuild}} install
```

- Install the temporary files to the live filesystem:

```
ebuild {{path/to/file.ebuild}} qmerge
```

- Fetch, unpack, compile, install, and qmerge the specified ebuild file:

```
ebuild {{path/to/file.ebuild}} merge
```

eclean-kernel

Remove old kernels in Gentoo.

More information: https://wiki.gentoo.org/wiki/Kernel/Removal#Using_eclean-kernel.

- List all kernel files:

```
sudo eclean-kernel {{[-l|--list-kernels]}}
```

- Remove all kernels except for the two newest ones:

```
sudo eclean-kernel {{[-n|--num]}} 2
```

- Remove all kernels except for the two newest ones and ask before removal:

```
sudo eclean-kernel {{[-a|--all]}} {{[-n|--num]}} 2
```

eclean

Clean repository source files and binary packages.

More information: https://wiki.gentoo.org/wiki/Eclean.

- Clean the source file directory:

```
sudo eclean distfiles
```

- Clean the binary package directory:

```
sudo eclean packages
```

- Clean the distfiles of all uninstalled packages, but keep the distfiles of installed packages:

```
sudo eclean {{[-d|--deep]}} {{[-n|--package-names]}} distfiles
```

- Clean the binary packages of all uninstalled packages, but keep the binaries of installed packages:

```
sudo eclean {{[-d|--deep]}} {{[-n|--package-names]}} packages
```

edid-decode

Parse EDID information of a display.

See also: **`get-edid`**.

More information: https://manned.org/edid-decode.

- View EDID information of a display:

```
edid-decode /sys/class/drm/{{card1-DP-1}}/edid
```

edit

This command is an alias of **`run-mailcap --action=edit`**.

- View documentation for the original command:

  ```
  tldr run-mailcap
  ```

edquota

Edit quotas for a user or group. By default it operates on all filesystems with quotas.

Quota information is stored permanently in the **`quota.user`** and **`quota.group`** files in the root of the filesystem.

More information: https://manned.org/edquota.

- Edit quota of the current user:

```
edquota {{[-u|--user]}} $(whoami)
```

- Edit quota of a specific user:

```
sudo edquota {{[-u|--user]}} {{username}}
```

- Edit quota for a group:

```
sudo edquota {{[-g|--group]}} {{group}}
```

- Restrict operations to a given filesystem (by default edquota operates on all filesystems with quotas):

```
sudo edquota {{[-f|--file-system]}} {{filesystem}}
```

- Edit the default grace period:

```
sudo edquota {{[-t|--edit-period]}}
```

- Duplicate a quota to other users:

```
sudo edquota {{[-p|--prototype]}} {{reference_user}}
{{destination_user1 destination_user2 ...}}
```

efibootdump

Dump boot entries from a variable or a file.

More information: https://manned.org/efibootdump.

- Dump boot entries from a file:

```
efibootdump {{[-f|--file]}} {{/sys/firmware/efi/efivars/
Boot0000-8be4df61-93ca-11d2-aa0d-00e098032b8c}}
```

efibootmgr

Manipulate the UEFI Boot Manager.

More information: https://manned.org/efibootmgr.

- List all boot options with their numbers:

```
efibootmgr {{[-u|--unicode]}}
```

- Add a UEFI executable (e.g. UEFI shell, Unified Kernel Image, etc.) as a boot option:

```
sudo efibootmgr {{[-c|--create]}} {{[-d|--disk]}} {{/dev/
sda}} {{[-p|--part]}} {{1}} {{[-l|--loader]}}
"{{path\to\executable.efi}}" {{[-L|--label]}}
"{{boot_entry_name}}"
```

- Add Linux as a boot option:

```
sudo efibootmgr {{[-c|--create]}} {{[-d|--disk]}} {{/dev/
sda}} {{[-p|--part]}} {{1}} {{[-l|--loader]}}
"{{path\to\vmlinuz}}" {{[-u|--unicode]}}
"{{root=UUID=partition_uuid rw loglevel=3
initrd=path\to\initramfs-linux.img}}" {{[-L|--label]}}
"{{Linux}}"
```

- Change the current boot order:

```
sudo efibootmgr {{[-o|--bootorder]}}
{{0002,0008,0001,001A,...}}
```

- Delete a boot option:

```
sudo efibootmgr {{[-B|--delete-bootnum]}} {{[-b|--bootnum]}}
{{0008}}
```

efivar

Manage UEFI variables.

More information: https://manned.org/efivar.

- List all UEFI variables:

```
efivar {{[-l|--list]}}
```

- Print the contents of a variable:

```
efivar {{[-n|--name]}} {{146b234d-4052-4e07-
b326-11220f8e1fe8-lBoot0000}} {{[-p|--print]}}
```

eglinfo

Display platform EGL information.

More information: https://github.com/dv1/eglinfo.

- Display full platform information:

```
eglinfo
```

- Display a brief version of platform information:

```
eglinfo -B
```

- Display help:

```
eglinfo -h
```

ego

Funtoo's official system personality management tool.

More information: https://funtoo-ego.readthedocs.io/en/develop/.

- Synchronize the Portage tree:

```
ego sync
```

- Update the bootloader configuration:

```
ego boot update
```

- Read a Funtoo wiki page by name:

```
ego doc {{wiki_page}}
```

- Print current profile:

```
ego profile show
```

- Enable/Disable mix-ins:

```
ego profile mix-in +{{gnome}} -{{kde-plasma-5}}
```

- Query Funtoo bugs, related to a specified package:

```
ego query bug {{package}}
```

einfo

Provide the number of records indexed in each database field, the last update date of the database, and the available links from the database to other Entrez databases.

More information: https://www.ncbi.nlm.nih.gov/books/NBK179288/.

- Print all database names:

```
einfo -dbs
```

- Print all information of the protein database in XML format:

```
einfo -db {{protein}}
```

- Print all fields of the nuccore database:

```
einfo -db {{nuccore}} -fields
```

- Print all links of the protein database:

```
einfo -db {{protein}} -links
```

eix

Utilities for searching local Gentoo packages.

Update local package cache using **`eix-update`**.

More information: https://wiki.gentoo.org/wiki/Eix.

- Search for a package:

```
eix {{query}}
```

- Search for installed packages:

```
eix --installed {{query}}
```

- Search in package descriptions:

```
eix --description "{{description}}"
```

- Search by package license:

```
eix --license {{license}}
```

- Exclude results from search:

```
eix --not --license {{license}}
```

eject

Eject CDs, floppy disks, tape drives, and USB sticks.

More information: https://manned.org/eject.

- Display the default device:

```
eject {{[-d|--default]}}
```

- Eject the default device:

```
eject
```

- Eject a specific device (the default order is cd-rom, scsi, floppy, and tape):

```
eject {{/dev/cdrom}}
```

- Toggle whether a device's tray is open or closed:

```
eject {{[-T|--traytoggle]}} {{/dev/cdrom}}
```

- Eject a cd drive:

```
eject {{[-r|--cdrom]}} {{/dev/cdrom}}
```

- Eject a floppy drive:

```
eject {{[-f|--floppy]}} {{/mnt/floppy}}
```

- Eject a tape drive:

```
eject {{[-q|--tape]}} {{/mnt/tape}}
```

- Set whether the physical eject button is [i]gnored (on prevents ejecting):

```
eject {{[-i|--manualeject]}} {{on|off}}
```

elink

Look up precomputed neighbors within a database, or find associated records in other databases.

It is part of the **edirect** package.

More information: https://www.ncbi.nlm.nih.gov/books/NBK179288/.

- Search pubmed then find related sequences:

```
esearch -db pubmed -query "{{selective serotonin reuptake inhibitor}}" | elink -target nuccore
```

- Search nucleotide then find related biosamples:

```
esearch -db nuccore -query "{{insulin [PROT] AND rodents [ORGN]}}" | elink -target biosample
```

emaint

Perform Portage maintenance tasks.

More information: https://wiki.gentoo.org/wiki/Portage#emaint.

- Synchronize repositories that are set to auto-sync (default for most repositories):

```
sudo emaint sync {{[-a|--auto]}}
```

- Synchronize a specific repository:

```
sudo emaint sync {{[-r|--repo]}} {{repository}}
```

- Synchronize all repositories:

```
sudo emaint sync {{[-A|--allrepos]}}
```

- Clear the Portage resume list:

```
sudo emaint cleanresume {{[-f|--fix]}}
```

- Clean Portage logs:

```
sudo emaint logs {{[-C|--clean]}}
```

emerge

Gentoo Linux package manager utility.

For equivalent commands in other package managers, see https://wiki.archlinux.org/title/Pacman/Rosetta.

More information: https://wiki.gentoo.org/wiki/Portage#emerge.

- Synchronize all packages:

```
sudo emerge --sync
```

- Update all packages, including dependencies:

```
sudo emerge {{[-avuDN|--ask --verbose --update --deep --newuse]}} @world
```

- Resume a failed update, skipping the failing package:

```
sudo emerge --resume --skipfirst
```

- Install a new package, with confirmation:

```
sudo emerge {{[-av|--ask --verbose]}} {{package}}
```

- Remove a package and its dependencies with confirmation:

```
sudo emerge {{[-avc|--ask --verbose --depclean]}} {{package}}
```

- Remove orphaned packages (installed as dependencies but no longer required by any package):

```
sudo emerge {{[-avc|--ask --verbose --depclean]}}
```

- Search the package database for a keyword:

```
emerge {{[-S|--searchdesc]}} {{keyword}}
```

engrampa

Package files into **zip**/**.tar** file in MATE desktop environment.

See also: **zip**, **tar**.

More information: https://github.com/mate-desktop/engrampa.

- Start Engrampa:

```
engrampa
```

- Open specific archives:

```
engrampa {{path/to/archive1.tar path/to/archive2.tar ...}}
```

- Archive specific files and/or directories recursively:

```
engrampa --add-to={{path/to/compressed.tar}} {{path/to/
file_or_directory1 path/to/file_or_directory2 ...}}
```

- Extract files and/or directories from archives to a specific path:

```
engrampa --extract-to={{path/to/directory}} {{path/to/
archive1.tar path/to/archive2.tar ...}}
```

enum4linux

Enumerate Windows and Samba information from remote systems.

More information: https://labs.portcullis.co.uk/tools/enum4linux/.

- Try to enumerate using all methods:

```
enum4linux -a {{remote_host}}
```

- Enumerate using given login credentials:

```
enum4linux -u {{user_name}} -p {{password}} {{remote_host}}
```

- List usernames from a given host:

```
enum4linux -U {{remote_host}}
```

- List shares:

```
enum4linux -S {{remote_host}}
```

- Get OS information:

```
enum4linux -o {{remote_host}}
```

envycontrol

GPU switching utility for Nvidia Optimus laptops.

More information: https://github.com/bayasdev/envycontrol#%EF%B8%8F-usage.

- Switch between different GPU modes:

```
sudo envycontrol {{[-s|--switch]}} {{nvidia|integrated|
hybrid}}
```

- Specify your [d]isplay [m]anager manually:

```
envycontrol --dm {{gdm|gdm3|sddm|lightdm}}
```

- Check current GPU mode:

```
sudo envycontrol {{[-q|--query]}}
```

- Reset settings:

```
sudo envycontrol --reset
```

- Display help:

```
envycontrol {{[-h|--help]}}
```

- Display version:

```
envycontrol {{[-v|--version]}}
```

eog

View and manage images.

More information: https://manned.org/eog.

- Open an image file:

```
eog {{path/to/image.png}}
```

- Open multiple images:

```
eog {{image1.jpg image2.png ...}}
```

- Open images in fullscreen mode:

```
eog --fullscreen {{path/to/image.jpg}}
```

- Start a slideshow:

```
eog --slide-show {{path/to/directory}}
```

- Open a single image without image collection:

```
eog --single-window {{path/to/image.jpg}}
```

- Open an image in a new window instance:

```
eog --new-instance {{path/to/image.jpg}}
```

eopkg

Package manager for Solus.

More information: https://help.getsol.us/docs/user/package-management/basics/.

- Install a specific package:

```
sudo eopkg install {{package}}
```

- Update all packages:

```
sudo eopkg upgrade
```

- Search for packages:

```
sudo eopkg search {{search_term}}
```

equery

View information about Portage packages.

More information: https://wiki.gentoo.org/wiki/Equery.

- List all installed packages:

```
equery list '*'
```

- Search for installed packages in the Portage tree and in overlays:

```
equery list -po {{package1 package2 ...}}
```

- List all packages that depend on a given package:

```
equery depends {{package}}
```

- List all packages that a given package depends on:

```
equery depgraph {{package}}
```

- List all files installed by a package:

```
equery files --tree {{package}}
```

esearch

Perform a new Entrez search using terms in indexed fields.

It is part of the **edirect** package.

More information: https://www.ncbi.nlm.nih.gov/books/NBK179288/.

- Search the pubmed database for selective serotonin reuptake inhibitor:

```
esearch -db pubmed -query "{{selective serotonin reuptake inhibitor}}"
```

- Search the protein database using a query and regex:

```
esearch -db {{protein}} -query '{{Escherichia*}}'
```

- Search the nucleotide database for sequences whose metadata contain insulin and rodents:

```
esearch -db nuccore -query "{{insulin [PROT] AND rodents [ORGN]}}"
```

- Display help:

```
esearch {{[-h|-help]}}
```

eselect kernel

An **`eselect`** module for managing the **`/usr/src/linux`** symlink.

More information: https://wiki.gentoo.org/wiki/Eselect#Kernel.

- List available kernel symlink targets with their numbers:

  ```
  eselect kernel list
  ```

- Set the `/usr/src/linux` symlink by name or number from the `list` command:

  ```
  eselect kernel set {{name|number}}
  ```

- Show what the current kernel symlink points to:

  ```
  eselect kernel show
  ```

- Set the kernel symlink to the currently running kernel:

  ```
  eselect kernel update
  ```

eselect locale

An **`eselect`** module for managing the **`$LANG`** environment variable, which sets the system language.

More information: https://wiki.gentoo.org/wiki/Eselect#Locale.

- List available locales:

  ```
  eselect locale list
  ```

- Set the `$LANG` environment variable in `/etc/profile.env` by name or index from the `list` command:

  ```
  eselect locale set {{name|index}}
  ```

- Display the value of `$LANG` in `/etc/profile.env`:

  ```
  eselect locale show
  ```

eselect news

An **eselect** module for reading Gentoo news items.

Note: Portage will print a notice when a repository is synchronized and there are unread news items.

More information: https://wiki.gentoo.org/wiki/Eselect#News.

- List available news items with their numbers (all by default):

  ```
  eselect news list {{all|new}}
  ```

- Print the specified news items:

  ```
  eselect news read {{number1 number2 ...}}
  ```

- Print all unread news items:

  ```
  eselect news read
  ```

- Mark the specified news items as unread:

  ```
  eselect news unread {{number1 number2 ...}}
  ```

- Delete all read news items:

  ```
  eselect news purge
  ```

- Print the number of available news items (new by default):

  ```
  eselect news count {{all|new}}
  ```

eselect profile

An **`eselect`** module for managing the **`/etc/portage/make.profile`** symlink, which sets the system profile.

More information: https://wiki.gentoo.org/wiki/Eselect#Profile.

- List available profile symlink targets with their numbers:

  ```
  eselect profile list
  ```

- Set the `/etc/portage/make.profile` symlink by name or number from the `list` command:

  ```
  eselect profile set {{name|number}}
  ```

- Show the current system profile:

  ```
  eselect profile show
  ```

eselect repository

An **`eselect`** module for configuring ebuild repositories for Portage.

After enabling a repository, you have to run **`emerge --sync repo_name`** to download ebuilds.

More information: https://wiki.gentoo.org/wiki/Eselect/Repository.

- List all ebuild repositories registered on https://repos.gentoo.org:

```
eselect repository list
```

- List enabled repositories:

```
eselect repository list -i
```

- Enable a repository from the list by its name or index from the `list` command:

```
eselect repository enable {{name|index}}
```

- Enable an unregistered repository:

```
eselect repository add {{name}} {{rsync|git|mercurial|
svn|...}} {{sync_uri}}
```

- Disable repositories without removing their contents:

```
eselect repository disable {{repo1 repo2 ...}}
```

- Disable repositories and remove their contents:

```
eselect repository remove {{repo1 repo2 ...}}
```

- Create a local repository and enable it:

```
eselect repository create {{name}} {{path/to/repo}}
```

eselect

Gentoo's multi-purpose configuration and management tool.

It consists of various modules that take care of individual administrative tasks.

Some subcommands such as **`kernel`**, **`locale`**, **`profile`**, etc. have their own usage documentation.

More information: https://wiki.gentoo.org/wiki/Eselect.

- Display a list of installed modules:

```
eselect
```

- View documentation for a specific module:

```
tldr eselect {{module}}
```

- Display a help message for a specific module:

```
eselect {{module}} help
```

etckeeper

Track system configuration files in Git.

More information: https://manned.org/etckeeper.

- Set up a Git repo and perform various setup tasks (run from `/etc`):

```
sudo etckeeper init
```

- Commit all changes in `/etc`:

```
sudo etckeeper commit {{message}}
```

- Run arbitrary Git commands:

```
sudo etckeeper vcs {{status}}
```

- Check if there are uncommitted changes (only returns an exit code):

```
sudo etckeeper unclean
```

- Destroy existing repo and stop tracking changes:

```
sudo etckeeper uninit
```

ethtool

Display and modify Network Interface Controller (NIC) parameters.

More information: https://manned.org/ethtool.

- Display the current settings for an interface:

```
ethtool {{eth0}}
```

- Display the driver information for an interface:

```
ethtool {{[-i|--driver]}} {{eth0}}
```

- Display all supported features for an interface:

```
ethtool {{[-k|--show-features]}} {{eth0}}
```

- Display the network usage statistics for an interface:

```
ethtool {{[-S|--statistics]}} {{eth0}}
```

- Blink one or more LEDs on an interface for 10 seconds:

```
ethtool {{[-p|--identify]}} {{eth0}} {{10}}
```

- Set the link speed, duplex mode, and parameter auto-negotiation for a given interface:

```
ethtool {{[-s|--change]}} {{eth0}} speed {{10|100|1000}}
duplex {{half|full}} autoneg {{on|off}}
```

eu-readelf

Display information about ELF files.

More information: https://manned.org/eu-readelf.

- Display all extractable information contained in the ELF file:

```
eu-readelf {{[-a|--all]}} {{path/to/file}}
```

- Display the contents of all NOTE segments/sections, or of a particular segment/section:

```
eu-readelf {{[-n|--notes]}} {{.note.ABI-tag}} {{path/to/file}}
```

euse

Enable, disable, and obtain information about Gentoo USE flags.

More information: https://wiki.gentoo.org/wiki/Euse.

- List active global USE flags:

```
euse {{[-a|--active]}} {{[-g|--global]}}
```

- List active local USE flags:

```
euse {{[-a|--active]}} {{[-l|--local]}}
```

- Enable a global USE flag:

```
sudo euse {{[-E|--enable]}} {{use_flag}}
```

- Disable a global USE flag (put a '-' sign in front of the USE flag):

```
sudo euse {{[-D|--disable]}} {{use_flag}}
```

- Remove a global USE flag:

```
sudo euse {{[-P|--prune]}} {{use_flag}}
```

evince

View documents.

More information: https://manned.org/evince.

- Open a PDF file:

```
evince {{path/to/file.pdf}}
```

- Open multiple documents:

```
evince {{file1.pdf file2.pdf ...}}
```

- Open in fullscreen mode:

```
evince {{[-f|--fullscreen]}} {{path/to/file.pdf}}
```

- Open in presentation mode:

```
evince {{[-s|--presentation]}} {{path/to/file.pdf}}
```

- Open a specific page number:

```
evince {{[-i|--page-index]}} {{5}} {{path/to/file.pdf}}
```

evtest

Display information from input device drivers.

More information: https://manned.org/evtest.

- List all detected input devices and select one for monitoring:

```
sudo evtest
```

- Display events from a specific input device:

```
sudo evtest /dev/input/event{{number}}
```

- Grab the device exclusively, preventing other clients from receiving events:

```
sudo evtest --grab /dev/input/event{{number}}
```

- Query the state of a specific key or button on an input device:

```
sudo evtest --query /dev/input/event{{number}} {{event_type}}
{{event_code}}
```

eww

Implement your own custom widgets in any window manager.

More information: https://elkowar.github.io/eww/.

- Start the daemon:

```
eww daemon
```

- Open a widget:

```
eww {{[-c|--config]}} {{path/to/source_code_directory}} open {{window_name}}
```

- Close a widget:

```
eww {{[-c|--config]}} {{path/to/source_code_directory}} close {{window_name}}
```

- Reload the configuration:

```
eww reload
```

- Kill the daemon:

```
eww kill
```

- Print and watch logs:

```
eww logs
```

exch

Swap the filepaths and filenames of two files.

More information: https://manned.org/exch.

- Swap filepaths:

```
exch {{path/to/file1}} {{path/to/file2}}
```

exec

Execute a command without creating a child process.

More information: https://www.gnu.org/software/bash/manual/bash.html#index-exec.

- Execute a specific command:

```
exec {{command -with -flags}}
```

- Execute a command with a (mostly) empty environment:

```
exec -c {{command -with -flags}}
```

- Execute a command as a login shell:

```
exec -l {{command -with -flags}}
```

- Execute a command with a different name:

```
exec -a {{name}} {{command -with -flags}}
```

exif

Show and change EXIF information in JPEG files.

More information: https://manned.org/exif.

- Show all recognized EXIF information in an image:

```
exif {{path/to/image.jpg}}
```

- Show a table listing known EXIF tags and whether each one exists in an image:

```
exif {{[-l|--list-tags]}} --no-fixup {{path/to/image.jpg}}
```

- Extract the image thumbnail into a separate file:

```
exif {{[-e|--extract-thumbnail]}} {{[-o|--output]}} {{path/to/thumbnail.jpg}} {{path/to/image.jpg}}
```

- Show the raw contents of the "Model" tag in the given image:

```
exif --ifd {{0}} {{[-t|--tag]}} "Model" {{[-m|--machine-readable]}} {{path/to/image.jpg}}
```

- Change the value of the "Artist" tag to John Smith and save to `new.jpg`:

```
exif {{[-o|--output]}} {{path/to/new.jpg}} --ifd {{0}} {{[-t|--tag]}} "Artist" --set-value "John Smith" --no-fixup {{path/to/image.jpg}}
```

exiqgrep

Perl script offering possibilities to **grep** in the Exim queue output.

More information: https://www.exim.org/exim-html-current/doc/html/spec_html/ch-exim_utilities.html.

- Match the sender address using a case-insensitive search:

```
exiqgrep -f '<{{email@example.com}}>'
```

- Match the sender address and display message IDs only:

```
exiqgrep -i -f '<{{email@example.com}}>'
```

- Match the [r]ecipient address:

```
exiqgrep -r '{{email@example.com}}'
```

- Remove all messages matching the sender address from the queue:

```
exiqgrep -i -f '<{{email@example.com}}>' | xargs exim -Mrm
```

- Test for bounced messages:

```
exiqgrep -f '^<>$'
```

- Display the [c]ount of bounced messages:

```
exiqgrep -c -f '^<>$'
```

expac

A data extraction tool for alpm databases, offering printf-like flexibility for pacman-based utilities.

See also: **pacman**.

More information: https://github.com/falconindy/expac#name.

- List the dependencies of a package:

```
expac {{[-S|--sync]}} '%D' {{package}}
```

- List the optional dependencies of a package:

```
expac {{[-S|--sync]}} "%o" {{package}}
```

- List the download size of packages in MiB:

```
expac {{[-S|--sync]}} {{[-H|--humansize]}} M
'%k\t%n' {{package1 package2 ...}}
```

- List packages marked for upgrade with their download size:

```
expac {{[-S|--sync]}} {{[-H|--humansize]}} M '%k\t%n' $
(pacman -Qqu) | sort {{[-sh|--sort --human-numeric-sort]}}
```

- List explicitly-installed packages with their optional dependencies:

```
expac {{[-d|--delim]}} '\n\n' {{[-l|--listdelim]}}
'\n\t' {{[-Q|--query]}} '%n\n\t%O' $(pacman -Qeq)
```

expect

Script executor that interacts with other programs that require user input.

More information: https://manned.org/expect.

- Execute an expect script from a file:

```
expect {{path/to/file}}
```

- Execute a specified expect script:

```
expect -c "{{commands}}"
```

- Enter an [i]nteractive REPL (use `exit` or `<Ctrl d>` to exit):

```
expect -i
```

explodepkg

Extract the contents of a Slackware package to the current directory.

See also: **`installpkg`**, **`removepkg`**, **`upgradepkg`**, **`makepkg`**, **`pkgtool`**.

More information: https://www.slackbook.org/html/book.html#PACKAGE-MANAGEMENT-EXPLODEPKG.

- Extract a package to the current directory:

```
explodepkg {{path/to/package.tgz}}
```

- Extract multiple packages to the current directory:

```
explodepkg {{path/to/package1.tgz}} {{path/to/package2.tgz}}
```

export

Export shell variables to child processes.

More information: https://www.gnu.org/software/bash/manual/bash.html#index-export.

- Set an environment variable:

```
export {{VARIABLE}}={{value}}
```

- Unset an environment variable:

```
export -n {{VARIABLE}}
```

- Export a [f]unction to child processes:

```
export -f {{FUNCTION_NAME}}
```

- Append a pathname to the environment variable `$PATH`:

```
export PATH=$PATH:{{path/to/append}}
```

- [p]rint a list of active exported variables in shell command form:

```
export -p
```

extrace

Trace exec() calls.

More information: https://github.com/leahneukirchen/extrace.

- Trace all program executions occurring on the system:

```
sudo extrace
```

- Run a command and only trace descendants of this command:

```
sudo extrace {{command}}
```

- Print the current working [d]irectory of each process:

```
sudo extrace -d
```

- Resolve the full path of each executable:

```
sudo extrace -l
```

- Display the [u]ser running each process:

```
sudo extrace -u
```

extrepo

Manage external Debian repositories.

It is used to manage external repositories in Debian.

More information: https://manned.org/extrepo.1p.

- Search for a given package:

```
extrepo search {{package}}
```

- Enable the repository:

```
sudo extrepo enable {{repository_name}}
```

- Disable the repository:

```
sudo extrepo disable {{repository_name}}
```

- Update the repository:

```
sudo extrepo update {{repository_name}}
```

extundelete

Recover deleted files from ext3 or ext4 partitions by parsing the journal.

See also: **`date`**, **`umount`**.

More information: https://extundelete.sourceforge.net/options.html.

- Restore all deleted files inside partition `N` on device `X`:

```
sudo extundelete {{/dev/sdXN}} --restore-all
```

- Restore a file from a path relative to root (Do not start the path with `/`):

```
extundelete {{/dev/sdXN}} --restore-file {{path/to/file}}
```

- Restore a directory from a path relative to root (Do not start the path with `/`):

```
extundelete {{/dev/sdXN}} --restore-directory {{path/to/
directory}}
```

- Restore all files deleted after January 1st, 2020 (in Unix time):

```
extundelete {{/dev/sdXN}} --restore-all --after
{{1577840400}}
```

eyeD3

Read and manipulate metadata of MP3 files.

More information: https://manned.org/eyeD3.

- View information about an MP3 file:

```
eyeD3 {{filename.mp3}}
```

- Set the title of an MP3 file:

```
eyeD3 {{[-t|--title]}} "{{A Title}}" {{filename.mp3}}
```

- Set the album of all the MP3 files in a directory:

```
eyeD3 {{[-A|--album]}} "{{Album Name}}" {{*.mp3}}
```

- Set the front cover art for an MP3 file:

```
eyeD3 --add-image {{front_cover.jpeg}}:FRONT_COVER:
{{filename.mp3}}
```

f5fpc

A proprietary commercial SSL VPN client by BIG-IP Edge.

More information: https://my.f5.com/manage/s/article/K47922841.

- Open a new VPN connection:

```
sudo f5fpc --start
```

- Open a new VPN connection to a specific host:

```
sudo f5fpc --start --host {{host.example.com}}
```

- Specify a username (user will be prompted for a password):

```
sudo f5fpc --start --host {{host.example.com}} --username
{{user}}
```

- Show the current VPN status:

```
sudo f5fpc --info
```

- Shut down the VPN connection:

```
sudo f5fpc --stop
```

Factorio

Create and start a headless Factorio server.

More information: https://wiki.factorio.com/Multiplayer.

- Create a new save file:

```
{{path/to}}/factorio --create {{path/to/save_file.zip}}
```

- Start a Factorio server:

```
{{path/to}}/factorio --start-server {{path/to/save_file.zip}}
```

- Create a new save file with specific settings:

```
{{path/to}}/factorio --create {{path/to/save.zip}} --map-gen-settings {{path/to/map_gen_settings.json}} --map-settings {{path/to/map_settings.json}}
```

- [Interactive] Shut the server gracefully:

```
/quit
```

- Display help:

```
{{path/to}}/factorio {{[-h|--help]}}
```

fadvise

Control Linux file caching behavior.

See also: **`fincore`**.

More information: https://manned.org/fadvise.

- Preload a file or directory into cache:

```
fadvise {{[-a|--advice]}} willneeded {{path/to/file_or_directory}}
```

- Suggest dropping a file from cache:

```
fadvise {{path/to/file}}
```

- Display help:

```
fadvise {{[-h|--help]}}
```

fail2ban-client

Configure and control fail2ban server.

More information: https://manned.org/fail2ban-client.

- Retrieve current status of the jail service:

```
fail2ban-client status {{jail}}
```

- Remove the specified IP from the jail service's ban list:

```
fail2ban-client set {{jail}} unbanip {{ip_address}}
```

- Verify fail2ban server is alive:

```
fail2ban-client ping
```

faillock

Display and modify authentication failure record files.

More information: https://manned.org/faillock.

- List login failures of the current user:

```
faillock
```

- Reset the failure records of the current user:

```
faillock --reset
```

- List login failures of all users:

```
sudo faillock
```

- List login failures of the specified user:

```
sudo faillock --user {{user}}
```

- Reset the failure records of the specified user:

```
sudo faillock --user {{user}} --reset
```

fakeroot

Run a command in an environment faking root privileges for file manipulation.

More information: https://manned.org/fakeroot.

- Start the default shell as fakeroot:

```
fakeroot
```

- Run a command as fakeroot:

```
fakeroot -- {{command}} {{command_arguments}}
```

- Run a command as fakeroot and [s]ave the environment to a file on exit:

```
fakeroot -s {{path/to/file}} -- {{command}}
{{command_arguments}}
```

- Load a fakeroot environment and run a command as fakeroot:

```
fakeroot -i {{path/to/file}} -- {{command}}
{{command_arguments}}
```

- Run a command keeping the real ownership of files instead of pretending they are owned by root:

```
fakeroot {{[-u|--unknown-is-real]}} -- {{command}}
{{command_arguments}}
```

- Display help:

```
fakeroot {{[-h|--help]}}
```

faketime

Fake the system time for a command.

More information: https://manned.org/faketime.

- Fake the time to this evening, before printing the result of `date`:

```
faketime '{{today 23:30}}' {{date}}
```

- Open a new Bash shell, which uses yesterday as the current date:

```
faketime '{{yesterday}}' {{bash}}
```

- Simulate how a program would act next Friday night:

```
faketime '{{next Friday 1 am}}' {{path/to/program}}
```

- Run a program on a specific date and time:

```
faketime '{{2020-01-01 12:00:00}}' {{program}}
```

fallocate

Reserve or deallocate disk space to files.

The utility allocates space without zeroing.

More information: https://manned.org/fallocate.

- Reserve a file taking up 700 MiB of disk space:

```
fallocate {{[-l|--length]}} 700M {{path/to/file}}
```

- Shrink an already allocated file by 200 MB:

```
fallocate {{[-c|--collapse-range]}} {{[-l|--length]}} 200MB
{{path/to/file}}
```

- Shrink 20 MB of space after 100 MiB in a file:

```
fallocate {{[-c|--collapse-range]}} {{[-o|--offset]}} 100M
{{[-l|--length]}} 20M {{path/to/file}}
```

fancontrol

Automated fan speed management.

Uses a configuration file to control a wide range of variables.

More information: https://manned.org/fancontrol.

- Start `fancontrol` using default `/etc/fancontrol` configuration file:

  `fancontrol`

- Start `fancontrol` using custom configuration file path:

  `fancontrol {{path/to/config_file}}`

farge

Display the color of a specific pixel on the screen in either hexadecimal or RGB formats.

More information: https://github.com/sdushantha/farge#usage.

- Display a small preview window of a pixel's color with its hexadecimal value, and copy this value to the clipboard:

```
farge
```

- Copy a pixel's hexadecimal value to the clipboard without displaying a preview window:

```
farge --no-preview
```

- Output a pixel's hexadecimal value to `stdout`, and copy this value to the clipboard:

```
farge --stdout
```

- Output a pixel's RGB value to `stdout`, and copy this value to the clipboard:

```
farge --rgb --stdout
```

- Display a pixel's hexadecimal value as a notification which expires in 5000 milliseconds, and copy this value to the clipboard:

```
farge --notify --expire-time 5000
```

fatlabel

Get or set the label of a FAT32 partition.

More information: https://manned.org/fatlabel.

- Get the label of a FAT32 partition:

```
fatlabel {{/dev/sda1}}
```

- Set the label of a FAT32 partition:

```
fatlabel {{/dev/sdc3}} "{{new_label}}"
```

fatrace

Report file access events.

See also: **`inotifywait`**.

More information: https://manned.org/fatrace.

- Print file access events in all mounted filesystems to `stdout`:

```
sudo fatrace
```

- Limit output to a program with a specific name:

```
sudo fatrace {{[-C|--command]}} {{program_name}}
```

- Print file access events on the mount of the current directory to `stdout`:

```
sudo fatrace {{[-c|--current-mount]}}
```

- Add timestamps to the printout:

```
sudo fatrace {{[-t|--timestamp]}}
```

fbgrab

Generate screenshots directly from the framebuffer.

More information: https://github.com/GunnarMonell/fbgrab#fbgrab.

- Generate a screenshot from the current TTY:

```
sudo fbgrab {{path/to/file}}.png
```

- Specify which TTY to capture:

```
sudo fbgrab -c {{number}} {{path/to/file}}.png
```

fbi

Display images in a terminal framebuffer.

More information: https://manned.org/fbi.

- Display an image:

```
sudo fbi {{path/to/file}}
```

- Display multiple images:

```
sudo fbi {{path/to/file1 path/to/file2 ...}}
```

- Start a slideshow with a custom delay (in seconds):

```
sudo fbi {{[-t|--timeout]}} {{delay}} {{path/to/files/*}}
```

- Scale the image to fit the screen:

```
sudo fbi {{[-a|--autozoom]}} {{path/to/file}}
```

- Display help:

```
fbi {{[-h|--help]}}
```

fbset

Show and modify frame buffer device settings.

More information: https://manned.org/fbset.1.

- Show current framebuffer settings:

```
sudo fbset {{[-i|--info]}}
```

- Set a framebuffer mode defined in `/etc/fb.modes`:

```
sudo fbset "{{800}}x{{600}}-{{60}}"
```

- Set the dimensions of the framebuffer:

```
sudo fbset -xres {{horizontal_pixels}} -yres
{{vertical_pixels}}
```

- Set an arbitrary framebuffer mode:

```
sudo fbset {{[-g|--geometry]}} {{tty_horizontal}}
{{tty_vertical}} {{monitor_horizontal}} {{monitor_vertical}}
{{color_depth}}
```

fcrackzip

ZIP archive password cracking utility.

More information: https://manned.org/fcrackzip.

- Brute-force a password with a length of 4 to 8 characters and contains only alphanumeric characters (order matters):

```
fcrackzip {{[-b|--brute-force]}} {{[-l|--length]}} 4-8 {{[-c|--charset]}} aA1 {{archive}}
```

- Brute-force a password in verbose mode with a length of 3 characters that only contains lowercase characters, `$`, and `%`:

```
fcrackzip {{[-v|--verbose]}} {{[-b|--brute-force]}} {{[-l|--length]}} 3 {{[-c|--charset]}} a:$% {{archive}}
```

- Brute-force a password that contains only lowercase and special characters:

```
fcrackzip {{[-b|--brute-force]}} {{[-l|--length]}} 4 {{[-c|--charset]}} a! {{archive}}
```

- Brute-force a password containing only digits, starting from the password `12345`:

```
fcrackzip {{[-b|--brute-force]}} {{[-l|--length]}} 5 {{[-c|--charset]}} 1 {{[-p|--init-password]}} 12345 {{archive}}
```

- Crack a password using a wordlist:

```
fcrackzip {{[-u|--use-unzip]}} {{[-D|--dictionary]}} {{[-p|--init-password]}} {{wordlist}} {{archive}}
```

- Benchmark cracking performance:

```
fcrackzip {{[-B|--benchmark]}}
```

fdisk

Manage partition tables and partitions on a storage drive.

See also: **`partprobe`**, **`parted`**, **`cfdisk`**.

More information: https://manned.org/fdisk.

- List partitions:

```
sudo fdisk {{[-l|--list]}}
```

- Start the interactive partition manipulator:

```
sudo fdisk {{/dev/sdX}}
```

- Open a help [m]enu:

```
<m>
```

- View the [p]artition table:

```
<p>
```

- Create a [n]ew partition:

```
<n>
```

- Select a partition to [d]elete:

```
<d>
```

- [w]rite the changes made:

```
<w>
```

- Discard the changes made and [q]uit:

```
<q>
```

feedreader

A GUI desktop RSS client.

Note: FeedReader is no longer being maintained.

More information: https://manned.org/feedreader.

- Print the count of unread articles:

  ```
  feedreader --unreadCount
  ```

- Add a URL for a feed to follow:

  ```
  feedreader --addFeed={{feed_url}}
  ```

- Grab a specific article using its URL:

  ```
  feedreader --grabArticle={{article_url}}
  ```

- Download all images from a specific article:

  ```
  feedreader --url={{feed_url}} --grabImages={{article_path}}
  ```

- Play media from a URL:

  ```
  feedreader --playMedia={{article_url}}
  ```

fftest

Test force-feedback devices (e.g., controllers with rumble functionality).

More information: https://manned.org/fftest.

- Open `fftest` on an event:

```
fftest {{/dev/input/eventX}}
```

fgconsole

Print the number of the foreground virtual terminal.

See also: **`chvt`**.

More information: https://manned.org/fgconsole.

- Print current terminal number or `serial` if the terminal is serial:

  `fgconsole`

- Print the next unallocated virtual terminal:

  `fgconsole {{[-n|--next-available]}}`

filefrag

Report how badly fragmented a particular file might be.

More information: https://manned.org/filefrag.

- Display a report for one or more files:

```
filefrag {{path/to/file1 path/to/file2 ...}}
```

- Display a report using a 1024 byte blocksize:

```
filefrag -k {{path/to/file}}
```

- Display a report using a certain blocksize:

```
filefrag -b{{1024|1K|1M|1G|...}} {{path/to/file}}
```

- Sync the file before requesting the mapping:

```
filefrag -s {{path/to/file1 path/to/file2 ...}}
```

- Display mapping of extended attributes:

```
filefrag -x {{path/to/file1 path/to/file2 ...}}
```

- Display a report with verbose information:

```
filefrag -v {{path/to/file1 path/to/file2 ...}}
```

finch

Console-based modular messaging client.

More information: https://developer.pidgin.im/wiki/Using%20Finch.

- Launch finch:

  `finch`

- Quit:

  `{{<Alt q>|<Ctrl c>}}`

- Show actions menu:

  `<Alt a>`

- Jump to n-th window:

  `<Alt {{Number}}>`

- Close current window:

  `<Alt c>`

- Start moving a window, use `<ArrowKeys>` to move, press `<Esc>` when done:

  `<Alt m>`

- Start resizing a window, use `<ArrowKeys>` to resize, press `<Esc>` when done:

  `<Alt r>`

fincore

Display how much cache memory a file is taking.

See also: **`fadvise`**.

More information: https://manned.org/fincore.

- Display cache details for a file:

```
fincore {{path/to/file}}
```

- Display all possible data columns:

```
fincore --output-all {{path/to/file}}
```

- Display help:

```
fincore {{[-h|--help]}}
```

findfs

Find a filesystem by label or UUID.

More information: https://manned.org/findfs.

- Search block devices by filesystem label:

```
findfs LABEL={{label}}
```

- Search by filesystem UUID:

```
findfs UUID={{uuid}}
```

- Search by partition label (GPT or MAC partition table):

```
findfs PARTLABEL={{partition_label}}
```

- Search by partition UUID (GPT partition table only):

```
findfs PARTUUID={{partition_uuid}}
```

findmnt

Find your filesystem.

More information: https://manned.org/findmnt.

- List all mounted filesystems:

```
findmnt
```

- Search for a device:

```
findmnt {{/dev/sdb1}}
```

- Search for a mountpoint:

```
findmnt {{/}}
```

- Find filesystems in specific type:

```
findmnt {{[-t|--types]}} {{ext4,virtiofs,btrfs,...}}
```

- Find filesystems with specific label:

```
findmnt LABEL={{BigStorage}}
```

- Check mount table content in detail and verify `/etc/fstab`:

```
findmnt {{[-x|--verify]}} --verbose
```

firejail

Securely sandboxes processes to containers using built-in Linux capabilities.

More information: https://manned.org/firejail.

- Integrate firejail with your desktop environment:

```
sudo firecfg
```

- Open a restricted Mozilla Firefox:

```
firejail {{firefox}}
```

- Start a restricted Apache server on a known interface and address:

```
firejail --net={{eth0}} --ip={{192.168.1.244}} {{/etc/init.d/apache2}} {{start}}
```

- List running sandboxes:

```
firejail --list
```

- List network activity from running sandboxes:

```
firejail --netstats
```

- Shut down a running sandbox:

```
firejail --shutdown={{7777}}
```

- Run a restricted Firefox session to browse the internet:

```
firejail --seccomp --private --private-dev --private-tmp --protocol=inet firefox --new-instance --no-remote --safe-mode --private-window
```

- Use custom hosts file (overriding `/etc/hosts` file):

```
firejail --hosts-file={{~/myhosts}} {{curl http://mysite.arpa}}
```

firewall-cmd

The firewalld client.

View and adapt the runtime or permanent firewall configuration state.

More information: https://firewalld.org/documentation/man-pages/firewall-cmd.

- View all available firewall zones and rules in their runtime configuration state:

```
firewall-cmd --list-all-zones
```

- Permanently move the interface into the block zone, effectively blocking all communication:

```
firewall-cmd --permanent --zone {{block}} --change-interface {{enp1s0}}
```

- Permanently open the port for a service in the specified zone (like port 443 when in the `public` zone):

```
firewall-cmd --permanent --zone {{public}} --add-service {{https}}
```

- Permanently close the port for a service in the specified zone (like port 80 when in the `public` zone):

```
firewall-cmd --permanent --zone {{public}} --remove-service {{http}}
```

- Permanently forward a port for incoming packets in the specified zone (like port 443 to 8443 when entering the `public` zone):

```
firewall-cmd --permanent --zone {{public}} --add-rich-rule 'rule family "{{ipv4|ipv6}}" forward-port port "{{443}}" protocol "{{udp|tcp}}" to-port "{{8443}}"'
```

- Reload firewalld to lose any runtime changes and force the permanent configuration to take effect immediately:

```
firewall-cmd --reload
```

- Save the runtime configuration state to the permanent configuration:

```
firewall-cmd --runtime-to-permanent
```

- Enable panic mode in case of Emergency. All traffic is dropped, any active connection will be terminated:

```
firewall-cmd --panic-on
```

fixfiles

Fix file SELinux security contexts.

More information: https://manned.org/fixfiles.

- Record the current date in the `/.autorelabel` file when used with `onboot` (to speed up labeling later), or only restore files modified today when used with `restore`:

```
fixfiles -B
```

- [F]orce reset of context to match `file_context` for customizable files:

```
fixfiles -F
```

- Clear `/tmp` directory without confirmation:

```
fixfiles -f
```

- Use the [R]pm database to discover all files within specific packages and restore the file contexts:

```
fixfiles -R {{rpm_package1,rpm_package2 ...}}
```

- Run a diff on the `PREVIOUS_FILECONTEXT` file to the [C]urrently installed one, and restore the context of all affected files:

```
fixfiles -C PREVIOUS_FILECONTEXT
```

- Only act on files created after a specific date which will be passed to find `--newermt` command:

```
fixfiles -N {{YYYY-MM-DD HH:MM}}
```

- Bind [M]ount filesystems before relabeling them, this allows fixing the context of files or directories that have been mounted over:

```
fixfiles -M
```

- Modify [v]erbosity from progress to verbose and run `restorecon` with `-v` instead of `-p`:

```
fixfiles -v
```

flameshot

Screenshot utility with a GUI.

Supports basic image editing, such as text, shapes, colors, and imgur.

More information: https://flameshot.org/docs/advanced/commandline-options/.

- Create a fullscreen screenshot:

```
flameshot full
```

- Create a screenshot interactively:

```
flameshot gui
```

- Create a screenshot and save it to a specific path:

```
flameshot gui {{[-p|--path]}} {{path/to/directory}}
```

- Create a screenshot interactively in a simplified mode:

```
flameshot launcher
```

- Create a screenshot from a specific monitor:

```
flameshot screen {{[-n|--number]}} {{2}}
```

- Create a screenshot and print it to `stdout`:

```
flameshot gui {{[-r|--raw]}}
```

- Create a screenshot and copy it to the clipboard:

```
flameshot gui {{[-c|--clipboard]}}
```

- Create a screenshot with a specific delay in milliseconds:

```
flameshot full {{[-d|--delay]}} {{5000}}
```

flash

Flash cards in the terminal.

More information: https://github.com/tallguyjenks/fla.sh.

- Open a menu of available flashcard decks for selection:

```
flash
```

- Display information about the flashcard system:

```
flash -i
```

- Change the previewer from default `bat` to `cat`:

```
flash -p {{cat}}
```

- Display help:

```
flash -h
```

- Display version:

```
flash -v
```

flashrom

Read, write, verify, and erase flash chips.

More information: https://manned.org/flashrom.

- Probe the chip, ensuring the wiring is correct:

```
flashrom {{[-p|--programmer]}} {{programmer}}
```

- Read flash and save it to a file:

```
flashrom {{[-p|--programmer]}} {{programmer}} {{[-r|--read]}} {{path/to/file}}
```

- Write a file to the flash:

```
flashrom {{[-p|--programmer]}} {{programmer}} {{[-w|--write]}} {{path/to/file}}
```

- Verify the flash against a file:

```
flashrom {{[-p|--programmer]}} {{programmer}} {{[-v|--verify]}} {{path/to/file}}
```

- Probe the chip using Raspberry Pi:

```
flashrom {{[-p|--programmer]}} {{linux_spi:dev=/dev/spidev0.0}}
```

flatpak-builder

Help build application dependencies.

More information: https://docs.flatpak.org/en/latest/flatpak-builder-command-reference.html.

- Build a Flatpak and export it to a new repository:

```
flatpak-builder {{path/to/build_directory}} {{path/to/manifest}}
```

- Build a Flatpak and export it to the specified repository:

```
flatpak-builder --repo {{repository_name}} {{path/to/build_directory}} {{path/to/manifest}}
```

- Build a Flatpak and install it locally:

```
flatpak-builder --install {{path/to/build_directory}} {{path/to/manifest}}
```

- Build and sign a Flatpak and export it to the specified repository:

```
flatpak-builder --gpg-sign {{key_id}} --repo {{repository_name}} {{path/to/manifest}}
```

- Run a shell inside of an application sandbox without installing it:

```
flatpak-builder --run {{path/to/build_directory}} {{path/to/manifest}} {{sh}}
```

flatpak mask

Mask out updates and automatic installation.

More information: https://docs.flatpak.org/en/latest/flatpak-command-reference.html#flatpak-mask.

- Ignore updates for a specific flatpak:

```
flatpak mask {{com.example.app}}
```

- Undo ignore updates:

```
flatpak mask --remove {{com.example.app}}
```

- List all currently masked patterns:

```
flatpak mask {{--system|--user}}
```

flatpak remote-info

Show information about an application or runtime in a remote.

More information: https://docs.flatpak.org/en/latest/flatpak-command-reference.html#flatpak-remote-info.

- Show information about a flatpak:

```
flatpak remote-info {{remote_name}} {{com.example.app}}
```

- Show a log of previous versions in a remote:

```
flatpak remote-info --log {{remote_name}} {{com.example.app}}
```

- Show information about the specific commit, rather than the latest version:

```
flatpak remote-info --commit {{COMMIT}} {{remote_name}}
{{com.example.app}}
```

flatpak run

Run flatpak applications and runtimes.

More information: https://docs.flatpak.org/en/latest/flatpak-command-reference.html#flatpak-run.

- Run an installed application:

```
flatpak run {{com.example.app}}
```

- Run an installed application from a specific branch e.g. stable, beta, master:

```
flatpak run --branch={{stable|beta|master|...}}
{{com.example.app}}
```

- Run an interactive shell inside a flatpak:

```
flatpak run --command={{sh}} {{com.example.app}}
```

- Run an installed application with a specific runtime version:

```
flatpak run --runtime-version={{24.08|master|stable|...}}
{{com.example.app}}
```

- Run an installed application with a different runtime (but same version number):

```
flatpak run --runtime={{org.freedesktop.Sdk}}
{{com.example.app}}
```

flatpak update

Update flatpak applications and runtimes.

More information: https://docs.flatpak.org/en/latest/flatpak-command-reference.html#flatpak-update.

- Update all installed applications and runtimes (use `-y` to confirm all prompts automatically):

```
flatpak update
```

- Update only a specific app:

```
flatpak update {{com.example.app}}
```

- Update/Downgrade to a specific commit (also see flatpak remote-info and flatpak mask):

```
flatpak update --commit {{COMMIT}} {{com.example.app}}
```

flatpak

Build, install, and run flatpak applications and runtimes.

More information: https://docs.flatpak.org/en/latest/flatpak-command-reference.html#flatpak.

- Run an installed application:

```
flatpak run {{com.example.app}}
```

- Install an application from a remote source:

```
flatpak install {{remote_name}} {{com.example.app}}
```

- List installed applications, ignoring runtimes:

```
flatpak list --app
```

- Update all installed applications and runtimes:

```
flatpak update
```

- Add a remote source:

```
flatpak remote-add --if-not-exists {{remote_name}}
{{remote_url}}
```

- Remove an installed application:

```
flatpak remove {{com.example.app}}
```

- Remove all unused applications:

```
flatpak remove --unused
```

- Show information about an installed application:

```
flatpak info {{com.example.app}}
```

flex

Lexical analyzer generator.

Given the specification for a lexical analyzer, generates C code implementing it.

More information: https://manned.org/flex.

- Generate an analyzer from a Lex file, storing it to the file `lex.yy.c`:

```
flex {{analyzer.l}}
```

- Write analyzer to `stdout`:

```
flex {{[-t|--stdout]}} {{analyzer.l}}
```

- Specify the output file:

```
flex {{analyzer.l}} {{[-o|--outfile]}} {{analyzer.c}}
```

- Generate a batch scanner instead of an interactive scanner:

```
flex {{[-B|--batch]}} {{analyzer.l}}
```

- Compile a C file generated by Lex:

```
cc {{path/to/lex.yy.c}} -o {{executable}}
```

flock

Manage file locks from shell scripts.

It can be used to ensure that only one instance of a command is running.

More information: https://manned.org/flock.

- Run a command with a file lock as soon as the lock is available:

```
flock {{path/to/lock.lock}} {{command}}
```

- Run a command with a file lock, or exit if the lock is currently being held (with exit code 1):

```
flock {{[-n|--nonblock]}} {{path/to/lock.lock}} {{command}}
```

- Run a command with a file lock, or exit with a specific error code if the lock is currently being held:

```
flock {{[-n|--nonblock]}} {{[-E|--conflict-exit-code]}} {{123}} {{path/to/lock.lock}} {{command}}
```

- Run a command with a file lock, waiting up to 10 seconds for the lock to be available before giving up:

```
flock {{[-w|--timeout]}} 10 {{path/to/lock.lock}} {{command}}
```

- Back up a bunch of files, waiting for the previous `tar` command to finish if it's still running elsewhere and holding the same lock file (can be used in a `cron` job that runs often):

```
flock {{path/to/backup.lock}} {{tar -cvf path/to/backup.tar path/to/data/}}
```

fluidsynth

Synthesize audio from MIDI files.

More information: https://github.com/FluidSynth/fluidsynth/wiki/UserManual.

- Play a MIDI file:

```
fluidsynth {{/usr/share/soundfonts/soundfont.sf2}} {{path/to/file.midi}}
```

- Specify the audio driver:

```
fluidsynth {{[-a|--audio-driver]}} {{pipewire|pulseaudio}} {{/usr/share/soundfonts/soundfont.sf2}} {{path/to/file.midi}}
```

- Display help:

```
fluidsynth {{[-h|--help]}}
```

fold

Folds long lines for fixed-width output devices.

More information: https://www.gnu.org/software/coreutils/manual/html_node/fold-invocation.html.

- Fold lines in a fixed width:

```
fold {{[-w|--width]}} {{width}} {{path/to/file}}
```

- Count width in bytes (the default is to count in columns):

```
fold {{[-b|--bytes]}} {{[-w|--width]}} {{width_in_bytes}} {{path/to/file}}
```

- Break the line after the rightmost blank within the width limit:

```
fold {{[-s|--spaces]}} {{[-w|--width]}} {{width}} {{path/to/file}}
```

fonttools subset

Generate subsets of fonts or optimize file sizes.

More information: https://fonttools.readthedocs.io/en/latest/subset/index.html.

- Subset a TTF font file to the Basic Latin Unicode block:

```
fonttools subset {{path/to/font.ttf}} --unicodes=U+0000-007F
```

- Change the file type to WOFF2:

```
fonttools subset {{path/to/font.ttf}} --unicodes=U+0000-007F
--flavor=woff2
```

- Keep only the onum (oldstyle figures) and kern (kerning) OpenType font features:

```
fonttools subset {{path/to/font.ttf}} --unicodes=U+0000-007F
--layout-features=onum,kern
```

- Set the output file's name:

```
fonttools subset {{path/to/font.ttf}} --unicodes=U+0000-007F
--output-file={{path/to/subset.ttf}}
```

fonttools

Manipulate fonts in Python.

More information: https://fonttools.readthedocs.io/en/latest/.

- Subset a TTF font file to the Basic Latin Unicode block:

```
fonttools subset {{path/to/font.ttf}} --unicodes=U+0000-007F
```

- Display help:

```
fonttools --help
```

foreman

Manage Procfile-based applications.

More information: https://manned.org/foreman.

- Start an application with the Procfile in the current directory:

```
foreman start
```

- Start an application with a specified Procfile:

```
foreman start {{[-f|--procfile]}} {{Procfile}}
```

- Start a specific application:

```
foreman start {{process}}
```

- Validate Procfile format:

```
foreman check
```

- Run one-off commands with the process's environment:

```
foreman run {{command}}
```

- Start all processes except the one named "worker":

```
foreman start {{[-m|--formation]}} all=1,{{worker}}=0
```

foremost

Recover files using their headers, footers, and data structures.

More information: https://manned.org/foremost.

- Recover files of a specific [t]ype (e.g., JPEG) from a disk image:

```
foremost -t {{jpg}} -i {{path/to/disk_image.dd}}
```

- Recover files of multiple [t]ypes:

```
foremost -t {{gif,png,pdf}} -i {{path/to/disk_image.dd}}
```

- Recover files using all predefined formats:

```
foremost -t all -i {{path/to/disk_image.dd}}
```

- Recover files into a specific [o]utput directory:

```
foremost -o {{path/to/output_directory}} -i {{path/to/
disk_image.dd}}
```

- Display [h]elp:

```
foremost -h
```

- Display [V]ersion:

```
foremost -V
```

fprintd-delete

Remove fingerprints from the database.

More information: https://manned.org/fprintd-delete.

- Remove all fingerprints for a specific user:

```
fprintd-delete {{username}}
```

- Remove a specific fingerprints for a specific user:

```
fprintd-delete {{username}} {{[-f|--finger]}} {{left-thumb|left-index-finger|left-middle-finger|left-ring-finger|left-little-finger|right-thumb|...}}
```

- Display help:

```
fprintd-delete
```

fprintd-enroll

Enroll fingerprints into the database.

More information: https://manned.org/fprintd-enroll.

- Enroll the right index finger for the current user:

```
fprintd-enroll
```

- Enroll a specific finger for the current user:

```
fprintd-enroll {{[-f|--finger]}} {{left-thumb|left-index-finger|left-middle-finger|left-ring-finger|left-little-finger|right-thumb|...}}
```

- Enroll the right index finger for a specific user:

```
fprintd-enroll {{username}}
```

- Enroll a specific finger for a specific user:

```
fprintd-enroll {{[-f|--finger]}} {{finger_name}} {{username}}
```

- Display help:

```
fprintd-enroll --help
```

fprintd-list

List enrolled fingerprints.

More information: https://manned.org/fprintd-list.

- List enrolled fingerprints for a specific user:

```
fprintd-list {{username}}
```

- List enrolled fingerprints for one or more users:

```
fprintd-list {{username1 username2 ...}}
```

- Display help:

```
fprintd-list
```

fprintd-verify

Verify fingerprints against the database.

More information: https://manned.org/fprintd-verify.

- Verify all stored fingerprints for the current user:

```
fprintd-verify
```

- Verify a specific fingerprint for the current user:

```
fprintd-verify {{[-f|--finger]}} {{left-thumb|left-index-finger|left-middle-finger|left-ring-finger|left-little-finger|right-thumb|...}}
```

- Verify fingerprints for a specific user:

```
fprintd-verify {{username}}
```

- Verify a specific fingerprint for a specific user:

```
fprintd-verify {{[-f|--finger]}} {{finger_name}} {{username}}
```

- Fail the process if a fingerprint doesn't match with ones stored in the database for the current user:

```
fprintd-verify --g-fatal-warnings
```

- Display help:

```
fprintd-verify {{[-h|--help]}}
```

fprintd

Fingerprint management daemon.

`fprintd` isn't a command, but a set of commands.

More information: https://fprint.freedesktop.org/.

- View documentation for listing enrolled fingerprints:

```
tldr fprintd-list
```

- View documentation for enrolling new fingerprints:

```
tldr fprintd-enroll
```

- View documentation for verifying a fingerprint against a database:

```
tldr fprintd-verify
```

- View documentation for deleting fingerprints from a database:

```
tldr fprintd-delete
```

free

Display amount of free and used memory in the system.

More information: https://manned.org/free.

- Display system memory:

```
free
```

- Display memory in Bytes/KB/MB/GB:

```
free -{{b|k|m|g}}
```

- Display memory in human-readable units:

```
free {{[-h|--human]}}
```

- Refresh the output every 2 seconds:

```
free {{[-s|--seconds]}} 2
```

fs_cli

Connect to and control a running FreeSWITCH server using the FreeSWITCH Command Line Interface (ESL client).

More information: https://developer.signalwire.com/freeswitch/FreeSWITCH-Explained/Client-and-Developer-Interfaces/1048948/.

- Connect to the local FreeSWITCH instance with an interactive session:

```
fs_cli
```

- Connect to a remote FreeSWITCH server:

```
fs_cli {{[-H|--host]}} {{host}} {{[-P|--port]}} {{port}} {{[-p|--password]}} {{password}}
```

- Execute a single FreeSWITCH command and exit:

```
fs_cli {{[-x|--execute]}} "{{command}}"
```

- Show FreeSWITCH system status:

```
fs_cli {{[-x|--execute]}} "status"
```

- Reload FreeSWITCH XML configuration:

```
fs_cli {{[-x|--execute]}} "reloadxml"
```

- Check if a module is loaded:

```
fs_cli {{[-x|--execute]}} "module_exists {{module_name}}"
```

- Show active calls:

```
fs_cli {{[-x|--execute]}} "show calls"
```

- Retry connection on failure:

```
fs_cli {{[-r|--retry]}}
```

fsadm

Check or resize a filesystem on a device.

More information: https://manned.org/fsadm.

- Check a filesystem for errors:

```
fsadm check {{/dev/vg_name/lv_name}}
```

- Simulate resizing to a specific size, without making any changes:

```
fsadm {{[-n|--dry-run]}} resize {{/dev/vg_name/lv_name}} {{10G}}
```

- Grow a filesystem to fill the entire device (omit the size):

```
fsadm resize {{/dev/vg_name/lv_name}}
```

- Resize the filesystem and the underlying logical volume together:

```
fsadm {{[-l|--lvresize]}} resize {{/dev/vg_name/lv_name}} {{100G}}
```

- For ext2/3/4, unmount and resize offline:

```
fsadm {{[-e|--ext-offline]}} resize {{/dev/vg_name/lv_name}} {{20G}}
```

fsck

Check the integrity of a filesystem or repair it. The filesystem should be unmounted at the time the command is run.

More information: https://manned.org/fsck.

- Check filesystem `/dev/sdXN`, reporting any damaged blocks:

  ```
  sudo fsck {{/dev/sdXN}}
  ```

- Check filesystem `/dev/sdXN`, reporting any damaged blocks and interactively letting the user choose to repair each one:

  ```
  sudo fsck -r {{/dev/sdXN}}
  ```

- Check filesystem `/dev/sdXN`, reporting any damaged blocks and [a]utomatically repairing them:

  ```
  sudo fsck -a {{/dev/sdXN}}
  ```

fscrypt

Go tool for managing Linux filesystem encryption.

More information: https://github.com/google/fscrypt#example-usage.

- Prepare the root filesystem for use with `fscrypt`:

```
sudo fscrypt setup
```

- Prepare a specific mountpoint for use with `fscrypt`:

```
fscrypt setup {{path/to/directory}}
```

- Enable filesystem encryption for a directory:

```
fscrypt encrypt {{path/to/directory}}
```

- Unlock an encrypted directory:

```
fscrypt unlock {{path/to/encrypted_directory}}
```

- Lock an encrypted directory:

```
fscrypt lock {{path/to/encrypted_directory}}
```

fstrim

Discard unused blocks on a mounted filesystem.

Only supported by flash memory devices such as SSDs and microSD cards.

More information: https://manned.org/fstrim.

- Trim unused blocks on all mounted partitions that support it:

```
sudo fstrim {{[-a|--all]}}
```

- Trim unused blocks on a specified partition:

```
sudo fstrim {{/}}
```

- Display statistics after trimming:

```
sudo fstrim {{[-v|--verbose]}} {{/}}
```

fuser

Display process IDs currently using files or sockets.

More information: https://manned.org/fuser.

- Find which processes are accessing a file or directory:

```
fuser {{path/to/file_or_directory}}
```

- Show more fields (`USER`, `PID`, `ACCESS`, and `COMMAND`):

```
fuser {{[-v|--verbose]}} {{path/to/file_or_directory}}
```

- Identify processes using a TCP socket:

```
fuser {{port}}/tcp
```

- Kill all processes accessing a file or directory (sends the `SIGKILL` signal):

```
fuser {{[-k|--kill]}} {{path/to/file_or_directory}}
```

- Find which processes are accessing the filesystem containing a specific file or directory:

```
fuser {{[-m|--mount]}} {{path/to/file_or_directory}}
```

- Kill all processes with a TCP connection on a specific port:

```
fuser {{[-k|--kill]}} {{port}}/tcp
```

fuzzel

A Wayland-native application launcher and fuzzy finder, inspired by **`rofi`** and **`dmenu`**.

More information: https://codeberg.org/dnkl/fuzzel.

- Run applications:

  ```
  fuzzel
  ```

- Run `fuzzel` in dmenu mode:

  ```
  fuzzel {{[-d|--dmenu]}}
  ```

- Display a menu of the output of the `ls` command:

  ```
  {{ls}} | fuzzel {{[-d|--dmenu]}}
  ```

- Display a menu with custom items separated by a new line (`\n`):

  ```
  echo -e "{{red}}\n{{green}}\n{{blue}}" | fuzzel {{[-d|--dmenu]}}
  ```

- Let the user choose between multiple items and save the selected one to a file:

  ```
  echo -e "{{red}}\n{{green}}\n{{blue}}" | fuzzel {{[-d|--dmenu]}} > {{color.txt}}
  ```

- Reset apps usage count (default cache directory: `$XDG_CACHE_HOME/fuzzel`):

  ```
  rm {{[-v|--verbose]}} $HOME/.cache/fuzzel
  ```

- Launch `fuzzel` on a specific monitor, see `wlr-randr` or `swaymsg --type get_outputs`:

  ```
  fuzzel {{[-o|--output]}} "{{DP-1}}"
  ```

- Use `fuzzel` to do an online search:

  ```
  fuzzel {{[-d|--dmenu]}} {{[-l|--lines]}} 0 --placeholder "{{Type your search}}" | sed 's/^/\"/g;s/$/\"/g' | xargs firefox --search
  ```

fwconsole

Manage and configure your FreePBX system (PBX server).

More information: https://sangomakb.atlassian.net/wiki/spaces/PG/pages/41779247/fwconsole+commands+13.

- Reload FreePBX configurations:

  ```
  fwconsole reload
  ```

- Start Asterisk and other commands needed by FreePBX:

  ```
  fwconsole start
  ```

- Stop Asterisk and other commands needed by FreePBX:

  ```
  fwconsole stop
  ```

- View and update settings:

  ```
  fwconsole setting {{keyword}} {{new_value}}
  ```

- List available backups:

  ```
  fwconsole backup --list
  ```

- List available FreePBX commands:

  ```
  fwconsole list
  ```

- Change ownership of all files and directories that FreePBX needs to be owned by the apache user:

  ```
  fwconsole chown
  ```

fwupdmgr

Update device firmware, including UEFI, using **`fwupd`**.

See also: **`fwupdtool`**.

More information: https://github.com/fwupd/fwupd/blob/main/src/fwupdmgr.md.

- Display all devices detected by `fwupd`:

```
fwupdmgr get-devices
```

- Download the latest firmware metadata from LVFS:

```
fwupdmgr refresh
```

- List the updates available for devices on your system:

```
fwupdmgr get-updates
```

- Install firmware updates:

```
fwupdmgr update
```

- Remount `/boot` with more privileges if update complains about a read-only filesystem:

```
sudo mount {{[-o|--options]}} uid=1000,gid=1000,umask=0022
{{/dev/sdX}} /boot
```

- Show firmware update history:

```
fwupdmgr get-history
```

fwupdtool

Update device firmware manually or manipulate firmware files.

See also: **`fwupdmgr`**.

More information: https://github.com/fwupd/fwupd/blob/main/src/fwupdtool.md.

- Display all devices detected by `fwupd`:

```
fwupdtool get-devices
```

- Install firmware from a file:

```
fwupdtool install {{path/to/firmware}}
```

- Display help:

```
fwupdtool {{[-h|--help]}}
```

gamemoderun

Invoke a set of optimizations to improve game performance.

More information: https://github.com/FeralInteractive/gamemode#requesting-gamemode.

- Run a program with optimizations:

  ```
  gamemoderun {{path/to/program}}
  ```

- Within Steam's launch options for a specific game, run a game with optimizations:

  ```
  gamemoderun %command%
  ```

gamescope

A micro-compositor used as a game layer.

See also: **cage**.

More information: https://github.com/ValveSoftware/gamescope#keyboard-shortcuts.

- Run a program with gamescope on the terminal:

```
gamescope -- {{program}}
```

- Run a game with gamescope through Steam:

```
gamescope -- %command%
```

- Upscale a 720p game to 1440p with integer scaling:

```
gamescope {{[-h|--nested-height]}} 720 {{[-H|--output-height]}} 1440 {{[-S|--scaler]}} integer -- {{command}}
```

- Limit a vsynced game to 30 FPS:

```
gamescope {{[-r|--nested-refresh]}} 30 -- {{command}}
```

- Launch Steam in Big Picture Mode and integrate with gamescope:

```
gamescope {{[-e|--steam]}} -- /usr/bin/steam -tenfoot
```

- Specify which display to prefer:

```
gamescope {{[-O|--prefer-output]}} {{HDMI-A-1,DP-3,...}} -- {{program}}
```

- Toggle fullscreen:

```
<Super f>
```

- Display help:

```
gamescope --help
```

gbp

A system to integrate the Debian package build system with Git.

More information: https://honk.sigxcpu.org/projects/git-buildpackage/manual-html/gbp.html.

- Convert an existing Debian package to gbp:

```
gbp import-dsc {{path/to/package.dsc}}
```

- Build the package in the current directory using the default builder (`debuild`):

```
gbp buildpackage -jauto -us -uc
```

- Build a package in a `pbuilder` environment for Debian Bullseye:

```
DIST={{bullseye}} ARCH={{amd64}} gbp buildpackage -jauto -us -uc --git-builder={{git-pbuilder}}
```

- Specify a package to be a source-only upload in the `.changes` file (see https://wiki.debian.org/SourceOnlyUpload):

```
gbp buildpackage -jauto -us -uc --changes-options={{-S}}
```

- Import a new upstream release:

```
gbp import-orig --pristine-tar {{path/to/package.tar.gz}}
```

gcov

Code coverage analysis and profiling tool that discovers untested parts of a program.

Also displays a copy of source code annotated with execution frequencies of code segments.

More information: https://gcc.gnu.org/onlinedocs/gcc/Invoking-Gcov.html.

- Generate a coverage report named `file.cpp.gcov`:

```
gcov {{path/to/file.cpp}}
```

- Write individual execution counts for every basic block:

```
gcov {{[-a|--all-blocks]}} {{path/to/file.cpp}}
```

- Write branch frequencies to the output file and print summary information to `stdout` as a percentage:

```
gcov {{[-b|--branch-probabilities]}} {{path/to/file.cpp}}
```

- Write branch frequencies as the number of branches taken, rather than the percentage:

```
gcov {{[-c|--branch-counts]}} {{path/to/file.cpp}}
```

- Do not create a `gcov` output file:

```
gcov {{[-n|--no-output]}} {{path/to/file.cpp}}
```

- Write file level as well as function level summaries:

```
gcov {{[-f|--function-summaries]}} {{path/to/file.cpp}}
```

gcrane completion

Generate the autocompletion script for gcrane for the specified shell.

The available shells are Bash, fish, PowerShell, and Zsh.

More information: https://github.com/google/go-containerregistry/blob/main/cmd/gcrane/README.md.

- Generate the autocompletion script for your shell:

```
gcrane completion {{shell_name}}
```

- Disable completion descriptions:

```
gcrane completion {{shell_name}} --no-descriptions
```

- Load completions in your current shell session (Bash/Zsh):

```
source <(gcrane completion bash/zsh)
```

- Load completions in your current shell session (fish):

```
gcrane completion fish | source
```

- Load completions for every new session (Bash):

```
gcrane completion bash > /etc/bash_completion.d/gcrane
```

- Load completions for every new session (Zsh):

```
gcrane completion zsh > "${fpath[1]}/_gcrane"
```

- Load completions for every new session (fish):

```
gcrane completion fish > ~/.config/fish/completions/gcrane.fish
```

- Display help:

```
gcrane completion {{shell_name}} {{[-h|--help]}}
```

gdbus

Interact with D-Bus objects.

Part of GLib.

More information: https://manned.org/gdbus.

- List all names on the session bus:

```
gdbus list-names --session
```

- List all names on the system bus:

```
gdbus list-names --system
```

- Introspect an object to see its interfaces and methods:

```
gdbus introspect --session --dest {{destination_bus_name}} --
object-path /{{path/to/object}}
```

- Call a method on an object with arguments:

```
gdbus call --session --dest {{destination_bus_name}} --
object-path /{{path/to/object}} --method
{{interface.method_name}} {{argument1 argument2 ...}}
```

- Emit a signal from an object with arguments:

```
gdbus emit --session --object-path /{{path/to/object}} --
signal {{interface.signal_name}} {{argument1 argument2 ...}}
```

- Monitor all messages on the session bus:

```
gdbus monitor --session
```

gdebi

Easily install **`.deb`** files.

More information: https://manned.org/gdebi.

- Install local `.deb` packages resolving and installing its dependencies:

```
gdebi {{path/to/package.deb}}
```

- Do not show progress information:

```
gdebi {{path/to/package.deb}} {{[-q|--quiet]}}
```

- Set an APT configuration option:

```
gdebi {{path/to/package.deb}} {{[-o|--option]}}
{{apt_options}}
```

- Use alternative root dir:

```
gdebi {{path/to/package.deb}} --root {{path/to/
root_directory}}
```

- Display version:

```
gdebi --version
```

gdisk

GPT (GUID Partition Table) disk partitioning tool.

See also: **`cfdisk`**, **`fdisk`**, **`parted`**.

More information: https://manned.org/gdisk.

- List partitions:

  `sudo gdisk {{[-l|--list]}}`

- Start the interactive partition manipulator:

  `sudo gdisk {{/dev/sdX}}`

- Open a help menu:

  `<?>`

- Print the [p]artition table:

  `<p>`

- Add a [n]ew partition:

  `<n>`

- Select a partition to [d]elete:

  `<d>`

- [w]rite table to disk and exit:

  `<w>`

- [q]uit without saving changes:

  `<q>`

gedit

Text editor of the GNOME Desktop project.

More information: https://manned.org/gedit.

- Open a text file:

```
gedit {{path/to/file}}
```

- Open multiple text files:

```
gedit {{file1 file2 ...}}
```

- Open a text file with a specific encoding:

```
gedit --encoding {{UTF-8}} {{path/to/file}}
```

- Display a list of supported encodings:

```
gedit --list-encodings
```

gemma3

The examples for this command have been moved together with **`inference-snap`**.

More information: https://github.com/canonical/gemma3-snap.

- View documentation for `inference-snap`:

```
tldr inference-snap
```

gemma4

The examples for this command have been moved together with **`inference-snap`**.

More information: https://github.com/canonical/gemma4-snap.

- View documentation for `inference-snap`:

```
tldr inference-snap
```

genfstab

Generate output suitable for addition to the **`/etc/fstab`** file.

More information: https://manned.org/genfstab.

- Generate the `/etc/fstab` file using volume UUIDs during an Arch Linux installation (requires root permissions):

```
genfstab -U {{/mnt}} >> {{/mnt/etc/fstab}}
```

- Display fstab-compatible output based on volume labels:

```
genfstab -L {{path/to/mount_point}}
```

- Display fstab-compatible output based on volume UUIDs:

```
genfstab -U {{path/to/mount_point}}
```

- Display fstab-compatible output based on the specified identifier:

```
genfstab -t {{LABEL|UUID|PARTLABEL|PARTUUID}}
```

- Append a volume into the `/etc/fstab` file to mount it automatically:

```
genfstab -U {{path/to/mount_point}} | sudo tee -a /etc/fstab
```

genie

Set up and use a "bottle" namespace to run systemd under WSL (Windows Subsystem for Linux).

To run these from Windows rather than an already-running distribution, precede them with **`wsl`**.

More information: https://github.com/arkane-systems/genie.

- Initialize the bottle (run once, at start):

```
genie {{[-i|--initialize]}}
```

- Run a login shell inside the bottle:

```
genie {{[-s|--shell]}}
```

- Run a specified command inside the bottle:

```
genie {{[-c|--command]}} {{command}}
```

genisoimage

This command is an alias of **`mkisofs`**.

- View documentation for the original command:

  ```
  tldr mkisofs
  ```

genkernel

Gentoo Linux utility to compile and install kernels.

More information: https://wiki.gentoo.org/wiki/Genkernel.

- Automatically compile and install a generic kernel:

```
sudo genkernel all
```

- Build and install the bzImage, initramfs, kernel, or ramdisk only:

```
sudo genkernel {{bzImage|initramfs|kernel|ramdisk}}
```

- Apply changes to the kernel configuration before compiling and installing:

```
sudo genkernel --menuconfig all
```

- Generate a kernel with a custom name:

```
sudo genkernel --kernname={{custom_name}} all
```

- Use a kernel source outside the default directory `/usr/src/linux`:

```
sudo genkernel --kerneldir={{path/to/directory}} all
```

get-edid

Retrieve monitor specifications using the VESA VBE DDC protocol.

See also: **`edid-decode`**.

More information: https://manned.org/get-edid.

- Retrieve monitor specifications:

```
sudo get-edid
```

- Parse the information:

```
sudo get-edid | parse-edid
```

getcap

Display the name and capabilities of each specified file.

More information: https://manned.org/getcap.

- Get capabilities for the given files:

```
getcap {{path/to/file1 path/to/file2 ...}}
```

- Get capabilities for all the files recursively under the given directories:

```
getcap -r {{path/to/directory1 path/to/directory2 ...}}
```

- Display all searched entries even if no capabilities are set:

```
getcap -v {{path/to/file1 path/to/file2 ...}}
```

getconf

Get configuration values from your Linux system.

More information: https://manned.org/getconf.1.

- List [a]ll configuration values available:

```
getconf -a
```

- List the configuration values for a specific directory:

```
getconf -a {{path/to/directory}}
```

- Check if the system is 32-bit or 64-bit:

```
getconf LONG_BIT
```

- Check how many processes the current user can run at once:

```
getconf CHILD_MAX
```

- List every configuration value and then find patterns with the `grep` command (i.e. every value with MAX in it):

```
getconf -a | grep MAX
```

getenforce

Get the current mode of SELinux (i.e. enforcing, permissive, or disabled).

See also: **`setenforce`**, **`semanage permissive`**.

More information: https://manned.org/getenforce.

- Display the current mode of SELinux:

```
getenforce
```

getent

Get entries from Name Service Switch libraries.

More information: https://manned.org/getent.

- Get list of all groups:

```
getent group
```

- See the members of a group:

```
getent group {{group_name}}
```

- Get list of all services:

```
getent services
```

- Find a username by UID:

```
getent passwd 1000
```

- Perform a reverse DNS lookup:

```
getent hosts {{host}}
```

getfacl

Get file access control lists (ACL).

More information: https://manned.org/getfacl.

- Display the file access control list:

```
getfacl {{path/to/file_or_directory}}
```

- Display the file access control list with numeric user and group IDs:

```
getfacl {{[-n|--numeric]}} {{path/to/file_or_directory}}
```

- Display the file access control list with tabular output format:

```
getfacl {{[-t|--tabular]}} {{path/to/file_or_directory}}
```

getfattr

Display file names and extended attributes.

See also: **`setfattr`**.

More information: https://manned.org/getfattr.

- Retrieve all extended attributes of a file and display them in a detailed format:

```
getfattr {{[-d|--dump]}} {{path/to/file}}
```

- Get a specific attribute of a file:

```
getfattr {{[-n|--name]}} user.{{attribute_name}} {{path/to/file}}
```

getopt

Parse command-line arguments.

More information: https://manned.org/getopt.

- Parse optional `verbose`/`version` flags with shorthands:

```
getopt {{[-o|--options]}} vV {{[-l|--longoptions]}} verbose,version -- --version --verbose
```

- Add a `--file` option with a required argument with shorthand `-f`:

```
getopt {{[-o|--options]}} f: {{[-l|--longoptions]}} file: -- --file=somefile
```

- Add a `--verbose` option with an optional argument with shorthand `-v`, and pass a non-option parameter `arg`:

```
getopt {{[-o|--options]}} v:: {{[-l|--longoptions]}} verbose:: -- --verbose arg
```

- Accept a `-r` and `--verbose` flag, a `--accept` option with an optional argument, and add a `--target` with a required argument option with shorthands:

```
getopt {{[-o|--options]}} rv::s::t: {{[-l|--longoptions]}} verbose,source::,target: -- -v --target target
```

getsebool

Get SELinux boolean value.

See also: **`semanage boolean`**, **`setsebool`**.

More information: https://manned.org/getsebool.

- Show the current setting of a boolean:

```
getsebool {{httpd_can_connect_ftp}}
```

- Show the current setting of [a]ll booleans:

```
getsebool -a
```

- Show the current setting of all booleans with explanations:

```
sudo semanage boolean {{[-l|--list]}}
```

gif2webp

Convert a GIF image to WebP.

More information: https://developers.google.com/speed/webp/docs/gif2webp.

- Convert a GIF image to WebP:

```
gif2webp {{path/to/image.gif}} -o {{path/to/image.webp}}
```

gio trash

Move files to the trash bin.

Used by GNOME to handle trash.

More information: https://manned.org/gio.

- Move specific files to the trash bin:

```
gio trash {{path/to/file_or_directory1 path/to/
file_or_directory2 ...}}
```

- List trash bin items:

```
gio trash --list
```

- Empty the trash:

```
gio trash --empty
```

- Restore a specific item from trash using its ID:

```
gio trash trash://{{item_id}}
```

gio

Handle local and virtual files (GVfs).

Part of GLib used in GNOME-based systems.

More information: https://manned.org/gio.

- Open a file with the default application (e.g. PDF, image):

```
gio open {{path/to/file}}
```

- List files in a directory:

```
gio list {{path/to/directory}}
```

- Show information about a file:

```
gio info {{path/to/file}}
```

- Copy a file:

```
gio copy {{path/to/source}} {{path/to/destination}}
```

- Send a file to the trash (reversible):

```
gio trash {{path/to/file}}
```

- Empty the trash:

```
gio trash --empty
```

- Launch an application from a `.desktop` file:

```
gio launch {{path/to/file}}.desktop
```

- Mark a `.desktop` file as trusted, allowing it to be executed:

```
gio set {{path/to/file}}.desktop metadata::trusted true
```

gksu

Frontend for **su**.

Run graphical commands which need root access without having to run an X terminal emulator.

Note: This command is deprecated and no longer maintained, use **pkexec** instead.

See also: **gksudo**.

More information: https://manned.org/gksu.

- Run a command as a specific user:

```
gksu {{[-u|--user]}} {{userid}} {{command}}
```

- Run the command while preserving the current environments:

```
gksu {{[-u|--user]}} {{userid}} {{[-k|--preserve-env]}}
{{command}}
```

- Force `gksu` to use `su` to run the command:

```
gksu {{[-u|--user]}} {{userid}} {{[-w|--su-mode]}}
{{command}}
```

- Force `gksu` to use `sudo` to run the command:

```
gksu {{[-u|--user]}} {{userid}} {{[-S|--sudo-mode]}}
{{command}}
```

- Output debug info for the given command:

```
gksu {{[-u|--user]}} {{userid}} {{[-d|--debug]}} {{command}}
```

gksudo

Frontend for **sudo**.

Run graphical commands which need root access without having to run an X terminal emulator.

Note: This command is deprecated and no longer maintained, use **pkexec** instead.

See also: **gksu**.

More information: https://manned.org/gksudo.

- Run a command as a specific user:

```
gksudo {{[-u|--user]}} {{userid}} {{command}}
```

- Run the command while preserving the current environments:

```
gksudo {{[-u|--user]}} {{userid}} {{[-k|--preserve-env]}}
{{command}}
```

- Force `gksudo` to use `su` to run the command:

```
gksu {{[-u|--user]}} {{userid}} {{[-w|--su-mode]}}
{{command}}
```

- Force `gksudo` to use `sudo` to run the command:

```
gksudo {{[-u|--user]}} {{userid}} {{[-S|--sudo-mode]}}
{{command}}
```

- Output debug info for the given command:

```
gksudo {{[-u|--user]}} {{userid}} {{[-d|--debug]}}
{{command}}
```

gnome-calculator

The official calculator for the GNOME desktop environment.

More information: https://wiki.gnome.org/Apps/Calculator.

- Launch the GNOME Calculator GUI:

```
gnome-calculator
```

- Solve the specified equation without launching the desktop application:

```
gnome-calculator --solve {{2^5 * 2 + 5}}
```

- Display version:

```
gnome-calculator --version
```

gnome-extensions

Manage gnome extensions from the terminal.

More information: https://wiki.gnome.org/Projects/GnomeShell/Extensions.

- List all the installed extensions:

```
gnome-extensions list
```

- Display information about a specific extension:

```
gnome-extensions info "{{extension_id}}"
```

- Enable a specific extension:

```
gnome-extensions enable "{{extension_id}}"
```

- Disable a specific extension:

```
gnome-extensions disable "{{extension_id}}"
```

- Uninstall a specific extension:

```
gnome-extensions uninstall "{{extension_id}}"
```

- Display help for a specific subcommand (like `list`):

```
gnome-extensions help {{subcommand}}
```

- Display version:

```
gnome-extensions version
```

gnome-screenshot

Capture the screen, a window, or a user-defined area and save the image to a file.

More information: https://manned.org/gnome-screenshot.

- Take a screenshot and save it to the default location, normally `~/Pictures`:

```
gnome-screenshot
```

- Take a screenshot and save it to the named file location:

```
gnome-screenshot {{[-f|--file]}} {{path/to/file}}
```

- Take a screenshot and save it to the clipboard:

```
gnome-screenshot {{[-c|--clipboard]}}
```

- Take a screenshot after the specified number of seconds:

```
gnome-screenshot {{[-d|--delay]}} {{5}}
```

- Launch the GNOME Screenshot GUI:

```
gnome-screenshot {{[-i|--interactive]}}
```

- Take a screenshot of the current window and save it to the specified file location:

```
gnome-screenshot {{[-w|--window]}} {{[-f|--file]}} {{path/to/file}}
```

- Take a screenshot after the specified number of seconds and save it to the clipboard:

```
gnome-screenshot {{[-d|--delay]}} {{10}} {{[-c|--clipboard]}}
```

- Display version:

```
gnome-screenshot --version
```

gnome-software

Add and remove applications and update your system.

More information: https://manned.org/gnome-software.

- Launch the GNOME Software GUI if it's not already running:

```
gnome-software
```

- Launch the GNOME Software GUI if it's not open, and navigate to the specified page:

```
gnome-software --mode {{updates|updated|installed|overview}}
```

- Launch the GNOME Software GUI if it's not open and view the details of the specified package:

```
gnome-software --details {{package}}
```

- Display version:

```
gnome-software --version
```

gnome-terminal

The GNOME Terminal emulator.

More information: https://help.gnome.org/users/gnome-terminal/stable/.

- Open a new GNOME terminal window:

```
gnome-terminal
```

- Run a specific command in a new terminal window:

```
gnome-terminal -- {{command}}
```

- Open a new tab in the last opened window instead:

```
gnome-terminal --tab
```

- Set the title of the new tab:

```
gnome-terminal --tab {{[-t|--title]}} "{{title}}"
```

gnu[

This command is an alias of GNU `[`.

- View documentation for the original command:

```
tldr [
```

gnuarch

This command is an alias of GNU **arch**.

- View documentation for the original command:

  `tldr arch`

gnub2sum

This command is an alias of GNU **b2sum**.

- View documentation for the original command:

```
tldr b2sum
```

gnubase32

This command is an alias of GNU **base32**.

- View documentation for the original command:

```
tldr base32
```

gnubase64

This command is an alias of GNU **base64**.

- View documentation for the original command:

```
tldr base64
```

gnubasename

This command is an alias of GNU **`basename`**.

- View documentation for the original command:

```
tldr basename
```

gnubasenc

This command is an alias of GNU **`basenc`**.

- View documentation for the original command:

```
tldr basenc
```

gnucat

This command is an alias of GNU **cat**.

- View documentation for the original command:

```
tldr cat
```

gnuchcon

This command is an alias of GNU **chcon**.

- View documentation for the original command:

```
tldr chcon
```

gnuchgrp

This command is an alias of GNU **`chgrp`**.

- View documentation for the original command:

  ```
  tldr chgrp
  ```

gnuchmod

This command is an alias of GNU **chmod**.

- View documentation for the original command:

```
tldr chmod
```

gnuchown

This command is an alias of GNU **chown**.

- View documentation for the original command:

```
tldr chown
```

gnucksum

This command is an alias of GNU **`cksum`**.

- View documentation for the original command:

```
tldr cksum
```

gnucomm

This command is an alias of GNU **comm**.

- View documentation for the original command:

```
tldr comm
```

gnucp

This command is an alias of GNU **cp**.

- View documentation for the original command:

```
tldr cp
```

gnucsplit

This command is an alias of GNU **`csplit`**.

- View documentation for the original command:

```
tldr csplit
```

gnucut

This command is an alias of GNU **`cut`**.

- View documentation for the original command:

```
tldr cut
```

gnudate

This command is an alias of GNU **`date`**.

- View documentation for the original command:

  ```
  tldr date
  ```

gnudd

This command is an alias of GNU **dd**.

- View documentation for the original command:

```
tldr dd
```

gnudf

This command is an alias of GNU **df**.

- View documentation for the original command:

```
tldr df
```

gnudir

This command is an alias of GNU **`dir`**.

- View documentation for the original command:

```
tldr dir
```

gnudircolors

This command is an alias of GNU **`dircolors`**.

- View documentation for the original command:

```
tldr dircolors
```

gnudirname

This command is an alias of GNU **`dirname`**.

- View documentation for the original command:

```
tldr dirname
```

gnudu

This command is an alias of GNU **du**.

- View documentation for the original command:

```
tldr du
```

gnuecho

This command is an alias of GNU **echo**.

- View documentation for the original command:

```
tldr echo
```

gnuenv

This command is an alias of GNU **env**.

- View documentation for the original command:

```
tldr env
```

gnuexpand

This command is an alias of GNU **expand**.

- View documentation for the original command:

```
tldr expand
```

gnuexpr

This command is an alias of GNU **`expr`**.

- View documentation for the original command:

```
tldr expr
```

gnufactor

This command is an alias of GNU **`factor`**.

- View documentation for the original command:

```
tldr factor
```

gnufalse

This command is an alias of GNU **`false`**.

- View documentation for the original command:

  `tldr false`

gnufmt

This command is an alias of GNU **fmt**.

- View documentation for the original command:

```
tldr fmt
```

gnufold

This command is an alias of GNU **`fold`**.

- View documentation for the original command:

  ```
  tldr fold
  ```

gnugroups

This command is an alias of GNU **`groups`**.

- View documentation for the original command:

```
tldr groups
```

gnuhead

This command is an alias of GNU **head**.

- View documentation for the original command:

```
tldr head
```

gnuhostid

This command is an alias of GNU **hostid**.

- View documentation for the original command:

```
tldr hostid
```

gnuid

This command is an alias of GNU **id**.

- View documentation for the original command:

```
tldr id
```

gnuinstall

This command is an alias of GNU **`install`**.

- View documentation for the original command:

  ```
  tldr install
  ```

gnujoin

This command is an alias of GNU **`join`**.

- View documentation for the original command:

```
tldr join
```

gnulink

This command is an alias of GNU **`link`**.

- View documentation for the original command:

```
tldr link
```

gnuln

This command is an alias of GNU **`ln`**.

- View documentation for the original command:

```
tldr ln
```

gnulogname

This command is an alias of GNU **`logname`**.

- View documentation for the original command:

```
tldr logname
```

gnuls

This command is an alias of GNU **`ls`**.

- View documentation for the original command:

```
tldr ls
```

gnumd5sum

This command is an alias of GNU **`md5sum`**.

- View documentation for the original command:

  ```
  tldr md5sum
  ```

gnumkdir

This command is an alias of GNU **`mkdir`**.

- View documentation for the original command:

```
tldr mkdir
```

gnumkfifo

This command is an alias of GNU **`mkfifo`**.

- View documentation for the original command:

  ```
  tldr mkfifo
  ```

gnumknod

This command is an alias of GNU **mknod**.

- View documentation for the original command:

  ```
  tldr mknod
  ```

gnumktemp

This command is an alias of GNU **mktemp**.

- View documentation for the original command:

```
tldr mktemp
```

gnumv

This command is an alias of GNU **mv**.

- View documentation for the original command:

```
tldr mv
```

gnunice

This command is an alias of GNU **`nice`**.

- View documentation for the original command:

```
tldr nice
```

gnunl

This command is an alias of GNU **`nl`**.

- View documentation for the original command:

```
tldr nl
```

gnunohup

This command is an alias of GNU **nohup**.

- View documentation for the original command:

```
tldr nohup
```

gnunproc

This command is an alias of GNU **`nproc`**.

- View documentation for the original command:

  ```
  tldr nproc
  ```

gnunumfmt

This command is an alias of GNU **`numfmt`**.

- View documentation for the original command:

  ```
  tldr numfmt
  ```

gnuod

This command is an alias of GNU **od**.

- View documentation for the original command:

```
tldr od
```

gnupaste

This command is an alias of GNU **paste**.

- View documentation for the original command:

```
tldr paste
```

gnupathchk

This command is an alias of GNU **pathchk**.

- View documentation for the original command:

```
tldr pathchk
```

gnupinky

This command is an alias of GNU **`pinky`**.

- View documentation for the original command:

```
tldr pinky
```

gnupr

This command is an alias of GNU **pr**.

- View documentation for the original command:

```
tldr pr
```

gnuprintenv

This command is an alias of GNU **`printenv`**.

- View documentation for the original command:

  ```
  tldr printenv
  ```

gnuprintf

This command is an alias of GNU **`printf`**.

- View documentation for the original command:

  ```
  tldr printf
  ```

gnuptx

This command is an alias of GNU **ptx**.

- View documentation for the original command:

```
tldr ptx
```

gnupwd

This command is an alias of GNU **pwd**.

- View documentation for the original command:

```
tldr pwd
```

gnureadlink

This command is an alias of GNU **`readlink`**.

- View documentation for the original command:

  ```
  tldr readlink
  ```

gnurealpath

This command is an alias of GNU **`realpath`**.

- View documentation for the original command:

  ```
  tldr realpath
  ```

gnurm

This command is an alias of GNU **rm**.

- View documentation for the original command:

  ```
  tldr rm
  ```

gnurmdir

This command is an alias of GNU **`rmdir`**.

- View documentation for the original command:

```
tldr rmdir
```

gnuruncon

This command is an alias of GNU **runcon**.

- View documentation for the original command:

```
tldr runcon
```

gnuseq

This command is an alias of GNU **seq**.

- View documentation for the original command:

```
tldr seq
```

gnusha1sum

This command is an alias of GNU **`sha1sum`**.

- View documentation for the original command:

```
tldr sha1sum
```

gnusha224sum

This command is an alias of GNU **`sha224sum`**.

- View documentation for the original command:

```
tldr sha224sum
```

gnusha256sum

This command is an alias of GNU **`sha256sum`**.

- View documentation for the original command:

```
tldr sha256sum
```

gnusha384sum

This command is an alias of GNU **`sha384sum`**.

- View documentation for the original command:

```
tldr sha384sum
```

gnusha512sum

This command is an alias of GNU **`sha512sum`**.

- View documentation for the original command:

  ```
  tldr sha512sum
  ```

gnushred

This command is an alias of GNU **shred**.

- View documentation for the original command:

```
tldr shred
```

gnushuf

This command is an alias of GNU **`shuf`**.

- View documentation for the original command:

```
tldr shuf
```

gnusleep

This command is an alias of GNU **`sleep`**.

- View documentation for the original command:

```
tldr sleep
```

gnusort

This command is an alias of GNU **`sort`**.

- View documentation for the original command:

```
tldr sort
```

gnusplit

This command is an alias of GNU **`split`**.

- View documentation for the original command:

```
tldr split
```

gnustat

This command is an alias of GNU **`stat`**.

- View documentation for the original command:

```
tldr stat
```

gnustdbuf

This command is an alias of GNU **`stdbuf`**.

- View documentation for the original command:

```
tldr stdbuf
```

gnustty

This command is an alias of GNU **`stty`**.

- View documentation for the original command:

```
tldr stty
```

gnusum

This command is an alias of GNU **`sum`**.

- View documentation for the original command:

```
tldr sum
```

gnusync

This command is an alias of GNU **sync**.

- View documentation for the original command:

```
tldr sync
```

gnutac

This command is an alias of GNU **tac**.

- View documentation for the original command:

```
tldr tac
```

gnutail

This command is an alias of GNU **`tail`**.

- View documentation for the original command:

```
tldr tail
```

gnutee

This command is an alias of GNU **tee**.

- View documentation for the original command:

```
tldr tee
```

gnutest

This command is an alias of GNU **`test`**.

- View documentation for the original command:

```
tldr test
```

gnutimeout

This command is an alias of GNU **`timeout`**.

- View documentation for the original command:

```
tldr timeout
```

gnutouch

This command is an alias of GNU **`touch`**.

- View documentation for the original command:

```
tldr touch
```

gnutr

This command is an alias of GNU **tr**.

- View documentation for the original command:

```
tldr tr
```

gnutrue

This command is an alias of GNU **`true`**.

- View documentation for the original command:

```
tldr true
```

gnutruncate

This command is an alias of GNU **`truncate`**.

- View documentation for the original command:

```
tldr truncate
```

gnutsort

This command is an alias of GNU **`tsort`**.

- View documentation for the original command:

```
tldr tsort
```

gnutty

This command is an alias of GNU **`tty`**.

- View documentation for the original command:

```
tldr tty
```

gnuuname

This command is an alias of GNU **`uname`**.

- View documentation for the original command:

```
tldr uname
```

gnuunexpand

This command is an alias of GNU **unexpand**.

- View documentation for the original command:

  ```
  tldr unexpand
  ```

gnuuniq

This command is an alias of GNU **`uniq`**.

- View documentation for the original command:

```
tldr uniq
```

gnuunlink

This command is an alias of GNU **`unlink`**.

- View documentation for the original command:

```
tldr unlink
```

gnuusers

This command is an alias of GNU **`users`**.

- View documentation for the original command:

```
tldr users
```

gnuvdir

This command is an alias of GNU **`vdir`**.

- View documentation for the original command:

```
tldr vdir
```

gnuwc

This command is an alias of GNU **`wc`**.

- View documentation for the original command:

```
tldr wc
```

gnuwho

This command is an alias of GNU **who**.

- View documentation for the original command:

```
tldr who
```

gnuwhoami

This command is an alias of GNU **`whoami`**.

- View documentation for the original command:

  ```
  tldr whoami
  ```

gnuyes

This command is an alias of GNU **yes**.

- View documentation for the original command:

```
tldr yes
```

goaccess

An open source real-time web log analyzer.

More information: https://goaccess.io/man.

- Analyze one or more log files in interactive mode:

```
goaccess {{path/to/log1 path/to/log2 ...}}
```

- Use a specific log-format (or pre-defined formats like "combined"):

```
goaccess {{path/to/logfile}} --log-format={{format}}
```

- Analyze a log from `stdin`:

```
tail {{[-f|--follow]}} {{path/to/logfile}} | goaccess -
```

- Analyze a log and write it to an HTML file in real-time:

```
goaccess {{path/to/logfile}} {{[-o|--output]}} {{path/to/
file.html}} --real-time-html
```

goldeneye.py

A HTTP DoS test tool.

More information: https://github.com/jseidl/GoldenEye#usage.

- Test a specific website:

```
{{path/to/}}goldeneye.py {{url}}
```

- Test a specific website with 100 user agents and 200 concurrent sockets:

```
{{path/to/}}goldeneye.py {{url}} {{[-u|--useragents]}} 100
{{[-s|--sockets]}} 200
```

- Test a specific website without verifying the SSL certificate:

```
{{path/to/}}goldeneye.py {{url}} {{[-n|--nosslcheck]}}
```

- Test a specific website in debug mode:

```
{{path/to/}}goldeneye.py {{url}} {{[-d|--debug]}}
```

- Display help:

```
{{path/to/}}goldeneye.py {{[-h|--help]}}
```

goobook

Access Google contacts from **`mutt`** or the command-line.

More information: https://manned.org/goobook.

- Allow `goobook` to access Google contacts using OAuth2:

```
goobook authenticate
```

- Dump all contacts to XML (`stdout`):

```
goobook dump_contacts
```

google-chrome-stable

This command is an alias of **`chromium`**.

More information: https://www.google.com/chrome/.

- View documentation for the original command:

```
tldr chromium
```

gpasswd

Administer **`/etc/group`** and **`/etc/gshadow`**.

More information: https://manned.org/gpasswd.

- Define group administrators:

```
sudo gpasswd {{[-A|--administrators]}} {{user1,user2}} {{group}}
```

- Set the list of group members:

```
sudo gpasswd {{[-M|--members]}} {{user1,user2}} {{group}}
```

- Create a password for the named group:

```
gpasswd {{group}}
```

- Add a user to the named group:

```
gpasswd {{[-a|--add]}} {{user}} {{group}}
```

- Remove a user from the named group:

```
gpasswd {{[-d|--delete]}} {{user}} {{group}}
```

gpclient

Connect to a GlobalProtect VPN on Linux via OpenConnect.

More information: https://github.com/yuezk/GlobalProtect-openconnect.

- Connect to a GlobalProtect VPN using a portal server:

```
gpclient connect {{vpn_gateway_url}}
```

- Disconnect from the currently connected VPN server:

```
gpclient disconnect
```

- Launch the graphical user interface (GUI) for VPN management:

```
gpclient launch-gui
```

- Use OpenSSL workaround to bypass legacy renegotiation errors:

```
gpclient connect --fix-openssl {{vpn_gateway_url}}
```

- Ignore TLS errors during connection:

```
gpclient connect --ignore-tls-errors {{vpn_gateway_url}}
```

- Display help for any command:

```
gpclient help {{command}}
```

- Display version:

```
gpclient --version
```

gphoto2

Control digital cameras from the command line.

More information: http://www.gphoto.org/doc/manual/ref-gphoto2-cli.html.

- List connected cameras:

```
gphoto2 --auto-detect
```

- List files on the camera:

```
gphoto2 {{[-L|--list-files]}}
```

- Download all images:

```
gphoto2 {{[-P|--get-all-files]}}
```

- Download only new images (skip existing):

```
gphoto2 {{[-P|--get-all-files]}} --new
```

- Download files 1 through 5:

```
gphoto2 {{[-p|--get-file]}} 1-5
```

- Delete all files on the camera:

```
gphoto2 {{[-D|--delete-all-files]}}
```

- Capture an image and download it:

```
gphoto2 --capture-image-and-download
```

- Show camera information:

```
gphoto2 --summary
```

gpm

Enable mouse support for the Linux virtual console.

More information: https://manned.org/gpm.

- Start gpm with a PS/2 [m]ouse of [t]ype ps2:

```
sudo gpm -m /dev/input/mice -t ps2
```

- Start gpm with a Microsoft serial [m]ouse of [t]ype ms:

```
sudo gpm -m /dev/ttyS0 -t ms
```

- Start gpm with a [m]ouse and [t]ype in the foreground for [D]ebugging:

```
sudo gpm -m {{path/to/mouse_device}} -t {{mouse_type}} -D
```

- [k]ill the running gpm:

```
sudo gpm -k
```

- Start gpm with a [m]ouse and [t]ype in [R]epeater mode for X server compatibility:

```
sudo gpm -m {{path/to/mouse_device}} -t {{mouse_type}} -R
```

- List the available mouse [t]ypes:

```
gpm -t help
```

gpu-screen-recorder

Record the screen and encode the video with a GPU.

More information: https://git.dec05eba.com/gpu-screen-recorder/about/.

- Select a source using a desktop portal and record it:

```
gpu-screen-recorder -w portal -o {{path/to/video.mp4}}
```

- Specify a specific video source:

```
gpu-screen-recorder -w {{screen|DP-1|HDMI-A1|...}} -o {{path/to/video.mp4}}
```

- List video capture sources:

```
gpu-screen-recorder --list-capture-options
```

- List audio capture sources:

```
gpu-screen-recorder {{--list-audio-devices|--list-application-audio}}
```

- Record using the replay buffer:

```
gpu-screen-recorder -w {{screen}} -r {{30}} -c {{mp4}} -ro {{path/to/directory}} -o {{whatever}}
```

- Capture a video from the replay buffer:

```
pkill -SIGUSR1 -f gpu-screen-recorder
```

- Run `gpu-screen-recorder` in the background:

```
systemctl start --user gpu-screen-recorder
```

grabc

A tool to identify a pixel color of an X Window.

More information: https://manned.org/grabc.

- Pick a pixel and print its color in hexadecimal:

```
grabc
```

- Pick a pixel and print its RGB values:

```
grabc -rgb
```

- Enable debug messages:

```
grabc -d
```

- Print the hex ID of the clicked window:

```
grabc -W
```

- Pick a pixel at a specific location on a specific window:

```
grabc -w {{window_id}} -l +{{x}}+{{y}}
```

- Print all 16 bits of color (default prints high 8 bits):

```
grabc -a
```

- Display help:

```
grabc -h
```

grim

Grab images (screenshots) from a Wayland compositor.

By default, files are saved to **`$GRIM_DEFAULT_DIR`** or **`$XDG_PICTURES_DIR`** if the first variable is unset.

If none of the environment variables are set, files are saved to the current working directory.

More information: https://manned.org/grim.

- Screenshot all outputs to the default path:

```
grim
```

- Screenshot a specific output to the specified file:

```
grim -o {{DP-1}} {{path/to/output.png}}
```

- Select a specific region using `slurp` and screenshot it:

```
grim -g "$(slurp)" {{path/to/output.png}}
```

- Screenshot and copy the image to the clipboard:

```
grim - | {{clipboard_manager}}
```

- Set the output file type (default: `png`):

```
grim -t {{png|ppm|jpeg}} {{path/to/output_file}}
```

- Set the PNG compression level (default: 6):

```
grim -l {{0..9}} {{path/to/output.png}}
```

- Set the JPEG quality level (default: 80):

```
grim -t jpeg -q {{0..100}} {{path/to/output.jpg}}
```

- Include cursors in the screenshot:

```
grim -c
```

groupadd

Add user groups to the system.

See also: **`groups`**, **`groupdel`**, **`groupmod`**.

More information: https://manned.org/groupadd.

- Create a new group:

```
sudo groupadd {{group_name}}
```

- Create a new system group:

```
sudo groupadd {{[-r|--system]}} {{group_name}}
```

- Create a new group with the specific groupid:

```
sudo groupadd {{[-g|--gid]}} {{group_id}} {{group_name}}
```

groupdel

Delete existing user groups from the system.

See also: **`groups`**, **`groupadd`**, **`groupmod`**.

More information: https://manned.org/groupdel.

- Delete an existing group:

```
sudo groupdel {{group_name}}
```

groupmod

Modify existing user groups in the system.

See also: **`groups`**, **`groupadd`**, **`groupdel`**.

More information: https://manned.org/groupmod.

- Change the group name:

```
sudo groupmod {{[-n|--new-name]}} {{new_group}} {{group_name}}
```

- Change the group ID:

```
sudo groupmod {{[-g|--gid]}} {{new_id}} {{group_name}}
```

growpart

Extend a partition in a disk or disk image to fill available space.

More information: https://github.com/canonical/cloud-utils.

- Extend partition `n` from `sdX` to fill empty space until end of disk or beginning of next partition:

```
growpart {{/dev/sdX}} {{n}}
```

- Simulate growing partition `n` in a disk image, showing what modifications would be made:

```
growpart {{[-N|--dry-run]}} /{{path/to/disk.img}} {{n}}
```

grub-bios-setup

Set up a device to use GRUB with a BIOS configuration.

You should use **`grub-install`** instead of **`grub-bios-setup`** in most cases.

More information: https://manned.org/grub-bios-setup.

- Set up a device to boot with GRUB:

```
grub-bios-setup {{/dev/sdX}}
```

- Install even if problems are detected:

```
grub-bios-setup {{[-f|--force]}} {{/dev/sdX}}
```

- Install GRUB in a specific directory:

```
grub-bios-setup {{[-d|--directory]}} {{/boot/grub}} {{/dev/sdX}}
```

grub-editenv

Edit GRUB environment variables.

More information: https://www.gnu.org/software/grub/manual/grub/grub.html.

- Set a default boot entry (Assuming the boot entry already exists):

```
grub-editenv /boot/grub/grubenv set default={{Ubuntu}}
```

- Display all GRUB environment variables:

```
grub-editenv /boot/grub/grubenv list
```

- Reset the `saved_entry` variable to the default:

```
grub-editenv /boot/grub/grubenv unset saved_entry
```

grub-file

Check if a file is of a bootable image type.

More information: https://manned.org/grub-file.

- Check if a file is an ARM EFI image:

```
grub-file --is-arm-efi {{path/to/file}}
```

- Check if a file is an i386 EFI image:

```
grub-file --is-i386-efi {{path/to/file}}
```

- Check if a file is an x86_64 EFI image:

```
grub-file --is-x86_64-efi {{path/to/file}}
```

- Check if a file is an ARM image (Linux kernel):

```
grub-file --is-arm-linux {{path/to/file}}
```

- Check if a file is an x86 image (Linux kernel):

```
grub-file --is-x86-linux {{path/to/file}}
```

- Check if a file is an x86_64 XNU image (macOS kernel):

```
grub-file --is-x86_64-xnu {{path/to/file}}
```

grub-install

Install GRUB to a device.

More information: https://www.gnu.org/software/grub/manual/grub/grub.html#Installing-GRUB-using-grub_002dinstall.

- Install GRUB on a BIOS system:

```
sudo grub-install {{path/to/device}}
```

- Install GRUB on a BIOS system while specifying architecture:

```
sudo grub-install --target {{i386-pc}} {{path/to/device}}
```

- Install GRUB on an UEFI system:

```
sudo grub-install --efi-directory {{path/to/efi_directory}}
```

- Install GRUB on an UEFI system while specifying architecture and boot menu text:

```
sudo grub-install --target {{x86_64-efi}} --efi-directory {{path/to/efi_directory}} --bootloader-id {{GRUB}}
```

- Install GRUB pre-loading specific modules:

```
sudo grub-install --target {{x86_64-efi}} --efi-directory {{path/to/efi_directory}} --modules "{{part_gpt part_msdos}}"
```

- Display help:

```
grub-install {{[-?|--help]}}
```

grub-mkconfig

Generate a GRUB configuration file.

More information: https://www.gnu.org/software/grub/manual/grub/grub.html#Invoking-grub_002dmkconfig.

- Simulate generating a GRUB configuration and print it to `stdout`:

```
sudo grub-mkconfig
```

- Generate the configuration file:

```
sudo grub-mkconfig {{[-o|--output]}} {{/boot/grub/grub.cfg}}
```

- Display help:

```
grub-mkconfig {{[-h|--help]}}
```

grub-mkfont

Convert common font file formats into the PF2 format used by GRUB.

More information: https://manned.org/grub-mkfont.

- Convert a font to PF2:

```
grub-mkfont {{[-o|--output]}} {{path/to/output.pf2}} {{path/to/font.ttf}}
```

- Convert a font at a specific size:

```
grub-mkfont {{[-o|--output]}} {{path/to/output.pf2}} {{[-s|--size]}} {{24}} {{path/to/font.ttf}}
```

- Convert only characters in specific Unicode ranges:

```
grub-mkfont {{[-o|--output]}} {{path/to/output.pf2}} {{[-r|--range]}} {{0x20-0x7E,0xA0-0xFF}} {{path/to/font.ttf}}
```

- Set the output font family name:

```
grub-mkfont {{[-o|--output]}} {{path/to/output.pf2}} {{[-n|--name]}} "{{font_family_name}}" {{path/to/font.ttf}}
```

- Convert a font to bold while forcing automatic hinting:

```
grub-mkfont {{[-o|--output]}} {{path/to/output.pf2}} {{[-b|--bold]}} {{[-a|--force-autohint]}} {{path/to/font.ttf}}
```

- Disable hinting and ignore embedded bitmap strikes:

```
grub-mkfont {{[-o|--output]}} {{path/to/output.pf2}} --no-hinting --no-bitmap {{path/to/font.ttf}}
```

grub-mkrelpath

Convert a system path to a path relative to its filesystem root for GRUB.

More information: https://www.gnu.org/software/grub/manual/grub/html_node/Invoking-grub_002dmkrelpath.html.

- Print the GRUB path of a file:

```
grub-mkrelpath {{path/to/file}}
```

- Print the GRUB path of a file on a separately mounted filesystem:

```
grub-mkrelpath {{/mnt/partition/path/to/file}}
```

grub-mkrescue

Make a GRUB CD/USB/floppy bootable image.

More information: https://www.gnu.org/software/grub/manual/grub/grub.html#Invoking-grub_002dmkrescue.

- Create a bootable ISO from the current directory and save it as `grub.iso`:

```
grub-mkrescue --output {{grub.iso}} .
```

- Create an ISO using GRUB files from a custom directory:

```
grub-mkrescue --directory {{/usr/lib/grub/i386-pc}} --output {{grub.iso}} {{path/to/source}}
```

- Use compression for GRUB files when building the image, setting `no` disables compression:

```
grub-mkrescue --compress {{no|xz|gz|lzo}} --output {{grub.iso}} {{path/to/source}}
```

- Disable the GRUB command-line interface in the generated image:

```
grub-mkrescue --disable-cli --output {{grub.iso}} {{path/to/source}}
```

- Preload specific GRUB modules into the image:

```
grub-mkrescue --modules "{{part_gpt iso9660}}" --output {{grub.iso}} {{path/to/source}}
```

- Pass additional options directly to `xorriso`:

```
grub-mkrescue --output {{grub.iso}} -- {{-volid}} {{volume_name}} {{path/to/source}}
```

- Display help:

```
grub-mkrescue {{[-?|--help]}}
```

- Display version:

```
grub-mkrescue --version
```

grub-mount

Mount a filesystem or filesystem image read-only using GRUB's filesystem drivers.

More information: https://www.gnu.org/software/grub/manual/grub/grub.html#Invoking-grub_002dmount.

- Mount a block device or filesystem image to a mount point:

```
grub-mount {{/dev/sdXY}} {{/mnt}}
```

- Mount an entire disk image's second partition, `-r` specifies the partition number in the image:

```
grub-mount {{[-r|--root]}} {{2}} {{disk.img}} {{/mnt}}
```

- Mount an encrypted device and prompt for a passphrase:

```
grub-mount {{[-C|--crypto]}} {{/dev/sdXY}} {{/mnt}}
```

- Load a ZFS encryption key from a file:

```
grub-mount {{[-K|--zfs-key]}} /{{path/to/zfs.key}} {{/dev/sdX}} {{/mnt}}
```

- Show debugging output for a matching category:

```
grub-mount {{[-d|--debug]}} {{string}} {{image}} {{/mnt}}
```

- Enable verbose output:

```
grub-mount {{[-v|--verbose]}} {{image}} {{/mnt}}
```

- Display help:

```
grub-mount {{[-?|--help]}}
```

- Display version:

```
grub-mount --version
```

grub-probe

Probe device information for a particular path or device.

More information: https://www.gnu.org/software/grub/manual/grub/html_node/Invoking-grub_002dprobe.html.

- Get GRUB filesystem module for a path:

```
sudo grub-probe {{[-t|--target]}} fs {{/boot/grub}}
```

- Get the system device containing a path:

```
sudo grub-probe {{[-t|--target]}} device {{/boot/grub}}
```

- Get GRUB disk name for a system device:

```
sudo grub-probe {{[-t|--target]}} drive {{/dev/sdX}} {{[-d|--device]}}
```

- Get filesystem UUID:

```
sudo grub-probe {{[-t|--target]}} fs_uuid {{/boot/grub}}
```

- Get filesystem label:

```
sudo grub-probe {{[-t|--target]}} fs_label {{/boot/grub}}
```

- Get MBR partition type code(two hexadecimal digits):

```
sudo grub-probe {{[-t|--target]}} msdos_parttype {{/dev/sdX}}
```

- Probe using a custom device map:

```
sudo grub-probe {{[-t|--target]}} drive {{/boot/grub}} {{[-m|--device-map]}} {{path/to/custom_device.map}}
```

grub-reboot

Set the default boot entry for GRUB, for the next boot only.

More information: https://manned.org/grub-reboot.

- Set the default boot entry to an entry number, name, or identifier for the next boot:

```
sudo grub-reboot {{entry_number}}
```

- Set the default boot entry to an entry number, name, or identifier for an alternative boot directory for the next boot:

```
sudo grub-reboot --boot-directory /{{path/to/boot_directory}} {{entry_number}}
```

grub-script-check

The program **`grub-script-check`** takes a GRUB script file and checks it for syntax errors.

It may take a path as a non-option argument. If none is supplied, it will read from **`stdin`**.

More information: https://www.gnu.org/software/grub/manual/grub/grub.html#Invoking-grub_002dscript_002dcheck.

- Check a specific script file for syntax errors:

```
grub-script-check {{path/to/grub_config_file}}
```

- Display each line of input after reading it:

```
grub-script-check {{[-v|--verbose]}}
```

- Display help:

```
grub-script-check --help
```

- Display version:

```
grub-script-check --version
```

grub-set-default

Set the default boot entry for GRUB.

More information: https://manned.org/grub-set-default.

- Set the default boot entry to an entry number, name, or identifier:

```
sudo grub-set-default {{entry_number}}
```

- Set the default boot entry to an entry number, name, or identifier for an alternative boot directory:

```
sudo grub-set-default --boot-directory /{{path/to/boot_directory}} {{entry_number}}
```

grub2-mkpasswd-pbkdf2

Generate a hashed password for GRUB.

More information: https://manned.org/grub2-mkpasswd-pbkdf2.

- Create a password hash for GRUB 2 using PBKDF2 and print it to `stdout`:

```
sudo grub2-mkpasswd-pbkdf2 {{[-c|--iteration-count]}}
{{number_of_pbkdf2_iterations}} {{[-s|--salt]}}
{{salt_length}}
```

grubby

Tool for configuring **`grub`** and **`zipl`** bootloaders.

More information: https://manned.org/grubby.8.

- Add kernel boot arguments to all kernel menu entries:

```
sudo grubby --update-kernel=ALL --args '{{quiet
console=ttyS0}}'
```

- Remove existing arguments from the entry for the default kernel:

```
sudo grubby --update-kernel=DEFAULT --remove-args {{quiet}}
```

- List all kernel menu entries:

```
sudo grubby --info=ALL
```

gs

GhostScript, a PDF and PostScript interpreter.

More information: https://manned.org/gs.

- View a file:

```
gs -dQUIET -dBATCH {{file.pdf}}
```

- Reduce PDF file size to 150 dpi images for reading on an e-book device:

```
gs -dNOPAUSE -dQUIET -dBATCH -sDEVICE=pdfwrite -
dPDFSETTINGS=/ebook -sOutputFile={{output.pdf}} {{input.pdf}}
```

- Convert PDF file (pages 1 through 3) to an image with 150 dpi resolution:

```
gs -dQUIET -dBATCH -dNOPAUSE -sDEVICE=jpeg -r150 -
dFirstPage=1 -dLastPage=3 -sOutputFile={{output_%d.jpg}}
{{input.pdf}}
```

- Extract pages from a PDF file:

```
gs -dQUIET -dBATCH -dNOPAUSE -sDEVICE=pdfwrite -
sOutputFile={{output.pdf}} {{input.pdf}}
```

- Merge PDF files:

```
gs -dQUIET -dBATCH -dNOPAUSE -sDEVICE=pdfwrite -
sOutputFile={{output.pdf}} {{input1.pdf}} {{input2.pdf}}
```

- Convert from PostScript file to PDF file:

```
gs -dQUIET -dBATCH -dNOPAUSE -sDEVICE=pdfwrite -
sOutputFile={{output.pdf}} {{input.ps}}
```

gsettings

Query and modify dconf settings with schema validation.

More information: https://manned.org/gsettings.

- Set the value of a key. Fails if the key doesn't exist or the value is out of range:

```
gsettings set {{org.example.schema}} {{example_key}} {{value}}
```

- Print the value of a key or the schema-provided default if the key has not been set in `dconf`:

```
gsettings get {{org.example.schema}} {{example_key}}
```

- Unset a key, so that its schema default value will be used:

```
gsettings reset {{org.example.schema}} {{example_key}}
```

- Display all (non-relocatable) schemas, keys, and values:

```
gsettings list-recursively
```

- Display all keys and values (default if not set) from one schema:

```
gsettings list-recursively {{org.example.schema}}
```

- Display schema-allowed values for a key (helpful with enum keys):

```
gsettings range {{org.example.schema}} {{example_key}}
```

- Display the human-readable description of a key:

```
gsettings describe {{org.example.schema}} {{example_key}}
```

gst-launch-1.0 pipewiresink

Create a PipeWire node to output data from.

More information: https://github.com/PipeWire/pipewire/tree/master/src/gst.

- Output test video:

```
gst-launch-1.0 videotestsrc ! pipewiresink mode=provide
```

- Give the PipeWire node a name:

```
gst-launch-1.0 {{source}} ! pipewiresink client-
name={{node_name}}
```

gst-launch-1.0 pipewiresrc

Read data from a PipeWire node.

More information: https://github.com/PipeWire/pipewire/tree/master/src/gst.

- Listen to the default microphone:

```
gst-launch-1.0 pipewiresrc ! autoaudiosink
```

- Specify node to record and view video in a window:

```
gst-launch-1.0 pipewiresrc target-object={{node_name}} !
autovideosink
```

- Record video into a file:

```
gst-launch-1.0 {{[-e|--eos-on-shutdown]}} pipewiresrc !
videoconvert ! {{x264enc}} ! {{h264parse}} !
{{matroskamux}} ! filesink location={{path/to/file.mkv}}
```

- Capture a screenshot from a video node:

```
gst-launch-1.0 pipewiresrc num-buffers=1 ! videoconvert !
{{pngenc}} ! filesink location={{path/to/file.png}}
```

- Record audio into a file:

```
gst-launch-1.0 {{[-e|--eos-on-shutdown]}} pipewiresrc !
{{opusenc}} ! {{oggmux}} ! filesink location={{path/to/
file.ogg}}
```

- Record the monitor of a device:

```
gst-launch-1.0 pipewiresrc target-object={{node_name}}
stream-properties=props,stream.capture.sink=true !
{{audioconvert ! fakesink}}
```

- Multiplex audio and video into a file:

```
gst-launch-1.0 {{[-e|--eos-on-shutdown]}} pipewiresrc do-
timestamp=true ! videoconvert ! {{x264enc}} ! {{h264parse}} !
{{mux}}. pipewiresrc do-timestamp=true ! {{opusenc}} !
{{mux}}. {{matroskamux}} name={{mux}} ! filesink
location={{path/to/file.mkv}}
```

gst-launch-1.0 v4l2src

Read frames from a Video4Linux2 device.

More information: https://gstreamer.freedesktop.org/documentation/video4linux2/v4l2src.html.

- View video in a window:

```
gst-launch-1.0 v4l2src device={{/dev/video0}} ! autovideosink
```

- Create a PipeWire node out of a v4l2 device:

```
gst-launch-1.0 v4l2src device={{/dev/video0}} !
videoconvert ! pipewiresink mode=provide stream-
properties="properties,media.class=Video/Source" client-
name="{{Virtual Camera}}"
```

gtk-launch

Launch applications from **`.desktop`** files that reside in standard locations.

More information: https://manned.org/gtk-launch.

- Launch an application:

```
gtk-launch {{Application_name}}
```

- Display help:

```
gtk-launch {{[-h|--help]}}
```

guake

A drop-down terminal for GNOME.

See also: **yakuake**.

More information: https://manned.org/guake.

- Toggle Guake visibility:

  `<F12>`

- Toggle fullscreen mode:

  `<F11>`

- Open a new tab:

  `<Ctrl Shift t>`

- Close the terminal:

  `<Super x>`

- Go to the previous tab:

  `<Ctrl PageUp>`

- Search the selected text in the browser:

  `<Ctrl Shift l>`

guix package

Install, upgrade, and remove Guix packages or roll back to previous configurations.

More information: https://guix.gnu.org/manual/en/guix.html#Invoking-guix-package.

- Install a new package:

```
guix package {{[-i|--install]}} {{package}}
```

- Remove a package:

```
guix package {{[-r|--remove]}} {{package}}
```

- Search the package database for a `regex`:

```
guix package {{[-s|--search]}} "{{search_pattern}}"
```

- List installed packages:

```
guix package {{[-I|--list-installed]}}
```

- List generations:

```
guix package {{[-l|--list-generations]}}
```

- Roll back to the previous generation:

```
guix package --roll-back
```

gummy

Screen brightness/temperature manager for Linux/X11.

More information: https://github.com/Gitoffthelawn/gummy.

- Set the screen temperature to 3000K:

```
gummy {{[-t|--temperature]}} {{3000}}
```

- Set the screen backlight to 50%:

```
gummy --backlight {{50}}
```

- Set the screen pixel brightness to 45%:

```
gummy {{[-b|--brightness]}} {{45}}
```

- Increase current screen pixel brightness by 10%:

```
gummy {{[-b|--brightness]}} {{+10}}
```

- Decrease current screen pixel brightness by 10%:

```
gummy {{[-b|--brightness]}} {{-10}}
```

- Set the temperature and pixel brightness for the second screen:

```
gummy {{[-s|--screen]}} {{1}} {{[-t|--temperature]}} {{3800}} {{[-b|--brightness]}} {{65}}
```

gzexe

Compress executable files while keeping them executable.

Back up the original file, appending **~** to its name, and create a shell script that uncompresses and executes the binary inside it.

More information: https://manned.org/gzexe.

- Compress an executable file in-place:

```
gzexe {{path/to/executable}}
```

- [d]ecompress a compressed executable in-place (i.e. convert the shell script back to an uncompressed binary):

```
gzexe -d {{path/to/compressed_executable}}
```

halt

Halt the system.

More information: https://manned.org/halt.

- Halt the system:

  ```
  halt
  ```

- Power off the system (same as `poweroff`):

  ```
  halt {{[-p|--poweroff]}}
  ```

- Reboot the system (same as `reboot`):

  ```
  halt --reboot
  ```

- Halt immediately without contacting the system manager:

  ```
  halt {{[-f|--force]}}
  ```

- Write the wtmp shutdown entry without halting the system:

  ```
  halt {{[-w|--wtmp-only]}}
  ```

handlr

Manage your default applications.

More information: https://github.com/chmln/handlr#usage.

- Open a URL in the default application:

```
handlr open {{https://example.com}}
```

- Open a PDF in the default PDF viewer:

```
handlr open {{path/to/file.pdf}}
```

- Set `imv` as the default application for PNG files:

```
handlr set {{.png}} {{imv.desktop}}
```

- Set MPV as the default application for all audio files:

```
handlr set '{{audio/*}}' {{mpv.desktop}}
```

- List all default apps:

```
handlr list
```

- Print the default application for PNG files:

```
handlr get {{.png}}
```

hardinfo

Show hardware information in GUI window.

More information: https://manned.org/hardinfo.

- Start `hardinfo`:

```
hardinfo
```

- Print report to `stdout`:

```
hardinfo {{[-r|--generate-report]}}
```

- Save report to HTML file:

```
hardinfo {{[-r|--generate-report]}} {{[-f|--report-format]}}
html > hardinfo.html
```

hardlink

Consolidate duplicate files by replacing them with hard links.

Part of **util-linux**, useful for saving disk space when identical files exist across directories.

More information: https://manned.org/hardlink.

- Simulate hardlinking duplicate files without modifying them:

```
hardlink {{[-n|--dry-run]}} {{path/to/directory}}
```

- Hardlink duplicate files in a directory:

```
hardlink {{path/to/directory}}
```

- Hardlink duplicate files in multiple directories:

```
hardlink {{path/to/directory1 path/to/directory2 ...}}
```

- Display verbose output while hardlinking:

```
hardlink {{[-v|--verbose]}} {{path/to/directory}}
```

- Only consider files with a minimum size:

```
hardlink {{[-s|--minimum-size]}} {{size}} {{path/to/
directory}}
```

haveged

Hardware-based random number generator.

More information: https://manned.org/haveged.

- Generate a random number:

```
sudo haveged
```

- Run `haveged` in foreground:

```
sudo haveged {{[-F|--Foreground]}}
```

- Set file path for output of `haveged`:

```
sudo haveged {{[-f|--file]}} {{path/to/file}}
```

- Set run level for daemon:

```
sudo haveged {{[-r|--run]}} {{runlevel}}
```

- Set collection buffer size in kibibyte words:

```
sudo haveged {{[-b|--buffer]}} {{buffer_size_in_kw}}
```

- Insert a command to an already running `haveged` process or daemon:

```
sudo haveged {{[-c|--command]}} {{command}}
```

- Set cache size in kibibyte words:

```
sudo haveged {{[-d|--data]}} {{cache_size_in_kw}}
```

- Set number of bytes to write to the output file:

```
sudo haveged {{[-n|--number]}} {{byteamount}}
```

hcitool

Monitor, configure connections, and send special commands to Bluetooth devices.

More information: https://manned.org/hcitool.

- Scan for Bluetooth devices:

```
hcitool scan
```

- Output the name of a device, returning its MAC address:

```
hcitool name {{bdaddr}}
```

- Fetch information about a remote Bluetooth device:

```
hcitool info {{bdaddr}}
```

- Check the link quality to a Bluetooth device:

```
hcitool lq {{bdaddr}}
```

- Modify the transmit power level:

```
hcitool tpl {{bdaddr}} {{0|1}}
```

- Display the link policy:

```
hcitool lp
```

- Request authentication with a specific device:

```
hcitool auth {{bdaddr}}
```

- Display local devices:

```
hcitool dev
```

hd-idle

Spin down external disks after a period of idle time.

More information: https://manned.org/hd-idle.

- Start a service to manage hard drive spin down. By default hard disks will spin down after 10 minutes of inactivity:

```
systemctl start hd-idle
```

- Spin down a disk immediately:

```
hd-idle -t {{/dev/sdX}}
```

- Set disks to never spin down, then set explicit idle times (in seconds) for disks which have "sda" or "sdb" in their device name:

```
hd-idle -i 0 -a /dev/sda -i {{300}} -a /dev/sdb -i {{1200}}
```

hddtemp

Display temperature of HDD via S.M.A.R.T.

More information: https://manned.org/hddtemp.

- Display temperature of a specific drive:

```
hddtemp {{type}}:{{/dev/sdX}}
```

- Display temperature of a SATA drive assigned to `sda`:

```
hddtemp SATA:/dev/sda
```

- Log temperatures to syslog every `n` seconds:

```
hddtemp {{[-S|--syslog]}} {{nseconds}} {{type}}:{{/dev/sdX}}
```

- Print only numeric value of temperature without unit:

```
hddtemp {{[-n|--numeric]}} {{type}}:{{/dev/sdX}}
```

- Define the unit used to denote temperature:

```
hddtemp {{[-u|--unit]}} {{C|F}} {{type}}:{{/dev/sdX}}
```

- Wake ATA drive before attempting to read temperature:

```
hddtemp {{[-w|--wake-up]}} {{type}}:{{/dev/sdX}}
```

- Enter debug mode to show S.M.A.R.T. fields and their values:

```
hddtemp {{[-D|--debug]}} {{type}}:{{/dev/sdX}}
```

- Suppress compatibility check for drive types:

```
hddtemp {{[-q|--quiet]}} {{type}}:{{/dev/sdX}}
```

hdparm

Get and set SATA and IDE hard drive parameters.

More information: https://manned.org/hdparm.

- Request the identification info of a given device:

```
sudo hdparm -I {{/dev/device}}
```

- Get the Advanced Power Management level:

```
sudo hdparm -B {{/dev/device}}
```

- Set the Advanced Power Management value (values 1-127 permit spin-down, and values 128-254 do not):

```
sudo hdparm -B {{1}} {{/dev/device}}
```

- Display the device's current power mode status:

```
sudo hdparm -C {{/dev/device}}
```

- Force a drive to immediately enter standby mode (usually causes a drive to spin down):

```
sudo hdparm -y {{/dev/device}}
```

- Put the drive into idle (low-power) mode, also setting its standby timeout:

```
sudo hdparm -S {{standby_timeout}} {{device}}
```

- Test the read speed of a specific device:

```
sudo hdparm -tT {{device}}
```

head

Output the first part of files.

See also: **`tail`**.

More information: https://www.gnu.org/software/coreutils/manual/html_node/head-invocation.html.

- Show first 10 lines in a file:

```
head {{path/to/file}}
```

- Show first 10 lines of multiple files:

```
head {{path/to/file1 path/to/file2 ...}}
```

- Output the first 5 lines of a file:

```
head {{[-5|--lines 5]}} {{path/to/file}}
```

- Output the first few lines of a file:

```
head {{[-n|--lines]}} {{count}} {{path/to/file}}
```

- Output the first few bytes of a file:

```
head {{[-c|--bytes]}} {{count}} {{path/to/file}}
```

- Output everything but the last few lines of a file:

```
head {{[-n|--lines]}} -{{count}} {{path/to/file}}
```

- Output everything but the last few bytes of a file:

```
head {{[-c|--bytes]}} -{{count}} {{path/to/file}}
```

hexdump

An ASCII, decimal, hexadecimal, octal dump.

See also: **`hexyl`**, **`od`**, **`xxd`**.

More information: https://manned.org/hexdump.

- Print the hexadecimal representation of a file, replacing duplicate lines by '*':

```
hexdump {{path/to/file}}
```

- Display the input offset in hexadecimal and its ASCII representation in two columns:

```
hexdump {{[-C|--canonical]}} {{path/to/file}}
```

- Display the hexadecimal representation of a file, but interpret only n bytes of the input:

```
hexdump {{[-C|--canonical]}} {{[-n|--length]}}
{{number_of_bytes}} {{path/to/file}}
```

- Don't replace duplicate lines with '*':

```
hexdump {{[-v|--no-squeezing]}} {{path/to/file}}
```

hlint

Suggest improvements to Haskell code.

More information: https://hackage.haskell.org/package/hlint.

- Display suggestions for a given file:

```
hlint {{path/to/file}} options
```

- Check all Haskell files and generate a report:

```
hlint {{path/to/directory}} {{[-r|--report]}}
```

- Automatically apply most suggestions:

```
hlint {{path/to/file}} --refactor
```

- Display additional options:

```
hlint {{path/to/file}} --refactor-options
```

- Generate a settings file ignoring all outstanding hints:

```
hlint {{path/to/file}} --default > {{.hlint.yaml}}
```

hollywood

Fill your console with Hollywood melodrama technobabble.

More information: https://manned.org/hollywood.

- Fill the console:

  ```
  hollywood
  ```

- Exit `hollywood`:

  ```
  <Ctrl c><Ctrl c>
  ```

- Display help:

  ```
  hollywood {{[-h|--help]}}
  ```

homectl

Create, remove, change, or inspect home directories using the systemd-homed service.

More information: https://www.freedesktop.org/software/systemd/man/latest/homectl.html.

- List user accounts and their associated home directories:

```
homectl list
```

- Create a user account and their associated home directory:

```
sudo homectl create {{username}}
```

- Remove a specific user and the associated home directory:

```
sudo homectl remove {{username}}
```

- Change the password for a specific user:

```
sudo homectl passwd {{username}}
```

- Run a shell or a command with access to a specific home directory:

```
sudo homectl with {{username}} -- {{command}} {{command_arguments}}
```

- Lock or unlock a specific home directory:

```
sudo homectl {{lock|unlock}} {{username}}
```

- Change the disk space assigned to a specific home directory to 100 GiB:

```
sudo homectl resize {{username}} {{100G}}
```

- Display help:

```
homectl {{[-h|--help]}}
```

homeshick

Synchronize Git dotfiles.

See also: **`chezmoi`**, **`stow`**, **`tuckr`**, **`vcsh`**.

More information: https://github.com/andsens/homeshick/wiki.

- Create a new castle:

```
homeshick generate {{castle_name}}
```

- Add a file to your castle:

```
homeshick track {{castle_name}} {{path/to/file}}
```

- Go to a castle:

```
homeshick cd {{castle_name}}
```

- Clone a castle:

```
homeshick clone {{github_username}}/{{repository_name}}
```

- Symlink all files from a castle:

```
homeshick link {{castle_name}}
```

hostnamectl

Get or set the hostname of the computer.

More information: https://www.freedesktop.org/software/systemd/man/latest/hostnamectl.html.

- Get the hostname of the computer:

```
hostnamectl
```

- Set the hostname of the computer:

```
sudo hostnamectl set-hostname "{{hostname}}"
```

- Set a pretty hostname for the computer:

```
sudo hostnamectl set-hostname --static
"{{hostname.example.com}}" && sudo hostnamectl set-hostname
--pretty "{{hostname}}"
```

- Reset hostname to its default value:

```
sudo hostnamectl set-hostname --pretty ""
```

htpdate

Synchronize local date and time via HTTP headers from web servers.

More information: https://www.vervest.org/htp/.

- Synchronize date and time:

```
sudo htpdate {{host}}
```

- Perform simulation of synchronization, without any action:

```
htpdate -q {{host}}
```

- Compensate the systematic clock drift:

```
sudo htpdate -x {{host}}
```

- Set time immediate after the synchronization:

```
sudo htpdate -s {{host}}
```

http-prompt

An interactive HTTP client featuring autocomplete and syntax highlighting.

More information: https://github.com/httpie/http-prompt.

- Launch a session targeting the default URL of http://localhost:8000 or the previous session:

  ```
  http-prompt
  ```

- Launch a session with a given URL:

  ```
  http-prompt {{http://example.com}}
  ```

- Launch a session with some initial options:

  ```
  http-prompt {{localhost:8000/api}} --auth
  {{username:password}}
  ```

http_load

An HTTP benchmarking tool.

Runs multiple HTTP fetches in parallel to test the throughput of a web server.

More information: https://www.acme.com/software/http_load/.

- Emulate 20 requests based on a given URL list file per second for 60 seconds:

```
http_load -rate {{20}} -seconds {{60}} {{path/to/urls.txt}}
```

- Emulate 5 concurrent requests based on a given URL list file for 60 seconds:

```
http_load -parallel {{5}} -seconds {{60}} {{path/to/
urls.txt}}
```

- Emulate 1000 requests at 20 requests per second, based on a given URL list file:

```
http_load -rate {{20}} -fetches {{1000}} {{path/to/urls.txt}}
```

- Emulate 1000 requests at 5 concurrent requests at a time, based on a given URL list file:

```
http_load -parallel {{5}} -fetches {{1000}} {{path/to/
urls.txt}}
```

hw-probe

Probe for hardware and upload the information to https://linux-hardware.org.

More information: https://manned.org/hw-probe.

- Probe for all hardware and upload the data:

```
sudo -E hw-probe -all -upload
```

hwclock

Read or change the hardware clock.

More information: https://manned.org/hwclock.

- Display the current time as reported by the hardware clock:

```
sudo hwclock
```

- Write the current software clock time to the hardware clock (sometimes used during system setup):

```
sudo hwclock {{[-w|--systohc]}}
```

- Write the current hardware clock time to the software clock:

```
sudo hwclock {{[-s|--hctosys]}}
```

hwinfo

Probe for the hardware present in the system.

See also: **`inxi`**, **`lshw`**, **`dmidecode`**.

More information: https://manpages.opensuse.org/hwinfo/hwinfo.8.en.html.

- Display all available hardware information:

```
hwinfo
```

- Display information about a specific hardware component:

```
hwinfo --{{cpu|memory|disk|gfxcard|network|usb|pci|keyboard|
mouse|monitor|sound|fingerprint|...}}
```

- Display information about a specific hardware component succinctly:

```
hwinfo {{--component}} --short
```

- Write all hardware information to a file:

```
hwinfo --all --log {{path/to/file}}
```

- Display help:

```
hwinfo --help
```

hwloc-ls

This command is an alias of **`lstopo-no-graphics`**.

- View documentation for the original command:

  ```
  tldr lstopo-no-graphics
  ```

hyprctl

Control parts of the Hyprland Wayland compositor.

More information: https://wiki.hypr.land/Configuring/Advanced-and-Cool/Using-hyprctl/.

- Reload Hyprland configuration:

```
hyprctl reload
```

- Return the active window name:

```
hyprctl activewindow
```

- List all connected input devices:

```
hyprctl devices
```

- List all outputs with respective properties:

```
hyprctl workspaces
```

- Call a dispatcher:

```
hyprctl dispatch {{dispatcher}}
```

- Set a configuration keyword dynamically:

```
hyprctl keyword {{keyword}} {{value}}
```

- Display version:

```
hyprctl version
```

hyprcursor-util

Utility to create and extract Hyprcursor cursor themes for Hyprland.

More information: https://github.com/hyprwm/hyprcursor/blob/main/hyprcursor-util/README.md.

- Compile a working directory into a Hyprcursor theme:

```
hyprcursor-util {{[-c|--create]}} {{path/to/theme_directory}}
```

- Extract an XCursor theme into a Hyprcursor working directory:

```
hyprcursor-util {{[-e|--extract]}} {{path/to/xcursor_theme}}
```

- Specify the output directory:

```
hyprcursor-util {{[-c|--create]}} {{path/to/theme_directory}}
{{[-o|--output]}} {{path/to/output}}
```

- Extract a theme with a specific resize mode:

```
hyprcursor-util --extract {{path/to/xcursor_theme}} --resize
{{none|nearest|bilinear}}
```

hypridle

Idle management daemon for the Hyprland Wayland compositor.

Executes commands based on inactivity timeouts.

Configured via **`~/.config/hypr/hypridle.conf`**.

More information: https://wiki.hypr.land/Hypr-Ecosystem/hypridle/.

- Start the idle daemon using the default configuration:

  ```
  hypridle
  ```

- Start the idle daemon using a specific configuration file:

  ```
  hypridle {{[-c|--config]}} {{path/to/hypridle.conf}}
  ```

- Start the idle daemon with verbose output:

  ```
  hypridle {{[-v|--verbose]}}
  ```

- Display help:

  ```
  hypridle {{[-h|--help]}}
  ```

hyprlock

GPU-accelerated screen locker for the Hyprland Wayland compositor.

Configured via **`~/.config/hypr/hyprlock.conf`**.

More information: https://wiki.hypr.land/Hypr-Ecosystem/hyprlock/.

- Lock the screen using the default configuration:

  ```
  hyprlock
  ```

- Lock the screen using a specific configuration file:

  ```
  hyprlock {{[-c|--config]}} {{path/to/hyprlock.conf}}
  ```

- Lock the screen immediately, bypassing the grace period:

  ```
  hyprlock --grace 0
  ```

- Disable the fade-in animation when locking:

  ```
  hyprlock --no-fade-in
  ```

- Display help:

  ```
  hyprlock {{[-h|--help]}}
  ```

hyprpaper

Wallpaper utility for Hyprland with the ability to dynamically change wallpapers.

Controlled by the config file **`~/.config/hypr/hyprpaper.conf`**.

More information: https://wiki.hypr.land/Hypr-Ecosystem/hyprpaper/.

- Start the `hyprpaper` daemon:

  ```
  hyprpaper
  ```

- Change the wallpaper for a specific monitor:

  ```
  hyprctl hyprpaper wallpaper "{{monitor}},{{path/to/
  image.png}}"
  ```

- Change the default wallpaper for all unspecified monitors and set its fit mode:

  ```
  hyprctl hyprpaper wallpaper ",{{path/to/image.png}},
  {{contain|cover|tile|fill}}"
  ```

hyprpicker

Minimal Wayland color picker for wlroots compositors (e.g., Hyprland).

Requires a Wayland session. For clipboard autocopy, **`wl-copy`** must be installed.

More information: https://wiki.hypr.land/Hypr-Ecosystem/hyprpicker/.

- Pick a color in the default (hex) format:

  ```
  hyprpicker
  ```

- Pick a color and output in a specific format:

  ```
  hyprpicker {{[-f|--format]}} {{hex|rgb|hsl|hsv|cmyk}}
  ```

- Copy the picked color to the clipboard:

  ```
  hyprpicker {{[-a|--autocopy]}}
  ```

- Disable colored output (print plain text only):

  ```
  hyprpicker {{[-n|--no-fancy]}}
  ```

- Store the picked color in a shell variable:

  ```
  {{color}}=$(hyprpicker {{[-f|--format]}} {{hex}})
  ```

- Display help:

  ```
  hyprpicker {{[-h|--help]}}
  ```

hyprpm

Control plugins for the Hyprland Wayland compositor.

More information: https://wiki.hypr.land/Plugins/Using-Plugins/#hyprpm.

- Add a plugin:

```
hyprpm add {{git_url}}
```

- Remove a plugin:

```
hyprpm remove {{git_url|plugin_name}}
```

- Enable a plugin:

```
hyprpm enable {{plugin_name}}
```

- Disable a plugin:

```
hyprpm disable {{plugin_name}}
```

- Update and check all plugins:

```
hyprpm update
```

- Force an operation:

```
hyprpm {{[-f|--force]}} {{operation}}
```

- List all installed plugins:

```
hyprpm list
```

hyprshot

Screenshot utility for the Hyprland Wayland compositor.

More information: https://github.com/Gustash/Hyprshot.

- Select and take a screenshot of a region:

```
hyprshot {{[-m|--mode]}} region
```

- Select and take a screenshot of a specific window:

```
hyprshot {{[-m|--mode]}} window
```

- Select and take a screenshot of a specific output:

```
hyprshot {{[-m|--mode]}} output
```

- Take a screenshot of the currently active window:

```
hyprshot {{[-m|--mode]}} active {{[-m|--mode]}} window
```

- Freeze the screen and take a screenshot of the selected region:

```
hyprshot {{[-z|--freeze]}} {{[-m|--mode]}} region
```

- Select and take a screenshot of a specific window, saving to the given output directory:

```
hyprshot {{[-o|--output-folder]}} {{path/to/directory}} {{[-m|--mode]}} window
```

- Select and take a screenshot of a specific output, saving the screenshot to the clipboard only:

```
hyprshot --clipboard {{[-m|--mode]}} output
```

hyprsunset

A blue light filter for Hyprland.

Optionally configured via **`~/.config/hypr/hyprsunset.conf`**.

More information: https://wiki.hypr.land/Hypr-Ecosystem/hyprsunset/.

- Start the hyprsunset service:

  ```
  hyprsunset
  ```

- Start the hyprsunset service with a specified color temperature and gamma percentage:

  ```
  hyprsunset {{[-t|--temperature]}} {{temperature}} {{[-g|--gamma]}} {{gamma}}
  ```

- Adjust the color temperature while the hyprsunset service is running:

  ```
  hyprctl hyprsunset temperature {{temperature}}
  ```

- Adjust the gamma while the hyprsunset service is running:

  ```
  hyprctl hyprsunset gamma {{gamma}}
  ```

- Reset the color temperature to 6000K:

  ```
  hyprctl hyprsunset reset temperature
  ```

- Reset the gamma to 100%:

  ```
  hyprctl hyprsunset reset gamma
  ```

i2cdetect

Scan I2C buses.

See also: **`i2cdump`**, **`i2cget`**, **`i2cset`**.

More information: https://manned.org/i2cdetect.

- List active I2C buses:

```
i2cdetect -l
```

- Scan devices on an I2C bus:

```
i2cdetect {{i2c_bus}}
```

- Scan devices on an I2C bus without asking for confirmation:

```
i2cdetect -y {{i2c_bus}}
```

i2cdump

Dump I2C device registers.

Note: All addresses should be specified in hexadecimal.

See also: **`i2cdetect`**, **`i2cget`**, **`i2cset`**.

More information: https://manned.org/i2cdump.

- Dump all registers of an I2C device:

```
i2cdump {{i2cbus}} {{device_address}}
```

- Dump all registers of an I2C device without asking for confirmation:

```
i2cdump -y {{i2cbus}} {{device_address}}
```

- Dump all registers of an I2C device using a specific mode:

```
i2cdump {{i2cbus}} {{device_address}} {{b|w|c|s|i}}
```

- Dump registers from `start` to `end` of an I2C device:

```
i2cdump -r {{start}}-{{end}} {{i2cbus}} {{device_address}}
```

i2cget

Read from a register of an I2C device.

Note: All addresses should be specified in hexadecimal.

See also: **`i2cdetect`**, **`i2cdump`**, **`i2cset`**.

More information: https://manned.org/i2cget.

- Read from a register of an I2C device:

```
i2cget {{i2cbus}} {{device_address}} {{register_address}}
```

- Read from a register of an I2C device without asking for confirmation:

```
i2cget -y {{i2cbus}} {{device_address}} {{register_address}}
```

- Read from a register of an I2C device using a specific mode:

```
i2cget {{i2cbus}} {{device_address}} {{register_address}}
{{b|w|c|s|i}}
```

i2cset

Set the value of a register of an I2C device.

Note: All addresses should be specified in hexadecimal.

See also: **`i2cdetect`**, **`i2cdump`**, **`i2cget`**.

More information: https://manned.org/i2cset.

- Write to a register of an I2C device:

```
i2cset {{i2cbus}} {{device_address}} {{register_address}} {{value}}
```

- Write to a register of an I2C device without asking for confirmation:

```
i2cset -y {{i2cbus}} {{device_address}} {{register_address}} {{value}}
```

- Write to a register of an I2C device using a specific mode:

```
i2cset {{i2cbus}} {{device_address}} {{register_address}} {{value}} {{b|w|c|s|i}}
```

i3-scrot

Wrapper script around the screenshot utility **`scrot`** for the i3 window manager.

The default save location is **`~/Pictures`** and can be changed in **`~/.config/i3-scrot.conf`**.

More information: https://gitlab.manjaro.org/packages/extra/i3-scrot.

- Capture a screenshot of the whole screen and save it to the default directory:

```
i3-scrot
```

- Capture a screenshot of the active window:

```
i3-scrot --window
```

- Capture a screenshot of a specific rectangular selection:

```
i3-scrot --select
```

- Capture a screenshot of the whole screen and copy it to the clipboard:

```
i3-scrot --desk-to-clipboard
```

- Capture a screenshot of the active window and copy it to the clipboard:

```
i3-scrot --window-to-clipboard
```

- Capture a screenshot of a specific selection and copy it to the clipboard:

```
i3-scrot --select-to-clipboard
```

- Capture a screenshot of the active window after a delay of 5 seconds:

```
i3-scrot --window {{5}}
```

i386

This command is an alias of **`setarch i386`**.

- View documentation for the original command:

```
tldr setarch
```

i3exit

Exit the i3 window manager.

More information: https://gitlab.manjaro.org/packages/extra/i3exit/-/blob/master/i3exit.

- Log out of i3:

```
i3exit logout
```

- Lock i3:

```
i3exit lock
```

- Shut down the system:

```
i3exit shutdown
```

- Suspend the system:

```
i3exit suspend
```

- Switch to the login screen to log in as a different user:

```
i3exit switch_user
```

- Hibernate the system:

```
i3exit hibernate
```

- Reboot the system:

```
i3exit reboot
```

i3status

Status line for the i3 window manager.

This command is usually called from the i3 configuration file.

More information: https://i3wm.org/i3status/manpage.html.

- Print the status line to `stdout` periodically, using the default configuration:

```
i3status
```

- Print the status line to `stdout` periodically, using a specific configuration:

```
i3status -c {{path/to/i3status.conf}}
```

- Display help and version:

```
i3status -h
```

i7z

An Intel CPU (only i3, i5, and i7) realtime reporting tool.

More information: https://manned.org/i7z.

- Start i7z (needs to be run in superuser mode):

```
sudo i7z
```

ico

Display an animation of a polyhedron.

More information: https://manned.org/ico.

- Display the wireframe of an icosahedron that changes its position every 0.1 seconds:

```
ico -sleep {{0.1}}
```

- Display a solid icosahedron with red faces on a blue background:

```
ico -faces -noedges -colors {{red}} -bg {{blue}}
```

- Display the wireframe of a cube with size 100x100 that moves by +1+2 per frame:

```
ico -obj {{cube}} -size {{100x100}} -delta {{+1+2}}
```

- Display the inverted wireframe of an icosahedron with line width 10 using 5 threads:

```
ico -i -lw {{10}} -threads {{5}}
```

id3v2

Manage id3v2 tags, convert and list id3v1 tags.

More information: https://manned.org/id3v2.

- List all genres:

```
id3v2 {{[-L|--list-genres]}}
```

- List all tags of specific files:

```
id3v2 {{[-l|--list]}} {{path/to/file1 path/to/file2 ...}}
```

- Delete all `id3v2` or `id3v1` tags of specific files:

```
id3v2 {{--delete-v2|--delete-v1}} {{path/to/file1 path/to/
file2 ...}}
```

- Display help:

```
id3v2 {{[-h|--help]}}
```

- Display version:

```
id3v2 {{[-v|--version]}}
```

ifdown

Disable network interfaces.

More information: https://manned.org/ifdown.

- Disable interface eth0:

```
ifdown {{eth0}}
```

- Disable all interfaces which are enabled:

```
ifdown {{[-a|--all]}}
```

ifmetric

An IPv4 route metrics manipulation tool.

More information: https://0pointer.de/lennart/projects/ifmetric/.

- Set the priority of the specified network interface (a higher number indicates lower priority):

```
sudo ifmetric {{interface}} {{value}}
```

- Reset the priority of the specified network interface:

```
sudo ifmetric {{interface}} {{0}}
```

ifreload

Reload network interface configuration.

More information: https://manned.org/ifreload.

- Reload all network interface configurations:

```
sudo ifreload {{[-a|--all]}}
```

- Reload a specific network interface:

```
sudo ifreload {{interface}}
```

- Reload interfaces and print detailed output:

```
sudo ifreload {{[-v|--verbose]}}
```

- Check the configuration without applying changes:

```
sudo ifreload {{[-c|--currently-up]}}
```

ifstat

View network interface statistics.

More information: https://manned.org/ifstat.

- View network interface statistics since last query:

```
ifstat
```

- View network interface statistics since last boot:

```
ifstat {{[-a|--ignore]}}
```

- View error rate:

```
ifstat {{[-e|--errors]}}
```

ifstatus

Display OpenWRT interface status in JSON format.

More information: https://openwrt.org/docs/techref/netifd.

- Display interface status:

```
ifstatus {{interface_name}}
```

- Display help:

```
ifstatus
```

iftop

Show bandwidth usage on an interface by host.

More information: https://manned.org/iftop.

- Show the bandwidth usage:

```
sudo iftop
```

- Show the bandwidth usage of a given interface:

```
sudo iftop -i {{interface}}
```

- Show the bandwidth usage with port information:

```
sudo iftop -P
```

- Do not show bar graphs of traffic:

```
sudo iftop -b
```

- Do not look up hostnames:

```
sudo iftop -n
```

- Display help:

```
<?>
```

ifup

Enable network interfaces.

More information: https://manned.org/ifup.

- Enable interface eth0:

```
ifup {{eth0}}
```

- Enable all the interfaces defined with "auto" in `/etc/network/interfaces`:

```
ifup {{[-a|--all]}}
```

ikaros

Vanilla OS Tool for managing drivers for your device.

More information: https://github.com/Vanilla-OS/Ikaros.

- Interactively install drivers for your device:

```
ikaros install {{device}}
```

- Automatically install the recommended drivers for your device:

```
ikaros auto-install {{device}}
```

- List devices:

```
ikaros list-devices
```

img2txt

Convert images to color ASCII characters and output them to text-based colored files.

More information: https://manned.org/img2txt.

- Set output column count to a specific value:

```
img2txt {{[-W|--width]}} {{10}} {{path/to/image}}
```

- Set output line count to a specific value:

```
img2txt {{[-H|--height]}} {{5}} {{path/to/image}}
```

- Set output font width to a specific value:

```
img2txt {{[-x|--font-width]}} {{12}} {{path/to/image}}
```

- Set output font height to a specific value:

```
img2txt {{[-y|--font-height]}} {{14}} {{path/to/image}}
```

- Set image brightness to a specific value:

```
img2txt {{[-b|--brightness]}} {{2}} {{path/to/image}}
```

img2webp

Convert an image to WebP.

More information: https://developers.google.com/speed/webp/docs/img2webp.

- Convert an image to WebP:

```
img2webp {{path/to/image}} -o {{path/to/image.webp}}
```

imgp

Resize and rotate JPEG and PNG images.

More information: https://github.com/jarun/imgp#usage.

- Convert single images and/or whole directories containing valid image formats:

```
imgp {{[-x|--res]}} {{1366x1000}} {{path/to/directory}} {{path/to/file}}
```

- Scale an image by 75% and overwrite the source image to a target resolution:

```
imgp {{[-x|--res]}} {{75}} {{[-w|--overwrite]}} {{path/to/file}}
```

- Rotate an image clockwise by 90 degrees:

```
imgp {{[-o|--rotate]}} {{90}} {{path/to/file}}
```

imhex

Hex editor for reverse engineers and programmers.

More information: https://docs.werwolv.net/imhex.

- Open a file in ImHex:

```
imhex {{path/to/file}}
```

- Create a new empty file:

```
imhex --new
```

- Open a file in the currently running ImHex instance and select a range of bytes (offsets in hexadecimal):

```
imhex --open {{path/to/file}} --select {{0xstart_offset}} {{0xend_offset}}
```

- Display information about a file:

```
imhex --file-info {{path/to/file}}
```

- Calculate the hash of a file using a specific algorithm:

```
imhex --hash {{md5|sha1|sha224|sha256|sha384|sha512}} {{path/to/file}}
```

- Generate a hex dump of a file:

```
imhex --hexdump {{path/to/file}}
```

- Display version:

```
imhex --version
```

imp

A helper to use native systemd support under WSL (Windows Subsystem for Linux).

Note: To run these from Windows rather than an already-running distribution, precede them with **`wsl`**.

More information: https://github.com/arkane-systems/bottle-imp#usage.

- Initialize the helper functions and keep WSL running until explicit shutdown (run once, at start):

  ```
  imp {{[-i|--initialize]}}
  ```

- Run a shell inside a systemd user session:

  ```
  imp {{[-s|--shell]}}
  ```

- Run a specified command inside a systemd user session (preserves working directory):

  ```
  imp {{[-c|--command]}} {{command}}
  ```

- Shut down systemd and the WSL instance:

  ```
  imp {{[-u|--shutdown]}}
  ```

impala

Manage Wi-Fi networks through a TUI.

More information: https://github.com/pythops/impala#-usage.

- Launch `impala` in station mode:

  `impala`

- Launch `impala` in Access Point mode:

  `impala {{[-m|--mode]}} ap`

- Switch between different sections:

  `{{<Tab>|<Shift Tab>}}`

- Select a network to connect to:

  `<Space>`

- Display hotkeys:

  `<?>`

importctl

Download, Import, or Export disk images.

More information: https://www.freedesktop.org/software/systemd/man/latest/importctl.html.

- Download image in tarball format from a url via pull:

```
sudo importctl pull-tar {{url}} {{path/to/directory}}
```

- Pull or download from a remote source that is either raw or `.qcow2` file, and store it as a raw file:

```
sudo importctl pull-raw {{https://example.com/source.ext}} {{name}} --class={{machine|portable|sysext|confext}}
```

- Import a raw disk image into the image directory that is possibly compressed with `xz`, `gzip`, or `bzip2`:

```
importctl import-raw {{path/to/file.ext}} {{name}} --class={{machine|portable|sysext|confext}}
```

- Export a container image as tarball into current working directory:

```
importctl export-tar --class={{machine|portable|sysext|confext}} {{name}} {{path/to/file.ext}}
```

imv

CLI image viewer for wayland and X11 aimed at tiling window managers.

Handles multiple formats including Photoshop (PSD).

More information: https://sr.ht/~exec64/imv/.

- View multiple images:

```
imv {{path/to/image1.ext path/to/image2.ext ...}}
```

- View in fullscreen mode:

```
imv -f {{path/to/image.ext}}
```

- View images [r]ecursively from a path:

```
imv -r --slideshow {{path/to/directory}}
```

- Open multiple images via `stdin`:

```
find . -type f -name "{{*.svg}}" | imv
```

- Make a slideshow from a directory showing each image for 10 seconds:

```
imv -t 10 {{path/to/directory}}
```

- View multiple images from the web:

```
curl {{[-Osw|--remote-name --silent --write-out]}} '%
{filename_effective}\n' '{{http://www.example.com/
[1-10].jpg}}' | imv
```

Inference snap

Chat with generative AI Language Models that runs locally without internet.

Here inference-snap is one of the supported models: **`deepseek-r1`**, **`gemma3`**, **`gemma4`**, **`nemotron3-nano`**, **`qwen-vl`**.

More information: https://documentation.ubuntu.com/inference-snaps/.

- Start a chat in terminal (and a chat server in background on first start):

  ```
  {{inference-snap}} chat
  ```

- Show current engine and status of chat server:

  ```
  {{inference-snap}} status
  ```

- Select specific engine (eg. `cuda` for NVIDIA GPU). Download and use the appropriate model for the engine:

  ```
  sudo {{inference-snap}} use-engine {{engine}}
  ```

- Show detailed device hardware information (RAM, architecture, etc.):

  ```
  sudo {{inference-snap}} show-machine
  ```

- Get all configuration (`http.host`, `http.port`) of running chat server:

  ```
  {{inference-snap}} get
  ```

informant

Read Arch Linux package news.

More information: https://github.com/bradford-smith94/informant.

- Read all unread news:

```
sudo informant read
```

- Check for news:

```
informant check
```

- List latest news:

```
informant list
```

- Display help:

```
informant {{[-h|--help]}}
```

init

Linux run level manager.

Requires the SYSVINIT compile-time option to be enabled if using systemd.

More information: https://manned.org/init.8.

- Set the system to run a graphical environment:

```
sudo init 5
```

- Set the system to run multiuser terminal:

```
sudo init 3
```

- Shut down the system:

```
init 0
```

- Reboot the system:

```
init 6
```

- Set the system to run on terminal with only root user allowed and no networking:

```
sudo init 1
```

inotifywait

Wait for changes to files.

See also: **`fatrace`**.

More information: https://manned.org/inotifywait.

- Watch a specific file for events, exiting after the first one:

```
inotifywait {{path/to/file}}
```

- Continuously watch a specific file for events without exiting:

```
inotifywait {{[-m|--monitor]}} {{path/to/file}}
```

- Watch a directory recursively for events:

```
inotifywait {{[-m|--monitor]}} {{[-r|--recursive]}} {{path/to/directory}}
```

- Watch a directory for changes, excluding files, whose names match a `regex`:

```
inotifywait {{[-m|--monitor]}} {{[-r|--recursive]}} --exclude "{{regex}}" {{path/to/directory}}
```

- Watch a file for changes, exiting when no event occurs for 30 seconds:

```
inotifywait {{[-m|--monitor]}} {{[-t|--timeout]}} {{30}} {{path/to/file}}
```

- Only watch a file for file modification events:

```
inotifywait {{[-e|--event]}} {{modify}} {{path/to/file}}
```

- Watch a file printing only events, and no status messages:

```
inotifywait {{[-q|--quiet]}} {{path/to/file}}
```

- Run a command when a file is accessed:

```
inotifywait {{[-e|--event]}} {{access}} {{path/to/file}} && {{command}}
```

inputattach

Attach a device to the Linux input system.

The input devices are presented as files in **`/dev/input/`**.

More information: https://manned.org/inputattach.

- Attach a Pulse8 CEC device to the input system:

```
inputattach --pulse8-cec {{/dev/ttyACM0}}
```

- Display help:

```
inputattach --help
```

insmod

Dynamically load modules into the Linux Kernel.

See also: **kmod**.

More information: https://manned.org/insmod.

- Insert a kernel module into the Linux kernel:

```
sudo insmod {{path/to/module.ko}}
```

installpkg

Install a Slackware package.

More information: https://www.slackbook.org/html/book.html#PACKAGE-MANAGEMENT-PACKAGE-UTILITIES-INSTALLPKG.

- Install a package:

```
sudo installpkg {{path/to/package.tgz}}
```

- Generate a report of a simulated installation to `stdout`:

```
installpkg -warn {{path/to/package.tgz}}
```

- Create a package from current directory and its subdirectories:

```
installpkg -m {{package_name.tgz}}
```

- Install the contents of the current directory and subdirectories as a package with a specified name:

```
sudo installpkg -r {{package_name.tgz}}
```

instaloader

Download pictures, videos, captions, and other metadata from Instagram.

Note: You will need to provide Instagram login information if you want high-quality media downloads.

More information: https://instaloader.github.io/cli-options.html.

- Download a profile:

```
instaloader {{profile_name}}
```

- Download highlights:

```
instaloader --highlights {{profile_name}}
```

- Download posts with geotags (if available), suppressing any user interaction:

```
instaloader {{[-q|--quiet]}} {{[-G|--geotags]}}
{{profile_name}}
```

- Specify a user agent for HTTP requests:

```
instaloader --user-agent {{user_agent}} {{profile_name}}
```

- Specify login info and download posts (useful for private profiles):

```
instaloader {{[-l|--login]}} {{username}} {{[-p|--password]}}
{{password}} {{profile_name}}
```

- Skip a target if the first downloaded file has been found (useful for updating Instagram archives):

```
instaloader {{[-F|--fast-update]}} {{profile_name}}
```

- Download stories and IGTV videos (login required):

```
instaloader {{[-l|--login]}} {{username}} {{[-p|--password]}}
{{password}} {{[-s|--stories]}} --igtv {{profile_name}}
```

- Download all types of posts (login required):

```
instaloader {{[-l|--login]}} {{username}} {{[-p|--password]}}
{{password}} {{[-s|--stories]}} --igtv --highlights
{{profile_name}}
```

intercept

Read raw input events from a specified input event device and redirect it to **`stdout`**.

More information: https://gitlab.com/interception/linux/tools/-/tree/master#intercept.

- Read and output raw input events from a given input device file (the system will not see any key presses):

```
sudo intercept -g {{/dev/input/eventX}}
```

- Read and output raw input events from a given input device file (the system can see key presses and does not block other programs from reading them):

```
sudo intercept {{/dev/input/eventX}}
```

inxi

Print a summary of system information and resources for debugging purposes.

See also: **`lshw`**, **`hwinfo`**, **`dmidecode`**.

More information: https://manned.org/inxi.

- Print a summary of CPU, memory, hard drive, and kernel information:

```
inxi
```

- Print a full description of CPU, memory, disk, network, and process information and filter sensitive information:

```
inxi {{[-ez|--expanded --filter]}}
```

- Print a summary of CPU information:

```
inxi {{[-C|--cpu]}}
```

- Print a summary of graphics information:

```
inxi {{[-G|--graphics]}}
```

- Print a summary of system RAM:

```
inxi {{[-m|--memory]}}
```

- Print a summary of system audio:

```
inxi {{[-A|--audio]}}
```

- Print available sensor data:

```
inxi {{[-s|--sensors]}}
```

- Print information about the distribution's repositories:

```
inxi {{[-r|--repos]}}
```

ionice

Get or set program I/O scheduling class and priority.

Scheduling classes: 1 (realtime), 2 (best-effort), 3 (idle).

Priority levels: 0 (the highest) - 7 (the lowest).

More information: https://manned.org/ionice.

- Run a command with the given scheduling class and priority:

```
ionice {{[-c|--class]}} {{scheduling_class}} {{[-n|--classdata]}} {{priority}} {{command}}
```

- Set I/O scheduling class of a running process with a specific [p]id, [P]gid, or [u]id:

```
ionice {{[-c|--class]}} {{scheduling_class}} -{{p|P|u}} {{id}}
```

- Set the priority of a running process, ignoring failure to do so (this can happen due to insufficient privileges or an old kernel version):

```
ionice {{[-t|--ignore]}} {{[-n|--classdata]}} {{priority}} {{[-p|--pid]}} {{process_id}}
```

- Print the I/O scheduling class and priority of a running process:

```
ionice {{[-p|--pid]}} {{process_id}}
```

iostat

Report statistics for devices and partitions.

More information: https://manned.org/iostat.

- Display a report of CPU and disk statistics since system startup:

```
iostat
```

- Display a report of CPU and disk statistics with units converted to megabytes:

```
iostat -m
```

- Display CPU statistics:

```
iostat {{[-c|--compact]}}
```

- Display disk statistics with disk names (including LVM):

```
iostat -N
```

- Display extended disk statistics with disk names for device "sda":

```
iostat -xN {{sda}}
```

- Display incremental reports of CPU and disk statistics every 2 seconds:

```
iostat {{2}}
```

ip address

IP Address management subcommand.

More information: https://manned.org/ip-address.

- List network interfaces and their associated IP addresses:

```
ip {{[a|address]}}
```

- Filter to show only active network interfaces:

```
ip {{[a|address]}} {{[s|show]}} up
```

- Display information about a specific network interface:

```
ip {{[a|address]}} {{[s|show]}} {{ethX}}
```

- Add an IP address to a network interface:

```
sudo ip {{[a|address]}} {{[a|add]}} {{ip_address}} dev
{{ethX}}
```

- Remove an IP address from a network interface:

```
sudo ip {{[a|address]}} {{[d|delete]}} {{ip_address}} dev
{{ethX}}
```

- Delete all IP addresses in a given scope from a network interface:

```
sudo ip {{[a|address]}} {{[f|flush]}} {{ethX}} scope
{{global|host|link}}
```

ip link

Manage network interfaces.

More information: https://manned.org/ip-link.

- Show information about all network interfaces:

```
ip {{[l|link]}}
```

- Show information about a specific network interface:

```
ip {{[l|link]}} {{[sh|show]}} {{ethX}}
```

- Bring a network interface up or down:

```
sudo ip {{[l|link]}} {{[s|set]}} {{ethX}} {{up|down}}
```

- Give a meaningful name to a network interface:

```
sudo ip {{[l|link]}} {{[s|set]}} {{ethX}} {{[al|alias]}}
"{{LAN Interface}}"
```

- Change the MAC address of a network interface:

```
sudo ip {{[l|link]}} {{[s|set]}} {{ethX}} {{[a|address]}}
{{ff:ff:ff:ff:ff:ff}}
```

- Change the MTU size for a network interface to use jumbo frames:

```
sudo ip {{[l|link]}} {{[s|set]}} {{ethX}} mtu {{9000}}
```

- Set the promisc mode status of a device:

```
sudo ip {{[l|link]}} {{[s|set]}} {{ethX}} promisc {{on|off}}
```

- Delete a device:

```
sudo ip {{[l|link]}} {{[d|delete]}} {{ethX}}
```

ip maddress

Manage multicast addresses.

More information: https://manned.org/ip-maddress.

- List multicast addresses and how many programs are subscribed to them:

```
ip {{[m|maddress]}}
```

- List device specific addresses:

```
ip {{[m|maddress]}} {{[s|show]}} dev {{ethX}}
```

- Join a multicast group statically:

```
sudo ip {{[m|maddress]}} {{[a|add]}} {{33:33:00:00:00:02}}
dev {{ethX}}
```

- Leave a static multicast group:

```
sudo ip {{[m|maddress]}} {{[d|delete]}} {{33:33:00:00:00:02}}
dev {{ethX}}
```

- Display help:

```
ip {{[m|maddress]}} {{[h|help]}}
```

ip monitor

Monitor network for state changes.

More information: https://manned.org/ip-monitor.

- Monitor the whole network for state changes:

```
ip {{[mo|monitor]}}
```

- Specify the type to monitor:

```
ip {{[mo|monitor]}} {{link|address|route|neigh|rule|
maddress|...}}
```

- Replay an event file (can be generated with `rtmon`):

```
ip {{[mo|monitor]}} {{[f|file]}} {{path/to/file}}
```

ip neighbor

Neighbor/ARP/NDP tables management IP subcommand.

See also: **`arp-scan`**.

More information: https://manned.org/ip-neighbour.

- Display the neighbor/ARP table entries:

```
ip {{[n|neighbor]}}
```

- Remove entries in the neighbor table on device `ethX`:

```
sudo ip {{[n|neighbor]}} {{[f|flush]}} dev {{ethX}}
```

- Perform a neighbor lookup and return a neighbor entry:

```
ip {{[n|neighbor]}} {{[g|get]}} {{lookup_ip}} dev {{ethX}}
```

- Add or delete an ARP entry for the neighbor IP address to `ethX`:

```
sudo ip {{[n|neighbor]}} {{add|delete}} {{ip_address}} lladdr
{{mac_address}} dev {{ethX}} nud reachable
```

- Change or replace an ARP entry for the neighbor IP address to `ethX`:

```
sudo ip {{[n|neighbor]}} {{change|replace}} {{ip_address}}
lladdr {{new_mac_address}} dev {{ethX}}
```

- Display only IPv6 or IPv4 neighbors:

```
ip {{-6|-4}} {{[n|neighbor]}}
```

ip neighbour

This command is an alias of **`ip neighbor`**.

- View documentation for the original command:

```
tldr ip neighbor
```

ip netconf

Display configuration parameters.

More information: https://manned.org/ip-netconf.

- Show network configuration for all interfaces:

```
ip {{[netc|netconf]}}
```

- Show network configuration for a specific interface:

```
ip {{[netc|netconf]}} {{[s|show]}} dev {{network_interface}}
```

- Show only IPv4 network configuration:

```
ip -4 {{[netc|netconf]}}
```

- Show only IPv6 network configuration:

```
ip -6 {{[netc|netconf]}}
```

ip route add

Add a new networking route.

More information: https://manned.org/ip-route.

- Add a default route using gateway forwarding:

```
sudo ip {{[r|route]}} {{[a|add]}} default via {{gateway_ip}}
```

- Add a default route using `ethX`:

```
sudo ip {{[r|route]}} {{[a|add]}} default dev {{ethX}}
```

- Add a static route:

```
sudo ip {{[r|route]}} {{[a|add]}} {{destination_ip}} via {{gateway_ip}} dev {{ethX}}
```

- Add a route to a specific routing table:

```
sudo ip {{[r|route]}} {{[a|add]}} {{destination_ip}} dev {{ethX}} {{[t|table]}} {{ip_address}}
```

- Force internet traffic to go through a specific device while leaving local traffic unchanged (requires also creating a rule):

```
sudo ip {{[r|route]}} {{[a|add]}} default via {{gateway_ip}} dev {{ethX}} table {{table_id}}
```

ip route get

Get a single route to a destination and print its contents exactly as the kernel sees it.

More information: https://manned.org/ip-route.

- Print route to a destination:

```
ip {{[r|route]}} {{[g|get]}} {{1.1.1.1}}
```

- Print route to a destination from a specific source address:

```
ip {{[r|route]}} {{[g|get]}} {{destination}} from {{source}}
```

- Print route to a destination for packets arriving on a specific interface:

```
ip {{[r|route]}} {{[g|get]}} {{destination}} iif {{ethX}}
```

- Print route to a destination, forcing output through a specific interface:

```
ip {{[r|route]}} {{[g|get]}} {{destination}} oif {{ethX}}
```

- Print route to a destination with a specified Type of Service (ToS):

```
ip {{[r|route]}} {{[g|get]}} {{destination}} tos {{0x10}}
```

- Print route to a destination using a specific VRF (Virtual Routing and Forwarding) instance:

```
ip {{[r|route]}} {{[g|get]}} {{destination}} vrf {{myvrf}}
```

ip route list

Display subcommand for IP Routing table management.

More information: https://manned.org/ip-route.

- Display the `main` routing table:

```
ip {{[r|route]}} {{[l|list]}}
```

- Display the main routing table (same as first example):

```
ip {{[r|route]}} {{[l|list]}} {{[t|table]}} {{main|254}}
```

- Display the local routing table:

```
ip {{[r|route]}} {{[l|list]}} {{[t|table]}} {{local|255}}
```

- Display all routing tables:

```
ip {{[r|route]}} {{[l|list]}} {{[t|table]}} {{all|unspec|0}}
```

- List routes from a given device only:

```
ip {{[r|route]}} {{[l|list]}} dev {{ethX}}
```

- List routes within a given scope:

```
ip {{[r|route]}} {{[l|list]}} {{[s|scope]}} link
```

- Display the routing cache:

```
ip {{[r|route]}} {{[l|list]}} {{[c|cache]}}
```

- Display only IPv6 or IPv4 routes:

```
ip {{-6|-4}} {{[r|route]}}
```

ip route show

This command is an alias of **`ip route list`**.

- View documentation for the original command:

```
tldr ip route list
```

ip route

IP Routing table management subcommand.

See also: **`routel`**, **`ip rule`**.

More information: https://manned.org/ip-route.

- Display the `main` routing table:

```
ip {{[r|route]}}
```

- Add a default route using gateway forwarding:

```
sudo ip {{[r|route]}} {{[a|add]}} default via {{gateway_ip}}
```

- Add a default route using `ethX`:

```
sudo ip {{[r|route]}} {{[a|add]}} default dev {{ethX}}
```

- Add a static route:

```
sudo ip {{[r|route]}} {{[a|add]}} {{destination_ip}} via
{{gateway_ip}} dev {{ethX}}
```

- Delete a static route:

```
sudo ip {{[r|route]}} {{[d|delete]}} {{destination_ip}} dev
{{ethX}}
```

- Change or replace a static route:

```
sudo ip {{[r|route]}} {{change|replace}} {{destination_ip}}
via {{gateway_ip}} dev {{ethX}}
```

- Show which route will be used by the kernel to reach an IP address:

```
ip {{[r|route]}} {{[g|get]}} {{destination_ip}}
```

- Display a specific routing table:

```
ip {{[r|route]}} {{[l|list]}} {{[t|table]}} {{table_number}}
```

ip rule

IP routing policy database management.

See also: **`ip route`**.

More information: https://manned.org/ip-rule.

- Display the routing policy:

```
ip {{[ru|rule]}}
```

- Create a new generic routing rule with a higher priority than `main`:

```
sudo ip {{[ru|rule]}} {{[a|add]}} from all lookup
{{table_id}}
```

- Add a new rule based on packet source addresses:

```
sudo ip {{[ru|rule]}} {{[a|add]}} from {{192.168.178.2/32}}
lookup {{table_id}}
```

- Add a new rule based on packet destination addresses:

```
sudo ip {{[ru|rule]}} {{[a|add]}} to {{192.168.178.2/32}}
lookup {{table_id}}
```

- Delete a rule based on packet source addresses:

```
sudo ip {{[ru|rule]}} {{[d|delete]}} from
{{192.168.178.2/32}}
```

- Remove all routing rules:

```
sudo ip {{[ru|rule]}} {{[f|flush]}}
```

- Save all rules to a file:

```
ip {{[ru|rule]}} {{[s|save]}} > {{path/to/ip_rules.dat}}
```

- Restore all rules from a file:

```
sudo ip < {{path/to/ip_rules.dat}} {{[ru|rule]}} {{[r|
restore]}}
```

ip stats

Manage and show interface statistics.

More information: https://manned.org/ip-stats.

- Show all interface statistics across all network devices:

```
ip {{[st|stats]}}
```

- Show statistics for a specific network interface:

```
ip {{[st|stats]}} show dev {{network_interface}}
```

- Show link-layer statistics (same as `ip -statistics link show`):

```
ip {{[st|stats]}} show group link
```

- Show hardware offload statistics for all devices:

```
ip {{[st|stats]}} show group offload
```

- Show offload statistics for a specific interface:

```
ip {{[st|stats]}} show dev {{network_interface}} group
offload
```

- Show a specific offload subgroup:

```
ip {{[st|stats]}} show dev {{network_interface}} group
offload subgroup {{l3_stats|cpu_hit|hw_stats_info}}
```

- Show address-family specific statistics (e.g. MPLS):

```
ip {{[st|stats]}} show group afstats subgroup {{mpls}}
```

- Enable Layer 3 hardware statistics collection on a device:

```
ip {{[st|stats]}} set dev {{network_interface}} l3_stats on
```

ip tuntap

Manage TUN/TAP virtual network interfaces.

More information: https://baturin.org/docs/iproute2/#ip-tuntap.

- Show all existing TUN/TAP devices:

```
ip {{[tunt|tuntap]}}
```

- Create a TUN device with a specific name:

```
sudo ip {{[tunt|tuntap]}} {{[a|add]}} {{[d|dev]}} {{tun0}}
{{[m|mode]}} {{[t|tun]}}
```

- Create a TAP device with a specific name:

```
sudo ip {{[tunt|tuntap]}} {{[a|add]}} {{[d|dev]}} {{tap0}}
{{[m|mode]}} {{[ta|tap]}}
```

- Delete a TUN or TAP device:

```
sudo ip {{[tunt|tuntap]}} {{[d|delete]}} {{[d|dev]}} {{tun0|
tap0}} {{[m|mode]}} {{tun|tap}}
```

- Set the owner (UID) of a TUN/TAP device:

```
sudo ip {{[tunt|tuntap]}} {{[a|add]}} {{[d|dev]}} {{tun0|
tap0}} {{[m|mode]}} {{tun|tap}} {{[u|user]}} {{username}}
```

- Set both owner (UID) and group (GID) for a TUN/TAP device:

```
sudo ip {{[tunt|tuntap]}} {{[a|add]}} {{[d|dev]}} {{tun0|
tap0}} {{[m|mode]}} {{tun|tap}} {{[u|user]}} {{username}}
{{[g|group]}} {{group_name}}
```

ip

Show/manipulate routing, devices, policy routing, and tunnels.

Some subcommands such as **`address`** have their own usage documentation.

More information: https://manned.org/ip.8.

- List interfaces with detailed info:

```
ip {{[a|address]}}
```

- List interfaces with brief network layer info:

```
ip {{[-br|-brief]}} {{[a|address]}}
```

- List interfaces with brief link layer info:

```
ip {{[-br|-brief]}} {{[l|link]}}
```

- Display the routing table:

```
ip {{[r|route]}}
```

- Show neighbors (ARP table):

```
ip {{[n|neighbor]}}
```

- Make an interface up/down:

```
sudo ip {{[l|link]}} {{[s|set]}} {{ethX}} {{up|down}}
```

- Add/Delete an IP address to an interface:

```
sudo ip {{[a|address]}} {{add|delete}} {{ip_address}}/
{{mask}} dev {{ethX}}
```

- Add a default route:

```
sudo ip {{[r|route]}} {{[a|add]}} default via {{ip_address}}
dev {{ethX}}
```

ip6tables-restore

This command is an alias of **`iptables-restore`** for the IPv6 firewall.

- View documentation for the original command:

```
tldr iptables-restore
```

ip6tables-save

This command is an alias of **`iptables-save`** for the IPv6 firewall.

- View documentation for the original command:

  ```
  tldr iptables-save
  ```

ip6tables

This command is an alias of **`iptables`** for the IPv6 firewall.

- View documentation for the original command:

```
tldr iptables
```

ipcmk

Create IPC (Inter-process Communication) resources.

More information: https://manned.org/ipcmk.

- Create a shared memory segment:

```
ipcmk {{[-M|--shmem]}} {{segment_size_in_bytes}}
```

- Create a semaphore:

```
ipcmk {{[-S|--semaphore]}} {{element_size}}
```

- Create a message queue:

```
ipcmk {{[-Q|--queue]}}
```

- Create a shared memory segment with specific permissions (default is 0644):

```
ipcmk {{[-M|--shmem]}} {{segment_size_in_bytes}}
{{octal_permissions}}
```

ipcrm

Delete IPC (Inter-process Communication) resources.

More information: https://manned.org/ipcrm.

- Delete a shared memory segment by ID:

```
ipcrm {{[-m|--shmem-id]}} {{shmem_id}}
```

- Delete a shared memory segment by key:

```
ipcrm {{[-M|--shmem-key]}} {{shmem_key}}
```

- Delete an IPC queue by ID:

```
ipcrm {{[-q|--queue-id]}} {{ipc_queue_id}}
```

- Delete an IPC queue by key:

```
ipcrm {{[-Q|--queue-key]}} {{ipc_queue_key}}
```

- Delete a semaphore by ID:

```
ipcrm {{[-s|--semaphore-id]}} {{semaphore_id}}
```

- Delete a semaphore by key:

```
ipcrm {{[-S|--semaphore-key]}} {{semaphore_key}}
```

- Delete all IPC resources:

```
ipcrm {{[-a|--all]}}
```

ipcs

Show information about the usage of System V IPC facilities: shared memory segments, message queues, and semaphore arrays.

See also: **`lsipc`**, **`ipcmk`**, **`ipcrm`**.

More information: https://manned.org/ipcs.

- Show information about all active IPC facilities:

```
ipcs
```

- Show information about active shared [m]emory segments, message [q]ueues or [s]emaphore sets:

```
ipcs {{--shmems|--queues|--semaphores}}
```

- Show full details on the resource with a specific ID:

```
ipcs {{--shmems|--queues|--semaphores}} {{[-i|--id]}} {{resource_id}}
```

- Show limits in [b]ytes or in a human-readable format:

```
ipcs {{[-l|--limits]}} {{--bytes|--human}}
```

- Show summary about current usage:

```
ipcs {{[-u|--summary]}}
```

- Show creator's and owner's UIDs and PIDs for all IPC facilities:

```
ipcs {{[-c|--creator]}}
```

- Show the PID of the last operators for all IPC facilities:

```
ipcs {{[-p|--pid]}}
```

- Show last access times for all IPC facilities:

```
ipcs {{[-t|--time]}}
```

ipmitool

Interface with the Intelligent Platform Management Interface (IPMI).

More information: https://manned.org/ipmitool.

- Start the IPMI driver for local connections:

```
systemctl start ipmidrv
```

- Open IPMI shell on the local hardware:

```
sudo ipmitool shell
```

- Open IPMI shell on a remote host:

```
ipmitool -H {{ip_address}} -U {{user_name}} shell
```

ipset

Create IP sets for firewall rules.

More information: https://manned.org/ipset.

- Create an empty IP set which will contain IP addresses:

```
ipset create {{set_name}} hash:ip
```

- Destroy a specific IP set:

```
ipset destroy {{set_name}}
```

- Add an IP address to a specific set:

```
ipset add {{set_name}} {{192.168.1.25}}
```

- Delete a specific IP address from a set:

```
ipset del {{set_name}} {{192.168.1.25}}
```

- Save an IP set:

```
ipset save {{set_name}} > {{path/to/ip_set}}
```

iptables-restore

Restore the **`iptables`** IPv4 configuration.

Use **`ip6tables-restore`** to do the same for IPv6.

More information: https://manned.org/iptables-restore.

- Restore the `iptables` configuration from a file:

```
sudo iptables-restore {{path/to/file}}
```

iptables-save

Save the **`iptables`** IPv4 configuration.

Use **`ip6tables-save`** to do the same for IPv6.

More information: https://manned.org/iptables-save.

- Print the `iptables` configuration:

```
sudo iptables-save
```

- Print the `iptables` configuration of a specific table:

```
sudo iptables-save {{[-t|--table]}} {{table}}
```

- Save the `iptables` configuration to a file:

```
sudo iptables-save {{[-f|--file]}} {{path/to/file}}
```

iptables

Configure tables, chains, and rules of the Linux kernel IPv4 firewall.

Use **`ip6tables`** to set rules for IPv6 traffic.

See also: **`iptables-save`**, **`iptables-restore`**.

More information: https://manned.org/iptables.

- View chains, rules, packet/byte counters, and line numbers for the filter table:

```
sudo iptables {{[-vnL --line-numbers|--verbose --numeric --list --line-numbers]}}
```

- Set chain policy rule:

```
sudo iptables {{[-P|--policy]}} {{chain}} {{rule}}
```

- Append rule to chain policy for IP:

```
sudo iptables {{[-A|--append]}} {{chain}} {{[-s|--source]}} {{ip_address}} {{[-j|--jump]}} {{rule}}
```

- Append rule to chain policy for IP considering protocol and port:

```
sudo iptables {{[-A|--append]}} {{chain}} {{[-s|--source]}} {{ip_address}} {{[-p|--protocol]}} {{tcp|udp|icmp|...}} --dport {{port}} {{[-j|--jump]}} {{rule}}
```

- Add a NAT rule to translate all traffic from the `192.168.0.0/24` subnet to the host's public IP:

```
sudo iptables {{[-t|--table]}} {{nat}} {{[-A|--append]}} {{POSTROUTING}} {{[-s|--source]}} {{192.168.0.0/24}} {{[-j|--jump]}} {{MASQUERADE}}
```

- Delete chain rule:

```
sudo iptables {{[-D|--delete]}} {{chain}} {{rule_line_number}}
```

iscsiadm

Manage iSCSI sessions, nodes, and discovery.

More information: https://manned.org/iscsiadm.

- Show active iSCSI sessions:

```
sudo iscsiadm {{[-m|--mode]}} session
```

- List all known iSCSI nodes:

```
sudo iscsiadm {{[-m|--mode]}} node
```

- Discover available iSCSI targets on a portal (no authentication):

```
sudo iscsiadm {{[-m|--mode]}} discovery {{[-t|--type]}}
sendtargets {{[-p|--portal]}} {{ip_address}}
```

- Log in to a specific iSCSI target without authentication:

```
sudo iscsiadm {{[-m|--mode]}} node {{[-T|--targetname]}}
{{iqn}} {{[-p|--portal]}} {{ip_address}}:3260 {{[-l|--
login]}}
```

- Log out from a specific iSCSI target:

```
sudo iscsiadm {{[-m|--mode]}} node {{[-T|--targetname]}}
{{iqn}} {{[-p|--portal]}} {{ip_address}}:3260 {{[-u|--
logout]}}
```

- Create an iSCSI node when discovery is blocked (for CHAP authentication):

```
sudo iscsiadm {{[-m|--mode]}} node {{[-o|--op]}} new {{[-T|--
targetname]}} {{iqn}} {{[-p|--portal]}} {{ip_address}}:3260
```

- Configure CHAP authentication for an iSCSI target:

```
sudo iscsiadm {{[-m|--mode]}} node {{[-T|--targetname]}}
{{iqn}} {{[-p|--portal]}} {{ip_address}}:3260 {{[-o|--op]}}
update {{[-n|--name]}} node.session.auth.authmethod {{[-v|--
value]}} CHAP
```

isoinfo

Utility programs for dumping and verifying ISO disk images.

More information: https://manned.org/isoinfo.

- List all the files included in an ISO image:

```
isoinfo -f -i {{path/to/image.iso}}
```

- E[x]tract a specific file from an ISO image and send it out `stdout`:

```
isoinfo -i {{path/to/image.iso}} -x {{/PATH/TO/FILE/INSIDE/ISO.EXT}}
```

- Show header information for an ISO disk image:

```
isoinfo -d -i {{path/to/image.iso}}
```

isosize

Display the size of an ISO file.

More information: https://manned.org/isosize.

- Display the size of an ISO file:

```
isosize {{path/to/file.iso}}
```

- Display the block count and block size of an ISO file:

```
isosize {{[-x|--sectors]}} {{path/to/file.iso}}
```

- Display the size of an ISO file divided by a given number (only usable when `--sectors` is not given):

```
isosize {{[-d|--divisor]}} {{number}} {{path/to/file.iso}}
```

iw dev

Show and manipulate wireless devices.

For a list of channels, frequencies, and reg information: https://wireless.docs.kernel.org/en/latest/en/developers/documentation/channellist.html.

More information: https://wireless.docs.kernel.org/en/latest/en/users/documentation/iw.html.

- Set device to monitor mode (interface must be down first. See also: `ip link`):

```
sudo iw dev {{wlanX}} set type monitor
```

- Set device to managed mode (interface must be down first):

```
sudo iw dev {{wlanX}} set type managed
```

- Set device Wi-Fi channel (device must first be in monitor mode with the interface up):

```
sudo iw dev {{wlanX}} set channel {{channel_number}}
```

- Set device Wi-Fi frequency in Mhz (device must first be in monitor mode with the interface up):

```
sudo iw dev {{wlanX}} set freq {{freq_in_mhz}}
```

- Show all known station info:

```
iw dev {{wlanX}} station dump
```

- Create a virtual interface in monitor mode with a specific MAC address:

```
sudo iw dev {{wlanX}} interface add "{{vif_name}}" type
monitor addr {{12:34:56:aa:bb:cc}}
```

- Delete virtual interface:

```
sudo iw dev "{{vif_name}}" del
```

iw event

Listen to wireless events.

More information: https://wireless.docs.kernel.org/en/latest/en/users/documentation/iw.html.

- Listen to wireless events:

```
iw event
```

- Print a kernel timestamp:

```
iw event -t
```

- Print a human readable timestamp:

```
iw event -T
```

- Print timestamp relative to the last event:

```
iw event -r
```

- Print full frame data:

```
iw event -f
```

iw help

Display help information.

More information: https://wireless.docs.kernel.org/en/latest/en/users/documentation/iw.html.

- Display full help:

```
iw help
```

- Display help on what a subcommand does:

```
iw help {{dev|phy|event|...}}
```

iw phy

Manage wireless radios.

More information: https://wireless.docs.kernel.org/en/latest/en/users/documentation/iw.html.

- Display info on all physical Wi-Fi radios:

```
iw phy
```

- Display info on a specific Wi-Fi radio:

```
iw phy phy{{0}} info
```

- Display channels available to a Wi-Fi radio:

```
iw phy phy{{0}} channels
```

iw reg

Manage WLAN regulatory domains.

More information: https://wireless.docs.kernel.org/en/latest/en/users/documentation/iw.html.

- Display the current regulatory domain:

```
iw reg get
```

- Set the regulatory domain according to ISO 3166-1 alpha-2:

```
sudo iw reg set {{US|JP|FI|...}}
```

- Reload the kernel's regulatory database:

```
sudo iw reg reload
```

iw

Show and manipulate wireless devices.

See also: **`iw dev`**, **`nmcli`**, **`iwctl`**.

More information: https://wireless.docs.kernel.org/en/latest/en/users/documentation/iw.html.

- Scan for available wireless networks:

```
iw dev {{wlanX}} scan
```

- Join an open wireless network:

```
iw dev {{wlanX}} connect {{ssid}}
```

- Close the current connection:

```
iw dev {{wlanX}} disconnect
```

- Show information about the current connection:

```
iw dev {{wlanX}} link
```

- List all physical and logical wireless network interfaces:

```
iw dev
```

- List all wireless capabilities for all physical hardware interfaces:

```
iw phy
```

- List the kernel's current wireless regulatory domain information:

```
iw reg get
```

- Display help:

```
iw help
```

iwconfig

Configure and show the parameters of a wireless network interface.

More information: https://manned.org/iwconfig.

- Show the parameters and statistics of all the interfaces:

```
iwconfig
```

- Show the parameters and statistics of the specified interface:

```
iwconfig {{interface}}
```

- Set the ESSID (network name) of the specified interface (e.g. `eth0` or `wlan0`):

```
iwconfig {{interface}} {{new_network_name}}
```

- Set the operating mode of the specified interface:

```
iwconfig {{interface}} mode {{Ad-Hoc|Managed|Master|Repeater|Secondary|Monitor|Auto}}
```

iwctl

Control the **`iwd`** network supplicant.

See also: **`nmcli`**, **`iw`**.

More information: https://manned.org/iwctl.

- Run `iwctl` in interactive mode:

```
iwctl
```

- Display Wi-Fi stations:

```
iwctl station list
```

- Look for networks with a station:

```
iwctl station {{station}} scan
```

- Display the networks found by a station:

```
iwctl station {{station}} get-networks
```

- Connect to a network with a station, if credentials are needed they will be asked:

```
iwctl station {{station}} connect {{network_name}}
```

- Display help:

```
iwctl {{[-h|--help]}}
```

iwinfo

Retrieve information about wireless interfaces on OpenWrt.

More information: https://openwrt.org/docs/guide-developer/ubus/iwinfo.

- List all available wireless interfaces:

```
iwinfo
```

- Display detailed information on a specific wireless interface:

```
iwinfo {{interface}} info
```

- Scan for nearby wireless networks visible to the interface:

```
iwinfo {{interface}} scan
```

- List connected devices:

```
iwinfo {{interface}} assoclist
```

- List channels supported by the interface:

```
iwinfo {{interface}} freqlist
```

- List available transmit power levels for the interface:

```
iwinfo {{interface}} txpowerlist
```

- Display help:

```
iwinfo h
```

iwlist

Get detailed information from a wireless interface.

More information: https://manned.org/iwlist.

- Display the list of access points and ad-hoc cells in range:

```
iwlist {{wireless_interface}} scan
```

- Display available frequencies in the device:

```
iwlist {{wireless_interface}} frequency
```

- List the bit-rates supported by the device:

```
iwlist {{wireless_interface}} rate
```

- List the WPA authentication parameters currently set:

```
iwlist {{wireless_interface}} auth
```

- List all the WPA encryption keys set in the device:

```
iwlist {{wireless_interface}} wpakeys
```

- List the encryption key sizes supported and list all the encryption keys set in the device:

```
iwlist {{wireless_interface}} keys
```

- List the various power management attributes and modes of the device:

```
iwlist {{wireless_interface}} power
```

- List generic information elements set in the device (used for WPA support):

```
iwlist {{wireless_interface}} genie
```

jhead

Image timestamp and EXIF data manipulation.

More information: https://www.sentex.net/~mwandel/jhead/usage.html.

- Show all EXIF data:

```
jhead {{path/to/image.jpg}}
```

- Set the file's date and time to the EXIF create date (file creation date will be changed):

```
jhead -ft {{path/to/image.jpg}}
```

- Set the EXIF time to the file's date and time (EXIF data will be changed):

```
jhead -dsft {{path/to/image.jpg}}
```

- Rename all JPEG files based on the EXIF create date to `YYYY_MM_DD-HH_MM_SS.jpg`:

```
jhead -n%Y_%m_%d-%H_%M_%S *.jpg
```

- Rotate losslessly all JPEG images by 90, 180, or 270 degrees based on the EXIF orientation tag:

```
jhead -autorot *.jpg
```

- Update all EXIF timestamps (Format: +- hour:minute:seconds) (example: forgot to change the camera's time zone - removing 1 hour from timestamps):

```
jhead -ta-1:00:00 *.jpg
```

- Remove all EXIF data (including thumbnails):

```
jhead -purejpg {{path/to/image.jpg}}
```

jobs

Shell builtin for viewing information about processes spawned by the current shell.

Options other than **`-l`** and **`-p`** are exclusive to Bash.

See also: **`fg`**, **`bg`**, **`disown`**, **`%`**.

More information: https://www.gnu.org/software/bash/manual/bash.html#index-jobs.

- View jobs spawned by the current shell:

```
jobs
```

- List jobs and their process IDs:

```
jobs -l
```

- Display information about jobs with changed status:

```
jobs -n
```

- Display only process IDs:

```
jobs -p
```

- Display running processes:

```
jobs -r
```

- Display stopped processes:

```
jobs -s
```

journalctl

Query the systemd journal.

See also: **`dmesg`**.

More information: https://www.freedesktop.org/software/systemd/man/latest/journalctl.html.

- Show the latest `n` lines and follow new messages (like `tail --follow` for traditional syslog):

```
journalctl {{[-n|--lines]}} {{n}} {{[-f|--follow]}}
```

- Show all messages with priority level 3 (errors) from the boot before last shutdown:

```
journalctl {{[-b|--boot]}} -1 {{[-p|--priority]}} 3
```

- Show all messages by a specific unit:

```
journalctl {{[-u|--unit]}} {{unit}}
```

- Show logs for a given unit since the last time it started:

```
journalctl _SYSTEMD_INVOCATION_ID=$(systemctl show --value --property=InvocationID {{unit}})
```

- Filter messages within a time range (either timestamp or placeholders like "yesterday"):

```
journalctl {{[-S|--since]}} {{now|today|yesterday|tomorrow|...}} {{[-U|--until]}} "{{YYYY-MM-DD HH:MM:SS}}"
```

- Show all messages by a specific process:

```
journalctl _PID={{process_id}}
```

- Show all messages by a specific executable:

```
journalctl {{path/to/executable}}
```

- Delete journal logs which are older than 2 days:

```
journalctl --vacuum-time 2d
```

jpegtran

Perform lossless transformation of JPEG files.

More information: https://manned.org/jpegtran.

- Mirror an image horizontally or vertically:

```
jpegtran {{[-f|-flip]}} {{horizontal|vertical}} {{path/to/image.jpg}} > {{path/to/output.jpg}}
```

- Rotate an image 90, 180, or 270 degrees clockwise:

```
jpegtran {{[-ro|-rotate]}} {{90|180|270}} {{path/to/image.jpg}} > {{path/to/output.jpg}}
```

- Transpose the image across the upper-left to lower right axis:

```
jpegtran -transpose {{path/to/image.jpg}} > {{path/to/output.jpg}}
```

- Transverse the image across the upper right to lower left axis:

```
jpegtran -transverse {{path/to/image.jpg}} > {{path/to/output.jpg}}
```

- Convert the image to grayscale:

```
jpegtran {{[-g|-grayscale]}} {{path/to/image.jpg}} > {{path/to/output.jpg}}
```

- Crop the image to a rectangular region of width `W` and height `H` from the upper-left corner, saving the output to a specific file:

```
jpegtran -crop {{W}}x{{H}} -outfile {{path/to/output.jpg}} {{path/to/image.jpg}}
```

- Crop the image to a rectangular region of width `W` and height `H`, starting at point `X` and `Y` from the upper-left corner:

```
jpegtran -crop {{W}}x{{H}}+{{X}}+{{Y}} {{path/to/image.jpg}} > {{path/to/output.jpg}}
```

just

A V8 JavaScript runtime for Linux.

More information: https://github.com/just-js/just.

- Start a REPL (interactive shell):

```
just
```

- Run a JavaScript file:

```
just {{path/to/file.js}}
```

- Evaluate JavaScript code by passing it as an argument:

```
just eval "{{code}}"
```

- Initialize a new project in a directory of the same name:

```
just init {{project_name}}
```

- Build a JavaScript application into an executable:

```
just build {{path/to/file.js}} --static
```

kde-builder

Easily build KDE components from its source repositories.

Drop-in replacement for **`kdesrc-build`**.

More information: https://kde-builder.kde.org/en/cmdline/supported-cmdline-params.html.

- Initialize `kde-builder`:

  ```
  kde-builder --initial-setup
  ```

- Compile a KDE component and its dependencies from the source (use `workspace` to compile Plasma desktop):

  ```
  kde-builder {{component_name1 component_name2 ...}}
  ```

- Compile a component without updating its local code and without compiling its dependencies:

  ```
  kde-builder {{[-SD|--no-src --no-include-dependencies]}} {{component_name}}
  ```

- Refresh the build directories before compiling:

  ```
  kde-builder {{[-r|--refresh-build]}} {{component_name}}
  ```

- Resume compilation from a specific dependency:

  ```
  kde-builder {{[-f|--resume-from]}} {{dependency_component}} {{component_name}}
  ```

- Run a component with a specified executable name:

  ```
  kde-builder --run {{executable_name}}
  ```

- Install login session:

  ```
  kde-builder --install-login-session-only
  ```

- Use system libraries in place of a component if it fails to build:

  ```
  kde-builder --no-stop-on-failure {{component_name}}
  ```

kde-inhibit

Inhibit various desktop functions while a command runs.

More information: https://invent.kde.org/plasma/kde-cli-tools/-/blob/master/kdeinhibit/main.cpp.

- Inhibit power management:

```
kde-inhibit --power {{command}} {{command_arguments}}
```

- Inhibit screen saver:

```
kde-inhibit --screenSaver {{command}} {{command_arguments}}
```

- Launch VLC, and inhibit color correction (night mode) while it's running:

```
kde-inhibit --colorCorrect {{vlc}}
```

kdesrc-build

Easily build KDE components from its source repositories.

More information: https://manned.org/kdesrc-build.

- Initialize `kdesrc-build`:

```
kdesrc-build --initial-setup
```

- Compile a KDE component and its dependencies from source:

```
kdesrc-build {{component_name}}
```

- Compile a component without updating its local code and without compiling its dependencies:

```
kdesrc-build --no-src --no-include-dependencies
{{component_name}}
```

- Refresh the build directories before compiling:

```
kdesrc-build --refresh-build {{component_name}}
```

- Resume compilation from a specific dependency:

```
kdesrc-build --resume-from {{dependency_component}}
{{component_name}}
```

- Run a component with a specified executable name:

```
kdesrc-build --run --exec {{executable_name}}
{{component_name}}
```

- Build all configured components:

```
kdesrc-build
```

- Use system libraries in place of a component if it fails to build:

```
kdesrc-build --no-stop-on-failure {{component_name}}
```

kdialog

Show KDE dialog boxes from within shell scripts.

More information: https://develop.kde.org/docs/administration/kdialog/.

- Open a dialog box displaying a specific message:

```
kdialog --msgbox "{{message}}"
"{{optional_detailed_message}}"
```

- Open a question dialog with a `yes` and `no` button, returning `0` and `1`, respectively:

```
kdialog --yesno "{{message}}"
```

- Open a warning dialog with a `yes`, `no`, and `cancel` button, returning `0`, `1`, or `2` respectively:

```
kdialog --warningyesnocancel "{{message}}"
```

- Open an input dialog box and print the input to `stdout` when `OK` is pressed:

```
kdialog --inputbox "{{message}}" "{{optional_default_text}}"
```

- Open a dialog to prompt for a specific password and print it to `stdout`:

```
kdialog --password "{{message}}"
```

- Open a dialog containing a specific dropdown menu and print the selected item to `stdout`:

```
kdialog --combobox "{{message}}" "{{item1}}" "{{item2}}"
"{{...}}"
```

- Open a file chooser dialog and print the selected file's path to `stdout`:

```
kdialog --getopenfilename
```

- Open a progressbar dialog and print a D-Bus reference for communication to `stdout`:

```
kdialog --progressbar "{{message}}"
```

kdocker

Easily dock applications to the system tray.

More information: https://github.com/user-none/KDocker.

- Display a cursor to send a window to the system tray when pressing the left mouse button (press any other mouse button to cancel):

```
kdocker
```

- Open an application and send it to the system tray:

```
kdocker {{application}}
```

- Send focused window to the system tray:

```
kdocker -f
```

- Display a cursor to send a window to the system tray with a custom icon when pressing the left mouse button:

```
kdocker -i /{{path/to/icon}}
```

- Open an application, send it to the system tray, and if focus is lost, minimize it:

```
kdocker -l {{application}}
```

- Display version:

```
kdocker --version
```

kernel-install

Add and remove kernel and initrd images to and from **/boot**.

More information: https://www.freedesktop.org/software/systemd/man/latest/kernel-install.html.

- Show the current kernel configuration that has been configured or auto-detected:

```
kernel-install
```

- Show the configuration for a specific kernel image:

```
kernel-install inspect {{path/to/kernel_image}}
```

- Add a kernel to the bootloader partition:

```
sudo kernel-install add {{kernel_version}} {{path/to/kernel_image}}
```

- Add a kernel and initramfs images to the bootloader partition:

```
sudo kernel-install add {{kernel_version}} {{path/to/kernel_image}} {{path/to/initrd1 path/to/initrd2 ...}}
```

- Remove a kernel from the bootloader partition:

```
sudo kernel-install remove {{kernel_version}}
```

kernelstub

Automatically manage Linux kernel loading on (U)EFI.

More information: https://github.com/isantop/kernelstub#usage.

- Configure the current kernel with default options:

```
sudo kernelstub
```

- Add custom kernel options:

```
sudo kernelstub {{[-o|--options]}} "{{quiet splash mitigations=off}}"
```

- Run in verbose mode with `systemd-boot` configuration:

```
sudo kernelstub {{[-v|--verbose]}} {{[-l|--loader]}}
```

- Copy kernel only to ESP without NVRAM changes:

```
sudo kernelstub {{[-m|--manage-only]}}
```

- Simulate the operation without making any changes:

```
sudo kernelstub {{[-c|--dry-run]}}
```

- Specify paths manually:

```
sudo kernelstub {{[-k|--kernel-path]}} /{{path/to/vmlinuz}} {{[-i|--initrd-path]}} /{{path/to/initrd.img}} {{[-e|--esp-path]}} /{{path/to/efi_partition}}
```

- Show current configuration:

```
sudo kernelstub {{[-p|--print-config]}}
```

kexec

Directly reboot into a new kernel.

More information: https://manned.org/kexec.

- Load a new kernel:

```
kexec {{[-l|--load]}} {{path/to/kernel}} --initrd={{path/to/initrd}} --command-line={{arguments}}
```

- Load a new kernel with current boot parameters:

```
kexec {{[-l|--load]}} {{path/to/kernel}} --initrd={{path/to/initrd}} --reuse-cmdline
```

- Execute a currently loaded kernel:

```
kexec {{[-e|--exec]}}
```

- Unload current kexec target kernel:

```
kexec {{[-u|--unload]}}
```

keyctl

Manipulate the Linux kernel keyring.

More information: https://manned.org/keyctl.

- List keys in a specific keyring:

```
keyctl list {{target_keyring}}
```

- List current keys in the user default session:

```
keyctl list {{@us}}
```

- Store a key in a specific keyring:

```
keyctl add {{type_keyring}} {{key_name}} {{key_value}}
{{target_keyring}}
```

- Store a key with its value from `stdin`:

```
echo -n {{key_value}} | keyctl padd {{type_keyring}}
{{key_name}} {{target_keyring}}
```

- Put a timeout on a key:

```
keyctl timeout {{key_name}} {{timeout_in_seconds}}
```

- Read a key and format it as a hex-dump if not printable:

```
keyctl read {{key_name}}
```

- Read a key and format as-is:

```
keyctl pipe {{key_name}}
```

- Revoke a key and prevent any further action on it:

```
keyctl revoke {{key_name}}
```

keyd

Remap keys.

More information: https://manned.org/keyd.

- Start and enable the `keyd` service:

```
systemctl enable keyd --now
```

- Display keypress information:

```
sudo keyd {{[-m|monitor]}}
```

- Reset bindings and reload the configuration files in `/etc/keyd`:

```
sudo keyd reload
```

- List all valid key names:

```
keyd list-keys
```

- Check the detected configuration files for errors:

```
keyd check
```

- Create a temporary binding:

```
sudo keyd bind "{{pressed_key}} = {{output_key}}"
```

kill

Send a signal to a process, usually related to stopping the process.

All signals except for SIGKILL and SIGSTOP can be intercepted by the process to perform a clean exit.

More information: https://manned.org/kill.

- Terminate a program using the default SIGTERM (terminate) signal:

```
kill {{process_id}}
```

- List signal values and their corresponding names (to be used without the `SIG` prefix). The available options may depend on the `kill` implementation:

```
kill {{-l|-L|--table}}
```

- Terminate a background job:

```
kill %{{job_id}}
```

- Terminate a program using the SIGHUP (hang up) signal. Many daemons will reload instead of terminating:

```
kill {{[-1|-HUP]}} {{process_id}}
```

- Terminate a program using the SIGINT (interrupt) signal. This is typically initiated by the user pressing `<Ctrl c>`:

```
kill {{[-2|-INT]}} {{process_id}}
```

- Signal the operating system to immediately terminate a program (which gets no chance to capture the signal):

```
kill {{[-9|-KILL]}} {{process_id}}
```

- Signal the operating system to pause a program until a SIGCONT ("continue") signal is received:

```
kill {{[-19|-STOP]}} {{process_id}}
```

- Send a `SIGUSR1` signal to all processes with the given GID (group id):

```
kill {{[-10|-SIGUSR1]}} -{{group_id}}
```

kinfocenter

KDE information center to show system information.

More information: https://manned.org/kinfocenter.

- Open the GUI:

```
kinfocenter
```

- List all possible KCM modules for `kinfocenter`:

```
kinfocenter --list
```

- Open a specific KCM:

```
kinfocenter {{kcm_name}}
```

- Display help:

```
kinfocenter {{[-h|--help]}}
```

kjv

The word of God available right on your desktop.

More information: https://github.com/layeh/kjv#kjv.

- Display books:

```
kjv -l
```

- Open a specific book:

```
kjv {{Genesis}}
```

- Open a specific chapter of a book:

```
kjv {{Genesis}} {{2}}
```

- Open a specific verse of a specific chapter of a book:

```
kjv {{John}} {{3}}:{{16}}
```

- Open a specific range of verses of a book's chapter:

```
kjv {{Proverbs}} {{3}}:{{1-6}}
```

- Display a specific range of verses of a book from different chapters:

```
kjv {{Matthew}} {{1}}:{{7}}-{{2}}:{{6}}
```

- Display all verses that match a pattern:

```
kjv /{{Plagues}}
```

- Display all verses that match a pattern in a specific book:

```
kjv {{1Jn}}/{{antichrist}}
```

kmod

Manage Linux kernel modules.

This program is usually called via its symlinks: **`lsmod`**, **`rmmod`**, **`insmod`**, **`modinfo`**, **`modprobe`**, and **`depmod`**.

See their respective pages for more information.

More information: https://manned.org/kmod.

- List currently loaded kernel modules:

  ```
  kmod list
  ```

- Display the static device nodes information provided by the modules of the currently running kernel:

  ```
  kmod static-nodes
  ```

kmscon

Use the framebuffer instead of text mode to draw a terminal in a TTY.

More information: https://manned.org/kmscon.

- Start `kmscon` on the first available TTY, as reported by `fgconsole --next-available`:

```
sudo kmscon
```

- Start `kmscon` in a specific TTY:

```
sudo kmscon --vt {{/dev/ttyX|ttyX|X}}
```

- Enable mouse support:

```
sudo kmscon --mouse
```

- Specify the command to use for login:

```
sudo kmscon {{[-l|--login]}} {{command}}
```

- Always start `kmscon` in a specific terminal:

```
systemctl enable --now kmsconvt@{{ttyX}}
```

knock

Port knocking client to open specific ports on firewall.

More information: https://manned.org/knock.

- Knock on ports using different protocols:

```
knock {{hostname}} {{portnumber}}:{{protocol}}
```

- Knock on port using UDP:

```
knock {{[-u|--udp]}} {{hostname}} {{portnumber}}
```

- Force usage of IPv4/IPv6:

```
knock {{-4|-6}} {{hostname}} {{portnumber}}
```

- Display errors and details of connection:

```
knock {{[-v|--verbose]}} {{hostname}} {{portnumber}}
```

knockd

Port knocking daemon to listen for port knocking and execute scripts.

More information: https://manned.org/knockd.

- Start knockd system daemon:

```
knockd {{[-d|--daemon]}}
```

- Use specified configuration file for knockd:

```
knockd {{[-c|--config]}} {{path/to/file}}.configuration
```

koji build

Build an RPM package.

More information: https://docs.pagure.org/koji/.

- Build a package from `src.rpm`:

```
koji build {{target}} {{path/to/src.rpm}}
```

- Build a package from a SCM (Source Code Management) URL:

```
koji build {{target}} {{git+https://src.fedoraproject.org/
rpms/vim.git#e847a50297a216229050bf4db3d06a139104e7cf}}
```

- Perform a scratch build:

```
koji build {{target}} {{path/to/src.rpm}} --scratch
```

- Wait on the build, even if it's running in the background:

```
koji build {{target}} {{path/to/src.rpm}} --wait
```

- Don't wait on build:

```
koji build {{target}} {{path/to/src.rpm}} --nowait
```

- Display help:

```
koji build {{[-h|--help]}}
```

koji buildinfo

Print basic information about a build.

More information: https://docs.pagure.org/koji/.

- Print basic information:

```
koji buildinfo {{BuildID_or_NVR1 BuildID_or_NRV2 ...}}
```

- Print basic information with changelog:

```
koji buildinfo {{BuildID_or_NVR1 BuildID_or_NRV2 ...}} --changelog
```

- Display help:

```
koji buildinfo {{[-h|--help]}}
```

koji call

Execute an arbitrary XML-RPC call.

Example: a build function declaration is **`build(src, target, opts=None, priority=None, channel=None)`**.

More information: https://koji.fedoraproject.org/koji/api.

- Call build function with scratch option:

```
koji call build '"{{git+https://src.fedoraproject.org/rpms/
vim.git#e847a50297a216229050bf4db3d06a139104e7cf}}"'
\"{{target}}\" --kwargs '{"opts":{"scratch": True\}\}'
```

- Call build function with arch_override option:

```
koji call build '"{{git+https://src.fedoraproject.org/rpms/
vim.git#e847a50297a216229050bf4db3d06a139104e7cf}}"'
\"{{target}}\" --kwargs '{"opts":{"arch_override":"sw_64"\}
\}'
```

- Call build function on `default` channel:

```
koji call build '"{{git+https://src.fedoraproject.org/rpms/
vim.git#e847a50297a216229050bf4db3d06a139104e7cf}}"'
\"{{target}}\" --kwargs '{"channel":"default"}'
```

- Display help:

```
koji call {{[-h|--help]}}
```

koji cancel

Cancel active tasks running on the Koji build system.

More information: https://docs.pagure.org/koji/.

- Cancel a task by its ID:

```
koji cancel {{task_id}}
```

- Cancel multiple tasks:

```
koji cancel {{task_id1 task_id2 ...}}
```

- Cancel a task with verbose output:

```
koji cancel --verbose {{task_id}}
```

- Display help:

```
koji cancel {{[-h|--help]}}
```

koji download-build

Download a built package.

More information: https://docs.pagure.org/koji/.

- Download all RPMs from a specific build:

```
koji download-build {{BuildID|RPM|NVR}}
```

- Download RPMs signed with the given key:

```
koji download-build {{BuildID|RPM|NVR}} --key {{key}}
```

- Only download RPMs for given arch:

```
koji download-build {{BuildID|RPM|NVR}} --arch
{{x86_64,aarch64,noarch,...}}
```

- Download the given RPM:

```
koji download-build {{RPM}} --rpm
```

- Display help:

```
koji download-build {{[-h|--help]}}
```

koji help

Display help information for Koji commands.

More information: https://docs.pagure.org/koji/HOWTO/#exploring-koji.

- Display all available commands:

```
koji help
```

- Display help for specific category (Available categories are: admin, all, bind, build, download, info, misc, monitor, search):

```
koji help {{category}}
```

- Display help:

```
koji help {{[-h|--help]}}
```

koji resubmit

Retry a cancelled or failed task, using the same parameter as the original task.

More information: https://docs.pagure.org/koji/.

- Resubmit a task:

```
koji resubmit {{task_id}}
```

- Resubmit a task without waiting for it to finish:

```
koji resubmit {{task_id}} --nowait
```

- Resubmit a task without printing task information:

```
koji resubmit {{task_id}} --quiet
```

- Display help:

```
koji resubmit {{[-h|--help]}}
```

koji tag-build

Apply a tag to one or more builds.

More information: https://docs.pagure.org/koji/.

- Apply a tag to one or more builds:

```
koji tag-build {{tag}} {{NVR1 NVR2 ...}}
```

- Don't wait on task:

```
koji tag-build {{tag}} {{NVR1 NVR2 ...}} --nowait
```

- Force operation:

```
koji tag-build {{tag}} {{NVR1 NVR2 ...}} --force
```

- Display help:

```
koji tag-build {{[-h|--help]}}
```

koji taginfo

Print basic information about a tag.

More information: https://docs.pagure.org/koji/.

- Print basic information:

```
koji taginfo {{tag1 tag2 ...}}
```

- Display help:

```
koji taginfo {{[-h|--help]}}
```

koji untag-build

Remove a tag from one or more builds.

More information: https://docs.pagure.org/koji/.

- Remove a tag from one or more builds:

```
koji untag-build {{tag}} {{NVR1 NVR2 ...}}
```

- Untag all versions of the package in this tag:

```
koji untag-build {{tag}} {{pkg1 pkg2 ...}} --all
```

- Untag all versions of the package in this tag except the latest:

```
koji untag-build {{tag}} {{pkg1 pkg2 ...}} --non-latest
```

- Test mode:

```
koji untag-build {{tag}} {{NVR1 NVR2 ...}} {{[-n|--test]}}
```

- Print details:

```
koji untag-build {{tag}} {{NVR1 NVR2 ...}} {{[-v|--verbose]}}
```

- Display help:

```
koji untag-build {{[-h|--help]}}
```

koji

Interact with kojihub.

Some subcommands such as **`build`**, **`tag-build`**, **`download-build`**, **`buildinfo`**, **`call`**, etc. have their own usage documentation.

More information: https://docs.pagure.org/koji/.

- Execute a koji subcommand:

  ```
  koji {{subcommand}}
  ```

- Introduce yourself to test connectivity with kojihub:

  ```
  koji moshimoshi
  ```

- Display help about global options:

  ```
  koji {{[-h|--help]}}
  ```

- Display help to get all available commands:

  ```
  koji help
  ```

- Display help for a specific subcommand (like `build`, `tag-build`, `download-build`, `buildinfo`,`call`, etc.):

  ```
  koji {{subcommand}} {{[-h|--help]}}
  ```

- Display version:

  ```
  koji version
  ```

konsave

Save and apply your Linux customizations with just one command.

More information: https://github.com/Prayag2/konsave.

- Save the current configuration as a profile:

```
konsave {{[-s|--save]}} {{profile_name}}
```

- Apply a profile:

```
konsave {{[-a|--apply]}} {{profile_name}}
```

- Save the current configuration as a profile, overwriting existing profiles if they exist with the same name:

```
konsave {{[-s|--save]}} {{profile_name}} {{[-f|--force]}}
```

- List all profiles:

```
konsave {{[-l|--list]}}
```

- Remove a profile:

```
konsave {{[-r|--remove]}} {{profile_name}}
```

- Export a profile as a `.knsv` to the home directory:

```
konsave {{[-e|--export-profile]}} {{profile_name}}
```

- Import a `.knsv` profile:

```
konsave {{[-i|--import-profile]}} {{path/to/
profile_name.knsv}}
```

konsole

KDE's terminal emulator.

More information: https://docs.kde.org/stable_kf6/en/konsole/konsole/command-line-options.html.

- Open the terminal in a specific directory:

```
konsole --workdir {{path/to/directory}}
```

- [e]xecute a specific command and don't close the window after it exits:

```
konsole --noclose -e "{{command}}"
```

- Open a new tab:

```
konsole --new-tab
```

- Open the terminal in the background and bring to the front when `<Ctrl Shift F12>` is pressed:

```
konsole --background-mode
```

kpackagetool5

KPackage Manager: install, list, remove Plasma packages.

More information: https://manned.org/kpackagetool5.

- List all known package types that can be installed:

```
kpackagetool5 --list-types
```

- Install the package from a directory:

```
kpackagetool5 {{[-t|--type]}} {{package_type}} {{[-i|--install]}} {{path/to/directory}}
```

- Update installed package from a directory:

```
kpackagetool5 {{[-t|--type]}} {{package_type}} {{[-u|--upgrade]}} {{path/to/directory}}
```

- List installed plasmoids (`--global` for all users):

```
kpackagetool5 {{[-t|--type]}} Plasma/Applet {{[-l|--list]}} {{[-g|--global]}}
```

- Remove a plasmoid by name:

```
kpackagetool5 {{[-t|--type]}} Plasma/Applet {{[-r|--remove]}} "{{name}}"
```

kpackagetool6

KPackage Manager: install, list, remove Plasma packages.

More information: https://manned.org/kpackagetool6.

- List all known package types that can be installed:

```
kpackagetool6 --list-types
```

- Install the package from a directory:

```
kpackagetool6 {{[-t|--type]}} {{package_type}} {{[-i|--install]}} {{path/to/directory}}
```

- Update installed package from a directory:

```
kpackagetool6 {{[-t|--type]}} {{package_type}} {{[-u|--upgrade]}} {{path/to/directory}}
```

- List installed plasmoids (`--global` for all users):

```
kpackagetool6 {{[-t|--type]}} Plasma/Applet {{[-l|--list]}} {{[-g|--global]}}
```

- Remove a plasmoid by name:

```
kpackagetool6 {{[-t|--type]}} Plasma/Applet {{[-r|--remove]}} "{{name}}"
```

kpartx

Create device maps from partition tables.

More information: https://manned.org/kpartx.

- Add partition mappings and print created mappings:

```
kpartx -av {{whole_disk.img}}
```

- Delete partition mappings:

```
kpartx -d {{whole_disk.img}}
```

- List partition mappings:

```
kpartx -l {{whole_disk.img}}
```

krdc

Connect to a remote desktop server.

More information: https://invent.kde.org/network/krdc#usage.

- Start KRDC:

```
krdc
```

- Automatically connect to a host with the current username using VNC:

```
krdc {{remote_host}}
```

- Specify the protocol and username used to connect to a host:

```
krdc {{vnc|rdp}}://{{username}}@{{remote_host}}
```

- Start the connection in fullscreen mode:

```
krdc {{rdp://username@ip_address}} --fullscreen
```

krdpserver

Start an RDP server.

More information: https://invent.kde.org/plasma/krdp#running-the-example-server.

- Start an RDP server with a username and password:

```
krdpserver {{[-u|--username]}} {{user_name}} {{[-p|--password]}} {{password}}
```

- Share a specific monitor marked by its index:

```
krdpserver {{[-u|--username]}} {{user_name}} {{[-p|--password]}} {{password}} --monitor {{n}}
```

kreadconfig5

Read KConfig entries for KDE Plasma.

More information: https://userbase.kde.org/KDE_System_Administration/Configuration_Files.

- Read a key from the global configuration:

```
kreadconfig5 --group {{group_name}} --key {{key_name}}
```

- Read a key from a specific configuration file:

```
kreadconfig5 --file {{path/to/file}} --group {{group_name}} --key {{key_name}}
```

- Check if systemd is used to start the Plasma session:

```
kreadconfig5 --file {{startkderc}} --group {{General}} --key {{systemdBoot}}
```

krfb-virtualmonitor

Create a virtual monitor and allow that monitor to be used with VNC.

More information: https://invent.kde.org/network/krfb.

- Create a virtual monitor with dimensions `1920x1080`:

```
krfb-virtualmonitor
```

- Set the virtual monitor dimensions:

```
krfb-virtualmonitor --resolution {{2560}}x{{1440}}
```

- Set the monitor name:

```
krfb-virtualmonitor --name {{monitor_name}}
```

- Set the monitor password for remote VNC connection on port `5900`:

```
krfb-virtualmonitor --password {{password}}
```

- Set the password and the port:

```
krfb-virtualmonitor --password {{password}} --port {{port}}
```

- Display help:

```
krfb-virtualmonitor {{[-h|--help]}}
```

kscreen-console

Query KScreen's status.

More information: https://manned.org/kscreen-console.

- Show all outputs and configuration files to attach to a bug report:

```
kscreen-console bug
```

- Show paths to KScreen configuration files:

```
kscreen-console config
```

- Show KScreen output information and configuration:

```
kscreen-console outputs
```

- Monitor for changes:

```
kscreen-console monitor
```

- Show the current KScreen configuration as JSON:

```
kscreen-console json
```

- Display help:

```
kscreen-console {{[-h|--help]}}
```

- Display help including Qt specific command-line options:

```
kscreen-console --help-all
```

kscreen-doctor

Change and manipulate the screen setup.

More information: https://invent.kde.org/plasma/libkscreen.

- Show display output information:

```
kscreen-doctor {{[-o|--outputs]}}
```

- Set the rotation of a display output with an ID of 1 to the right:

```
kscreen-doctor output.1.rotation.right
```

- Set the scale of a display output with an ID of `HDMI-2` to 2 (200%):

```
kscreen-doctor output.HDMI-2.scale.2
```

- Enable a specific HDMI display:

```
kscreen-doctor output.{{HDMI-A-1}}.enable
```

- Disable a specific DisplayPort display:

```
kscreen-doctor output.{{DP-2}}.disable
```

- Set a display as primary display:

```
kscreen-doctor output.{{HDMI-A-1}}.primary
```

- Display help:

```
kscreen-doctor {{[-h|--help]}}
```

kscreenctl

Manage display outputs on KDE Plasma.

See also: **`kscreen-doctor`**, **`kscreen-console`**.

More information: https://invent.kde.org/plasma/kscreen.

- List all connected outputs:

```
kscreenctl list-outputs
```

- Show an on-screen label on each monitor to identify connector names:

```
kscreenctl identify
```

- Show information about a specific output (or use `active-output` / `primary-output`):

```
kscreenctl {{DP-1}}
```

- Set the resolution and refresh rate of an output:

```
kscreenctl {{DP-1}} set-mode 1920x1080@60
```

- Set the scale of an output to 200%:

```
kscreenctl {{DP-1}} set-scale 200%
```

- Place an output to the right of another:

```
kscreenctl {{HDMI-A-1}} right-of {{DP-1}}
```

- Disable a specific output:

```
kscreenctl {{HDMI-A-1}} set-enabled false
```

- Turn all outputs off through Display Power Management Signaling:

```
kscreenctl off
```

ksvgtopng5

Convert SVG files to PNG format.

More information: https://invent.kde.org/plasma/kde-cli-tools/-/blob/master/ksvgtopng/ksvgtopng.cpp.

- Convert an SVG file (should be an absolute path) to PNG:

```
ksvgtopng5 {{width}} {{height}} {{path/to/file.svg}} {{output_filename.png}}
```

kwallet-query

Read and write to a KDE Wallet.

More information: https://manned.org/kwallet-query.

- List all entries in the `Passwords` folder of `kdewallet`:

```
kwallet-query {{kdewallet}} {{[-l|--list-entries]}}
```

- List all entries in a specific folder:

```
kwallet-query {{kdewallet}} {{[-l|--list-entries]}} {{[-f|--folder]}} {{folder_name}}
```

- List all available folders:

```
kwallet-query {{kdewallet}} {{[-l|--list-entries]}} {{[-f|--folder]}} ""
```

- Display help:

```
kwallet-query {{[-h|--help]}}
```

kwrite

Text editor of the KDE Desktop project.

See also: **kate**.

More information: https://docs.kde.org/stable_kf6/en/kate/kwrite/command-line-options.html.

- Open a text file:

```
kwrite {{path/to/file}}
```

- Open multiple text files:

```
kwrite {{file1 file2 ...}}
```

- Open a text file with a specific encoding:

```
kwrite --encoding {{UTF-8}} {{path/to/file}}
```

- Open a text file and navigate to a specific line and column:

```
kwrite --line {{line_number}} --column {{column_number}} {{path/to/file}}
```

kwriteconfig5

Write KConfig entries for KDE Plasma.

More information: https://userbase.kde.org/KDE_System_Administration/Configuration_Files.

- Set a global configuration key:

```
kwriteconfig5 --group {{group_name}} --key {{key}} {{value}}
```

- Set a key in a specific configuration file:

```
kwriteconfig5 --file {{path/to/file}} --group {{group_name}} --key {{key}} {{value}}
```

- Delete a key:

```
kwriteconfig5 --group {{group_name}} --key {{key}} --delete
```

- Use systemd to start the Plasma session when available:

```
kwriteconfig5 --file {{startkderc}} --group {{General}} --key {{systemdBoot}} {{true}}
```

- Hide the title bar when a window is maximized (like Ubuntu):

```
kwriteconfig5 --file {{~/.config/kwinrc}} --group {{Windows}} --key {{BorderlessMaximizedWindows}} {{true}}
```

- Configure KRunner to open with the Meta (Command/Windows) global hotkey:

```
kwriteconfig5 --file {{~/.config/kwinrc}} --group {{ModifierOnlyShortcuts}} --key {{Meta}} "{{org.kde.kglobalaccel,/component/krunner_desktop,org.kde.kglobalaccel.Component,invokeShortcut,_launch}
```

- Display help:

```
kwriteconfig5 --help
```

laptop-detect

Attempt to determine if the script is running on a laptop or desktop.

More information: https://gitlab.com/debiants/laptop-detect.

- Return an exit status of 0 if the current device is likely a laptop, else returns 1:

```
laptop-detect
```

- Print the type of device that the current system is detected as:

```
laptop-detect --verbose
```

- Display version:

```
laptop-detect --version
```

larasail

Manage Laravel on Digital Ocean servers.

More information: https://github.com/thedevdojo/larasail#setup-your-server.

- Set up the server with Laravel dependencies using the default PHP version:

  ```
  larasail setup
  ```

- Set up the server with Laravel dependencies using a specific PHP version:

  ```
  larasail setup {{php71}}
  ```

- Add a new Laravel site:

  ```
  larasail host {{domain}} {{path/to/site_directory}}
  ```

- Retrieve the Larasail user password:

  ```
  larasail pass
  ```

- Retrieve the Larasail MySQL password:

  ```
  larasail mysqlpass
  ```

last

View the last logged in users.

More information: https://manned.org/last.

- View last login information (e.g., username, terminal, boot time, kernel) of all users as read from `/var/log/wtmp`:

```
last
```

- List login information of a specific user:

```
last {{username}}
```

- Specify how many of the last logins to show:

```
last {{[-n|--limit]}} {{login_count}}
```

- Print the full date and time for entries and then display the hostname column last to prevent truncation:

```
last {{[-F|--fulltimes]}} {{[-a|--hostlast]}}
```

- View all logins by a specific user and show the IP address instead of the hostname:

```
last {{username}} {{[-i|--ip]}}
```

- List information since a specific time and date:

```
last {{[-s|--since]}} {{-7days}}
```

- View all recorded reboots (i.e., the last logins of the pseudo user "reboot"):

```
last reboot
```

- Display help:

```
last {{[-h|--help]}}
```

lastb

List last logged in users.

More information: https://manned.org/lastb.

- List last logged in users:

```
sudo lastb
```

- List all last logged in users since a given time:

```
sudo lastb {{[-s|--since]}} {{YYYY-MM-DD}}
```

- List all last logged in users until a given time:

```
sudo lastb {{[-t|--until]}} {{YYYY-MM-DD}}
```

- List all logged in users at a specific time:

```
sudo lastb {{[-p|--present]}} {{hh:mm}}
```

- List all last logged in users and translate the IP into a hostname:

```
sudo lastb {{[-d|--dns]}}
```

lastlog

Show the most recent login of all users or of a user.

More information: https://manned.org/lastlog.

- Display the most recent login of all users:

```
lastlog
```

- Display the lastlog record of the specified user:

```
lastlog --user {{username}}
```

- Display records older than 7 days:

```
lastlog --before 7
```

- Display records more recent than 3 days:

```
lastlog --time 3
```

latte-dock

Replacement dock for Plasma desktop.

More information: https://github.com/KDE/latte-dock.

- Clear QML cache:

  ```
  latte-dock --clear-cache
  ```

- Import and load default layout on startup:

  ```
  latte-dock --default-layout
  ```

- Load a specific layout on startup:

  ```
  latte-dock --layout {{layout_name}}
  ```

- Import and load a specific layout:

  ```
  latte-dock --import-layout {{path/to/file}}
  ```

lbu

Manage **apk** overlay files on a diskless Alpine Linux system.

Note: Subcommands like **include** write to **/etc**, which is stored in RAM. You need to run **lbu commit** to save the changes.

More information: https://wiki.alpinelinux.org/wiki/Alpine_local_backup.

- Commit changes to persistent storage (only files in `/etc` by default):

```
lbu {{[ci|commit]}}
```

- List files that would be saved using `commit`:

```
lbu {{[st|status]}}
```

- Display changes in tracked files that would be saved using `commit`:

```
lbu diff
```

- Include a specific file or directory in the `apk` overlay:

```
lbu {{[inc|include]}} {{path/to/file_or_directory}}
```

- Exclude a specific file or directory in `/etc` from the `apk` overlay:

```
lbu {{[ex|exclude]}} {{path/to/file_or_directory}}
```

- Display the list of manually included/excluded files:

```
lbu {{include|exclude}} -l
```

- List backups (previously created overlays):

```
lbu {{[lb|list-backup]}}
```

- Revert to a backup overlay:

```
lbu revert {{overlay_filename.tar.gz}}
```

lchage

Display or change user password policy.

More information: https://manned.org/lchage.

- Disable password expiration for the user:

```
sudo lchage --date -1 {{username}}
```

- Display the password policy for the user:

```
sudo lchage --list {{username}}
```

- Require password change for the user a certain number of days after the last password change:

```
sudo lchage --maxdays {{number_of_days}} {{username}}
```

- Start warning the user a certain number of days before the password expires:

```
sudo lchage --warndays {{number_of_days}} {{username}}
```

lci

LOLCODE interpreter written in C.

More information: https://github.com/justinmeza/lci.

- Run a LOLCODE file:

```
lci {{path/to/file}}
```

- Display help:

```
lci {{[-h|--help]}}
```

- Display version:

```
lci {{[-v|--version]}}
```

ldapdomaindump

Dump users, computers, groups, OS, and membership information via LDAP to HTML, JSON, and greppable output.

See also: **`ldapsearch`**.

More information: https://github.com/dirkjanm/ldapdomaindump#usage.

- Dump all information using the given LDAP account:

```
ldapdomaindump {{[-u|--user]}} {{domain}}\{{username}} {{[-
p|--password]}} {{password|ntlm_hash}} {{hostname|ip}}
```

- Dump all information, resolving computer hostnames:

```
ldapdomaindump {{[-r|--resolve]}} {{[-u|--user]}} {{domain}}\
{{username}} {{[-p|--password]}}{{password}} {{hostname|ip}}
```

- Dump all information, resolving computer hostnames with the selected DNS server:

```
ldapdomaindump {{[-r|--resolve]}} {{[-n|--dns-server]}}
{{domain_controller_ip}} {{[-u|--user]}} {{domain}}\
{{username}} {{[-p|--password]}}{{password}} {{hostname|ip}}
```

- Dump all information to the given directory without JSON output:

```
ldapdomaindump --no-json {{[-o|--outdir]}} {{path/to/
directory}} {{[-u|--user]}} {{domain}}\{{username}} {{[-p|--
password]}}{{password}} {{hostname|ip}}
```

ldconfig

Configure symlinks and cache for shared library dependencies.

More information: https://manned.org/ldconfig.

- Update symlinks and rebuild the cache (usually run when a new library is installed):

```
sudo ldconfig
```

- Update the symlinks for a given directory:

```
sudo ldconfig -n {{path/to/directory}}
```

- Print the libraries in the cache and check whether a given library is present:

```
ldconfig {{[-p|--print-cache]}} | grep {{library_name}}
```

ldd

Display shared library dependencies of a binary.

Do not use on an untrusted binary, use objdump for that instead.

More information: https://manned.org/ldd.

- Display shared library dependencies of a binary:

```
ldd {{path/to/binary}}
```

- Display all information about dependencies:

```
ldd {{[-v|--verbose]}} {{path/to/binary}}
```

- Display unused direct dependencies:

```
ldd {{[-u|--unused]}} {{path/to/binary}}
```

- Report missing data objects and perform data relocations:

```
ldd {{[-d|--data-relocs]}} {{path/to/binary}}
```

- Report missing data objects and functions, and perform relocations for both:

```
ldd {{[-r|--function-relocs]}} {{path/to/binary}}
```

lddd

Find broken library links on the system.

This tool is only available on Arch Linux.

More information: https://manned.org/lddd.

- Scan directories to find and list packages with broken library links that need to be rebuilt:

```
lddd
```

ledctl

Intel(R) Enclosure LED Control Application.

More information: https://manned.org/ledctl.

- Turn on the "Locate" LED for specified device(s):

```
sudo ledctl locate={{/dev/sda,/dev/sdb,...}}
```

- Turn off the "Locate" LED for specified device(s):

```
sudo ledctl locate_off={{/dev/sda,/dev/sdb,...}}
```

- Turn off the "Status" LED and "Failure" LED for specified device(s):

```
sudo ledctl off={{/dev/sda,/dev/sdb,...}}
```

- Turn off the "Status" LED, "Failure" LED, and "Locate" LED for specified device(s):

```
sudo ledctl normal={{/dev/sda,/dev/sdb,...}}
```

legit

Complementary command-line interface for Git.

More information: https://frostming.github.io/legit/.

- Switch to a specified branch, stashing and restoring unstaged changes:

```
git sw {{target_branch}}
```

- Synchronize current branch, automatically merging or rebasing, and stashing and unstashing:

```
git sync
```

- Publish a specified branch to the remote server:

```
git publish {{branch_name}}
```

- Remove a branch from the remote server:

```
git unpublish {{branch_name}}
```

- List all branches and their publication status:

```
git branches {{glob_pattern}}
```

- Remove the last commit from the history:

```
git undo --hard
```

lex

This command is an alias of **`flex`**.

- View documentation for the original command:

```
tldr flex
```

lftp

Sophisticated file transfer program.

More information: https://lftp.yar.ru/lftp-man.html.

- Connect to an FTP server:

```
lftp {{[-u|--user]}} {{username}} {{ftp.example.com}}
```

- [Interactive] Download multiple files (`glob` expression):

```
mget {{path/to/*.png}}
```

- [Interactive] Upload multiple files (`glob` expression):

```
mput {{path/to/*.zip}}
```

- [Interactive] Delete multiple files on the remote server:

```
mrm {{path/to/*.txt}}
```

- [Interactive] Rename a file on the remote server:

```
mv {{original_filename}} {{new_filename}}
```

- [Interactive] Download or update an entire directory:

```
mirror {{path/to/remote_directory}} {{path/to/
local_output_directory}}
```

- [Interactive] Upload or update an entire directory:

```
mirror {{[-R|--reverse]}} {{path/to/local_directory}} {{path/
to/remote_output_directory}}
```

libinput

Interface with libinput.

More information: https://wayland.freedesktop.org/libinput/doc/latest/.

- List all devices recognized by libinput:

```
sudo libinput list-devices
```

- Print all libinput events:

```
sudo libinput debug-events
```

- Show a GUI to visualize libinput's events:

```
sudo libinput debug-gui
```

- Debug tablet axis values:

```
sudo libinput debug-tablet
```

- Record a single device:

```
sudo libinput record
```

- Display help:

```
libinput {{[-h|--help]}}
```

libtool

A generic library support script that hides the complexity of using shared libraries behind a consistent, portable interface.

More information: https://www.gnu.org/software/libtool/manual/libtool.html#Invoking-libtool.

- Compile a source file into a `libtool` object:

```
libtool {{[c|compile]}} gcc {{[-c|--compile]}} {{path/to/source.c}} {{[-o|--output]}} {{path/to/source.lo}}
```

- Create a library or an executable:

```
libtool {{[l|link]}} gcc {{[-o|--output]}} {{path/to/library.lo}} {{path/to/source.lo}}
```

- Automatically set the library path so that another program can use uninstalled `libtool` generated programs or libraries:

```
libtool {{[e|execute]}} gdb {{path/to/program}}
```

- Install a shared library:

```
libtool {{[i|install]}} cp {{path/to/library.la}} {{path/to/installation_directory}}
```

- Complete the installation of `libtool` libraries on the system:

```
libtool {{[f|finish]}} {{path/to/installation_directory}}
```

- Delete installed libraries or executables:

```
libtool {{[u|uninstall]}} {{path/to/installed_library.la}}
```

- Delete uninstalled libraries or executables:

```
libtool {{[cl|clean]}} rm {{path/to/source.lo}} {{path/to/library.la}}
```

libtoolize

An **autotools** tool to prepare a package for using **libtool**.

It performs various tasks, including generating necessary files and directories to integrate **libtool** seamlessly into a project.

More information: https://www.gnu.org/software/libtool/manual/libtool.html#Invoking-libtoolize.

- Initialize a project for `libtool` by copying necessary files (avoiding symbolic links) and overwriting existing files if needed:

  ```
  libtoolize {{[-cf|--copy --force]}}
  ```

libuser-lid

This command is an alias of **`lid`**.

- View documentation for the original command:

  ```
  tldr lid.libuser
  ```

lid

Query an ID database for tokens matching a pattern.

Note: An ID database must first be built using **`mkid`**.

More information: https://www.gnu.org/software/idutils/manual/idutils.html#lid-invocation.

- List all tokens and their file locations in the ID database:

```
lid
```

- Find files containing a specific token:

```
lid {{token}}
```

- Find tokens matching a pattern, ignoring case:

```
lid {{[-i|--ignore-case]}} {{token}}
```

- Find tokens matching an extended `regex`:

```
lid {{[-r|--regexp]}} "{{pattern}}"
```

- Output matching lines in grep-style format:

```
lid {{[-R|--result]}} grep {{token}}
```

- Find tokens that appear only once (useful for finding unused definitions):

```
lid {{[-F|--frequency]}} 1
```

lid

Display a user's groups or a group's users.

More information: https://manned.org/lid.

- List primary and secondary groups of a specific user:

```
sudo lid {{username}}
```

- List users of a specific group:

```
sudo lid --group {{group_name}}
```

lid

`lid` can refer to multiple commands with the same name.

- View documentation for the `libuser` tool:

  `tldr lid.libuser`

- View documentation for the `idutils` tool:

  `tldr lid.idutils`

light

Control the backlight of your screen.

More information: https://manned.org/light.

- Get the current backlight value in percent:

```
light
```

- Set the backlight value to 50 percent:

```
light -S {{50}}
```

- Reduce 20 percent from the current backlight value:

```
light -U {{20}}
```

- Add 20 percent to the current backlight value:

```
light -A {{20}}
```

limine-enroll-config

Embed or reset the BLAKE2B hash of **`limine.conf`** in the Limine EFI executable.

Used to ensure the configuration file has not been tampered with when Secure Boot is enabled.

More information: https://codeberg.org/Limine/Limine/src/branch/trunk/USAGE.md#secure-boot.

- Embed a config file's BLAKE2B hash into the Limine EFI executable:

```
limine-enroll-config {{path/to/BOOTX64.EFI}} {{blake2b_hash}}
```

- Remove the enrolled hash from the executable, disabling the config integrity check:

```
limine-enroll-config --reset {{path/to/BOOTX64.EFI}}
```

- Display help:

```
limine-enroll-config --help
```

limine-entry-tool

A helper script to manage Limine bootloader entries on UEFI systems.

More information: https://gitlab.com/Zesko/limine-entry-tool.

- Scan for other active UEFI boot entries and add them to the Limine menu:

```
limine-entry-tool --scan
```

- Add a new kernel boot entry with an initramfs and a kernel file:

```
limine-entry-tool --add "{{kernel_name}}" "{{path/to/
initramfs}}" "{{path/to/vmlinuz}}"
```

- Add a new Unified Kernel Image (UKI) boot entry:

```
limine-entry-tool --add-uki "{{kernel_name}}" "{{path/to/
uki.efi}}"
```

- Remove a kernel boot entry and its associated files from the ESP:

```
limine-entry-tool --remove "{{kernel_name}}"
```

- Remove an entire OS entry by its name or machine ID:

```
limine-entry-tool --remove-os "{{os_name|machine_id}}"
```

- Add an EFI boot entry for an alternative bootloader (e.g., Windows):

```
limine-entry-tool --add-efi "{{efi_entry_name}}" "{{path/to/
loader.efi}}"
```

limine-scan

This command is an alias of **`limine-entry-tool --scan`**.

- View documentation for the original command:

  ```
  tldr limine-entry-tool
  ```

limine-snapper-sync

Synchronize Limine boot menu entries with Btrfs snapshots managed by Snapper.

More information: https://gitlab.com/Zesko/limine-snapper-sync.

- Manually synchronize Snapper snapshots to create boot entries in Limine:

  `limine-snapper-sync`

- List the current snapshot entries managed by Limine:

  `limine-snapper-list`

- Display detailed information about bootable snapshots and their files:

  `limine-snapper-info`

- Restore the system from a selected bootable snapshot:

  `limine-snapper-restore`

- Start the watcher process to monitor for Snapper snapshot changes:

  `limine-snapper-watcher`

limine

An advanced, portable, multiprotocol bootloader.

See also: **`limine-enroll-config`**, **`limine-entry-tool`**, **`limine-snapper-sync`**.

More information: https://codeberg.org/Limine/Limine.

- Install Limine to an MBR-partitioned disk:

```
limine bios-install {{/dev/sdX}}
```

- Install Limine to a GPT-partitioned disk with a specific BIOS boot partition:

```
limine bios-install {{/dev/sdX}} {{partition_number}}
```

- Install Limine to a disk image file:

```
limine bios-install {{path/to/image.iso}}
```

- Install Limine for modern UEFI systems (requires the `limine-entry-tool` package):

```
limine-install
```

- Update boot entries after a kernel upgrade (requires the `limine-entry-tool` package):

```
limine-update
```

- Scan for other operating systems to add to the boot menu (requires the `limine-entry-tool` package):

```
limine-scan
```

line

Read a single line of input.

More information: https://manned.org/line.1.

- Read input:

```
line
```

links

Command-line text-only web browser.

See also: **`links2`**.

More information: https://links.twibright.com/user_en.html#subch-browser_calibration.

- Visit a website:

```
links {{https://example.com}}
```

- Apply restrictions for anonymous account:

```
links -anonymous {{https://example.com}}
```

- Enable Cookies (`1` to enable):

```
links -enable-cookies {{0|1}} {{https://example.com}}
```

- Navigate forwards and backwards through the links on a page:

```
{{<ArrowUp>|<ArrowDown>}}
```

- Go forwards and backwards one page:

```
{{<ArrowLeft>|<ArrowRight>}}
```

- Exit:

```
<q><y>
```

links2

Command-line web browser with optional graphics support.

See also: **`links`**.

More information: https://links.twibright.com/user_en.html#subch-browser_calibration.

- Visit a website in graphics mode:

```
links2 -g {{https://example.com}}
```

linux-boot-prober

Probe a partition for bootable operating systems.

More information: https://github.com/MaddieM4/os-prober.

- Probe a partition:

```
sudo linux-boot-prober {{/dev/sdXY}}
```

linux32

This command is an alias of **`setarch linux32`**.

- View documentation for the original command:

  `tldr setarch`

linux64

This command is an alias of **`setarch linux64`**.

- View documentation for the original command:

  `tldr setarch`

llama-cli

Command-line interface for LLM inference.

More information: https://github.com/ggml-org/llama.cpp#llama-cli.

- Start up LLM [m]odel and interface:

```
llama-cli {{[-m|--model]}} {{path/to/model}}
```

- Start with setup prompt [c]ontext size:

```
llama-cli {{[-m|--model]}} {{path/to/model}} {{[-c|--ctx-size]}} {{number}}
```

- Start with set offload [n]umber of layer [g]pu [l]ayers:

```
llama-cli {{[-m|--model]}} {{path/to/model}} {{[-ngl|--n-gpu-layers]}} {{auto|all|number}}
```

- Start with sending content as [sys]tem prompt from a [f]ile:

```
llama-cli {{[-m|--model]}} {{path/to/model}} {{[-sysf|--system-prompt-file]}} {{path/to/prompt}}
```

- Start with sending content in [f]ile as first prompt:

```
llama-cli {{[-m|--model]}} {{path/to/model}} {{[-f|--file]}} {{path/to/prompt}}
```

lldpctl

Print link layer discovery protocol information.

More information: https://manned.org/lldpctl.

- Start the lldp daemon:

```
systemctl start lldpd
```

- Display collected neighbor data:

```
sudo lldpctl
```

- Display help:

```
lldpctl {{[-h|--help]}}
```

lnav

Advanced log file viewer to analyze logs with little to no setup.

More information: https://docs.lnav.org/en/latest/cli.html.

- View logs of a program, specifying log files, directories, or URLs:

```
lnav {{path/to/log_or_directory|url}}
```

- View logs of a specific remote host (SSH passwordless login required):

```
lnav {{ssh}} {{user}}@{{host1.example.com}}:{{/var/log/syslog.log}}
```

- Validate the format of log files against the configuration and report any errors:

```
lnav -C {{path/to/log_directory}}
```

lndir

Create a shadow directory of symbolic links to another directory tree.

More information: https://manned.org/lndir.

- Create a shadow directory in the current directory:

```
lndir {{path/to/directory}}
```

loadkeys

Load the kernel keymap for the console.

See also: **`localectl`**.

More information: https://manned.org/loadkeys.

- Load a specific keyboard layout for the current console:

```
sudo loadkeys {{en|de|fi|dvorak|defkeymap|...}}
```

- Load a default keymap:

```
sudo loadkeys {{[-d|--default]}}
```

- Print the kernel source table of a keymap to `stdout`:

```
loadkeys {{[-m|--mktable]}} {{en|de|fi|...}}
```

- Print the binary format of a keymap to `stdout`:

```
loadkeys {{[-b|--bkeymap]}} {{en|de|fi|...}}
```

- Search and parse keymap without action:

```
loadkeys {{[-p|--parse]}} {{en|de|fi|...}}
```

- Load a keymap from `stdin`, suppressing all output:

```
{{command}} | sudo loadkeys {{[-q|--quiet]}}
```

- Set a keymap for a specific console:

```
sudo loadkeys {{[-C|--console]}} {{/dev/ttyN}} {{uk}}
```

- Load a keymap from the specified file for the console:

```
sudo loadkeys {{[-C|--console]}} {{/dev/ttyN}} /{{path/to/file}}
```

locale-gen

Generate locales defined in **`/etc/locale.gen`**.

More information: https://manned.org/locale-gen.

- Generate locales:

```
sudo locale-gen
```

- Do not delete undefined locales:

```
sudo locale-gen --keep-existing
```

locale

Get locale-specific information.

More information: https://manned.org/locale.

- List all global environment variables describing the user's locale:

```
locale
```

- List all available locales:

```
locale {{[-a|--all-locales]}}
```

- Display all available locales and the associated metadata:

```
locale {{[-a|--all-locales]}} {{[-v|--verbose]}}
```

- Display the current date format:

```
locale date_fmt
```

localectl

Control the system locale and keyboard layout settings.

More information: https://www.freedesktop.org/software/systemd/man/latest/localectl.html.

- Show the current settings of the system locale and keyboard mapping:

```
localectl
```

- List available locales:

```
localectl list-locales
```

- Set a system locale variable:

```
localectl set-locale {{LANG}}={{en_US.UTF-8}}
```

- List available keymaps:

```
localectl list-keymaps
```

- Set the system keyboard mapping for the console and graphical sessions:

```
localectl set-keymap {{us}}
```

localedef

Manage locale definition files.

More information: https://manned.org/localedef.

- List compiled locales:

```
localedef --list-archive
```

- Display help:

```
localedef {{[-?|--help]}}
```

locate

Find filenames quickly.

More information: https://manned.org/locate.

- Look for pattern in the database. Note: The database is recomputed periodically (usually weekly or daily):

```
locate "{{pattern}}"
```

- Look for a pattern case-insensitively:

```
locate {{[-i|--ignore-case]}} "{{pattern}}"
```

- Look for a file by its exact filename (a pattern containing no globbing characters is interpreted as `*pattern*`):

```
locate "*/{{filename}}"
```

- Recompute the database. You need to do it if you want to find recently added files:

```
sudo updatedb
```

logger

Add messages to the system log.

More information: https://manned.org/logger.

- Log a message to syslog:

```
logger {{message}}
```

- Take input from `stdin` and log to syslog:

```
echo {{log_entry}} | logger
```

- Send the output to a remote syslog server running at a given port. Default port is 514:

```
echo {{log_entry}} | logger {{[-n|--server]}} {{hostname}} {{[-P|--port]}} {{port}}
```

- Use a specific tag for every line logged. Default is the name of logged in user:

```
echo {{log_entry}} | logger {{[-t|--tag]}} {{tag}}
```

- Log messages with a given priority. Default is `user.notice`. See `man logger` for all priority options:

```
echo {{log_entry}} | logger {{[-p|--priority]}} {{user.warning}}
```

login

Initiate a session for a user.

More information: https://manned.org/login.

- Log in as a user:

```
login {{user}}
```

- Log in as user without authentication if user is preauthenticated:

```
login -f {{user}}
```

- Log in as user and preserve environment:

```
login -p {{user}}
```

- Log in as a user on a remote host:

```
login -h {{host}} {{user}}
```

loginctl

Manage the systemd login manager.

See also: **`lslogins`**.

More information: https://www.freedesktop.org/software/systemd/man/latest/loginctl.html.

- Print all current sessions:

```
loginctl
```

- Print all properties of a specific session:

```
loginctl show-session {{session_id}} {{[-a|--all]}}
```

- Print all properties of a specific user:

```
loginctl show-user {{username}}
```

- Print a specific property of a user:

```
loginctl show-user {{username}} {{[-p|--property]}} {{property_name}}
```

- Execute a `loginctl` operation on a remote host:

```
loginctl list-users {{[-H|--host]}} {{hostname}}
```

- Log a user out on all of their sessions:

```
loginctl terminate-user {{username}}
```

- Display help:

```
loginctl {{[-h|--help]}}
```

logread

Read the **logd** ring buffer log.

More information: https://openwrt.org/docs/guide-user/base-system/log.essentials.

- Print the log:

```
logread
```

- Print n messages:

```
logread -l {{n}}
```

- Filter messages by (Keyword/regex):

```
logread -e {{pattern}}
```

- Print log messages as they happen:

```
logread -f
```

- Display help:

```
logread -h
```

logrotate

Rotate, compress, and mail system logs.

More information: https://manned.org/logrotate.

- Trigger a run manually:

```
logrotate {{path/to/logrotate.conf}} --force
```

- Run using a specific command to mail reports:

```
logrotate {{path/to/logrotate.conf}} --mail {{/usr/bin/mail_command}}
```

- Run without using a state (lock) file:

```
logrotate {{path/to/logrotate.conf}} --state /dev/null
```

- Run and skip the state (lock) file check:

```
logrotate {{path/to/logrotate.conf}} --skip-state-lock
```

- Tell `logrotate` to log verbose output into the log file:

```
logrotate {{path/to/logrotate.conf}} --log {{path/to/log_file}}
```

logsave

Save the output of a command in a logfile.

More information: https://manned.org/logsave.

- Execute command with specified argument(s) and save its output to log file:

```
logsave {{path/to/logfile}} {{command}}
```

- Take input from `stdin` and save it in a log file:

```
logsave {{logfile}} -
```

- Append the output to a log file, instead of replacing its current contents:

```
logsave -a {{logfile}} {{command}}
```

- Show verbose output:

```
logsave -v {{logfile}} {{command}}
```

logwatch

Summarize many different logs for common services (e.g. apache, pam_unix, sshd, etc.) in a single report.

More information: https://manned.org/logwatch.

- Analyze logs for a range of dates at a certain level of detail:

```
logwatch --range {{yesterday|today|all|help}} --detail {{low|medium|others}}'
```

- Restrict report to only include information for a selected service:

```
logwatch --range {{all}} --service {{apache|pam_unix|...}}
```

look

Display lines beginning with a prefix in a file.

Note: The lines in the file must be sorted.

See also: **`grep`**, **`sort`**.

More information: https://manned.org/look.

- Search for lines beginning with a specific prefix in a specific file:

```
look {{prefix}} {{path/to/file}}
```

- Case-insensitively search only on blank and alphanumeric characters:

```
look {{[-f|--ignore-case]}} {{[-d|--alphanum]}} {{prefix}} {{path/to/file}}
```

- Specify a string termination character (space by default):

```
look {{[-t|--terminate]}} {{,}}
```

- Search in `/usr/share/dict/words` (`--ignore-case` and `--alphanum` are assumed):

```
look {{prefix}}
```

- Search in `/usr/share/dict/web2` (`--ignore-case` and `--alphanum` are assumed):

```
look {{[-a|--alternative]}} {{prefix}}
```

lookandfeeltool

This command is an alias of **`plasma-apply-lookandfeel`**.

- View documentation for the original command:

  ```
  tldr plasma-apply-lookandfeel
  ```

losetup

Set up and control loop devices.

More information: https://manned.org/losetup.

- List loop devices with detailed info:

```
losetup {{[-a|--all]}}
```

- Attach a file to a given loop device:

```
sudo losetup {{/dev/loop}} /{{path/to/file}}
```

- Attach a file to a new free loop device and scan the device for partitions:

```
sudo losetup --show {{[-P|--partscan]}} {{[-f|--find]}} /
{{path/to/file}}
```

- Attach a file to a read-only loop device:

```
sudo losetup {{[-r|--read-only]}} {{/dev/loop}} /{{path/to/
file}}
```

- Detach all loop devices:

```
sudo losetup {{[-D|--detach-all]}}
```

- Detach a given loop device:

```
sudo losetup {{[-d|--detach]}} {{/dev/loop}}
```

lrunzip

This command is an alias of **`lrzip --decompress`**.

- View documentation for the original command:

  ```
  tldr lrzip
  ```

lrzip

A large file compression program.

See also: **`lrunzip`**, **`lrztar`**, **`lrzuntar`**.

More information: https://manned.org/lrzip.

- Compress a file with LZMA - slow compression, fast decompression:

```
lrzip {{path/to/file}}
```

- Compress a file with BZIP2 - good middle ground for compression/speed:

```
lrzip {{[-b|--bzip2]}} {{path/to/file}}
```

- Compress with ZPAQ - extreme compression, but very slow:

```
lrzip {{[-z|--zpaq]}} {{path/to/file}}
```

- Compress with LZO - light compression, extremely fast decompression:

```
lrzip {{[-l|--lzo]}} {{path/to/file}}
```

- Compress a file and password protect/encrypt it:

```
lrzip {{[-e|--encrypt]}} {{path/to/file}}
```

- Override the number of processor threads to use:

```
lrzip {{[-p|--threads]}} {{8}} {{path/to/file}}
```

lrztar

A wrapper for **`lrzip`** to simplify compression of directories.

See also: **`tar`**, **`lrzuntar`**, **`lrunzip`**.

More information: https://manned.org/lrztar.

- Archive a directory with `tar`, then compress:

```
lrztar {{path/to/directory}}
```

- Archive a directory with `tar`, then compress with ZPAQ (extreme compression, but very slow):

```
lrztar {{[-z|--zpaq]}} {{path/to/directory}}
```

- Specify the output file:

```
lrztar {{[-o|--outfile]}} {{path/to/file}} {{path/to/directory}}
```

- Override the number of processor threads to use:

```
lrztar {{[-p|--threads]}} {{8}} {{path/to/directory}}
```

- Force overwriting of existing files:

```
lrztar {{[-f|--force]}} {{path/to/directory}}
```

lrzuntar

This command is an alias of **`lrztar --decompress`**.

- View documentation for the original command:

  `tldr lrztar`

lsattr

List file attributes on a Linux filesystem.

See also: **`chattr`**.

More information: https://manned.org/lsattr.

- Display the attributes of the files in the current directory:

```
lsattr
```

- List the attributes of files in a particular path:

```
lsattr {{path}}
```

- List file attributes recursively in the current and subsequent directories:

```
lsattr -R
```

- Show attributes of all the files in the current directory, including hidden ones:

```
lsattr -a
```

- Display attributes of directories in the current directory:

```
lsattr -d
```

lsb_release

Get LSB (Linux Standard Base) and distribution-specific information.

More information: https://manned.org/lsb_release.

- Print all available information:

```
lsb_release {{[-a|--all]}}
```

- Print a description (usually the full name) of the operating system:

```
lsb_release {{[-d|--description]}}
```

- Print only the operating system name (ID), in short format (omitting the field name):

```
lsb_release {{[-is|--id --short]}}
```

- Print the release number and codename of the distribution, in short format:

```
lsb_release {{[-rcs|--release --codename --short]}}
```

lsblk

List information about devices.

More information: https://manned.org/lsblk.

- List all storage devices in a tree-like format:

```
lsblk
```

- Also list empty devices:

```
lsblk {{[-a|--all]}}
```

- Print the SIZE column in bytes rather than in a human-readable format:

```
lsblk {{[-b|--bytes]}}
```

- Output info about filesystems:

```
lsblk {{[-f|--fs]}}
```

- Use ASCII characters for tree formatting:

```
lsblk {{[-i|--ascii]}}
```

- Output info about block-device topology:

```
lsblk {{[-t|--topology]}}
```

- Exclude the devices specified by the comma-separated list of major device numbers:

```
lsblk {{[-e|--exclude]}} {{1,7,...}}
```

- Add extra information to the output using a comma-separated list of columns (omit the `+` sign to only display the specified columns):

```
lsblk {{[-o|--output]}} +
{{NAME,ROTA,SERIAL,MODEL,TRAN,TYPE,SIZE,FSTYPE,MOUNTPOINT,...}}
```

lscpu

Display information about the CPU architecture.

More information: https://manned.org/lscpu.

- Display information about all CPUs:

```
lscpu
```

- Display information in a table:

```
lscpu {{[-e|--extended]}}
```

- Display only information about online CPUs in a table:

```
lscpu {{[-e|--extended]}} {{[-b|--online]}}
```

- Display only information about offline CPUs in a table:

```
lscpu {{[-e|--extended]}} {{[-c|--offline]}}
```

- Display details about CPU caches:

```
lscpu {{[-C|--caches]}}
```

- Display information in JSON format:

```
lscpu {{[-J|--json]}}
```

lsdev

Display installed hardware detected in the **`/proc`** director.

More information: https://manned.org/lsdev.

- Show list of installed hardware:

```
lsdev
```

lsfd

List open files and the corresponding processes in Linux.

More information: https://manned.org/lsfd.

- List all open file descriptors:

```
lsfd
```

- List all files kept open by a specific program:

```
lsfd {{[-Q|--filter]}} 'PID == {{process_id}}'
```

- Check what program has a specific file open:

```
lsfd {{[-Q|--filter]}} "NAME == '{{path/to/file}}'"
```

- List open IPv4 or IPv6 sockets:

```
lsfd {{-i4|-i6}}
```

- Display help:

```
lsfd {{[-h|--help]}}
```

lshw

List detailed information about hardware configurations as root user.

See also: **`inxi`**, **`hwinfo`**, **`dmidecode`**.

More information: https://ezix.org/project/wiki/HardwareLiSter.

- Launch the X11 GUI (if available):

```
sudo lshw -X
```

- List all hardware in tabular format:

```
sudo lshw -short
```

- List multiple class of hardware (all disks and storage controllers) in tabular format:

```
sudo lshw {{[-c|-class]}} disk {{[-c|-class]}} storage -short
```

- Save all network interfaces to an HTML/XML/JSON file:

```
sudo lshw {{[-c|-class]}} network -{{html|xml|json}} >
interfaces{{.html|.xml|.json}}
```

- List network interfaces without revealing sensitive information (IP addresses, serial numbers, etc.):

```
sudo lshw {{[-c|-class]}} network -sanitize
```

- List a particular class of hardware:

```
sudo lshw {{[-c|-class]}} {{system|bridge|memory|processor|
address|storage|disk|tape|bus|network|display|input|printer|
multimedia|communication|power|volume|generic}}
```

lsinitcpio

View the contents of an initramfs image.

See also: **`mkinitcpio`**.

More information: https://manned.org/lsinitcpio.

- View a list of all files and directories of a specific image:

```
lsinitcpio {{path/to/initramfs.img}}
```

- Extract an image to the current directory:

```
lsinitcpio {{[-x|--extract]}} {{path/to/initramfs.img}}
```

- View human-readable information on an image:

```
lsinitcpio {{[-a|--analyze]}} {{path/to/initramfs.img}}
```

lsinitrd

Show the contents of an initramfs image.

See also: **dracut**.

More information: https://github.com/dracutdevs/dracut/blob/master/man/lsinitrd.1.asc.

- Show the contents of the initramfs image for the current kernel:

```
lsinitrd
```

- Show the contents of the initramfs image for the specified kernel:

```
lsinitrd {{[-k|--kver]}} {{kernel_version}}
```

- Show the contents of the specified initramfs image:

```
lsinitrd {{path/to/initramfs.img}}
```

- List modules included in the initramfs image:

```
lsinitrd {{[-m|--mod]}}
```

- Unpack the initramfs to the current directory:

```
lsinitrd --unpack
```

lsipc

Show information on System V IPC facilities currently employed in the system.

See also: **`ipcs`**.

More information: https://manned.org/lsipc.

- Show information about all active IPC facilities:

```
lsipc
```

- Show information about active shared [m]emory segments, message [q]ueues, or [s]emaphore sets:

```
lsipc {{--shmems|--queues|--semaphores}}
```

- Show full details on the resource with a specific ID:

```
lsipc {{--shmems|--queues|--semaphores}} {{[-i|--id]}}
{{resource_id}}
```

- Print the given output columns (see all supported columns with `--help`):

```
lsipc {{[-o|--output]}}
{{KEY,ID,PERMS,SEND,STATUS,NSEMS,RESOURCE,...}}
```

- Use [r]aw, [J]SON, [l]ist, or [e]xport (key="value") format:

```
lsipc {{--raw|--json|--list|--export}}
```

- Don't truncate the output:

```
lsipc --notruncate
```

lslocks

List local system locks.

More information: https://manned.org/lslocks.

- List all local system locks:

```
lslocks
```

- List locks with defined column headers:

```
lslocks {{[-o|--output]}} {{PID,COMMAND,PATH,...}}
```

- List locks producing a raw output (no columns), and without column headers:

```
lslocks {{[-r|--raw]}} {{[-n|--noheadings]}}
```

- List locks by PID input:

```
lslocks {{[-p|--pid]}} {{process_id}}
```

- List locks with JSON output to `stdout`:

```
lslocks {{[-J|--json]}}
```

lslogins

Show information about users on a Linux system.

More information: https://manned.org/lslogins.

- Display users in the system:

```
lslogins
```

- Display users belonging to a specific group:

```
lslogins {{[-g|--groups]}} {{groups}}
```

- Display user accounts:

```
lslogins {{[-u|--user-accs]}}
```

- Display last logins:

```
lslogins {{[-L|--last]}}
```

- Display system accounts:

```
lslogins {{[-s|--system-accs]}}
```

- Display supplementary groups:

```
lslogins {{[-G|--supp-groups]}}
```

lsmem

List the characteristics of the system's memory, including size and type of memory modules.

More information: https://manned.org/lsmem.

- List memory information:

```
lsmem
```

- List memory information in JSON format:

```
lsmem {{[-J|--json]}}
```

- List memory information with size in bytes:

```
lsmem {{[-b|--bytes]}}
```

lsmod

Show the status of Linux kernel modules.

See also: **kmod**.

More information: https://manned.org/lsmod.

- List all currently loaded kernel modules:

```
lsmod
```

lsns

List information about all namespaces or about the specified namespace.

More information: https://manned.org/lsns.

- List all namespaces:

```
lsns
```

- List namespaces in JSON format:

```
lsns {{[-J|--json]}}
```

- List namespaces associated with the specified process:

```
lsns {{[-p|--task]}} {{process_id}}
```

- List the specified type of namespaces only:

```
lsns {{[-t|--type]}} {{mnt|net|ipc|user|pid|uts|cgroup|time}}
```

- List namespaces, only showing the namespace ID, type, PID, and command:

```
lsns {{[-o|--output]}} {{NS,TYPE,PID,COMMAND}}
```

lspci

List all PCI devices.

More information: https://manned.org/lspci.

- Show a brief list of devices:

```
lspci
```

- Display [v]erbose information (Note: the `-v` flag can be repeated to increase verbosity):

```
lspci -v
```

- Display [k]ernel drivers and modules handling each device:

```
lspci -k
```

- [s]elect a specific device:

```
lspci -s {{00:18.3}}
```

- Dump info in a ([m]achine) readable form:

```
lspci -vm
```

- Show PCI vendor and device codes as both [n]umbers and [n]ames:

```
lspci -nn
```

lsscsi

List SCSI devices (or hosts) and their attributes.

More information: https://manned.org/lsscsi.

- List all SCSI devices:

```
lsscsi
```

- List all SCSI devices with detailed attributes:

```
lsscsi {{[-L|--list]}}
```

- List all SCSI devices with human-readable disk capacity:

```
lsscsi {{[-s|--size]}}
```

lstopo-no-graphics

Manage and query hardware topology information.

More information: https://manned.org/lstopo-no-graphics.

- Display the machine topology in a tree format:

```
lstopo-no-graphics
```

- Display only physical cores (ignore logical processors):

```
lstopo-no-graphics --only pu
```

- Display the topology with physical indexes:

```
lstopo-no-graphics {{[-p|--physical]}}
```

- Display help:

```
lstopo-no-graphics {{[-h|--help]}}
```

lsusb

Display information about USB buses and devices connected to them.

More information: https://manned.org/lsusb.

- List all the USB devices available:

```
lsusb
```

- List the USB hierarchy as a tree:

```
lsusb {{[-t|--tree]}}
```

- List verbose information about USB devices:

```
sudo lsusb {{[-v|--verbose]}}
```

- List detailed information about a USB device:

```
sudo lsusb {{[-v|--verbose]}} -s {{bus}}:{{device_number}}
```

- List devices with a specified vendor and product ID only:

```
lsusb -d {{vendor}}:{{product}}
```

ltrace

Display dynamic library calls of a process.

More information: https://manned.org/ltrace.

- Print (trace) library calls of a program binary:

```
ltrace {{path/to/program}}
```

- Count library calls. Print a handy summary at the bottom:

```
ltrace -c {{path/to/program}}
```

- Trace calls to malloc and free, omit those done by libc:

```
ltrace -e malloc+free-@libc.so* {{path/to/program}}
```

- Write to file instead of terminal:

```
ltrace {{[-o|--output]}} {{file}} {{path/to/program}}
```

lure

A distro-agnostic build system and user repository for Linux.

More information: https://github.com/lure-sh/lure/blob/master/docs/usage.md.

- Install a package:

```
lure {{[in|install]}} {{package}}
```

- Remove a package:

```
lure {{[rm|remove]}} {{package}}
```

- Update packages:

```
lure {{[up|upgrade]}}
```

- List all available packages:

```
lure {{[ls|list]}}
```

- Pull all repositories that have changed:

```
lure {{[ref|refresh]}}
```

- Add a new repository:

```
lure {{[ar|addrepo]}} {{[-n|--name]}} {{repository_name}} --
url {{repository_url}}
```

- Remove an existing repository:

```
lure {{[rr|removerepo]}} {{[-n|--name]}} {{repository_name}}
```

- Build a package:

```
lure build -s {{path/to/script}}
```

lvchange

Change attributes or the activation state of logical volumes.

More information: https://manned.org/lvchange.

- Activate a logical volume:

```
sudo lvchange {{[-a|--activate]}} y {{/dev/vg_name/lv_name}}
```

- Deactivate a logical volume:

```
sudo lvchange {{[-a|--activate]}} n {{/dev/vg_name/lv_name}}
```

- Enable autoactivation for a logical volume:

```
sudo lvchange {{[-a|--activate]}} ay {{/dev/vg_name/lv_name}}
```

- Set a logical volume to read-only (use `rw` for read-write):

```
sudo lvchange {{[-p|--permission]}} r {{/dev/vg_name/
lv_name}}
```

- Skip activation for a logical volume:

```
sudo lvchange {{[-k|--setactivationskip]}} y {{/dev/vg_name/
lv_name}}
```

- Refresh a logical volume using the latest metadata:

```
sudo lvchange --refresh {{/dev/vg_name/lv_name}}
```

lvconvert

Convert or modify the type, redundancy, or state of logical volumes.

More information: https://manned.org/lvconvert.

- Convert a linear logical volume to RAID1 (add one mirror: two copies total):

```
sudo lvconvert --type raid1 {{[-m|--mirrors]}} 1 {{/dev/vg_name/lv_name}}
```

- Remove mirroring and convert back to a linear logical volume:

```
sudo lvconvert {{[-m|--mirrors]}} 0 {{/dev/vg_name/lv_name}}
```

- Merge a snapshot back into its origin logical volume (applies on next activation):

```
sudo lvconvert --merge {{/dev/vg_name/snapshot_lv}}
```

- Repair a degraded RAID logical volume:

```
sudo lvconvert --repair {{/dev/vg_name/lv_name}}
```

- Convert an existing logical volume into a thin pool with a separate metadata LV:

```
sudo lvconvert --type thin-pool --poolmetadata {{/dev/vg_name/pool_metadata_lv}} {{/dev/vg_name/pool_lv}}
```

lvcreate

Create a logical volume in an existing volume group. A volume group is a collection of logical and physical volumes.

See also: **`lvm`**.

More information: https://manned.org/lvcreate.

- Create a logical volume of 10 gigabytes in the volume group `vg1`:

```
sudo lvcreate {{[-L|--size]}} 10G vg1
```

- Create a 1500 megabyte linear logical volume named `mylv` in the volume group `vg1`:

```
sudo lvcreate {{[-L|--size]}} 1500 {{[-n|--name]}} mylv vg1
```

- Create a logical volume called `mylv` that uses 60% of the total space in volume group `vg1`:

```
sudo lvcreate {{[-l|--extents]}} 60%VG {{[-n|--name]}} mylv vg1
```

- Create a logical volume called `mylv` that uses all the unallocated space in the volume group `vg1`:

```
sudo lvcreate {{[-l|--extents]}} 100%FREE {{[-n|--name]}} mylv vg1
```

lvdisplay

Display information about Logical Volume Manager (LVM) logical volumes.

See also: **`lvm`**, **`lvs`**.

More information: https://manned.org/lvdisplay.

- Display information about all logical volumes:

  ```
  sudo lvdisplay
  ```

- Display the information in a short format (same as running `lvs`):

  ```
  sudo lvdisplay {{[-C|--columns]}}
  ```

- Display information about all logical volumes in volume group vg1:

  ```
  sudo lvdisplay {{vg1}}
  ```

- Display information about logical volume lv1 in volume group vg1:

  ```
  sudo lvdisplay {{vg1/lv1}}
  ```

lvextend

Increase the size of a logical volume.

See also: **`lvm`**.

More information: https://manned.org/lvextend.

- Increase a volume's size to 120 GB:

```
sudo lvextend {{[-L|--size]}} {{120G}} {{logical_volume}}
```

- Increase a volume's size by 40 GB as well as the underlying filesystem:

```
sudo lvextend {{[-L|--size]}} +{{40G}} {{[-r|--resizefs]}}
{{logical_volume}}
```

- Increase a volume's size to 100% of the free physical volume space:

```
sudo lvextend {{[-l|--extents]}} +{{100}}%FREE
{{logical_volume}}
```

- Increase a volume's size to 100% of the free physical volume space and resize the underlying filesystem:

```
sudo lvextend {{[-l|--extents]}} +{{100}}%FREE {{[-r|--
resizefs]}} {{logical_volume}}
```

lvm

Manage physical volumes, volume groups, and logical volumes using the Logical Volume Manager (LVM) interactive shell.

More information: https://manned.org/lvm.

- Start the Logical Volume Manager interactive shell:

```
sudo lvm
```

- Initialize a drive or partition to be used as a physical volume:

```
sudo lvm pvcreate {{/dev/sdXY}}
```

- Display information about physical volumes:

```
sudo lvm pvdisplay
```

- Create a volume group called vg1 from the physical volume on `/dev/sdXY`:

```
sudo lvm vgcreate {{vg1}} {{/dev/sdXY}}
```

- Display information about volume groups:

```
sudo lvm vgdisplay
```

- Create a logical volume with size 10G from volume group vg1:

```
sudo lvm lvcreate {{[-L|--size]}} {{10G}} {{vg1}}
```

- Display information about logical volumes:

```
sudo lvm lvdisplay
```

- Display help for a specific command:

```
lvm help {{command}}
```

lvm_import_vdo

Import a VDO volume created by the VDO manager into an LVM-managed logical volume (irreversible).

More information: https://manned.org/lvm_import_vdo.

- Import a VDO volume with automatic names for the VG/LV:

```
lvm_import_vdo {{/dev/mapper/vdo_volume}}
```

- Import and set the destination VG/LV name:

```
lvm_import_vdo {{[-n|--name]}} {{vg_name/lv_name}} {{/dev/mapper/vdo_volume}}
```

- Simulate the import, showing what would be done without changing anything:

```
lvm_import_vdo --dry-run {{/dev/mapper/vdo_volume}}
```

- Convert in place without using a temporary snapshot (less safe):

```
lvm_import_vdo --no-snapshot {{/dev/mapper/vdo_volume}}
```

- Convert a VDO volume with verbose output and automatically answer "yes" to prompts:

```
lvm_import_vdo {{[-v|--verbose]}} {{[-y|--yes]}} {{/dev/mapper/vdo_volume}}
```

- Use a VDO manager configuration file during import:

```
lvm_import_vdo --vdo-config {{path/to/vdo.conf}} {{/dev/mapper/vdo_volume}}
```

lvmconfig

Display and manipulate LVM configuration information.

More information: https://manned.org/lvmconfig.

- Display the effective configuration in use (after merging all config sources):

```
lvmconfig --typeconfig current --mergedconfig
```

- Show only settings that differ from their defaults:

```
lvmconfig --typeconfig diff
```

- List all configuration keys:

```
lvmconfig {{[-l|--list]}}
```

- Print the default configuration with full comments and extra spacing:

```
lvmconfig --typeconfig default --withcomments --withspaces
```

- Validate the full merged configuration and report errors:

```
lvmconfig --mergedconfig --validate
```

- Write the current effective configuration to a file:

```
lvmconfig --typeconfig current {{[-f|--file]}} {{path/to/output.conf}}
```

lvmdevices

Manage the LVM devices file that lists block devices allowed for physical volumes.

More information: https://manned.org/lvmdevices.

- List devices recorded in the devices file:

```
sudo lvmdevices
```

- Add a device to the devices file:

```
sudo lvmdevices --adddev {{/dev/sdXN}}
```

- Remove a device from the devices file:

```
sudo lvmdevices --deldev {{/dev/sdXN}}
```

- Add a physical volume by its PVID:

```
sudo lvmdevices --addpvid {{pvid}}
```

- Remove a physical volume by its PVID:

```
sudo lvmdevices --delpvid {{pvid}}
```

- Update the devices file after device names change:

```
sudo lvmdevices --update
```

- Check the devices file for problems:

```
sudo lvmdevices --check
```

- Display version:

```
lvmdevices --version
```

lvmdiskscan

Scan for devices that may be used as physical volumes by LVM.

Note: This command is deprecated, use **pvs** instead.

More information: https://manned.org/lvmdiskscan.

- Scan all devices:

```
lvmdiskscan
```

- Show only physical volumes (PVs):

```
lvmdiskscan {{[-l|--lvmpartition]}}
```

- Increase verbosity (repeat for more detail):

```
lvmdiskscan {{[-v|--verbose]}}
```

lvmdump

Collect diagnostic information about LVM2 (Logical Volume Manager).

By default, outputs a compressed **`.tar`** archive with system and configuration data in the home directory.

More information: https://manned.org/lvmdump.

- Generate a basic dump:

```
lvmdump
```

- Generate an extended dump with metadata and daemon info:

```
lvmdump -a -l -m
```

- Dump the information into a directory instead of a tarball:

```
lvmdump -d {{path/to/directory}}
```

- Display help:

```
lvmdump -h
```

lvmpersist

Manage persistent reservations (PR) on block devices or all PVs in a volume group.

More information: https://manned.org/lvmpersist.

- Start PR on all PVs in a VG with a local key (exclusive access by default):

```
lvmpersist start --ourkey {{0x1234abcd}} --vg {{vg_name}}
```

- Start PR for a shared VG (allow multiple hosts):

```
lvmpersist start --ourkey {{0x1234abcd}} --access {{sh}} --vg
{{vg_name}}
```

- Stop PR on a VG and unregister the local key:

```
lvmpersist stop --ourkey {{0x1234abcd}} --vg {{vg_name}}
```

- Take over a local VG by preempting another host while starting PR:

```
lvmpersist start --ourkey {{0xmy_key}} --removekey
{{0xother_key}} --vg {{vg_name}}
```

- Remove another host's key from a shared VG:

```
lvmpersist remove --ourkey {{0xmy_key}} --removekey
{{0xother_key}} --vg {{vg_name}}
```

- Show registered keys and reservations for a VG:

```
lvmpersist read --vg {{vg_name}}
```

- Operate on specific devices instead of a VG:

```
lvmpersist start --ourkey {{0x1234abcd}} --device {{/dev/
sdX}} --device {{/dev/mapper/mpathY}}
```

lvmpolld

LVM poll daemon that supervises long-running LVM operations.

More information: https://manned.org/lvmpolld.

- Start the daemon in the foreground:

```
lvmpolld {{[-f|--foreground]}}
```

- Start in the foreground with debug logging:

```
lvmpolld {{[-f|--foreground]}} {{[-l|--log]}} debug
```

- Set the idle shutdown timeout (seconds):

```
lvmpolld {{[-t|--timeout]}} {{300}}
```

- Use a custom socket path:

```
lvmpolld {{[-s|--socket]}} {{/tmp/lvmpolld.socket}}
```

- Use a custom PID file:

```
lvmpolld {{[-p|--pidfile]}} {{/tmp/lvmpolld.pid}}
```

- Dump the current state:

```
lvmpolld --dump
```

lvmsadc

LVM system activity data collector (not supported under LVM2; prefer **`dmstats`**).

More information: https://manned.org/lvmsadc.

- Run the collector (legacy LVM1 systems only):

```
lvmsadc
```

- Report I/O statistics using the device-mapper replacement:

```
dmstats report {{/dev/mapper/device}}
```

lvmsar

LVM system activity reporter.

Not supported under LVM2; prefer **`dmstats`**.

More information: https://manned.org/lvmsar.

- Run the legacy reporter (LVM1 systems only):

```
lvmsar
```

- Report I/O statistics for a device using device-mapper stats:

```
dmstats report {{/dev/mapper/device}}
```

- List statistics regions for a device:

```
dmstats list {{/dev/mapper/device}}
```

lvreduce

Reduce the size of a logical volume.

See also: **`lvm`**.

More information: https://manned.org/lvreduce.

- Reduce a volume's size to 120 GB:

```
sudo lvreduce {{[-L|--size]}} {{120G}} {{logical_volume}}
```

- Reduce a volume's size by 40 GB as well as the underlying filesystem:

```
sudo lvreduce {{[-L|--size]}} -{{40G}} {{[-r|--resizefs]}}
{{logical_volume}}
```

lvremove

Remove logical volumes.

See also: **`lvm`**.

More information: https://manned.org/lvremove.

- Remove a logical volume in a volume group:

```
sudo lvremove {{volume_group}}/{{logical_volume}}
```

- Remove all logical volumes in a volume group:

```
sudo lvremove {{volume_group}}
```

lvrename

Rename a logical volume.

More information: https://manned.org/lvrename.

- Rename an LV using full paths:

```
sudo lvrename {{/dev/vg_name/old_lv}} {{/dev/vg_name/new_lv}}
```

- Rename an LV using the volume group and names:

```
sudo lvrename {{vg_name}} {{old_lv}} {{new_lv}}
```

- Answer "yes" to any prompts:

```
sudo lvrename {{[-y|--yes]}} {{/dev/vg_name/old_lv}} {{/dev/vg_name/new_lv}}
```

lvresize

Change the size of a logical volume.

See also: **`lvm`**.

More information: https://manned.org/lvresize.

- Change the size of a logical volume to 120 GB:

```
sudo lvresize {{[-L|--size]}} 120G {{volume_group}}/
{{logical_volume}}
```

- Extend the size of a logical volume as well as the underlying filesystem by 120 GB:

```
sudo lvresize {{[-L|--size]}} +120G {{[-r|--resizefs]}}
{{volume_group}}/{{logical_volume}}
```

- Extend the size of a logical volume to 100% of the free physical volume space:

```
sudo lvresize {{[-l|--extents]}} 100%FREE {{volume_group}}/
{{logical_volume}}
```

- Reduce the size of a logical volume as well as the underlying filesystem by 120 GB:

```
sudo lvresize {{[-L|--size]}} -120G {{[-r|--resizefs]}}
{{volume_group}}/{{logical_volume}}
```

lvs

Display information about logical volumes.

See also: **`lvm`**.

More information: https://manned.org/lvs.

- Display information about logical volumes:

```
sudo lvs
```

- Display all logical volumes:

```
sudo lvs {{[-a|--all]}}
```

- Change default display to show more details:

```
sudo lvs {{[-v|--verbose]}}
```

- Display only specific fields:

```
sudo lvs {{[-o|--options]}} {{field_name_1,field_name_2,...}}
```

- Append field to default display:

```
sudo lvs {{[-o|--options]}} +{{field_name}}
```

- Suppress heading line:

```
sudo lvs --noheadings
```

- Use a separator to separate fields:

```
sudo lvs --separator {{=}}
```

lvscan

Scan (list) all logical volumes in the system.

Part of the LVM (Logical Volume Manager) suite.

More information: https://manned.org/lvscan.

- List all logical volumes:

```
sudo lvscan
```

- List only active logical volumes:

```
sudo lvscan --active
```

- List only inactive logical volumes:

```
sudo lvscan --inactive
```

- Display logical volumes in JSON format:

```
sudo lvscan --reportformat json
```

lxc-attach

Attach to a container.

More information: https://linuxcontainers.org/lxc/getting-started/.

- Attach to a container:

```
sudo lxc-attach {{container_name}}
```

- Attach to a container without passing host environment variables to it:

```
sudo lxc-attach {{container_name}} --clear-env
```

- Display help:

```
lxc-attach {{[-?|--help]}}
```

lxc-checkconfig

Check a kernel for LXC support.

More information: https://linuxcontainers.org/lxc/getting-started/.

- Check the current kernel for LXC support:

```
lxc-checkconfig
```

- Check any kernel for LXC support:

```
CONFIG=/{{path/to/configuration}} lxc-checkconfig
```

lxc-console

Attach to a container.

More information: https://linuxcontainers.org/lxc/manpages//man1/lxc-console.1.html.

- Start a console in a container:

```
agetty {{[-L|--local-line]}} {{38400}} tty1
```

- Connect to an lxc console:

```
sudo lxc-console {{container_name}}
```

- Exit `lxc-console`:

```
<Ctrl a><q>
```

- Display help:

```
lxc-console {{[-?|--help]}}
```

lxc-create

Create linux containers.

More information: https://linuxcontainers.org/lxc/getting-started/.

- Create a container interactively in `/var/lib/lxc/`:

```
sudo lxc-create {{[-n|--name]}} {{container_name}} {{[-t|--template]}} download
```

- Create a container in a target directory:

```
sudo lxc-create {{[-P|--lxcpath]}} /{{path/to/directory}}/ {{[-n|--name]}} {{container_name}} {{[-t|--template]}} download
```

- Create a container passing options to a template:

```
sudo lxc-create {{[-n|--name]}} {{container_name}} {{[-t|--template]}} download -- {{[-d|--dist]}} {{distro_name}} {{[-r|--release]}} {{release_version}} {{[-a|--arch]}} {{architecture}}
```

- Display help:

```
lxc-create {{[-?|--help]}}
```

lxc-destroy

Delete a container.

More information: https://linuxcontainers.org/lxc/getting-started/.

- Delete a container:

```
sudo lxc-destroy {{container_name}}
```

- Display help:

```
lxc-destroy {{[-?|--help]}}
```

lxc-info

Get info on a container.

More information: https://linuxcontainers.org/lxc/getting-started/.

- Query information from a container:

```
sudo lxc-info {{container_name}}
```

- Display help:

```
lxc-info {{[-?|--help]}}
```

lxc-ls

List Linux containers.

More information: https://linuxcontainers.org/lxc/manpages/man1/lxc-ls.1.html.

- List all containers:

```
sudo lxc-ls
```

- List active containers (including frozen and running):

```
sudo lxc-ls --active
```

- List only frozen containers:

```
sudo lxc-ls --frozen
```

- List only stopped containers:

```
sudo lxc-ls --stopped
```

- List containers in a fancy, column-based output:

```
sudo lxc-ls {{[-f|--fancy]}}
```

- Display help:

```
lxc-ls {{[-?|--help]}}
```

lxc network

Manage networks for LXD containers.

More information: https://canonical.com/lxd/docs/latest/reference/manpages/lxc/network/.

- List all available networks:

```
lxc network list
```

- Show the configuration of a specific network:

```
lxc network show {{network_name}}
```

- Add a running instance to a specific network:

```
lxc network attach {{network_name}} {{container_name}}
```

- Create a new managed network:

```
lxc network create {{network_name}}
```

- Set a bridge interface of a specific network:

```
lxc network set {{network_name}} bridge.external_interfaces {{eth0}}
```

- Disable NAT for a specific network:

```
lxc network set {{network_name}} ipv{{4}}.nat false
```

lxc profile

Manage profiles for LXD containers.

More information: https://canonical.com/lxd/docs/latest/reference/manpages/lxc/profile/.

- List all available profiles:

```
lxc profile list
```

- Show the configuration of a specific profile:

```
lxc profile show {{profile_name}}
```

- Edit a specific profile in the default editor:

```
lxc profile edit {{profile_name}}
```

- Edit a specific profile importing the configuration values from a file:

```
lxc < {{config.yaml}} profile edit {{profile_name}}
```

- Launch a new container with specific profiles:

```
lxc launch {{container_image}} {{container_name}} {{[-p|--profile]}} {{profile1}} {{[-p|--profile]}} {{profile2}}
```

- Change the profiles of a running container:

```
lxc profile assign {{container_name}} {{profile1,profile2}}
```

lxc-start

Start a container.

More information: https://linuxcontainers.org/lxc/getting-started/.

- Start the lxc service:

```
systemctl start lxc-net
```

- Start a container:

```
sudo lxc-start {{container_name}}
```

- Start a container in the foreground:

```
sudo lxc-start {{container_name}} {{[-F|--foreground]}}
```

- Exit out of a foreground container (run this in a separate terminal):

```
sudo lxc-stop {{container_name}}
```

- Write debug logs to a file:

```
sudo lxc-start {{container_name}} {{[-l|--logpriority]}}
DEBUG {{[-o|--logfile]}} {{path/to/logfile}}
```

- Display help:

```
lxc-start {{[-?|--help]}}
```

lxc-stop

Stop a container.

More information: https://linuxcontainers.org/lxc/getting-started/.

- Stop a container:

```
sudo lxc-stop {{container_name}}
```

- Display help:

```
lxc-stop {{[-?|--help]}}
```

lxc-top

Display resource usage of LXC containers.

More information: https://linuxcontainers.org/lxc/manpages/man1/lxc-top.1.html.

- Start `lxc-top`:

```
lxc-top
```

- Adjust update interval:

```
lxc-top {{[-d|--delay]}} {{5}}
```

- Sort by [n]ame, [c]pu use, [b]lock I/O, [m]emory, or [k]ernel memory:

```
lxc-top {{[-s|--sort]}} {{n|c|b|m|k}}
```

lxc

Manage Linux containers using the lxd REST API.

Any container names or patterns can be prefixed with the name of a remote server.

More information: https://manned.org/lxc.

- List local containers matching a string. Omit the string to list all local containers:

```
lxc list {{match_string}}
```

- List images matching a string. Omit the string to list all images:

```
lxc image list [{{remote}}:]{{match_string}}
```

- Create a new container from an image:

```
lxc init [{{remote}}:]{{image}} {{container}}
```

- Start a container:

```
lxc start [{{remote}}:]{{container}}
```

- Stop a container:

```
lxc stop [{{remote}}:]{{container}}
```

- Show detailed info about a container:

```
lxc info [{{remote}}:]{{container}}
```

- Take a snapshot of a container:

```
lxc snapshot [{{remote}}:]{{container}} {{snapshot}}
```

- Execute a specific command inside a container:

```
lxc exec [{{remote}}:]{{container}} {{command}}
```

lxi

Control LXI compatible instruments such as oscilloscopes.

More information: https://github.com/lxi-tools/lxi-tools#32-lxi.

- Discover LXI devices on available networks:

```
lxi discover
```

- Capture a screenshot, detecting a plugin automatically:

```
lxi screenshot {{[-a|--address]}} {{ip_address}}
```

- Capture a screenshot using a specified plugin:

```
lxi screenshot {{[-a|--address]}} {{ip_address}} {{[-p|--plugin]}} {{rigol-1000z}}
```

- Send an SCPI command to an instrument:

```
lxi scpi {{[-a|--address]}} {{ip_address}} "{{*IDN?}}"
```

- Run a benchmark for request and response performance:

```
lxi benchmark {{[-a|--address]}} {{ip_address}}
```

lxterminal

Terminal emulator for LXDE.

More information: https://manned.org/lxterminal.

- Open an LXTerminal window:

```
lxterminal
```

- Open an LXTerminal window, run a command, and then exit:

```
lxterminal {{[-e|--command]}} "{{command}}"
```

- Open an LXTerminal window with multiple tabs:

```
lxterminal --tabs={{tab_name1,tab_name2,...}}
```

- Open an LXTerminal window with a specific title:

```
lxterminal --title={{title_name}}
```

- Open an LXTerminal window with a specific working directory:

```
lxterminal --working-directory={{path/to/directory}}
```

lynis

System and security auditing tool.

More information: https://cisofy.com/documentation/lynis/.

- Check that Lynis is up-to-date:

```
sudo lynis update info
```

- Run a security audit of the system:

```
sudo lynis audit system
```

- Run a security audit of a Dockerfile:

```
sudo lynis audit dockerfile {{path/to/dockerfile}}
```

lz

List all files inside a **`.tar.gz`** compressed archive.

More information: https://manned.org/lz.

- List all files inside a compressed archive:

```
lz {{path/to/file.tar.gz}}
```

mac2unix

Change macOS-style line endings to Unix-style.

Replaces CR with LF.

See also: **`unix2dos`**, **`unix2mac`**, **`dos2unix`**.

More information: https://manned.org/mac2unix.

- Change the line endings of a file:

```
mac2unix {{path/to/file}}
```

- Create a copy with Unix-style line endings:

```
mac2unix {{[-n|--newfile]}} {{path/to/file}} {{path/to/new_file}}
```

- Display file information:

```
mac2unix {{[-i|--info]}} {{path/to/file}}
```

- Keep/add/remove Byte Order Mark:

```
mac2unix --{{keep-bom|add-bom|remove-bom}} {{path/to/file}}
```

macchanger

Manipulate network interface MAC addresses.

More information: https://manned.org/macchanger.

- View the current and permanent MAC addresses of an interface:

```
macchanger {{[-s|--show]}} {{interface}}
```

- Set interface to a random MAC:

```
macchanger {{[-r|--random]}} {{interface}}
```

- Set an interface to a random MAC address, and pretend to be a [b]urned-[i]n-[a]ddress:

```
macchanger {{[-r|--random]}} {{[-b|--bia]}} {{interface}}
```

- Set an interface to a specific MAC address:

```
macchanger {{[-m|--mac]}} {{XX:XX:XX:XX:XX:XX}} {{interface}}
```

- Print the identifications (the first three bytes of a MAC address) of all known vendors:

```
macchanger {{[-l|--list]}}
```

- Reset an interface to its permanent hardware MAC address:

```
macchanger {{[-p|--permanent]}} {{interface}}
```

machinectl

Control the systemd machine manager.

Execute operations on virtual machines, containers, and images.

More information: https://www.freedesktop.org/software/systemd/man/latest/machinectl.html.

- Start a machine as a service using `systemd-nspawn`:

```
sudo machinectl start {{machine_name}}
```

- Stop a running machine:

```
sudo machinectl stop {{machine_name}}
```

- Display a list of running machines:

```
machinectl list
```

- Open an interactive shell inside the machine:

```
sudo machinectl shell {{machine_name}}
```

maim

Screenshot utility.

More information: https://manned.org/maim.

- Capture a screenshot and save it to the given path:

```
maim {{path/to/screenshot.png}}
```

- Capture a screenshot of the selected region:

```
maim {{[-s|--select]}} {{path/to/screenshot.png}}
```

- Capture a screenshot of the selected region and save it in the clipboard (requires `xclip`):

```
maim {{[-s|--select]}} | xclip {{[-se|-selection]}} {{[c|clipboard]}} {{[-t|-target]}} image/png
```

- Capture a screenshot of the current active window (requires `xdotool`):

```
maim {{[-i|--window]}} $(xdotool getactivewindow) {{path/to/screenshot.png}}
```

makepkg

Create a package which can be used with **`pacman`**.

Uses the **`PKGBUILD`** file in the current working directory by default.

More information: https://manned.org/makepkg.

- Make a package:

  `makepkg`

- Make a package and install its dependencies:

  `makepkg {{[-s|--syncdeps]}}`

- Make a package, install its dependencies then install it to the system:

  `makepkg {{[-si|--syncdeps --install]}}`

- Make a package, but skip checking the source's hashes, PGP signatures, and the `PKGBUILD` `check()` function:

  `makepkg --skipchecksums --skippgpcheck --nocheck`

- Clean up work directories after a successful build:

  `makepkg {{[-c|--clean]}}`

- Verify the hashes of the sources:

  `makepkg --verifysource`

- Generate and save the source information into `.SRCINFO`:

  `makepkg --printsrcinfo > .SRCINFO`

- Download the source and install only the build dependencies for a program:

  `makepkg {{[-so|--syncdeps --nobuild]}}`

mako

Notification daemon for Wayland compositors.

Can be controlled with **`makoctl`**.

More information: https://manned.org/mako.

- Start the `mako` notification daemon:

  ```
  mako
  ```

- Start with a custom configuration file:

  ```
  mako {{[-c|--config]}} {{path/to/config}}
  ```

- Set maximum number of visible notifications:

  ```
  mako --max-visible {{5}}
  ```

- Set default timeout in milliseconds (0 to disable):

  ```
  mako --default-timeout {{2000}}
  ```

- Group notifications by application name:

  ```
  mako --group-by {{app_name}}
  ```

- Display help:

  ```
  mako {{[-h|--help]}}
  ```

makoctl dismiss

Dismiss notifications in **mako**.

More information: https://manned.org/makoctl.

- Dismiss the most recent notification:

```
makoctl dismiss
```

- Dismiss a specific notification by ID:

```
makoctl dismiss -n {{notification_id}}
```

- Dismiss all notifications:

```
makoctl dismiss {{[-a|--all]}}
```

- Dismiss all notifications in the first group:

```
makoctl dismiss {{[-g|--group]}}
```

- Dismiss without adding to history:

```
makoctl dismiss {{[-h|--no-history]}}
```

makoctl invoke

Invoke actions on notifications in **mako**.

More information: https://manned.org/makoctl.

- Invoke the default action on the most recent notification:

```
makoctl invoke
```

- Invoke a specific action on a notification (if not specified, default is used):

```
makoctl invoke -n {{notification_id}} {{action_name}}
```

makoctl mode

Manage notification modes in **mako**.

Modes can be used to change notification behavior (e.g., do-not-disturb).

More information: https://manned.org/makoctl.

- List all currently active modes:

```
makoctl mode
```

- Add a mode:

```
makoctl mode -a {{do-not-disturb}}
```

- Remove a mode:

```
makoctl mode -r {{do-not-disturb}}
```

- Toggle a mode (add if absent, remove if present):

```
makoctl mode -t {{do-not-disturb}}
```

- Set specific modes, replacing all current modes:

```
makoctl mode -s {{mode1 mode2 ...}}
```

makoctl

Control the **mako** notification daemon.

Some subcommands such as **dismiss**, **invoke**, and **mode** have their own usage documentation.

More information: https://manned.org/makoctl.

- List all current notifications:

```
makoctl list
```

- List notification history:

```
makoctl history
```

- Reload the configuration file:

```
makoctl reload
```

- Restore the most recently expired notification from history:

```
makoctl restore
```

- Display help:

```
makoctl help
```

mandb

Manage the pre-formatted manual page database.

More information: https://manned.org/mandb.

- Purge and process manual pages:

  `mandb`

- Update a single entry:

  `mandb --filename {{path/to/file}}`

- Create entries from scratch instead of updating:

  `mandb --create`

- Only process user databases:

  `mandb --user-db`

- Do not purge obsolete entries:

  `mandb --no-purge`

- Check the validity of manual pages:

  `mandb --test`

mangohud

Display a monitoring HUD on top of a Vulkan or OpenGL graphical application.

More information: https://github.com/flightlessmango/MangoHud#normal-usage.

- Use `mangohud` on top of an application:

  `mangohud {{command}}`

- Change overlay position:

  `<RightShift F11>`

- Change overlay verbosity:

  `<RightShift F10>`

- Toggle overlay visibility:

  `<RightShift F12>`

manpath

Determine the search path for manual pages.

More information: https://manned.org/manpath.

- Display the search path used to find man pages:

```
manpath
```

- Show the entire global manpath:

```
manpath {{[-g|--global]}}
```

marzban cli

Manage administrators, users, and subscriptions.

More information: https://github.com/Gozargah/Marzban/blob/master/cli/README.md.

- List all administrators:

```
marzban cli admin list
```

- Create a new administrator:

```
marzban cli admin create {{[-u|--username]}} {{username}}
```

- List all users:

```
marzban cli user list
```

- Transfer ownership of a user to another administrator:

```
marzban cli user set-owner {{[-u|--username]}} {{username}} --owner {{owner}}
```

- Generate a subscription configuration for a user:

```
marzban cli subscription get-config {{[-u|--username]}} {{username}} {{[-f|--format]}} {{v2ray|clash}}
```

- Display a user's subscription link:

```
marzban cli subscription get-link {{[-u|--username]}} {{username}}
```

- Display help:

```
marzban cli --help
```

mashtree

Make a fast tree from genomes.

Does not make a phylogeny.

More information: https://github.com/lskatz/mashtree#usage.

- Create a tree from fastq and/or fasta files using the fastest method with multiple threads, piping into a newick file:

```
mashtree --numcpus {{12}} {{*.fastq.gz}} {{*.fasta}} >
{{mashtree.dnd}}
```

- Create a tree from fastq and/or fasta files using the most accurate method with multiple threads, piping into a newick file:

```
mashtree --mindepth {{0}} --numcpus {{12}} {{*.fastq.gz}}
{{*.fasta}} > {{mashtree.dnd}}
```

- Create a tree with confidence values using the most accurate method (note that any options for `mashtree` itself have to be on the right side of the `--`):

```
mashtree_bootstrap.pl --reps {{100}} --numcpus {{12}}
{{*.fastq.gz}} -- --min-depth {{0}} >
{{mashtree.bootstrap.dnd}}
```

matchpathcon

Look up the persistent SELinux security context setting of a path.

See also: **`semanage fcontext`**, **`secon`**, **`chcon`**, **`restorecon`**.

More information: https://manned.org/matchpathcon.8.

- Look up the persistent security context setting of an absolute path:

```
matchpathcon /{{path/to/file}}
```

- Restrict lookup to settings on a specific file type:

```
matchpathcon -m {{file|dir|pipe|chr_file|blk_file|lnk_file|
sock_file}} /{{path/to/file}}
```

- [V]erify that the persistent and current security context of a path agree:

```
matchpathcon -V /{{path/to/file}}
```

mate-about

Show information about MATE desktop environment.

More information: https://manned.org/mate-about.

- Display MATE version:

```
mate-about --version
```

mate-calc-cmd

Calculate mathematic expressions in MATE desktop environment in terminal.

More information: https://manned.org/mate-calc-cmd.

- Start an interactive calculator session:

```
mate-calc-cmd
```

- Calculate a specific mathematic expression:

```
{{2 + 5}}
```

mate-calc

Calculate mathematic expressions in MATE desktop environment.

More information: https://manned.org/mate-calc.

- Start the calculator:

```
mate-calc
```

- Calculate a specific mathematic expression:

```
mate-calc --solve {{2 + 5}}
```

mate-screenshot

Make screenshots in MATE desktop environment.

More information: https://manned.org/mate-screenshot.

- Create a fullscreen screenshot:

```
mate-screenshot
```

- Create an active window screenshot:

```
mate-screenshot --window
```

- Create a specific area screenshot:

```
mate-screenshot --area
```

- Create a screenshot interactively:

```
mate-screenshot --interactive
```

- Create a screenshot without borders:

```
mate-screenshot --window --remove-border
```

- Create a screenshot with a specific effect:

```
mate-screenshot --effect={{shadow|border|none}}
```

- Create a screenshot with a specific delay in seconds:

```
mate-screenshot --delay={{5}}
```

mate-search-tool

Search files in MATE desktop environment.

More information: https://manned.org/mate-search-tool.

- Search files containing a specific string in their name in a specific directory:

```
mate-search-tool --named={{string}} --path={{path/to/directory}}
```

- Search files without waiting a user confirmation:

```
mate-search-tool --start --named={{string}} --path={{path/to/directory}}
```

- Search files with name matching a specific `regex`:

```
mate-search-tool --start --regex={{string}} --path={{path/to/directory}}
```

- Set a sorting order in search results:

```
mate-search-tool --start --named={{string}} --path={{path/to/directory}} --sortby={{name|folder|size|type|date}}
```

- Set a descending sorting order:

```
mate-search-tool --start --named={{string}} --path={{path/to/directory}} --descending
```

- Search files owned by a specific user/group:

```
mate-search-tool --start --{{user|group}}={{value}} --path={{path/to/directory}}
```

mbw

Memory Bandwidth Benchmark.

More information: https://manned.org/mbw.

- Run 3 memory bandwidth tests with 512MB size:

```
mbw -n 3 512
```

- Run 3 memory bandwidth tests with 512MB memory size, output only statistics, not averages:

```
mbw -n 3 -q -a 512
```

- Run memcpy test 3 times with 512MB size, only display statistics:

```
mbw -n 3 -q -t{{0}} 512
```

- Run the memcpy test 10 times with 1024 byte blocks allocated 8192MB of memory:

```
mbw -n 10 -q -t{{2}} -b 1024 8192
```

- Run dumb test with 2048MB size, output only statistics, run forever:

```
mbw -n 0 -t{{1}} -q 2048
```

mcookie

Generate random 128-bit hexadecimal numbers.

More information: https://manned.org/mcookie.

- Generate a random number:

```
mcookie
```

- Generate a random number, using the contents of a file as a seed for the randomness:

```
mcookie {{[-f|--file]}} {{path/to/file}}
```

- Generate a random number, using a specific number of bytes from a file as a seed for the randomness:

```
mcookie {{[-f|--file]}} {{path/to/file}} {{[-m|--max-size]}} {{number_of_bytes}}
```

- Print the details of the randomness used, such as the origin and seed for each source:

```
mcookie {{[-v|--verbose]}}
```

mdadm

RAID management utility.

More information: https://manned.org/mdadm.

- Create array:

```
sudo mdadm --create {{/dev/md/MyRAID}} --level {{raid_level}}
--raid-devices {{number_of_disks}} {{/dev/sdXN}}
```

- Stop array:

```
sudo mdadm --stop {{/dev/md0}}
```

- Mark disk as failed:

```
sudo mdadm --fail {{/dev/md0}} {{/dev/sdXN}}
```

- Remove disk:

```
sudo mdadm --remove {{/dev/md0}} {{/dev/sdXN}}
```

- Add disk to array:

```
sudo mdadm --assemble {{/dev/md0}} {{/dev/sdXN}}
```

- Show RAID info:

```
sudo mdadm --detail {{/dev/md0}}
```

- Reset disk by deleting RAID metadata:

```
sudo mdadm --zero-superblock {{/dev/sdXN}}
```

mdbook

Create online books by writing Markdown files.

More information: https://rust-lang.github.io/mdBook/cli/index.html.

- Create an mdbook project in the current directory:

```
mdbook init
```

- Create an mdbook project in a specific directory:

```
mdbook init {{path/to/directory}}
```

- Clean the directory with the generated book:

```
mdbook clean
```

- Serve a book at http://localhost:3000, auto build when file changes:

```
mdbook serve
```

- Watch a set of Markdown files and automatically build when a file is changed:

```
mdbook watch
```

mediamtx

Real-time media server and proxy.

More information: https://github.com/bluenviron/mediamtx.

- Run MediaMTX:

```
mediamtx
```

- Run MediaMTX with a custom configuration location:

```
mediamtx {{path/to/config.yml}}
```

- Start MediaMTX as a daemon:

```
systemctl start mediamtx
```

megadl

This command is an alias of **megatools-dl**.

- View documentation for the original command:

```
tldr megatools-dl
```

megatools-dl

Download files from **`mega.nz`**.

Part of the **`megatools`** suite.

More information: https://xff.cz/megatools/man/megatools-dl.html.

- Download files from a `mega.nz` link into the current directory:

```
megatools-dl {{https://mega.nz/...}}
```

- Download files from a `mega.nz` link into a specific directory:

```
megatools-dl --path {{path/to/directory}} {{https://
mega.nz/...}}
```

- Interactively choose which files to download:

```
megatools-dl --choose-files {{https://mega.nz/...}}
```

- Limit the download speed in KiB/s:

```
megatools-dl --limit-speed {{speed}} {{https://mega.nz/...}}
```

mesg

Check or set a terminal's ability to receive messages from other users, usually from the **`write`** command.

See also: **`write`**, **`talk`**.

More information: https://manned.org/mesg.

- Check terminal's openness to write messages:

```
mesg
```

- Disallow receiving messages from other users:

```
mesg n
```

- Allow receiving messages from other users:

```
mesg y
```

- Enable verbose mode, printing a warning if the command is not executed from a terminal:

```
mesg {{[-v|--verbose]}}
```

mhwd-gpu

Configure graphics cards in Manjaro.

More information: https://wiki.manjaro.org/index.php/Configure_NVIDIA_(non-free)_settings_and_load_them_on_Startup/en#Configure_The_Resolution.2FRefresh_Rate.

- Show current Xorg configuration path:

```
mhwd-gpu --status
```

- Check if Xorg configuration has a valid symlink:

```
mhwd-gpu --check
```

- Set a custom Xorg configuration for an Nvidia GPU:

```
sudo mhwd-gpu --setmod nvidia --setxorg /{{path/to/nvidia.conf}}
```

- Set a custom Xorg configuration for an AMD GPU:

```
sudo mhwd-gpu --setmod {{catalyst|ati}} --setxorg /{{path/to/amdgpu.conf}}
```

- Display help:

```
mhwd-gpu --help
```

mhwd-kernel

Manage and install Linux kernels in Manjaro.

More information: https://wiki.manjaro.org/index.php/Manjaro_Kernels.

- List all available kernels:

```
mhwd-kernel {{[-l|--list]}}
```

- List all installed kernels:

```
mhwd-kernel {{[-li|--listinstalled]}}
```

- Install a kernel:

```
sudo mhwd-kernel {{[-i|--install]}} {{kernel}}
```

- Remove a kernel:

```
sudo mhwd-kernel {{[-r|--remove]}} {{kernel}}
```

- Install a kernel, replacing the currently running kernel:

```
sudo mhwd-kernel {{[-i|--install]}} {{kernel}} rmc
```

mhwd

Manjaro Hardware Detection utility.

More information: https://wiki.manjaro.org/index.php/Manjaro_Hardware_Detection_Overview.

- List available drivers:

```
mhwd {{[-l|--list]}}
```

- List installed drivers:

```
mhwd {{[-li|--listinstalled]}}
```

- Install a driver:

```
mhwd {{[-i|--install]}} {{pci|usb}} {{driver_name}}
```

- Remove a driver:

```
mhwd {{[-r|--remove]}} {{pci|usb}} {{driver_name}}
```

- Display detailed information about detected hardware:

```
mhwd {{[-l|--list]}} {{[-d|--detail]}}
```

- Automatically install best available driver for the detected graphics card:

```
mhwd {{[-a|--auto]}} pci {{free|nonfree}} 0300
```

microcom

A minimalistic terminal program, used to access remote devices via a serial, CAN, or telnet connection from the console.

More information: https://manned.org/microcom.

- Open a serial port using the specified baud rate:

```
microcom {{[-p|--port]}} {{/dev/ttyXYZ}} {{[-s|--speed]}} {{baud_rate}}
```

- Establish a telnet connection to the specified host:

```
microcom {{[-t|--telnet]}} {{hostname}}:{{port}}
```

mimetype

Automatically determine the MIME type of a file.

More information: https://manned.org/mimetype.

- Print the MIME type of a given file:

```
mimetype {{path/to/file}}
```

- Display only the MIME type, and not the filename:

```
mimetype --brief {{path/to/file}}
```

- Display a description of the MIME type:

```
mimetype --describe {{path/to/file}}
```

- Determine the MIME type of `stdin` (does not check a filename):

```
{{command}} | mimetype --stdin
```

- Display debug information about how the MIME type was determined:

```
mimetype --debug {{path/to/file}}
```

- Display all the possible MIME types of a given file in confidence order:

```
mimetype --all {{path/to/file}}
```

- Explicitly specify the 2-letter language code of the output:

```
mimetype --language {{path/to/file}}
```

minicom

Communicate with the serial interface of a device.

See also: **`picocom`**, **`cu`**, **`tio`**.

More information: https://manned.org/minicom.

- Open a given serial port:

```
sudo minicom {{[-D|--device]}} {{/dev/ttyXYZ}}
```

- Open a given serial port with a given baud rate:

```
sudo minicom {{[-D|--device]}} {{/dev/ttyXYZ}} {{[-b|--baudrate]}} {{115200}}
```

- Enter the configuration menu before communicating with a given serial port:

```
sudo minicom {{[-D|--device]}} {{/dev/ttyXYZ}} {{[-s|--setup]}}
```

- Capture the output of a serial port to a file:

```
sudo minicom {{[-D|--device]}} {{/dev/ttyXYZ}} {{[-C|--capturefile]}} {{path/to/file}}
```

- Exit minicom:

```
<Ctrl a><x><Enter>
```

- Display help:

```
minicom {{[-h|--help]}}
```

mke2fs

Create a Linux filesystem inside a partition.

More information: https://manned.org/mke2fs.

- Create an ext2 filesystem on a partition:

```
sudo mke2fs -t ext2 {{/dev/sdXY}}
```

- Create an ext3 filesystem on a partition:

```
sudo mke2fs -t ext3 {{/dev/sdXY}}
```

- Create an ext4 filesystem on a partition:

```
sudo mke2fs -t ext4 {{/dev/sdXY}}
```

mkfs.bcachefs

Create a **bcachefs** filesystem inside a partition.

See also: **bcachefs**.

More information: https://bcachefs-docs.readthedocs.io/en/latest/mgmt-formatting.html.

- Create a bcachefs filesystem inside partition Y on a device X:

```
sudo mkfs.bcachefs {{/dev/sdXY}}
```

- Create a bcachefs filesystem with a volume label:

```
sudo mkfs.bcachefs {{[-L|--fs_label]}} {{volume_label}} {{/dev/sdXY}}
```

mkfs.btrfs

Create a BTRFS filesystem.

Defaults to **`raid1`**, which specifies 2 copies of a data block spread across 2 different devices.

More information: https://btrfs.readthedocs.io/en/latest/mkfs.btrfs.html.

- Create a Btrfs filesystem on an empty partition:

```
sudo mkfs.btrfs {{/dev/sdXY}}
```

- Create a btrfs filesystem on a single device:

```
sudo mkfs.btrfs {{[-m|--metadata]}} single {{[-d|--data]}}
single {{/dev/sdX}}
```

- Create a btrfs filesystem on multiple devices with raid1:

```
sudo mkfs.btrfs {{[-m|--metadata]}} raid1 {{[-d|--data]}}
raid1 {{/dev/sdX /dev/sdY /dev/sdZ ...}}
```

- Set a label for the filesystem:

```
sudo mkfs.btrfs {{[-L|--label]}} "{{label}}" {{/dev/sdX /dev/
sdY ...}}
```

- Overwrite existing filesystem if one is detected:

```
sudo mkfs.btrfs {{[-f|--force]}} {{/dev/sdX}}
```

mkfs.cramfs

Create a ROM filesystem inside a partition.

More information: https://manned.org/mkfs.cramfs.

- Create a ROM filesystem out of a directory inside partition Y on device X:

```
sudo mkfs.cramfs {{path/to/directory}} {{/dev/sdXY}}
```

- Create a ROM filesystem with a volume-name:

```
sudo mkfs.cramfs -n {{volume_name}} {{path/to/directory}} {{/dev/sdXY}}
```

mkfs.erofs

Create an EROFS filesystem in an image.

More information: https://manned.org/mkfs.erofs.

- Create an EROFS filesystem based on the root directory:

```
mkfs.erofs image.erofs root/
```

- Create an EROFS image with a specific UUID:

```
mkfs.erofs -U {{uuid}} image.erofs root/
```

- Create a compressed EROFS image:

```
mkfs.erofs -zlz4hc image.erofs root/
```

- Create an EROFS image where all files are owned by root:

```
mkfs.erofs --all-root image.erofs root/
```

mkfs.exfat

Create an exfat filesystem inside a partition.

More information: https://manned.org/mkfs.exfat.

- Create an exfat filesystem inside partition Y on device X:

```
sudo mkfs.exfat {{/dev/sdXY}}
```

- Create filesystem with a volume-name:

```
sudo mkfs.exfat {{[-L|--volume-label]}} {{volume_name}} {{/dev/sdXY}}
```

- Create filesystem with a volume-id:

```
sudo mkfs.exfat {{[-U|--volume-guid]}} {{volume_id}} {{/dev/sdXY}}
```

mkfs.ext4

Create an ext4 filesystem inside a partition.

More information: https://manned.org/mkfs.ext4.

- Create an ext4 filesystem inside partition Y on device X:

```
sudo mkfs.ext4 {{/dev/sdXY}}
```

- Create an ext4 filesystem with a volume-label:

```
sudo mkfs.ext4 -L {{volume_label}} {{/dev/sdXY}}
```

- Create an ext4 filesystem owned by a specific user and group:

```
sudo mkfs.ext4 -E root_owner={{user_id}}:{{group_id}} {{/dev/sdXY}}
```

mkfs.f2fs

Create an F2FS filesystem inside a partition.

More information: https://manned.org/mkfs.f2fs.

- Create an F2FS filesystem inside partition Y on device X:

```
sudo mkfs.f2fs {{/dev/sdXY}}
```

- Create an F2FS filesystem with a volume label:

```
sudo mkfs.f2fs -l {{volume_label}} {{/dev/sdXY}}
```

mkfs.fat

Create an MS-DOS filesystem inside a partition.

More information: https://manned.org/mkfs.fat.

- Create a fat filesystem inside partition Y on device X:

```
sudo mkfs.fat {{/dev/sdXY}}
```

- Create filesystem with a volume-name:

```
sudo mkfs.fat -n {{volume_name}} {{/dev/sdXY}}
```

- Create filesystem with a volume-id:

```
sudo mkfs.fat -i {{volume_id}} {{/dev/sdXY}}
```

- Use 4 instead of 2 file allocation tables:

```
sudo mkfs.fat -f 4 {{/dev/sdXY}}
```

- Specify filesystem type:

```
sudo mkfs.fat -F {{12|16|32}} {{/dev/sdXY}}
```

mkfs

Build a Linux filesystem on a hard disk partition.

Note: This command is deprecated, use filesystem specific commands like **`mkfs.ext4`** instead.

More information: https://manned.org/mkfs.

- Build a Linux ext2 filesystem on a partition:

```
sudo mkfs {{/dev/sdXY}}
```

- Build a filesystem of a specified type:

```
sudo mkfs {{[-t|--type]}} {{ext4}} {{/dev/sdXY}}
```

- Build a filesystem of a specified type and check for bad blocks:

```
sudo mkfs -c {{[-t|--type]}} {{ntfs}} {{/dev/sdXY}}
```

mkfs.minix

Create a Minix filesystem inside a partition.

More information: https://manned.org/mkfs.minix.

- Create a Minix filesystem inside partition Y on device X:

```
sudo mkfs.minix {{/dev/sdXY}}
```

mkfs.ntfs

Create a NTFS filesystem inside a partition.

More information: https://manned.org/mkfs.ntfs.

- Create a NTFS filesystem inside partition Y on device X:

```
sudo mkfs.ntfs {{/dev/sdXY}}
```

- Create filesystem with a volume-label:

```
sudo mkfs.ntfs {{[-L|--label]}} {{volume_label}} {{/dev/sdXY}}
```

- Create filesystem with specific UUID:

```
sudo mkfs.ntfs {{[-U|--with-uuid]}} {{uuid}} {{/dev/sdXY}}
```

mkfs.vfat

This command is an alias of **`mkfs.fat`**.

- View documentation for the original command:

  ```
  tldr mkfs.fat
  ```

mkfs.xfs

Create an XFS filesystem inside a partition.

More information: https://manned.org/mkfs.xfs.

- Create an XFS filesystem inside partition Y on device X:

```
sudo mkfs.xfs {{/dev/sdXY}}
```

- Create an XFS filesystem with a volume label:

```
sudo mkfs.xfs -L {{volume_label}} {{/dev/sdXY}}
```

mkhomedir_helper

Create the user's home directory after creating the user.

More information: https://manned.org/mkhomedir_helper.

- Create a home directory for a user based on `/etc/skel` with umask 022:

```
sudo mkhomedir_helper {{username}}
```

- Create a home directory for a user based on `/etc/skel` with all permissions for owner (0) and read permission for group (3):

```
sudo mkhomedir_helper {{username}} {{037}}
```

- Create a home directory for a user based on a custom skeleton:

```
sudo mkhomedir_helper {{username}} {{umask}} {{path/to/skeleton_directory}}
```

mkid

Build an ID database for use with **`lid`** and other idutils tools.

More information: https://www.gnu.org/software/idutils/manual/idutils.html#mkid-invocation.

- Build an ID database for the current directory:

```
mkid
```

- Build an ID database for specific directories:

```
mkid {{path/to/directory1 path/to/directory2 ...}}
```

- Build an ID database and save it to a specific file:

```
mkid {{[-o|--output]}} {{path/to/database.id}}
```

- Include only specific languages:

```
mkid {{[-i|--include]}} "{{language1 language2 ...}}"
```

- Exclude specific directories from indexing:

```
mkid {{[-p|--prune]}} {{path/to/excluded_directory}}
```

- Display statistics after building the database:

```
mkid {{[-s|--statistics]}}
```

mkinitcpio

Generate initial ramdisk environments for booting the Linux kernel based on the specified preset(s).

More information: https://manned.org/mkinitcpio.

- Simulate generating the initial ramdisk environments and print what would be done:

```
mkinitcpio
```

- Generate ramdisk environments based on all existing presets (used to regenerate all the initramfs images after a change in `/etc/mkinitcpio.conf`):

```
sudo mkinitcpio {{[-P|--allpresets]}}
```

- Generate a ramdisk environment based on the `linux` preset:

```
sudo mkinitcpio {{[-p|--preset]}} linux
```

- Generate a ramdisk environment based on the `linux-lts` preset:

```
sudo mkinitcpio {{[-p|--preset]}} linux-lts
```

- Generate an initramfs image using an alternative configuration file:

```
sudo mkinitcpio {{[-c|--config]}} {{path/to/mkinitcpio.conf}} {{[-g|--generate]}} {{path/to/initramfs.img}}
```

- Generate an initramfs image for a kernel other than the one currently running (the installed kernel releases can be found in `/usr/lib/modules/`):

```
sudo mkinitcpio {{[-k|--kernel]}} {{kernel_version}} {{[-g|--generate]}} {{path/to/initramfs.img}}
```

- List all available hooks:

```
mkinitcpio {{[-L|--listhooks]}}
```

- Display help for a specific hook:

```
mkinitcpio {{[-H|--hookhelp]}} {{hook_name}}
```

mkinitfs

Generate an initramfs on Alpine Linux.

More information: https://manned.org/mkinitfs.

- Generate an initramfs with the features specified in `/etc/mkinitfs/mkinitfs.conf`:

```
mkinitfs
```

- Use a different configuration file:

```
mkinitfs -c {{path/to/config}}
```

- Compress the initramfs using the specified compression algorithm (default: `gzip`):

```
mkinitfs -C {{gzip|xz|zstd|lz4|none}}
```

- List files that will be included in the initramfs image:

```
mkinitfs -l
```

- List all available features:

```
mkinitfs -L
```

mkisofs

Create ISO files from directories.

Also aliased as **`genisoimage`**.

More information: https://manned.org/mkisofs.

- Create an ISO from a directory:

```
mkisofs -o {{filename.iso}} {{path/to/source_directory}}
```

- Set the disc label when creating an ISO:

```
mkisofs -o {{filename.iso}} -V "{{label_name}}" {{path/to/source_directory}}
```

- Create an ISO image with files larger than 2GiB by reporting a smaller apparent size for ISO9660 filesystems:

```
mkisofs -o {{filename.iso}} -allow-limited-size {{path/to/source_directory}}
```

mklost+found

Create a lost+found directory.

More information: https://manned.org/mklost%2Bfound.

- Create a `lost+found` directory in the current directory:

```
mklost+found
```

mknod

Create block or character device special files.

More information: https://www.gnu.org/software/coreutils/manual/html_node/mknod-invocation.html.

- Create a block device:

```
sudo mknod {{path/to/device_file}} b {{major_device_number}} {{minor_device_number}}
```

- Create a character device:

```
sudo mknod {{path/to/device_file}} c {{major_device_number}} {{minor_device_number}}
```

- Create a FIFO (queue) device:

```
sudo mknod {{path/to/device_file}} p
```

- Create a device file with default SELinux security context:

```
sudo mknod {{[-Z|--context]}} {{path/to/device_file}} {{type}} {{major_device_number}} {{minor_device_number}}
```

mkosi

Build modern, legacy-free Linux images.

Part of **systemd**.

More information: https://manned.org/mkosi.

- Show current build configuration to verify what would be built:

```
mkosi summary
```

- Build an image with default settings (if no distribution is selected, the distribution of the host system is used):

```
mkosi build {{[-d|--distribution]}} {{fedora|debian|ubuntu|arch|opensuse|...}}
```

- Build an image and run an interactive shell in a systemd-nspawn container of the image:

```
mkosi shell
```

- Boot an image in a virtual machine using QEMU (only supported for disk images or CPIO images when a kernel is provided):

```
mkosi qemu
```

- Display help:

```
mkosi help
```

mksquashfs

Create or append files and directories to squashfs filesystems.

More information: https://manned.org/mksquashfs.

- Create or append files and directories to a squashfs filesystem (compressed using `gzip` by default):

```
mksquashfs {{path/to/file_or_directory1 path/to/
file_or_directory2 ...}} {{filesystem.squashfs}}
```

- Create or append files and directories to a squashfs filesystem, using a specific [comp]ression algorithm:

```
mksquashfs {{path/to/file_or_directory1 path/to/
file_or_directory2 ...}} {{filesystem.squashfs}} -comp
{{gzip|lzo|lz4|xz|zstd|lzma}}
```

- Create or append files and directories to a squashfs filesystem, [e]xcluding some of them:

```
mksquashfs {{path/to/file_or_directory1 path/to/
file_or_directory2 ...}} {{filesystem.squashfs}} -e {{file|
directory1 file|directory2 ...}}
```

- Create or append files and directories to a squashfs filesystem, [e]xcluding those ending with `gzip`:

```
mksquashfs {{path/to/file_or_directory1 path/to/
file_or_directory2 ...}} {{filesystem.squashfs}} -wildcards -
e "{{*.gz}}"
```

- Create or append files and directories to a squashfs filesystem, [e]xcluding those matching a `regex`:

```
mksquashfs {{path/to/file_or_directory1 path/to/
file_or_directory2 ...}} {{filesystem.squashfs}} -regex -e
"{{regex}}"
```

mkswap

Set up a Linux swap area on a device or in a file.

Note: **`path/to/file`** can either point to a regular file or a swap partition.

More information: https://manned.org/mkswap.

- Set up a given swap area:

```
sudo mkswap {{path/to/file}}
```

- Check a partition for bad blocks before creating the swap area:

```
sudo mkswap {{[-c|--check]}} {{path/to/file}}
```

- Specify a label for the partition (to allow `swapon` to use the label):

```
sudo mkswap {{[-L|--label]}} {{label}} {{/dev/sdXY}}
```

- Use the specified UUID:

```
sudo mkswap {{[-U|--uuid]}} {{clear|random|time|uuid_value}}
```

- Set up a swap file (for btrfs, see `tldr btrfs filesystem` instead):

```
sudo mkswap {{[-s|--size]}} {{file_size}} {{[-F|--file]}}
{{path/to/swapfile}}
```

mktemp

Create a temporary file or directory.

More information: https://www.gnu.org/software/coreutils/manual/html_node/mktemp-invocation.html.

- Create an empty temporary file and print its absolute path:

```
mktemp
```

- Use a custom directory (defaults to `$TMPDIR`, or `/tmp`):

```
mktemp {{[-p |--tmpdir=]}}/{{path/to/temporary_directory}}
```

- Use a custom path template (`X`s are replaced with random alphanumeric characters):

```
mktemp {{/tmp/example.XXXXXXXX}}
```

- Use a custom file name template:

```
mktemp -t {{example.XXXXXXXX}}
```

- Create an empty temporary file with the given suffix and print its absolute path:

```
mktemp --suffix {{.ext}}
```

- Create an empty temporary directory and print its absolute path:

```
mktemp {{[-d|--directory]}}
```

- Print the name of a temporary file or directory without actually creating it:

```
mktemp {{[-u|--dry-run]}}
```

mkvpropedit

Modify properties of existing Matroska files without a complete remux.

More information: https://mkvtoolnix.download/doc/mkvpropedit.html.

- Delete title:

```
mkvpropedit {{[-d|--delete]}} title {{path/to/file.mkv}}
```

- Mark subtitle track 3 as SDH - Subtitles for deaf and hearing impaired:

```
mkvpropedit {{path/to/file.mkv}} {{[-e|--edit]}} track:s3
{{[-s|--set]}} flag-hearing-impaired=1
```

- Mark audio track 2 as Default:

```
mkvpropedit {{path/to/file.mkv}} {{[-e|--edit]}} track:a2
{{[-s|--set]}} flag-default=1
```

- Delete the name of video track 1:

```
mkvpropedit {{path/to/file.mkv}} {{[-e|--edit]}} track:v1
{{[-d|--delete]}} name
```

mlabel

Set an MS-DOS volume label for FAT and VFAT filesystems.

More information: https://www.gnu.org/software/mtools/manual/mtools.html#mlabel.

- Set a filesystem label:

```
mlabel -i {{/dev/sda}} ::"{{new_label}}"
```

mmcli

Control and monitor the ModemManager.

More information: https://www.freedesktop.org/software/ModemManager/man/latest/mmcli.1.html.

- List available modems:

```
mmcli {{[-L|--list-modems]}}
```

- List available modems and monitor for ones added or removed:

```
mmcli {{[-M|--monitor-modems]}}
```

- Print information about a modem:

```
mmcli {{[-m|--modem]}} {{modem_number}}
```

- Enable a modem:

```
mmcli {{[-m|--modem]}} {{modem_number}} {{[-e|--enable]}}
```

- List SMS messages available on the modem:

```
sudo mmcli {{[-m|--modem]}} {{modem_number}} --messaging-list-sms
```

- Delete a message from the modem, specifying its path:

```
sudo mmcli {{[-m|--modem]}} {{modem_number}} --messaging-delete-sms {{path/to/message_file}}
```

mmdebstrap

Create a Debian chroot.

Alternative to **debootstrap**.

More information: https://gitlab.mister-muffin.de/josch/mmdebstrap/.

- Create a Debian Stable directory chroot:

```
sudo mmdebstrap stable {{path/to/debian-root}}/
```

- Create a Debian Bookworm tarball chroot using a mirror:

```
mmdebstrap bookworm {{path/to/debian-bookworm.tar}} {{http://
mirror.example.org/debian}}
```

- Create a Debian Sid tarball chroot with additional packages:

```
mmdebstrap sid {{path/to/debian-sid.tar}} --
include={{pkg1,pkg2}}
```

mocp

Music on Console (MOC) audio player.

More information: https://manned.org/mocp.

- Launch the MOC terminal UI:

```
mocp
```

- Launch the MOC terminal UI in a specific directory:

```
mocp {{path/to/directory}}
```

- Start the MOC server in the background, without launching the MOC terminal UI:

```
mocp {{[-S|--server]}}
```

- Add a specific song to the play queue while MOC is in the background:

```
mocp {{[-q|--enqueue]}} {{path/to/audio_file}}
```

- Add songs recursively to the play queue while MOC is in the background:

```
mocp {{[-a|--append]}} {{path/to/directory}}
```

- Clear the play queue while MOC is in the background:

```
mocp {{[-c|--clear]}}
```

- Play or stop the currently queued song while MOC is in the background:

```
mocp --{{play|stop}}
```

- Stop the MOC server while it's in the background:

```
mocp {{[-x|--exit]}}
```

modetest

Diagnose Direct Rendering Manager and Kernel Mode Setting.

More information: https://xilinx-wiki.atlassian.net/wiki/spaces/A/pages/18841850/Video_Mixer#modetest.

- List connectors and their available modes:

```
modetest -c
```

- List connectors and their available modes for a specific driver:

```
modetest -M {{mgag200}} -c
```

- Set the resolution of a connector:

```
sudo modetest -M {{mgag200}} -s {{connector_id}}:{{1600}}x{{1200}}
```

modinfo

Extract information about a Linux kernel module.

See also: **kmod**.

More information: https://manned.org/modinfo.

- List all attributes of a kernel module:

```
modinfo {{kernel_module}}
```

- List the specified attribute only:

```
modinfo {{[-F|--field]}} {{author|description|license|parm|filename|version|...}} {{kernel_module}}
```

modprobe

Add or remove modules from the Linux kernel.

See also: **kmod**.

More information: https://manned.org/modprobe.

- Simulate loading a module into the kernel:

```
modprobe {{[-n|--dry-run]}} {{module_name}}
```

- Load a module into the kernel:

```
sudo modprobe {{module_name}}
```

- Remove a module from the kernel:

```
sudo modprobe {{[-r|--remove]}} {{module_name}}
```

- Remove a module and those that depend on it from the kernel:

```
sudo modprobe {{[-r|--remove]}} --remove-holders
{{module_name}}
```

- Show a kernel module's dependencies:

```
sudo modprobe {{[-D|--show-depends]}} {{module_name}}
```

module

Modify a users' environment.

More information: https://lmod.readthedocs.io/en/latest/010_user.html.

- Display available modules:

```
module avail
```

- Search for a module by name:

```
module avail {{module_name}}
```

- Load a module:

```
module load {{module_name}}
```

- Display loaded modules:

```
module list
```

- Unload a specific loaded module:

```
module unload {{module_name}}
```

- Unload all loaded modules:

```
module purge
```

- Specify user-created modules:

```
module use {{path/to/module_file1 path/to/module_file2 ...}}
```

- Save the current set of loaded modules:

```
module save {{collection_name}}
```

mokutil

Configure Secure Boot Machine Owner Keys (MOK).

Some operations, such as enabling and disabling Secure Boot or enrolling keys require a reboot.

More information: https://manned.org/mokutil.

- Show if Secure Boot is enabled:

```
mokutil --sb-state
```

- Enable Secure Boot:

```
mokutil --enable-validation
```

- Disable Secure Boot:

```
mokutil --disable-validation
```

- List enrolled keys:

```
mokutil {{[-l|--list-enrolled]}}
```

- Enroll a new key:

```
mokutil {{[-i|--import]}} {{path/to/key.der}}
```

- List the keys to be enrolled:

```
mokutil {{[-N|--list-new]}}
```

- Set shim verbosity:

```
mokutil --set-verbosity true
```

mono

Runtime for the .NET Framework.

More information: https://www.mono-project.com/docs/.

- Run a .NET assembly in debug mode:

```
mono --debug {{path/to/program.exe}}
```

- Run a .NET assembly:

```
mono {{path/to/program.exe}}
```

mons

Quickly manage two displays.

More information: https://github.com/Ventto/mons#usage.

- Enable only the primary monitor:

```
mons -o
```

- Enable only the [s]econdary monitor:

```
mons -s
```

- [d]uplicate the primary monitor onto the secondary monitor, using the resolution of the primary monitor:

```
mons -d
```

- [m]irror the primary monitor onto the secondary monitor, using the resolution of the secondary monitor:

```
mons -m
```

mopac

MOPAC (Molecular Orbital PACkage) is a semiempirical quantum chemistry program based on Dewar and Thiel's NDDO approximation.

More information: https://github.com/openmopac/mopac.

- Perform calculations according to an input file (`.mop`, `.dat`, and `.arc`):

```
mopac {{path/to/input_file}}
```

- Run a minimal working example with HF that writes to the current directory and streams the output file:

```
touch test.out; echo "PM7\n#comment\n\nH 0.95506 0.05781 -0.03133\nF 1.89426 0.05781 -0.03133" > test.mop; mopac test.mop & tail {{[-f|--follow]}} test.out
```

more

Interactively display a file, allowing scrolling and searching.

See also: **`less`**.

More information: https://manned.org/more.

- Open a file:

  `more {{path/to/file}}`

- Display a specific line:

  `more +{{line_number}} {{path/to/file}}`

- Go to the next page:

  `<Space>`

- Search for a string (press `<n>` to go to the next match):

  `</>{{something}}<Enter>`

- Exit:

  `<q>`

- Display help about interactive commands:

  `<h>`

mount.cifs

Mount SMB (Server Message Block) or CIFS (Common Internet File System) shares.

Note: You can also do the same thing by passing the **`-t cifs`** option to **`mount`**.

More information: https://manned.org/mount.cifs.

- Connect using the specified username or $USER by default (you will be prompted for a password):

```
mount.cifs -o user={{username}} //{{server}}/{{share_name}}
{{path/to/mount_point}}
```

- Connect as the guest user (without a password):

```
mount.cifs -o guest //{{server}}/{{share_name}} {{path/to/
mount_point}}
```

- Set ownership information for the mounted directory:

```
mount.cifs -o uid={{user_id|username}},gid={{group_id|
groupname}} //{{server}}/{{share_name}} {{path/to/
mount_point}}
```

mount.ddi

Mount Discoverable Disk Images.

See also: **`systemd-dissect`**.

More information: https://www.freedesktop.org/software/systemd/man/latest/systemd-dissect.html.

- Mount an OS image:

```
mount.ddi {{path/to/image.raw}} {{/mnt/image}}
```

mount

Get access to an entire filesystem in one directory.

See also: **`udisksctl`**.

More information: https://manned.org/mount.8.

- Show all mounted filesystems:

```
mount
```

- Mount a device to a directory:

```
mount {{path/to/device_file}} {{path/to/target_directory}}
```

- Create a specific directory if it does not exist and mount a device to it:

```
mount {{[-m|--mkdir]}} {{path/to/device_file}} {{path/to/target_directory}}
```

- Mount a device to a directory for a specific user:

```
mount {{[-o|--options]}} uid={{user_id}},gid={{group_id}} {{path/to/device_file}} {{path/to/target_directory}}
```

- Mount a CD-ROM device (with the filetype ISO9660) to `/cdrom` (readonly):

```
mount {{[-t|--types]}} iso9660 {{[-o|--options]}} ro {{/dev/cdrom}} /cdrom
```

- Mount all the filesystems defined in `/etc/fstab`:

```
mount {{[-a|--all]}}
```

- Mount a specific filesystem described in `/etc/fstab` (e.g. `/dev/sda1 /path/to/mount_point ext2 defaults 0 2`):

```
mount {{path/to/mount_point}}
```

- Mount a directory to another directory:

```
mount {{[-B|--bind]}} {{path/to/old_directory}} {{path/to/new_directory}}
```

mount.smb3

This command is an alias of **`mount.cifs`**.

Note: For SMB versions before 3 you have to use **`mount.cifs`** instead.

- View documentation for the original command:

```
tldr mount.cifs
```

mount.steamos

Mount or unmount SteamOS filesystem partitions.

More information: https://gitlab.com/users/evlaV/projects.

- Mount all necessary partitions from a device to a target directory:

```
sudo mount.steamos {{/dev/sdX}} {{/mnt}}
```

- Mount with options to exclude specific partitions (e.g. `/home`, overlays):

```
sudo mount.steamos {{[-o|--options]}} nohome,nooverlay {{/dev/sdX}} {{/mnt}}
```

- Unmount all partitions mounted under a target directory:

```
sudo mount.steamos -u {{/mnt}}
```

- Display help:

```
mount.steamos {{[-h|--help]}}
```

mountpoint

Test if a directory is a filesystem mountpoint.

More information: https://manned.org/mountpoint.

- Check if a directory is a mountpoint:

```
mountpoint {{path/to/directory}}
```

- Check if a directory is a mountpoint without showing any output:

```
mountpoint {{[-q|--quiet]}} {{path/to/directory}}
```

- Show major/minor numbers of a mountpoint's filesystem:

```
mountpoint {{[-d|--fs-devno]}} {{path/to/directory}}
```

mpg123

Console MPEG audio player.

More information: https://manned.org/mpg123.

- Play the specified mp3 files:

```
mpg123 {{path/to/file1.mp3 path/to/file2.mp3 ...}}
```

- Play the mp3 from `stdin`:

```
cat {{file.mp3}} | mpg123 -
```

- Jump forward to the next song:

```
<f>
```

- Jump back to the beginning for the song:

```
<b>
```

- Stop or replay the current file:

```
<s>
```

- Fast forward:

```
<.>
```

- Quit:

```
<q>
```

mpstat

Report CPU statistics.

More information: https://manned.org/mpstat.

- Display CPU statistics every 2 seconds:

```
mpstat 2
```

- Display 5 reports, one by one, at 2 second intervals:

```
mpstat 2 5
```

- Display 5 reports, one by one, from a given processor, at 2 second intervals:

```
mpstat -P {{0}} 2 5
```

mssh

GTK+ based SSH client for interacting with multiple SSH servers at once.

More information: https://manned.org/mssh.

- Open a new window and connect to multiple SSH servers:

```
mssh {{user@host1 user@host2 ...}}
```

- Open a new window and connect to a group of servers predefined in `~/.mssh_clusters`:

```
mssh {{[-a|--alias]}} {{alias_name}}
```

mt

Control magnetic tape drive operation (commonly LTO tape).

More information: https://manned.org/mt.

- Check the status of a tape drive:

```
mt -f {{/dev/nstX}} status
```

- Rewind the tape to beginning:

```
mt -f {{/dev/nstX}} rewind
```

- Move forward a given files, then position the tape on first block of next file:

```
mt -f {{/dev/nstX}} fsf {{count}}
```

- Rewind the tape, then position the tape at beginning of the given file:

```
mt -f {{/dev/nstX}} asf {{count}}
```

- Position the tape at the end of valid data:

```
mt -f {{/dev/nstX}} eod
```

- Rewind the tape and unload/eject it:

```
mt -f {{/dev/nstX}} eject
```

- Write EOF (End-of-file) mark at the current position:

```
mt -f {{/dev/nstX}} eof
```

mux

Intercept and multiplex streams of input events.

More information: https://gitlab.com/interception/linux/tools/-/tree/master#mux.

- Create a new muxer with a specified name:

```
mux -c {{muxer_name1 muxer_name2 ...}}
```

- Set the muxer's internal queue size (default is 100):

```
mux -s {{size}}
```

- Read input from a named muxer (can be repeated in "switch mode"):

```
mux -i {{input_muxer_name}}
```

- Write output to a named muxer (can be repeated):

```
mux -o {{output_muxer_name}}
```

nala

Package management utility with better formatting.

Front-end for the **`python-apt`** API.

More information: https://gitlab.com/volian/nala.

- Install a package, or update it to the latest available version:

```
sudo nala install {{package}}
```

- Remove a package:

```
sudo nala remove {{package}}
```

- Remove a package and its configuration files:

```
nala purge {{package}}
```

- Search package names and descriptions using a word, `regex` (default), or `glob`:

```
nala search "{{pattern}}"
```

- Update the list of available packages and upgrade the system:

```
sudo nala upgrade
```

- Remove all unused packages and dependencies from your system:

```
sudo nala autoremove
```

- Fetch fast mirrors to improve download speeds:

```
sudo nala fetch
```

- Display the history of all transactions:

```
nala history
```

namcap

Check binary packages and source **PKGBUILD**s for common packaging mistakes.

More information: https://manned.org/namcap.

- Check a specific PKGBUILD file:

```
namcap {{path/to/pkgbuild}}
```

- Check a specific package file:

```
namcap {{path/to/package.pkg.tar.zst}}
```

- Check a file, printing extra informational messages:

```
namcap {{[-i|--info]}} {{path/to/file}}
```

named

Execute the DNS (Dynamic Name Service) server daemon that converts host names to IP addresses and vice versa.

More information: https://manned.org/named.

- Read the default configuration file `/etc/named.conf`, read any initial data, and listen for queries:

```
named
```

- Read a custom configuration file:

```
named -c {{path/to/named.conf}}
```

- Use IPv4 or IPv6 only, even if the host machine is capable of utilizing other protocols:

```
named {{-4|-6}}
```

- Listen for queries on a specific port instead of the default port 53:

```
named -p {{port}}
```

- Run the server in the foreground and do not daemonize:

```
named -f
```

namei

Follow a pathname (which can be a symbolic link) until a terminal point is found (a file/directory/char device etc.).

This program is useful for finding "too many levels of symbolic links" problems.

More information: https://manned.org/namei.

- Resolve the pathnames specified as the argument parameters:

```
namei {{path/to/a}} {{path/to/b}} {{path/to/c}}
```

- Display the results in a long-listing format:

```
namei {{[-l|--long]}} {{path/to/a}} {{path/to/b}} {{path/to/c}}
```

- Show the mode bits of each file type in the style of `ls`:

```
namei {{[-m|--modes]}} {{path/to/a}} {{path/to/b}} {{path/to/c}}
```

- Show owner and group name of each file:

```
namei {{[-o|--owners]}} {{path/to/a}} {{path/to/b}} {{path/to/c}}
```

- Don't follow symlinks while resolving:

```
namei {{[-n|--nosymlinks]}} {{path/to/a}} {{path/to/b}} {{path/to/c}}
```

Natural Selection 2

Start a headless Natural Selection 2 server.

More information: https://naturalselection.fandom.com/wiki/Dedicated_Server.

- Start a server with the default settings:

```
{{path/to}}/server_linux
```

- Give a server a custom name that shows in the server browser:

```
{{path/to}}/server_linux -name '{{server_name}}'
```

- Specify a connection port for the server:

```
{{path/to}}/server_linux -port {{27015}}
```

- Specify maximum player count:

```
{{path/to}}/server_linux -limit {{2..24}}
```

- Specify the initial map the server starts on:

```
{{path/to}}/server_linux -map {{ns2_summit}}
```

- Limit access to the server with a password:

```
{{path/to}}/server_linux -password {{password}}
```

- Start a server with webui admin interface:

```
{{path/to}}/server_linux -webadmin -webport {{8080}}
```

nautilus

Default file explorer for GNOME desktop environment.

Also known as GNOME Files.

See also: **`dolphin`**, **`caja`**, **`thunar`**, **`vifm`**.

More information: https://manned.org/nautilus.

- Launch Nautilus:

```
nautilus
```

- Launch Nautilus as root user:

```
nautilus admin:/
```

- Launch Nautilus and display a specific directory:

```
nautilus {{path/to/directory}}
```

- Launch Nautilus with a specific file or directory selected:

```
nautilus --select {{path/to/file_or_directory}}
```

- Launch Nautilus in a separated window:

```
nautilus --new-window
```

- Close all Nautilus instances:

```
nautilus --quit
```

- Display help:

```
nautilus --help
```

navi

An interactive cheatsheet tool for the command-line and application launchers.

See also: **`tldr`**, **`cheatshh`**, **`navi`**.

More information: https://github.com/denisidoro/navi.

- Browse through all available cheatsheets:

```
navi
```

- Browse the cheatsheet for `navi` itself:

```
navi fn welcome
```

- Print a command from the cheatsheet without executing it:

```
navi --print
```

- Output shell widget source code (It automatically detects your shell if possible, but can also be specified manually):

```
navi widget {{shell}}
```

- Autoselect and execute the snippet that best matches a query:

```
navi {{[-q|--query]}} '{{query}}' --best-match
```

ncal

This command is an alias of **`cal`**.

- View documentation for the original command:

  ```
  tldr cal
  ```

ncat

Read, write, redirect, and encrypt data across a network.

An alternative implementation of a similar utility called **`netcat`**/**`nc`**.

More information: https://nmap.org/ncat/guide/index.html.

- Listen for input on the specified port and write it to the specified file:

```
ncat {{[-l|--listen]}} {{port}} > {{path/to/file}}
```

- Accept multiple connections and keep ncat open after they have been closed:

```
ncat {{[-lk|--listen --keep-open]}} {{port}}
```

- Write output of specified file to the specified host on the specified port:

```
ncat < {{path/to/file}} {{address}} {{port}}
```

- Accept multiple incoming connections on an encrypted channel evading detection of traffic content:

```
ncat --ssl {{[-k|--keep-open]}} {{[-l|--listen]}} {{port}}
```

- Connect to an open `ncat` connection over SSL:

```
ncat --ssl {{host}} {{port}}
```

- Check connectivity to a remote host on a particular port with timeout:

```
ncat {{[-w|--wait]}} {{seconds}} {{[-vz|--verbose -z]}}
{{host}} {{port}}
```

ndctl

Utility for managing Non-Volatile DIMMs.

More information: https://manned.org/ndctl.

- Create an `fsdax` mode namespace:

```
ndctl create-namespace --mode={{fsdax}}
```

- Change the mode of a namespace to `raw`:

```
ndctl create-namespace --reconfigure={{namespaceX.Y}} --
mode={{raw}}
```

- Check a sector mode namespace for consistency, and repair if needed:

```
ndctl check-namespace --repair {{namespaceX.Y}}
```

- List all namespaces, regions, and buses (including disabled ones):

```
ndctl list --namespaces --regions --buses --idle
```

- List a specific namespace and include lots of additional information:

```
ndctl list -vvv --namespace={{namespaceX.Y}}
```

- Run a monitor to watch for SMART health events for NVDIMMs on the `ACPI.NFIT` bus:

```
ndctl monitor --bus={{ACPI.NFIT}}
```

- Remove a namespace (when applicable) or reset it to an initial state:

```
ndctl destroy-namespace --force {{namespaceX.Y}}
```

needrestart

Check which daemons need to be restarted after library upgrades.

More information: https://manned.org/needrestart.

- List outdated processes:

```
needrestart
```

- Interactively restart services:

```
sudo needrestart
```

- List outdated processes in [v]erbose or [q]uiet mode:

```
needrestart {{-v|-q}}
```

- Check if the [k]ernel is outdated:

```
needrestart -k
```

- Check if the CPU microcode is outdated:

```
needrestart -w
```

- List outdated processes in [b]atch mode:

```
needrestart -b
```

- List outdated processed using a specific [c]onfiguration file:

```
needrestart -c {{path/to/config}}
```

- Display help:

```
needrestart --help
```

nemo

Manage files and directories in Cinnamon desktop environment.

More information: https://manned.org/nemo.

- Open the current user home directory:

```
nemo
```

- Open specific directories in separate windows:

```
nemo {{path/to/directory1 path/to/directory2 ...}}
```

- Open specific directories in tabs:

```
nemo --tabs {{path/to/directory1 path/to/directory2 ...}}
```

- Open a directory with a specific window size:

```
nemo --geometry={{600}}x{{400}} {{path/to/directory}}
```

- Close all windows:

```
nemo --quit
```

nemotron3-nano

The examples for this command have been moved together with **`inference-snap`**.

More information: https://github.com/canonical/nemotron-3-nano-snap.

- View documentation for `inference-snap`:

```
tldr inference-snap
```

neo

Simulate the digital rain from "The Matrix".

See also: **`cmatrix`**.

More information: https://manned.org/neo.

- Set scroll speed and asynchronous columns:

```
neo {{[-S|--speed]}} {{12}} {{[-a|--async]}}
```

- Change text color and colormode:

```
neo {{[-c|--color]}} {{green}} --colormode {{256}}
```

- Display a centered message:

```
neo {{[-m|--message]}} "{{Hello World}}"
```

- Set droplet density and glitch percentage:

```
neo {{[-d|--density]}} {{2.0}} {{[-G|--glitchpct]}} {{20.0}}
```

- Use a specific charset:

```
neo --charset {{ascii|greek|cyrillic|arabic|braille|
runic|...}}
```

- Clear the screen:

```
<Space>
```

- Exit neo:

```
{{<Esc>|<q>}}
```

- Display help:

```
neo {{[-h|--help]}}
```

nerdctl

Docker-compatible CLI for containerd.

More information: https://github.com/containerd/nerdctl/blob/main/docs/command-reference.md.

- List all containers (running and stopped):

```
nerdctl ps {{[-a|--all]}}
```

- Start a container from an image, with a custom name:

```
nerdctl run --name {{container_name}} {{image}}
```

- Start or stop an existing container:

```
nerdctl {{start|stop}} {{container_name}}
```

- Pull an image from a container registry:

```
nerdctl pull {{image}}
```

- Display the list of already downloaded images:

```
nerdctl images
```

- Open an interactive tty with Bourne shell (`sh`) inside a running container:

```
nerdctl exec {{[-it|--interactive --tty]}} {{container_name}} sh
```

- Remove stopped containers:

```
nerdctl rm {{container1 container2 ...}}
```

- Fetch and follow the logs of a container:

```
nerdctl logs {{[-f|--follow]}} {{container_name}}
```

nethogs

Monitor bandwidth usage per process.

More information: https://manned.org/nethogs.

- Start NetHogs as root (default device is `eth0`):

```
sudo nethogs
```

- Monitor bandwidth on specific device:

```
sudo nethogs {{device}}
```

- Monitor bandwidth on multiple devices:

```
sudo nethogs {{device1 device2 ...}}
```

- Specify refresh interval in seconds:

```
sudo nethogs -d {{seconds}}
```

- Change the traffic display unit (default: 0, 0 = kB/s, 1 = total kB, 2 = total bytes, 3 = total MB, 4 = MB/s, 5 = GB/s):

```
sudo nethogs -v {{0..5}}
```

netplan

Network configuration utility using YAML.

More information: https://netplan.readthedocs.io/en/stable/cli/.

- Apply a network configuration and make it persistent:

```
sudo netplan apply
```

- Generate backend configuration files:

```
sudo netplan generate
```

- Configure a network interface to use DHCP:

```
sudo netplan set ethernets.{{interface_name}}.dhcp4=true
```

- Try configuration changes without applying them permanently:

```
sudo netplan try --timeout {{seconds}}
```

- Return to previous working configuration after failed apply:

```
sudo netplan --debug apply
```

- Display the current netplan configuration status:

```
netplan status
```

netselect-apt

Create a **`sources.list`** file for a Debian mirror with the lowest latency.

More information: https://manned.org/netselect-apt.

- Create `sources.list` using the lowest latency server:

```
sudo netselect-apt
```

- Specify Debian branch, stable is used by default:

```
sudo netselect-apt {{testing}}
```

- Include non-free section:

```
sudo netselect-apt {{[-n|--non-free]}}
```

- Specify a country for the mirror list lookup:

```
sudo netselect-apt {{[-c|--country]}} {{India}}
```

netselect

Speed test for choosing a fast network server.

More information: https://manned.org/netselect.

- Choose the server with the lowest latency:

```
sudo netselect {{host_1 host_2 ...}}
```

- Display nameserver resolution and statistics:

```
sudo netselect -vv {{host_1 host_2 ...}}
```

- Define maximum TTL (time to live):

```
sudo netselect -m {{10}} {{host_1 host_2 ...}}
```

- Print n fastest servers among the hosts:

```
sudo netselect -s {{n}} {{host_1 host_2 host_3 ...}}
```

- Display help:

```
netselect
```

networkctl

Query the status of network links.

Manage the network configuration using **`systemd-networkd`**.

More information: https://www.freedesktop.org/software/systemd/man/latest/networkctl.html.

- List existing links with their status:

```
networkctl
```

- Show an overall network status:

```
networkctl status
```

- Bring network devices up:

```
sudo networkctl up {{interface1 interface2 ...}}
```

- Bring network devices down:

```
sudo networkctl down {{interface1 interface2 ...}}
```

- Renew dynamic configurations (e.g. IP addresses received from a DHCP server):

```
sudo networkctl renew {{interface1 interface2 ...}}
```

- Reload configuration files (`.netdev` and `.network`):

```
sudo networkctl reload
```

- Reconfigure network interfaces (if you edited the config, you need to call `networkctl reload` first):

```
sudo networkctl reconfigure {{interface1 interface2 ...}}
```

newgrp

Switch primary group membership.

More information: https://manned.org/newgrp.

- Change user's primary group membership:

  `newgrp {{group_name}}`

- Reset primary group membership to user's default group in `/etc/passwd`:

  `newgrp`

newrole

Run a new shell with a different SELinux role.

Allows users to switch to a different SELinux security context.

See also: **`runcon`**, **`semanage user`**.

More information: https://manned.org/newrole.

- Start a new shell with a specific SELinux role:

```
newrole {{[-r|--role]}} {{role_name}}
```

- Start a new shell with a specific SELinux type:

```
newrole {{[-t|--type]}} {{type_name}}
```

- Start a new shell with a specific SELinux level (format: `s0-s0:c0.c1023` where levels range from `s0` to `s15`, `-` indicates level range, categories start with `c`, `:` separates level from categories, `.` indicates category range):

```
newrole {{[-l|--level]}} {{s0-s0:c0.c1023}}
```

- Display the current SELinux context:

```
id {{[-Z|--context]}}
```

- Start a new shell with both role and type:

```
newrole {{[-r|--role]}} {{role_name}} {{[-t|--type]}} {{type_name}}
```

nft monitor

Show real-time changes happening inside the Linux firewall **`nftables`**.

More information: https://manned.org/nft#head21.

- Monitor all nftables events:

```
sudo nft monitor
```

- Monitor only rule updates (add, delete, replace):

```
sudo nft monitor rules
```

- Monitor set and element updates:

```
sudo nft monitor sets
```

- Monitor events and print JSON output:

```
sudo nft {{[-j|--json]}} monitor
```

nft

Allow configuration of tables, chains, and rules provided by the Linux kernel firewall.

Nftables replaces iptables.

More information: https://wiki.nftables.org/wiki-nftables/index.php/Main_Page.

- View current configuration:

```
sudo nft list ruleset
```

- Add a new table with family "inet" and table "filter":

```
sudo nft add table {{inet}} {{filter}}
```

- Add a new chain to accept all inbound traffic:

```
sudo nft add chain {{inet}} {{filter}} {{input}} \{ type
{{filter}} hook {{input}} priority {{0}} \; policy {{accept}}
\; \}
```

- Add a new rule to accept several TCP ports:

```
sudo nft add rule {{inet}} {{filter}} {{input}} {{tcp}}
{{dport \{ telnet, ssh, http, https \} accept}}
```

- Add a NAT rule to translate all traffic from the `192.168.0.0/24` subnet to the host's public IP:

```
sudo nft add rule {{nat}} {{postrouting}} ip saddr
{{192.168.0.0/24}} {{masquerade}}
```

- Show rule handles:

```
sudo nft --handle --numeric list chain {{family}} {{table}}
{{chain}}
```

- Delete a rule:

```
sudo nft delete rule {{inet}} {{filter}} {{input}} handle
{{3}}
```

- Save current configuration:

```
sudo nft list ruleset > {{/etc/nftables.conf}}
```

niri

A scrollable-tiling Wayland compositor.

More information: https://github.com/YaLTeR/niri.

- List all outputs and their properties:

  ```
  niri msg outputs
  ```

- Turn off an output (monitor):

  ```
  niri msg output {{output_name}} off
  ```

- Focus the workspace below the current one:

  ```
  niri msg action focus-workspace-down
  ```

- Focus the workspace above the current one:

  ```
  niri msg action focus-workspace-up
  ```

- Move the current workspace down:

  ```
  niri msg action move-workspace-down
  ```

- Close the currently focused window:

  ```
  niri msg action close-window
  ```

- Focus a specific workspace by index:

  ```
  niri msg action focus-workspace {{workspace_index}}
  ```

nitch

A small and incredibly fast system fetch written fully in Nim.

More information: https://github.com/ssleert/nitch#usage-.

- Display system information (hostname, kernel, uptime, etc.):

```
nitch
```

- Display help:

```
nitch {{[-h|--help]}}
```

- Display version:

```
nitch {{[-v|--version]}}
```

nitrogen

Desktop background browser and setter for X Window.

More information: https://manned.org/nitrogen.

- View and set the wallpapers from a specific directory:

```
nitrogen {{path/to/directory}}
```

- Set the wallpaper with automatic size settings:

```
nitrogen --set-auto {{path/to/file}}
```

- Restore the previous wallpaper:

```
nitrogen --restore
```

nixos-container

Start NixOS containers using Linux containers.

More information: https://nixos.org/manual/nixos/stable/#ch-containers.

- List running containers:

```
sudo nixos-container list
```

- Create a NixOS container with a specific configuration file:

```
sudo nixos-container create {{container_name}} --config-file
{{path/to/nix_config_file}}
```

- Start, stop, terminate, or destroy a specific container:

```
sudo nixos-container {{start|stop|terminate|destroy|status}}
{{container_name}}
```

- Run a command in a running container:

```
sudo nixos-container run {{container_name}} -- {{command}}
{{command_arguments}}
```

- Update a container configuration:

```
sudo $EDITOR /var/lib/container/{{container_name}}/etc/nixos/
configuration.nix && sudo nixos-container update
{{container_name}}
```

- Enter an interactive shell session on an already-running container:

```
sudo nixos-container root-login {{container_name}}
```

nixos-option

Inspect a NixOS configuration.

More information: https://nixos.org/manual/nixos/stable/index.html#sec-modularity.

- List all subkeys of a given option key:

```
nixos-option {{option_key}}
```

- List current boot kernel modules:

```
nixos-option boot.kernelModules
```

- List authorized keys for a specific user:

```
nixos-option users.users.{{username}}.openssh.authorizedKeys.{{keyFiles|keys}}
```

- List all remote builders:

```
nixos-option nix.buildMachines
```

- List all subkeys of a given key on another NixOS configuration:

```
NIXOS_CONFIG={{path/to/configuration.nix}} nixos-option {{option_key}}
```

- Show recursively all values of a user:

```
nixos-option {{[-r|--recursive]}} users.users.{{user}}
```

nixos-rebuild

Reconfigure a NixOS machine.

More information: https://nixos.org/nixos/manual/#sec-changing-config.

- Build and switch to the new configuration, making it the boot default:

```
sudo nixos-rebuild switch
```

- Build and switch to the new configuration, making it the boot default and naming the boot entry:

```
sudo nixos-rebuild switch {{[-p|--profile-name]}} {{name}}
```

- Build and switch to the new configuration, making it the boot default and installing updates:

```
sudo nixos-rebuild switch --upgrade
```

- Roll back changes to the configuration, switching to the previous generation:

```
sudo nixos-rebuild switch --rollback
```

- Build the new configuration and make it the boot default without switching to it:

```
sudo nixos-rebuild boot
```

- Build and activate the new configuration, but don't make a boot entry (for testing purposes):

```
sudo nixos-rebuild test
```

- Build the configuration and open it in a virtual machine:

```
sudo nixos-rebuild build-vm
```

- List available generations similar to the boot loader menu:

```
nixos-rebuild list-generations
```

nl

Number lines from a file or from **`stdin`**.

More information: https://manned.org/nl.

- Number non-blank lines in a file:

```
nl {{path/to/file}}
```

- Read from `stdin`:

```
{{command}} | nl
```

- Number [a]ll body lines including blank lines or do [n]ot number body lines:

```
nl {{[-b|--body-numbering]}} {{a|n}} {{path/to/file}}
```

- Number only the body lines that match a basic `regex` (BRE) [p]attern:

```
nl {{[-b|--body-numbering]}} p'FooBar[0-9]' {{path/to/file}}
```

- Use a specific increment for line numbering:

```
nl {{[-i|--line-increment]}} {{increment}} {{path/to/file}}
```

- Specify the line numbering format to [r]ight or [l]eft justified, keeping leading [z]eros or [n]ot:

```
nl {{[-n|--number-format]}} {{rz|ln|rn}}
```

- Specify the line numbering's width (6 by default):

```
nl {{[-w|--number-width]}} {{col_width}} {{path/to/file}}
```

- Use a specific string to separate the line numbers from the lines (`TAB` by default):

```
nl {{[-s|--number-separator]}} {{separator}} {{path/to/file}}
```

nm-online

Ask NetworkManager whether the network is connected.

More information: https://networkmanager.pages.freedesktop.org/NetworkManager/NetworkManager/nm-online.html.

- Find out whether the network is connected and print the result to `stdout`:

```
nm-online
```

- Wait `n` seconds for a connection (30 by default):

```
nm-online {{[-t|--timeout]}} {{n}}
```

nmcli agent

Run **`nmcli`** as a NetworkManager secret agent or polkit agent.

More information: https://networkmanager.pages.freedesktop.org/NetworkManager/NetworkManager/nmcli.html#agent.

- Register `nmcli` as a secret agent and listen for secret requests:

```
nmcli {{[a|agent]}} {{[s|secret]}}
```

- Register `nmcli` as a polkit agent and listen for authorization requests:

```
nmcli {{[a|agent]}} {{[p|polkit]}}
```

- Register `nmcli` as a secret agent and a polkit agent:

```
nmcli {{[a|agent]}} {{[a|all]}}
```

nmcli connection

Manage connections with NetworkManager.

More information: https://networkmanager.pages.freedesktop.org/NetworkManager/NetworkManager/nmcli.html#connection.

- List all NetworkManager connections (shows name, UUID, type, and device):

```
nmcli {{[c|connection]}}
```

- Activate a connection:

```
nmcli {{[c|connection]}} {{[u|up]}} {{uuid}}
```

- Deactivate a connection:

```
nmcli {{[c|connection]}} {{[d|down]}} {{uuid}}
```

- Create an auto-configured dual stack connection:

```
nmcli {{[c|connection]}} {{[a|add]}} ifname
{{interface_name}} type {{ethernet}} ipv4.method {{auto}}
ipv6.method {{auto}}
```

- Create a static IPv6-only connection:

```
nmcli {{[c|connection]}} {{[a|add]}} ifname
{{interface_name}} type {{ethernet}} ip6 {{2001:db8::2/64}}
gw6 {{2001:db8::1}} ipv6.dns {{2001:db8::1}} ipv4.method
{{ignore}}
```

- Create a static IPv4-only connection:

```
nmcli {{[c|connection]}} {{[a|add]}} ifname
{{interface_name}} type {{ethernet}} ip4 {{10.0.0.7/8}} gw4
{{10.0.0.1}} ipv4.dns {{10.0.0.1}} ipv6.method {{ignore}}
```

- Create a VPN connection using OpenVPN from an OVPN file:

```
nmcli {{[c|connection]}} {{[i|import]}} type {{openvpn}} file
{{path/to/vpn_config.ovpn}}
```

nmcli device

Manage network interfaces and establish new Wi-Fi connections using NetworkManager.

More information: https://networkmanager.pages.freedesktop.org/NetworkManager/NetworkManager/nmcli.html#device.

- Print the statuses of all network interfaces:

```
nmcli {{[d|device]}}
```

- Print the available Wi-Fi access points:

```
nmcli {{[d|device]}} {{[w|wifi]}}
```

- Connect to a Wi-Fi network with the specified SSID (you will be prompted for a password):

```
nmcli {{[d|device]}} {{[w|wifi]}} {{[c|connect]}} {{ssid}} {{[-a|--ask]}}
```

- Create a Wi-Fi hotspot:

```
nmcli {{[d|device]}} {{[w|wifi]}} {{[ho|hotspot]}} ifname {{wlan0}} ssid "{{hotspot_ssid}}" password "{{password}}"
```

- Print the password and QR code for the current Wi-Fi network:

```
nmcli {{[d|device]}} {{[w|wifi]}} {{[s|show-password]}}
```

- Print detailed information about a device:

```
nmcli {{[d|device]}} {{[sh|show]}} {{wlan0}}
```

nmcli general

Manage general settings of NetworkManager.

More information: https://networkmanager.pages.freedesktop.org/NetworkManager/NetworkManager/nmcli.html#general.

- Show the general status of NetworkManager:

```
nmcli {{[g|general]}}
```

- Show the hostname of the current device:

```
nmcli {{[g|general]}} {{[h|hostname]}}
```

- Change the hostname of the current device:

```
sudo nmcli {{[g|general]}} {{[h|hostname]}} {{new_hostname}}
```

- Show the permissions of NetworkManager:

```
nmcli {{[g|general]}} {{[p|permissions]}}
```

- Show the current logging level and domains:

```
nmcli {{[g|general]}} {{[l|logging]}}
```

- Set the logging level and/or domains (see `man NetworkManager.conf` for all available domains):

```
sudo nmcli {{[g|general]}} {{[l|logging]}} {{[l|level]}}
{{INFO|OFF|ERR|WARN|DEBUG|TRACE}} domain
{{domain_1,domain_2,...}}
```

nmcli monitor

Monitor changes to the NetworkManager connection status.

More information: https://networkmanager.pages.freedesktop.org/NetworkManager/NetworkManager/nmcli.html#monitor.

- Start monitoring NetworkManager changes:

```
nmcli {{[m|monitor]}}
```

nmcli networking

Manage the networking status of NetworkManager.

More information: https://networkmanager.pages.freedesktop.org/NetworkManager/NetworkManager/nmcli.html#networking.

- Show the networking status of NetworkManager:

```
nmcli {{[n|networking]}}
```

- Enable or disable networking and all interfaces managed by NetworkManager:

```
nmcli {{[n|networking]}} {{on|off}}
```

- Show the last known connectivity state:

```
nmcli {{[n|networking]}} {{[c|connectivity]}}
```

- Show the current connectivity state:

```
nmcli {{[n|networking]}} {{[c|connectivity]}} {{[c|check]}}
```

nmcli radio

Show the status of radio switches or enable/disable them using NetworkManager.

More information: https://networkmanager.pages.freedesktop.org/NetworkManager/NetworkManager/nmcli.html#radio.

- Show status of Wi-Fi:

```
nmcli {{[r|radio]}} {{[w|wifi]}}
```

- Turn Wi-Fi on or off:

```
nmcli {{[r|radio]}} {{[w|wifi]}} {{on|off}}
```

- Show status of WWAN:

```
nmcli {{[r|radio]}} {{[ww|wwan]}}
```

- Turn WWAN on or off:

```
nmcli {{[r|radio]}} {{[ww|wwan]}} {{on|off}}
```

- Show status of both switches:

```
nmcli {{[r|radio]}}
```

- Turn both switches on or off:

```
nmcli {{[r|radio]}} {{[a|all]}} {{on|off}}
```

nmcli

Manage the network configuration using NetworkManager.

See also: **`nmtui`**, **`iw`**, **`iwctl`**.

More information: https://networkmanager.pages.freedesktop.org/NetworkManager/NetworkManager/nmcli.html.

- View documentation for managing network interfaces and establishing new Wi-Fi connections:

```
tldr nmcli device
```

- View documentation for managing network connections:

```
tldr nmcli connection
```

- View documentation for running `nmcli` as a NetworkManager secret/polkit agent:

```
tldr nmcli agent
```

- View documentation for managing general settings of NetworkManager:

```
tldr nmcli general
```

- View documentation for NetworkManager's activity monitor:

```
tldr nmcli monitor
```

- View documentation for enabling/disabling and checking the status of networking:

```
tldr nmcli networking
```

- View documentation for managing radio switches:

```
tldr nmcli radio
```

nmon

A system administrator, tuner, and benchmark tool.

More information: https://manned.org/nmon.

- Start `nmon`:

  ```
  nmon
  ```

- Save records to file ("-s 300 -c 288" by default):

  ```
  nmon -f
  ```

- Save records to file with a total of 240 measurements, by taking 30 seconds between each measurement:

  ```
  nmon -f -s {{30}} -c {{240}}
  ```

nmtui-connect

This command is an alias of **`nmtui connect`**.

- View documentation for the original command:

  ```
  tldr nmtui
  ```

nmtui-edit

This command is an alias of **`nmtui edit`**.

- View documentation for the original command:

  ```
  tldr nmtui
  ```

nmtui-hostname

This command is an alias of **`nmtui hostname`**.

- View documentation for the original command:

  ```
  tldr nmtui
  ```

nmtui

Text user interface for controlling NetworkManager.

Use **<ArrowKeys>** to navigate, **<Enter>** to select an option.

See also: **nmcli**.

More information: https://networkmanager.pages.freedesktop.org/NetworkManager/NetworkManager/nmtui.html.

- Open the user interface:

```
nmtui
```

- List available connections, with the option to activate or deactivate them:

```
nmtui connect
```

- Connect to a given network:

```
nmtui connect {{name|uuid|device|ssid}}
```

- Edit/Add/Delete a given network:

```
nmtui edit {{name|id}}
```

- Set the system hostname:

```
nmtui hostname
```

nologin

Alternative shell that prevents a user from logging in.

More information: https://manned.org/nologin.8.

- Set a user's login shell to `nologin` to prevent the user from logging in:

```
chsh {{[-s|--shell]}} {{user}} nologin
```

- Customize message for users with the login shell of `nologin`:

```
echo "{{declined_login_message}}" > /etc/nologin.txt
```

nordvpn

Command-line interface for NordVPN.

More information: https://support.nordvpn.com/hc/articles/20196094470929-Installing-NordVPN-on-Linux-distributions.

- Interactively log into a NordVPN account:

```
nordvpn login
```

- Display the connection status:

```
nordvpn status
```

- Connect to the nearest NordVPN server:

```
nordvpn {{[c|connect]}}
```

- List all available countries:

```
nordvpn countries
```

- Connect to a NordVPN server in a specific country:

```
nordvpn {{[c|connect]}} {{Germany}}
```

- Connect to a NordVPN server in a specific country and city:

```
nordvpn {{[c|connect]}} {{Germany}} {{Berlin}}
```

- Set autoconnect option:

```
nordvpn {{[s|set]}} autoconnect on
```

nova

The OpenStack project that provides a way to provision compute instances.

More information: https://docs.openstack.org/nova/latest/.

- List VMs on current tenant:

```
nova list
```

- List VMs of all tenants (admin user only):

```
nova list --all-tenants
```

- Boot a VM on a specific host:

```
nova boot --nic net-id={{net_id}} --image {{image_id}} --
flavor {{flavor}} --availability-zone nova:{{host_name}}
{{vm_name}}
```

- Start a server:

```
nova start {{server}}
```

- Stop a server:

```
nova stop {{server}}
```

- Attach a network interface to a specific VM:

```
nova interface-attach --net-id {{net_id}} {{server}}
```

nsenter

Run a new command in a running process' namespace.

Particularly useful for Docker images or chroot jails.

More information: https://manned.org/nsenter.

- Run a specific command using the same namespaces as an existing process:

```
nsenter {{[-t|--target]}} {{process_id}} {{[-a|--all]}} {{command}} {{command_arguments}}
```

- Run a specific command in an existing process's mount|UTS|IPC|network|PID|user|cgroup|time namespace:

```
nsenter {{[-t|--target]}} {{process_id}} --{{mount|uts|ipc|net|pid|user|cgroup}} {{command}} {{command_arguments}}
```

- Run a specific command in an existing process's UTS, time, and IPC namespaces:

```
nsenter {{[-t|--target]}} {{process_id}} {{[-u|--uts]}} {{[-T|--time]}} {{[-i|--ipc]}} -- {{command}} {{command_arguments}}
```

- Run a specific command in an existing process's namespace by referencing procfs:

```
nsenter {{[-p|--pid=]}}/proc/{{process_id}}/pid/net -- {{command}} {{command_arguments}}
```

nsnake

Snake game in the terminal.

More information: https://github.com/alexdantas/nsnake/#controls.

- Start a snake game:

  `nsnake`

- Navigate the snake:

  `{{<ArrowUp>|<ArrowDown>|<ArrowLeft>|<ArrowRight>}}`

- Pause/unpause the game:

  `<p>`

- Quit the game:

  `<q>`

- Display help during the game:

  `<h>`

nstat

View network statistics.

More information: https://manned.org/nstat.

- View network statistics since last time `nstat` was run:

  `nstat`

- View all-time network statistics:

  `nstat {{[-a|--ignore]}}`

- Display help:

  `nstat {{[-h|--help]}}`

nsxiv

Neo Simple X Image Viewer.

More information: https://nsxiv.codeberg.page/man/.

- Open images:

```
nsxiv {{path/to/file1 path/to/file2 ...}}
```

- Open images from directories in image mode:

```
nsxiv {{path/to/directory1 path/to/directory2 ...}}
```

- Search directories recursively for images to view:

```
nsxiv {{[-r|--recursive]}} {{path/to/directory1 path/to/
directory2 ...}}
```

- Quit nsxiv:

```
<q>
```

- Switch to thumbnail mode or open selected image in image mode:

```
<Enter>
```

- Count images forward in image mode:

```
<n>
```

- Count images backward in image mode:

```
<p>
```

ntfsfix

Fix common problems on an NTFS partition.

More information: https://manned.org/ntfsfix.

- Fix a given NTFS partition:

```
sudo ntfsfix {{/dev/sdXN}}
```

ntpd

The official NTP (Network Time Protocol) daemon to synchronize the system clock to remote time servers or local reference clocks.

More information: https://manned.org/ntpd.

- Start the daemon:

```
sudo ntpd
```

- Synchronize system time with remote servers a single time (quit after synchronizing):

```
sudo ntpd --quit
```

- Synchronize a single time allowing "Big" adjustments:

```
sudo ntpd --panicgate --quit
```

ntpdate

Synchronize and set the date and time via NTP.

More information: https://manned.org/ntpdate.

- Synchronize and set date and time:

```
sudo ntpdate {{host}}
```

- Query the host without setting the time:

```
ntpdate -q {{host}}
```

- Use an unprivileged port in case a firewall is blocking privileged ports:

```
sudo ntpdate -u {{host}}
```

- Force time to be stepped using `settimeofday` instead of `slewed`:

```
sudo ntpdate -b {{host}}
```

ntpq

Query the Network Time Protocol (NTP) daemon.

More information: https://manned.org/ntpq.

- Start `ntpq` in interactive mode:

```
ntpq
```

- Print a list of NTP peers:

```
ntpq {{[-p|--peers]}}
```

- Print a list of NTP peers without resolving hostnames from IP addresses:

```
ntpq {{[-n|--numeric]}} {{[-p|--peers]}}
```

- Use `ntpq` in debugging mode:

```
ntpq {{[-d|--debug-level]}}
```

- Print NTP system variables values:

```
ntpq {{[-c|--command]}} {{rv}}
```

numactl

Control NUMA policy for processes or shared memory.

More information: https://manned.org/numactl.

- Run a command on node 0 with memory allocated on node 0 and 1:

```
numactl --cpunodebind={{0}} --membind={{0,1}} -- {{command}}
{{command_arguments}}
```

- Run a command on CPUs (cores) 0-4 and 8-12 of the current cpuset:

```
numactl --physcpubind={{+0-4,8-12}} -- {{command}}
{{command_arguments}}
```

- Run a command with its memory interleaved on all CPUs:

```
numactl --interleave={{all}} -- {{command}}
{{command_arguments}}
```

numlockx

Control the number lock key status in X11 sessions.

More information: https://manned.org/numlockx.

- Show the current number lock status:

```
numlockx status
```

- Turn the number lock on:

```
numlockx on
```

- Turn the number lock off:

```
numlockx off
```

- Toggle the current state:

```
numlockx toggle
```

nvtop

Interactive ncurses-based GPU process and status viewer for AMD, Intel, and NVIDIA GPUs.

See also: **`amdgpu_top`**, **`radeontop`**.

More information: https://manned.org/nvtop.

- Launch the interactive GPU monitor:

```
nvtop
```

- Set the update delay in tenths of a second (for example, 2 = 0.2 seconds):

```
nvtop {{[-d|--delay]}} {{2}}
```

- Run in monochrome (no color) mode:

```
nvtop {{[-C|--no-color]}}
```

- Use Fahrenheit for temperature display:

```
nvtop {{[-f|--freedom-unit]}}
```

- Always show encoder/decoder meters, disabling auto-hide:

```
nvtop {{[-E|--encode-hide]}} -1
```

- Show a single combined bar plot instead of per-GPU plots:

```
nvtop {{[-p|--no-plot]}}
```

- Display version:

```
nvtop {{[-v|--version]}}
```

obabel

Translate chemistry-related data.

More information: https://open-babel.readthedocs.io/en/latest/Command-line_tools/babel.html.

- Convert a `.mol` file to XYZ coordinates:

```
obabel {{path/to/file.mol}} -O {{path/to/output_file.xyz}}
```

- Convert a Simplified Molecular Input Line Entry System string to a 500x500 picture:

```
obabel -:"{{smiles_string}}" -O {{path/to/output_file.png}} -xp 500
```

- Convert a file of SMILES string to separate 3D `.mol` files:

```
obabel {{path/to/file.smi}} -O {{path/to/output_file.mol}} --gen3D -m
```

- Render multiple inputs into one picture:

```
obabel {{path/to/file1 path/to/file2 ...}} -O {{path/to/output_file.png}}
```

objcopy

Copy the contents of an object file to another file.

More information: https://manned.org/objcopy.

- Copy data to another file:

```
objcopy {{path/to/source_file}} {{path/to/target_file}}
```

- Translate object files from one format to another:

```
objcopy --input-target={{input_format}} --output-target
{{output_format}} {{path/to/source_file}} {{path/to/
target_file}}
```

- Strip all symbol information from the file:

```
objcopy --strip-all {{path/to/source_file}} {{path/to/
target_file}}
```

- Strip debugging information from the file:

```
objcopy --strip-debug {{path/to/source_file}} {{path/to/
target_file}}
```

- Copy a specific section from the source file to the destination file:

```
objcopy --only-section {{section}} {{path/to/source_file}}
{{path/to/target_file}}
```

oma

A package management frontend for dpkg-based Linux distributions.

More information: https://github.com/AOSC-Dev/oma#usage.

- Enter the interactive package management interface:

```
sudo oma
```

- Install a package:

```
sudo oma install {{package_name}}
```

- Remove a package:

```
sudo oma remove {{package_name}}
```

- Search for a package:

```
oma search {{keyword}}
```

- Show detailed information for a package:

```
oma show
```

- Upgrade all installed packages to their latest versions:

```
sudo oma upgrade
```

- Update the list of available packages and versions (done automatically before `oma install` and `oma upgrade`):

```
sudo oma refresh
```

- Display help:

```
oma help
```

oniux

Isolate an arbitrary application and route traffic over the Tor network.

Note: This is experimental software.

More information: https://gitlab.torproject.org/tpo/core/oniux.

- Isolate an application:

  ```
  oniux {{command}}
  ```

- Query a website:

  ```
  oniux curl {{https://example.com}}
  ```

- Query an onion site:

  ```
  oniux curl {{http://example.onion}}
  ```

- Run an entire shell in "torified" isolation:

  ```
  oniux bash
  ```

- Isolate graphical applications in desktop environments:

  ```
  oniux hexchat
  ```

oomctl

Analyze the state stored in **`systemd-oomd`**.

More information: https://www.freedesktop.org/software/systemd/man/latest/oomctl.html.

- Show the current state of the cgroups and system contexts stored by `systemd-oomd`:

```
oomctl
```

openfortivpn

A VPN client, for Fortinet's proprietary PPP+SSL VPN solution.

More information: https://manned.org/openfortivpn.

- Connect to a VPN with a username and password:

```
openfortivpn {{[-u|--username]}} {{username}} {{[-p|--password]}} {{password}}
```

- Connect to a VPN using a specific configuration file (defaults to `/etc/openfortivpn/config`):

```
sudo openfortivpn {{[-c|--config]}} {{path/to/config}}
```

- Connect to a VPN by specifying the host and port:

```
openfortivpn {{host}}:{{port}}
```

- Trust a given gateway by passing in its certificate's sha256 sum:

```
openfortivpn --trusted-cert {{sha256_sum}}
```

openrc

The OpenRC service manager.

See also: **`rc-status`**, **`rc-update`**, **`rc-service`**.

More information: https://wiki.gentoo.org/wiki/OpenRC.

- Change to a specific runlevel:

```
sudo openrc {{runlevel_name}}
```

- Change to a specific runlevel, but don't stop any existing services:

```
sudo openrc {{[-n|--no-stop]}} {{runlevel_name}}
```

openvpn3

OpenVPN 3 Linux client.

More information: https://community.openvpn.net/openvpn/wiki/OpenVPN3Linux.

- Start a new VPN session:

```
openvpn3 session-start {{[-c|--config]}} {{path/to/
config.conf}}
```

- List established sessions:

```
openvpn3 sessions-list
```

- Disconnect the currently established session started with given configuration:

```
openvpn3 session-manage {{[-c|--config]}} {{path/to/
config.conf}} {{[-D|--disconnect]}}
```

- Import VPN configuration:

```
openvpn3 config-import {{[-c|--config]}} {{path/to/
config.conf}}
```

- List imported configurations:

```
openvpn3 configs-list
```

opera-stable

This command is an alias of **`chromium`**.

More information: https://www.opera.com/.

- View documentation for the original command:

```
tldr chromium
```

opi

Search and install packages from openSUSE, community, and proprietary repositories.

More information: https://manpages.opensuse.org/Tumbleweed/opi/opi.8.en.html.

- Search for a package:

```
opi {{package}}
```

- Install media codecs:

```
opi codecs
```

- Search for a package without running scripts:

```
opi -P {{package}}
```

- Search for a package in non-interactive mode:

```
sudo opi -n {{package}}
```

- Search for multiple packages:

```
opi -m {{package1 package2 ...}}
```

opkg

A lightweight package manager used to install OpenWrt packages.

More information: https://openwrt.org/docs/guide-user/additional-software/opkg.

- Install a package:

```
opkg install {{package}}
```

- Remove a package:

```
opkg remove {{package}}
```

- Update the list of available packages:

```
opkg update
```

- Upgrade one or more specific package(s):

```
opkg upgrade {{package1 package2 ...}}
```

- Display information for a specific package:

```
opkg info {{package}}
```

- List all the available packages:

```
opkg list
```

- Find out which package owns a file:

```
opkg search /{{path/to/file}}
```

- List all files belonging to a package:

```
opkg files {{package}}
```

optimus-manager

GPU switching utility for Nvidia Optimus laptops.

More information: https://github.com/Askannz/optimus-manager.

- Switch between different GPU modes:

```
optimus-manager --switch {{nvidia|integrated|hybrid}}
```

- Clean up:

```
optimus-manager --cleanup
```

ostree

Version control for binary files similar to **`git`** but optimized for operating system root filesystems.

Foundation for immutable image-based operating systems such as Fedora Silverblue, Fedora IoT, or Fedora CoreOS.

More information: https://ostreedev.github.io/ostree/.

- Initialize a repository of the files in `$PWD` with metadata in `$PWD/path/to/repo`:

```
ostree init --repo {{path/to/repo}}
```

- Create a commit (snapshot) of the files:

```
ostree commit --repo {{path/to/repo}} --branch {{branch_name}}
```

- Show files in commit:

```
ostree ls --repo {{path/to/repo}} {{commit_id}}
```

- Show metadata of commit:

```
ostree show --repo {{path/to/repo}} {{commit_id}}
```

- Show list of commits:

```
ostree log --repo {{path/to/repo}} {{branch_name}}
```

- Show repo summary:

```
ostree summary --repo {{path/to/repo}} --view
```

- Show available refs (branches):

```
ostree refs --repo {{path/to/repo}}
```

owut

OpenWrt Upgrade Tool for automating builds and installs via Attended SysUpgrade (ASU).

More information: https://openwrt.org/docs/guide-user/installation/sysupgrade.owut.

- List available OpenWrt versions for the current device:

```
owut versions
```

- List user installed or removed packages:

```
owut list
```

- Check for updates without performing an upgrade:

```
owut check
```

- Automatically build, download, verify, and install the latest available firmware:

```
owut upgrade
```

- Upgrade to a specific version and include additional packages:

```
owut upgrade {{[-V|--version-to]}} {{version}} {{[-a|--add]}} "{{htop vim}}"
```

- Download and verify a specific image without installing it:

```
owut download {{[-V|--version-to]}} {{25.12.0}}
```

- Verify the latest downloaded image and install it (device will reboot):

```
owut install
```

pacaur

A utility for Arch Linux to build and install packages from the Arch User Repository.

More information: https://github.com/rmarquis/pacaur#name.

- Synchronize and update all packages (includes AUR):

```
pacaur -Syu
```

- Synchronize and update only AUR packages:

```
pacaur -Syua
```

- Install a new package (includes AUR):

```
pacaur -S {{package}}
```

- Remove a package and its dependencies (includes AUR packages):

```
pacaur -Rs {{package}}
```

- Search the package database for a keyword (includes AUR):

```
pacaur -Ss {{keyword}}
```

- List all currently installed packages (includes AUR packages):

```
pacaur -Qs
```

paccache

A **pacman** cache cleaning utility.

More information: https://manned.org/paccache.

- Remove all but the 3 most recent package versions from the pacman cache:

```
paccache {{[-r|--remove]}}
```

- Set the number of package versions to keep:

```
paccache {{[-rk|--remove --keep]}} {{num_versions}}
```

- Simulate the cleaning and show the number of candidate packages for deletion:

```
paccache {{[-d|--dryrun]}}
```

- Move candidate packages to a directory instead of deleting them:

```
paccache {{[-m|--move]}} {{path/to/directory}}
```

paccapability

Query and display the capabilities supported by libalpm.

More information: https://github.com/andrewgregory/pacutils/blob/master/doc/paccapability.pod.

- List all available capabilities:

```
paccapability
```

- Check for the specified capability:

```
paccapability {{nls|downloader|signatures}}
```

- Display help:

```
paccapability --help
```

- Display version:

```
paccapability --version
```

paccheck

Check installed packages on an Arch-based system to verify dependencies, integrity, and consistency.

More information: https://github.com/andrewgregory/pacutils/blob/master/doc/paccheck.pod.

- List and check all installed packages:

```
paccheck
```

- Check the specified packages:

```
paccheck {{package1 package2 ...}}
```

- Only display messages if a problem is found:

```
paccheck --quiet
```

- Check that all package dependencies are satisfied:

```
paccheck --depends
```

- Display help:

```
paccheck --help
```

- Display version:

```
paccheck --version
```

pacconf

Query and display pacman's configuration options, showing either the full configuration or specific directive values as parsed by pacman.

More information: https://github.com/andrewgregory/pacutils/blob/master/doc/pacconf.pod.

- Show full parsed pacman configuration:

```
pacconf
```

- List configured repositories:

```
pacconf --repo-list
```

- Always show directive names even if only one directive is provided:

```
pacconf --verbose {{directive}}
```

- Display only first value of multi-value options:

```
pacconf --single
```

- Display help:

```
pacconf --help
```

- Display version:

```
pacconf --version
```

pacdiff

Maintenance utility for **`.pacorig`**, **`.pacnew`**, and **`.pacsave`** files created by **`pacman`**.

More information: https://manned.org/pacdiff.

- Review files that need maintenance in interactive mode:

```
pacdiff
```

- Use sudo and sudoedit to remove and merge files:

```
pacdiff {{[-s|--sudo]}}
```

- Review files needing maintenance, creating `.bak`ups of the original if you `(O)verwrite`:

```
pacdiff {{[-s|--sudo]}} {{[-b|--backup]}}
```

- Use a specific editor to view and merge configuration files (default is `vim -d`):

```
DIFFPROG={{editor}} pacdiff
```

- Scan for configuration files with `locate` instead of using `pacman` database:

```
pacdiff {{[-l|--locate]}}
```

- Display help:

```
pacdiff {{[-h|--help]}}
```

pacfile

Display information about package files, including repository data, filesystem checks, and database comparisons.

More information: https://github.com/andrewgregory/pacutils/blob/master/doc/pacfile.pod.

- List all available packages:

```
pacfile {{path/to/file_or_directory}}
```

- Compare database values to the filesystem:

```
pacfile {{path/to/file_or_directory}} --check
```

- Display help:

```
pacfile --help
```

- Display version:

```
pacfile --version
```

pacgraph

Draw a graph of installed packages to PNG/SVG/GUI/console.

More information: https://manned.org/pacgraph.

- Produce an SVG and PNG graph:

```
pacgraph
```

- Produce an SVG graph:

```
pacgraph {{[-s|--svg]}}
```

- Print summary to console:

```
pacgraph {{[-c|--console]}}
```

- Override the default filename/location (Note: Do not specify the file extension):

```
pacgraph {{[-f|--file]}} {{path/to/file}}
```

- Change the color of packages that are not dependencies:

```
pacgraph {{[-t|--top]}} {{color}}
```

- Change the color of package dependencies:

```
pacgraph {{[-d|--dep]}} {{color}}
```

- Change the background color of a graph:

```
pacgraph {{[-b|--background]}} {{color}}
```

- Change the color of links between packages:

```
pacgraph {{[-l|--link]}} {{color}}
```

pacinfo

Display information about installed packages.

More information: https://github.com/andrewgregory/pacutils/blob/master/doc/pacinfo.pod.

- Display information about a specific package:

```
pacinfo {{package_name}}
```

- Disable low-speed timeouts for downloads:

```
pacinfo --no-timeout {{package_name}}
```

- Display sizes in bytes and date values as Unix timestamps:

```
pacinfo --raw {{package_name}}
```

- Display additional package information:

```
pacinfo --verbose {{package_name}}
```

- Display help:

```
pacinfo --help
```

- Display version:

```
pacinfo --version
```

pacini

Query pacman-style configuration files.

More information: https://github.com/andrewgregory/pacutils/blob/master/doc/pacini.pod.

- Show the full parsed configuration file (default: `stdin`):

```
pacini {{path/to/file}}
```

- List configured sections:

```
pacini {{path/to/file}} --section-list
```

- Always show directive names even if only one directive is provided:

```
pacini {{path/to/file}} --verbose
```

- Display directives listed in a specific section:

```
pacini {{path/to/file}} --section {{section_name}}
```

- Display help:

```
pacini --help
```

- Display version:

```
pacini --version
```

pacinstall

This command is an alias of **`pactrans --install`**.

- View documentation for the original command:

  `tldr pactrans`

paclock

Lock/unlock the libalpm database (used by **pacman**) to prevent or allow simultaneous package management operations.

More information: https://github.com/andrewgregory/pacutils/blob/master/doc/paclock.pod.

- Lock the database:

```
sudo paclock
```

- Write the lock file path to `stdout` (without locking the database):

```
paclock --print
```

- Unlock the database:

```
sudo paclock --unlock
```

- Display help:

```
paclock --help
```

- Display version:

```
paclock --version
```

paclog

Filter pacman log entries.

More information: https://github.com/andrewgregory/pacutils/blob/master/doc/paclog.pod.

- Display the entire pacman log:

```
paclog
```

- Display pacman-style logged commandline entries:

```
paclog --commandline
```

- Display log events for a specific package:

```
paclog --package {{package_name}}
```

- Display package actions of a specific type:

```
paclog --action {{install|reinstall|upgrade|downgrade|remove|all}}
```

- Display only errors, warnings, and notes:

```
paclog --warnings
```

- Display the list of installed packages according to the log:

```
paclog --pkglist
```

- Display help:

```
paclog --help
```

- Display version:

```
paclog --version
```

pacman -D

This command is an alias of **`pacman --database`**.

- View documentation for the original command:

  ```
  tldr pacman database
  ```

pacman --database

Operate on the Arch Linux package database.

Modify certain attributes of the installed packages.

More information: https://manned.org/pacman.8.

- Mark a package as implicitly installed:

```
sudo pacman -D --asdeps {{package}}
```

- Mark a package as explicitly installed:

```
sudo pacman -D --asexplicit {{package}}
```

- Chec[k] that all the package dependencies are installed:

```
pacman -Dk
```

- Chec[k] the sync [D]atabase to ensure all specified dependencies of downloadable packages are available:

```
pacman -Dkk
```

- Chec[k] and display in [q]uiet mode (only error messages are displayed):

```
pacman -Dkq
```

- Display [h]elp:

```
pacman -Dh
```

pacman --deptest

Check each dependency specified and return a list of dependencies that are not currently satisfied on the system.

More information: https://manned.org/pacman.8.

- Print the package names of the dependencies that are not installed:

```
pacman -T {{package1 package2 ...}}
```

- Check if the installed package satisfies the given minimum version:

```
pacman -T "{{bash>=5}}"
```

- Check if a later version of a package is installed:

```
pacman -T "{{bash>5}}"
```

- Display [h]elp:

```
pacman -Th
```

pacman -F

This command is an alias of **`pacman --files`**.

- View documentation for the original command:

  ```
  tldr pacman files
  ```

pacman --files

Query the local files database.

See also: **`pkgfile`**.

More information: https://manned.org/pacman.8.

- Update the package database:

```
sudo pacman -Fy
```

- Find the package that owns a specific [F]ile:

```
pacman -F {{filename}}
```

- Find the package that owns a specific [F]ile, using a `rege[x]`:

```
pacman -Fx '{{regex}}'
```

- List only the package names:

```
pacman -Fq {{filename}}
```

- [l]ist the [F]iles owned by a specific package:

```
pacman -Fl {{package}}
```

- Display [h]elp:

```
pacman -Fh
```

pacman-key

Wrapper script for GnuPG used to manage pacman's keyring.

See also: **pacman**.

More information: https://manned.org/pacman-key.

- Initialize the pacman keyring:

```
sudo pacman-key --init
```

- Add the default Arch Linux keys:

```
sudo pacman-key --populate
```

- List keys from the public keyring:

```
pacman-key {{[-l|--list-keys]}}
```

- Add the specified keys:

```
sudo pacman-key {{[-a|--add]}} {{path/to/keyfile.gpg}}
```

- Receive a key from a key server:

```
sudo pacman-key {{[-r|--recv-keys]}} "{{uid|name|email}}"
```

- Print the fingerprint of a specific key:

```
pacman-key {{[-f|--finger]}} "{{uid|name|email}}"
```

- Sign an imported key locally:

```
sudo pacman-key --lsign-key "{{uid|name|email}}"
```

- Remove a specific key:

```
sudo pacman-key {{[-d|--delete]}} "{{uid|name|email}}"
```

pacman-mirrors

Generate a **pacman** mirrorlist for Manjaro Linux.

Every run of **pacman-mirrors** requires you to synchronize your database and update your system using **sudo pacman -Syyu**.

See also: **pacman**.

More information: https://wiki.manjaro.org/index.php?title=Pacman-mirrors.

- Generate a mirrorlist using the default settings:

```
sudo pacman-mirrors --fasttrack
```

- Get the status of the current mirrors:

```
pacman-mirrors --status
```

- Display the current branch:

```
pacman-mirrors --get-branch
```

- Switch to a different branch:

```
sudo pacman-mirrors --api --set-branch {{stable|unstable|
testing}}
```

- List available countries:

```
pacman-mirrors --country-list
```

- Generate a mirrorlist using only mirrors in specific countries:

```
sudo pacman-mirrors --country
{{United_States,France,Germany,...}}
```

pacman -Q

This command is an alias of **`pacman --query`**.

- View documentation for the original command:

  ```
  tldr pacman query
  ```

pacman --query

Query the local package database.

More information: https://manned.org/pacman.8.

- [Q]uery the local package database and list installed packages and versions:

```
pacman -Q
```

- List only packages that were [e]xplicitly installed without version numbers:

```
pacman -Qeq
```

- Find which package [o]wns a file:

```
pacman -Qo {{filename}}
```

- Display information about an [i]nstalled package:

```
pacman -Qi {{package}}
```

- Display the [l]ist of files owned by a specific package:

```
pacman -Ql {{package}}
```

- List orphan packages (installed as [d]ependencies but unrequired ([t]) by any package and print in [q]uiet mode (only package name is displayed)):

```
pacman -Qdtq
```

- List installed packages foreign ([m]) to the repository database:

```
pacman -Qm
```

- List packages that can be [u]pgraded:

```
pacman -Qu
```

pacman -R

This command is an alias of **`pacman --remove`**.

- View documentation for the original command:

  ```
  tldr pacman remove
  ```

pacman --remove

Remove packages from the system.

More information: https://manned.org/pacman.8.

- [R]emove a package and its dependencies recur[s]ively:

```
sudo pacman -Rs {{package}}
```

- [R]emove a package and its dependencies. Also do [n]ot save backups of configuration files:

```
sudo pacman -Rsn {{package}}
```

- [R]emove a package without prompting:

```
sudo pacman -R --noconfirm {{package}}
```

- [R]emove orphan packages (installed as [d]ependencies but no[t] required by any package):

```
sudo pacman -Rsn $(pacman -Qdtq)
```

- [R]emove a package and [c]ascade that to all packages that depend on it:

```
sudo pacman -Rc {{package}}
```

- List and [p]rint packages that would be affected (does not [R]emove any packages):

```
pacman -Rp {{package}}
```

- Display [h]elp:

```
pacman -Rh
```

pacman -S

This command is an alias of **`pacman --sync`**.

- View documentation for the original command:

  ```
  tldr pacman sync
  ```

pacman --sync

Synchronize packages from remote repositories.

More information: https://manned.org/pacman.8.

- Install a new package:

```
sudo pacman -S {{package}}
```

- [S]ynchronize and refresh ([y]) the package database along with a sys[u]pgrade (add `--downloadonly` to only download the packages and not update them):

```
sudo pacman -Syu
```

- Update and [u]pgrade all packages and install a new one without prompting:

```
sudo pacman -Syu --noconfirm {{package}}
```

- [s]earch the package database for a `regex` or keyword:

```
pacman -Ss "{{search_pattern}}"
```

- Display [i]nformation about a package:

```
pacman -Si {{package}}
```

- Overwrite conflicting files during a package update:

```
sudo pacman -Syu --overwrite {{path/to/file}}
```

- Remove not installed packages and unused repositories from the cache (use the flags `Scc` to [c]lean all packages):

```
sudo pacman -Sc
```

- Specify the package version that should be installed:

```
sudo pacman -S {{package}}={{version}}
```

pacman -T

This command is an alias of **`pacman --deptest`**.

- View documentation for the original command:

  ```
  tldr pacman deptest
  ```

pacman -U

This command is an alias of **`pacman --upgrade`**.

- View documentation for the original command:

```
tldr pacman upgrade
```

pacman --upgrade

Install packages manually from archive files.

More information: https://manned.org/pacman.8.

- Install one or more packages from files:

```
sudo pacman -U {{path/to/package1.pkg.tar.zst path/to/package2.pkg.tar.zst ...}}
```

- Install a package without prompting:

```
sudo pacman -U --noconfirm {{path/to/package.pkg.tar.zst}}
```

- Overwrite conflicting files during a package installation:

```
sudo pacman -U --overwrite {{path/to/file}} {{path/to/package.pkg.tar.zst}}
```

- Install a package, skipping the [d]ependency version checks:

```
sudo pacman -Ud {{path/to/package.pkg.tar.zst}}
```

- Fetch and [p]rint packages that would be affected by upgrade (does not install any packages):

```
pacman -Up {{path/to/package.pkg.tar.zst}}
```

- Display [h]elp:

```
pacman -Uh
```

pacman

Arch Linux package manager utility.

For equivalent commands in other package managers, see https://wiki.archlinux.org/title/Pacman/Rosetta.

See also: **`pacman-sync`**, **`pacman-remove`**, **`pacman-query`**, **`pacman-upgrade`**, **`pacman-files`**, **`pacman-database`**, **`pacman-deptest`**, **`pacman-key`**, **`pacman-mirrors`**.

More information: https://manned.org/pacman.8.

- [S]ynchronize and update all packages:

```
sudo pacman -Syu
```

- Install a new package:

```
sudo pacman -S {{package}}
```

- [R]emove a package and its dependencies:

```
sudo pacman -Rs {{package}}
```

- Search ([s]) the package database for a `regex` or keyword:

```
pacman -Ss "{{search_pattern}}"
```

- Search the database for packages containing a specific [F]ile:

```
pacman -F "{{file_name}}"
```

- List only the [e]xplicitly installed packages and versions:

```
pacman -Qe
```

- List orphan packages (installed as [d]ependencies but not actually required by any package):

```
pacman -Qtdq
```

- Empty the entire `pacman` cache:

```
sudo pacman -Scc
```

pacman4console

A text-based console game inspired by the original Pacman.

More information: https://github.com/YoctoForBeaglebone/pacman4console.

- Start a game at Level 1:

```
pacman4console
```

- Start a game on a certain level (there are nine official levels):

```
pacman4console --level={{level_number}}
```

- Start the pacman4console level editor, saving to a specified text file:

```
pacman4consoleedit {{path/to/level_file}}
```

- Play a custom level:

```
pacman4console --level={{path/to/level_file}}
```

pacremove

This command is an alias of **`pactrans --remove`**.

- View documentation for the original command:

  `tldr pactrans`

pacrepairdb

Fix corrupted database entries in libalpm database.

More information: https://github.com/andrewgregory/pacutils/blob/master/doc/pacrepairdb.pod.

- Perform a basic repair on a specific package:

```
pacrepairdb {{package_name}}
```

- Update the database entries without extracting or removing any packages:

```
pacrepairdb {{package_name}} --dbonly
```

- Display the packages to be repaired and the cache packages to be used without making any changes:

```
pacrepairdb {{package_name}} --print-only
```

- Display additional progress and debug information:

```
pacrepairdb {{package_name}} --verbose
```

- Display help:

```
pacrepairdb --help
```

- Display version:

```
pacrepairdb --version
```

pacrepairfile

Reset properties on files managed by alpm.

More information: https://github.com/andrewgregory/pacutils/blob/master/doc/pacrepairfile.pod.

- Search for the package and reset the properties of a file:

```
pacrepairfile {{path/to/file}} --package
```

- Reset a file quietly:

```
pacrepairfile {{package_name}} --quiet --package
```

- Reset specific file properties (mode, owner UID, group GID, or modification time):

```
pacrepairfile {{package_name}} --{{mode|gid|mtime|uid}} --package
```

- Display help:

```
pacrepairfile --help
```

- Display version:

```
pacrepairfile --version
```

pacreport

Generate a report of installed packages.

More information: https://github.com/andrewgregory/pacutils/blob/master/doc/pacreport.pod.

- Generate a summary of installed packages:

```
pacreport
```

- List unowned files:

```
pacreport --unowned-files
```

- List missing package files:

```
pacreport --missing-files
```

- Search for unmerged backup files (i.e. `.pacnew`, `.pacsave`) in `/etc`:

```
pacreport --backups
```

- Display packages in a specific group that are not currently installed:

```
pacreport --group {{group_name}}
```

pacsift

Query and filter packages.

More information: https://github.com/andrewgregory/pacutils/blob/master/doc/pacsift.pod.

- List all available packages:

```
pacsift
```

- Filter packages that provide a given package:

```
pacsift --satisfies {{package}}
```

pacstall

An AUR package manager for Ubuntu.

More information: https://github.com/pacstall/pacstall.

- Search the package database for a package name:

```
pacstall {{[-S|--search]}} {{query}}
```

- Install a package:

```
pacstall {{[-I|--install]}} {{package}}
```

- Remove a package:

```
pacstall {{[-R|--remove]}} {{package}}
```

- Add a repository to the database (only GitHub and GitLab are supported):

```
pacstall {{[-A|--add-repo]}} {{remote_repository_location}}
```

- Update pacstall's scripts:

```
pacstall {{[-U|--update]}}
```

- Update all packages:

```
pacstall {{[-Up|--upgrade]}}
```

- Display information about a package:

```
pacstall {{[-Ci|--cache-info]}} {{package}}
```

- List all installed packages:

```
pacstall {{[-L|--list]}}
```

pacstrap

Install Arch Linux packages in the specified new root directory.

More information: https://manned.org/pacstrap.

- Install the `base` package, the Linux kernel, and firmware for common hardware:

```
pacstrap {{path/to/new_root}} {{base}} {{linux}} {{linux-firmware}}
```

- Install the `base` package, the Linux LTS kernel, and `base-devel` build tools:

```
pacstrap {{path/to/new_root}} {{base}} {{base-devel}} {{linux-lts}}
```

- Install packages and copy the host's Pacman config to the target:

```
pacstrap -P {{path/to/new_root}} {{packages}}
```

- Install packages without copying the host's mirrorlist to the target:

```
pacstrap -M {{path/to/new_root}} {{packages}}
```

- Use an alternate configuration file for Pacman:

```
pacstrap -C {{path/to/pacman.conf}} {{path/to/new_root}} {{packages}}
```

- Install packages using the package cache on the host instead of on the target:

```
pacstrap -c {{path/to/new_root}} {{packages}}
```

- Initialize an empty `pacman` keyring in the target without copying it from the host:

```
pacstrap -K {{path/to/new_root}} {{packages}}
```

- Install packages in interactive mode (prompts for confirmation):

```
pacstrap -i {{path/to/new_root}} {{packages}}
```

pacsync

Update sync databases.

More information: https://github.com/andrewgregory/pacutils/blob/master/doc/pacsync.pod.

- Update all sync databases:

```
sudo pacsync
```

- Update specific sync databases:

```
sudo pacsync {{repository1 repository2 ...}}
```

- Update sync databases even if they are already up-to-date:

```
sudo pacsync --force
```

- Update sync databases using a specific configuration file:

```
sudo pacsync --config {{path/to/pacman.conf}}
```

- Update sync databases and return true only if a database was actually updated:

```
sudo pacsync --updated
```

pactrans

Install, remove, and upgrade ALPM packages.

See also: **`pacinstall`**, **`pacremove`**.

More information: https://github.com/andrewgregory/pacutils/blob/master/doc/pactrans.pod.

- Install a package from a repository:

```
sudo pactrans --install {{package_name}}
```

- Remove a package:

```
sudo pactrans --remove {{package_name}}
```

- Upgrade all installed packages:

```
sudo pactrans --sysupgrade
```

- Install a package file:

```
sudo pactrans --file {{path/to/package.pkg.tar.zst}}
```

- Replace a locally installed package with a package from a repository:

```
sudo pactrans local/{{package_to_remove}}
{{repository_name}}/{{package_to_install}}
```

- Print what the transaction would do without performing it:

```
pactrans --print-only --install {{package_name}}
```

pactree

Package dependency tree viewer for pacman.

More information: https://manned.org/pactree.

- Print the dependency tree of a specific package:

```
pactree {{package}}
```

- Print what packages depend on a specific package:

```
pactree {{[-r|--reverse]}} {{package}}
```

- Dump dependencies one per line, skipping duplicates:

```
pactree {{[-u|--unique]}} {{package}}
```

- Include optional dependencies of a specific package and colorize the output:

```
pactree {{[-co|--color --optional]}} {{package}}
```

- Display help:

```
pactree
```

Palworld

Create and start a headless Palworld server.

More information: https://docs.palworldgame.com/settings-and-operation/arguments/.

- Start the server with default settings:

```
{{path/to}}/PalServer.sh
```

- Start the server with a specific port and set a maximum player count:

```
{{path/to}}/PalServer.sh -port={{8211}} -players={{1..32}}
```

- Start a public lobby server:

```
{{path/to}}/PalServer.sh -publiclobby
```

- Start the server with performance optimizations for multi-threaded CPUs:

```
{{path/to}}/PalServer.sh -useperfthreads -
NoAsyncLoadingThread -UseMultithreadForDS
```

- Start the server with a specific public IP and port for community servers:

```
{{path/to}}/PalServer.sh -publicip={{ip_address}} -
publicport={{port}}
```

pamac

Utility for the GUI package manager pamac.

If you can't see the AUR packages, enable it in **`/etc/pamac.conf`** or in the GUI.

More information: https://wiki.manjaro.org/index.php/Pamac.

- Install a new package:

  `pamac install {{package_name}}`

- Remove a package and its no longer required dependencies (orphans):

  `pamac remove --orphans {{package_name}}`

- Search the package database for a package:

  `pamac search {{package_name}}`

- List installed packages:

  `pamac list --installed`

- Check for package updates:

  `pamac checkupdates`

- Upgrade all packages:

  `pamac upgrade`

partclone

Copy and restore partitions to and from an image while disregarding empty blocks.

More information: https://manned.org/partclone.

- Copy a partition into an image:

```
sudo partclone.{{ext4|btrfs|fat32|xfs|...}} {{[-c|--clone]}} {{[-s|--source]}} {{/dev/sdXY}} {{[-o|--output]}} {{path/to/backup.img}}
```

- Restore a partition from an image:

```
sudo partclone.{{ext4|btrfs|fat32|xfs|...}} {{[-c|--clone]}} {{[-s|--source]}} {{path/to/backup.img}} {{[-o|--output]}} {{/dev/sdXY}}
```

- Display help:

```
partclone.{{ext4|btrfs|fat32|xfs|...}} {{[-h|--help]}}
```

parted

A partition manipulation program.

See also: **partprobe**.

More information: https://www.gnu.org/software/parted/parted.html.

- Start interactive mode with the specified disk selected:

```
sudo parted {{/dev/sdX}}
```

- [Interactive] Show partition information in interactive mode:

```
print
```

- [Interactive] Select a disk in interactive mode:

```
select {{/dev/sdX}}
```

- [Interactive] Create a 16 GB partition with the specified filesystem in interactive mode (GPT partition table):

```
mkpart {{partition_name}} {{btrfs|ext2|ext3|ext4|fat16|fat32|
hfs|hfs+|linux-swap|ntfs|reiserfs|udf|xfs}} {{0%}} {{16G}}
```

- [Interactive] Create a 16 GB partition with the specified filesystem in interactive mode (MBR partition table):

```
mkpart {{primary|logical|extended}} {{btrfs|ext2|ext3|ext4|
fat16|fat32|hfs|hfs+|linux-swap|ntfs|reiserfs|udf|xfs}}
{{0%}} {{16G}}
```

- [Interactive] Resize a partition in interactive mode:

```
resizepart {{/dev/sdXN}} {{end_position_of_partition}}
```

- [Interactive] Remove a partition in interactive mode:

```
rm {{/dev/sdXN}}
```

- [Interactive] Display help:

```
?
```

parted

A partition manipulation program.

See also: **`parted.interactive`**, **`cfdisk`**, **`partprobe`**.

More information: https://www.gnu.org/software/parted/manual/parted.html#Invoking-Parted.

- List partitions on all block devices:

```
sudo parted {{[-l|--list]}}
```

- Create a new partition table of the specified label-type:

```
sudo parted {{/dev/sdX}} mklabel {{aix|amiga|bsd|dvh|gpt|loop|mac|msdos|pc98|sun}}
```

- Create a new `gpt` partition table with a 500MiB boot partition and give the rest for the system partition (`--script` skips user intervention prompts):

```
sudo parted {{/dev/sdX}} {{[-s|--script]}} mklabel gpt mkpart "{{boot_partition_name}}" 0% 500MiB mkpart "{{system_partition_name}}" 500MiB 100%
```

- Set a partition to have its boot flag turned on:

```
sudo parted {{/dev/sdX}} set {{1}} boot on
```

- Start interactive mode with the specified disk selected:

```
sudo parted {{/dev/sdX}}
```

- Display help:

```
parted {{[-h|--help]}}
```

partprobe

Notify the operating system kernel of partition table changes.

More information: https://manned.org/partprobe.

- Notify the operating system kernel of partition table changes:

```
sudo partprobe
```

- Notify the kernel of partition table changes and show a summary of devices and their partitions:

```
sudo partprobe {{[-s|--summary]}}
```

- Show a summary of devices and their partitions but don't notify the kernel:

```
sudo partprobe {{[-s|--summary]}} {{[-d|--dry-run]}}
```

partx

Parse a partition table and tell the kernel about it.

More information: https://manned.org/partx.

- List the partitions on a block device or disk image:

```
sudo partx {{[-l|--list]}} {{path/to/device_or_disk_image}}
```

- Add all the partitions found in a given block device to the kernel:

```
sudo partx {{[-a|--add]}} {{[-v|--verbose]}} {{path/to/
device_or_disk_image}}
```

- Delete all the partitions found from the kernel (does not alter partitions on disk):

```
sudo partx {{[-d|--delete]}} {{path/to/device_or_disk_image}}
```

paru

An AUR helper and pacman wrapper.

See also: **`pacman`**, **`yay`**.

More information: https://github.com/Morganamilo/paru#examples.

- Interactively search for and install a package:

```
paru {{package_name_or_search_term}}
```

- Synchronize and update all packages:

```
paru
```

- Upgrade AUR packages:

```
paru -Sua
```

- List manually installed packages:

```
paru -Qqm
```

- Remove an installed package, its configuration files, and dependencies:

```
paru -Rns {{package}}
```

- Get information about a package:

```
paru -Si {{package}}
```

- Download `PKGBUILD` and other package source files from the AUR or ABS:

```
paru --getpkgbuild {{package}}
```

- Display the `PKGBUILD` file of a package:

```
paru -Gp {{package}}
```

pasuspender

Temporarily suspends **`pulseaudio`** while another command is running to allow access to alsa.

More information: https://manned.org/pasuspender.

- Suspend PulseAudio while running `jackd`:

```
pasuspender -- {{jackd --driver alsa --device hw:0}}
```

patool

Archive file manager.

Various archive formats can be created, extracted, tested, listed, searched, repacked, and compared.

More information: https://github.com/wummel/patool/blob/master/doc/patool.txt.

- Extract an archive:

```
patool extract {{path/to/archive}}
```

- Create an archive:

```
patool create {{path/to/archive}} {{path/to/
file_or_directory1 path/to/file_or_directory2 ...}}
```

- List contents of an archive:

```
patool list {{path/to/archive}}
```

- Compare the contents of two archives and display the differences in `stdout`:

```
patool diff {{path/to/archive1}} {{path/to/archive2}}
```

- Search for a string inside the contents of an archive:

```
patool search {{path/to/archive}}
```

paxs

Manage packages across Yay, Flatpak, and Snap.

Supports searching, installing, removing, and upgrading packages.

More information: https://github.com/zamhedonia/paxs#usage.

- Search for a package:

```
paxs {{search_term}}
```

- Upgrade all packages:

```
paxs {{[-u|--upgrade-all]}}
```

- Install a package (prompting for the source):

```
paxs {{[-i|--install]}} {{package}}
```

- Remove a package (prompting for the source):

```
paxs {{[-r|--remove]}} {{package}}
```

- Check for updates across all package managers:

```
paxs {{[-c|--check-update]}}
```

- Display help:

```
paxs {{[-h|--help]}}
```

pct clone

Clone a container.

More information: https://pve.proxmox.com/pve-docs/pct.1.html#cli_pct_clone.

- Clone a container:

```
pct {{[cl|clone]}} {{100}} {{101}}
```

- Clone a container with a custom name:

```
pct {{[cl|clone]}} {{100}} {{101}} --hostname {{host_name}}
```

- Create a full clone instead of a linked clone:

```
pct {{[cl|clone]}} {{100}} {{101}} --full
```

pct config

Print the configuration of a container.

More information: https://pve.proxmox.com/pve-docs/pct.1.html#cli_pct_config.

- Display the saved configuration:

```
pct {{[conf|config]}} {{100}}
```

- Display the running configuration without pending changes:

```
pct {{[conf|config]}} {{100}} --current
```

- Display configuration of a specific snapshot:

```
pct {{[conf|config]}} {{100}} --snapshot {{snapshot_name}}
```

pct console

Attach to a container TTY.

See also: **`pct enter`**.

More information: https://pve.proxmox.com/pve-docs/pct.1.html#cli_pct_console.

- Attach to a terminal:

```
pct {{[cons|console]}} {{100}}
```

- Detach from a terminal:

```
<Ctrl a><q>
```

pct cpusets

Display the list of assigned CPU sets.

More information: https://pve.proxmox.com/pve-docs/pct.1.html#cli_pct_cpusets.

- Display assigned CPU sets:

```
pct {{[cp|cpusets]}}
```

pct create

Create LXC containers in Proxmox.

More information: https://pve.proxmox.com/pve-docs/pct.1.html#cli_pct_create.

- Create a container from a template with 4GB size, give it 512MiB of memory, and unlimited access to CPU:

```
pct {{[cr|create]}} {{100}} {{local:vztmpl/distro-name.tar.zst}} --rootfs {{local-lvm}}:4
```

- Give a container a specific memory limit in megabytes:

```
pct {{[cr|create]}} {{100}} {{local:vztmpl/distro-name.tar.zst}} --rootfs {{local-lvm}}:{{4}} --memory {{8192}}
```

- Give a container a hostname and a password:

```
pct {{[cr|create]}} {{100}} {{local:vztmpl/distro-name.tar.zst}} --rootfs {{local-lvm}}:{{4}} --hostname {{hostname}} --password {{password}}
```

- Give a container network access:

```
pct {{[cr|create]}} {{100}} {{local:vztmpl/distro-name.tar.zst}} --rootfs {{local-lvm}}:{{4}} --net0 name={{eth0}},bridge={{vmbr0}},ip={{dhcp|manual|10.0.0.1/24}} --features nesting=1
```

- Start a container immediately after creation:

```
pct {{[cr|create]}} {{100}} {{local:vztmpl/distro-name.tar.zst}} --rootfs {{local-lvm}}:{{4}} --start
```

- Set the container to start on system boot:

```
pct {{[cr|create]}} {{100}} {{local:vztmpl/distro-name.tar.zst}} --rootfs {{local-lvm}}:{{4}} --onboot
```

pct delsnapshot

Delete a container snapshot.

More information: https://pve.proxmox.com/pve-docs/pct.1.html#cli_pct_delsnapshot.

- Delete a snapshot with a specific name:

```
pct {{[del|delsnapshot]}} {{100}} {{snapshot_name}}
```

pct destroy

Destroy a container.

More information: https://pve.proxmox.com/pve-docs/pct.1.html#cli_pct_destroy.

- Destroy a container:

```
pct {{[des|destroy]}} {{100}}
```

- Destroy a container even if it's running:

```
pct {{[des|destroy]}} {{100}} --force
```

- Also delete all references to this container:

```
pct {{[des|destroy]}} {{100}} --purge
```

pct enter

Launch a shell for a container.

See also: **`pct console`**.

More information: https://pve.proxmox.com/pve-docs/pct.1.html#cli_pct_enter.

- Launch a shell:

```
pct {{[en|enter]}} {{100}}
```

pct exec

Launch a command inside a specified container.

More information: https://pve.proxmox.com/pve-docs/pct.1.html#cli_pct_exec.

- Launch a command in a container:

```
pct {{[ex|exec]}} {{100}} {{command}}
```

- Open a Bash shell in a container:

```
pct {{[ex|exec]}} {{100}} bash
```

- Pass arguments to the command:

```
pct {{[ex|exec]}} {{100}} -- {{command}} {{arguments}}
```

pct fsck

Run a filesystem check on a container volume.

More information: https://pve.proxmox.com/pve-docs/pct.1.html#cli_pct_fsck.

- Check all volumes of a container:

```
pct fsck {{100}}
```

- Specify which volume to check:

```
pct fsck {{100}} --device {{mp0|mp1|rootfs|...}}
```

pct list

List containers and their states.

More information: https://pve.proxmox.com/pve-docs/pct.1.html#cli_pct_list.

- List containers:

```
pct list
```

pct listsnapshot

List snapshots of a container.

More information: https://pve.proxmox.com/pve-docs/pct.1.html#cli_pct_listsnapshot.

- List snapshots:

```
pct {{[lists|listsnapshot]}} {{100}}
```

pct mount

Mount a container's filesystem on the host.

More information: https://pve.proxmox.com/pve-docs/pct.1.html#cli_pct_mount.

- Mount the filesystem of a specific container:

```
pct mount {{100}}
```

pct move-volume

Move a volume to a different storage or to a different container.

More information: https://pve.proxmox.com/pve-docs/pct.1.html#cli_pct_move-volume.

- Move the root filesystem of a container to a different storage:

```
pct {{[mov|move-volume]}} {{100}} rootfs {{storage_id}}
```

- Delete the filesystem association to the old volume once the move is complete:

```
pct {{[mov|move-volume]}} {{100}} rootfs {{storage_id}} --delete
```

pct move_volume

This command is an alias of **`pct move-volume`**.

- View documentation for the original command:

  ```
  tldr pct move-volume
  ```

pct pull

Copy a file from a container to the local system.

See also: **`pct push`**.

More information: https://pve.proxmox.com/pve-docs/pct.1.html#cli_pct_pull.

- Copy a file from a container:

```
pct pull {{100}} /{{path/to/source_file}} {{path/to/
destination_file}}
```

pct push

Copy a local file to a container.

See also: **`pct pull`**.

More information: https://pve.proxmox.com/pve-docs/pct.1.html#cli_pct_push.

- Copy a file to a container:

```
pct push {{100}} {{path/to/source_file}} /{{path/to/
destination_file}}
```

pct reboot

Reboot a container.

More information: https://pve.proxmox.com/pve-docs/pct.1.html#cli_pct_reboot.

- Reboot a container:

```
pct {{[reb|reboot]}} {{100}}
```

pct resize

Resize container storage.

More information: https://pve.proxmox.com/pve-docs/pct.1.html#cli_pct_resize.

- Resize the container size to 20GB:

```
pct {{[resi|resize]}} {{100}} rootfs 20G
```

- Add 10GB to the container storage:

```
pct {{[resi|resize]}} {{100}} rootfs +10G
```

- Resize a mounted volume:

```
pct {{[resi|resize]}} {{100}} mp{{0}} {{+10G}}
```

pct rollback

Restore a specific snapshot.

More information: https://pve.proxmox.com/pve-docs/pct.1.html#cli_pct_rollback.

- Restore a snapshot:

```
pct {{[ro|rollback]}} {{100}} {{snapshot_name}}
```

- Start the container as soon as the snapshot is restored:

```
pct {{[ro|rollback]}} {{100}} {{snapshot_name}} --start
```

pct set

Set container options.

More information: https://pve.proxmox.com/pve-docs/pct.1.html#cli_pct_set.

- Set container to start automatically on boot:

```
pct {{[se|set]}} {{100}} --onboot
```

- Set a container to have a static IP:

```
pct {{[se|set]}} {{100}} --net0
name=eth0,bridge=vmbr0,ip={{10.0.0.100/24}},gw={{10.0.0.1}}
```

- Set container memory and CPU limit:

```
pct {{[se|set]}} {{100}} --memory {{8192}} --cpulimit {{4}}
```

- Set the hostname of a container:

```
pct {{[se|set]}} {{100}} --hostname {{new_name}}
```

- Mount a host file location in a guest:

```
pct {{[se|set]}} {{100}} --mp{{0}} /{{path/to/
host_directory}},mp=/{{path/to/guest_mount_point}}
```

- Set container tags:

```
pct {{[se|set]}} {{100}} --tags {{tag1,tag2,...}}
```

- Remove an option:

```
pct {{[se|set]}} {{100}} --delete
{{unused0,net0,mp0,mp1,...}}
```

pct shutdown

Cleanly shutdown a container.

See also: **`pct stop`**.

More information: https://pve.proxmox.com/pve-docs/pct.1.html#cli_pct_shutdown.

- Shut down a container:

```
pct {{[sh|shutdown]}} {{100}}
```

pct snapshot

Snapshot a container.

More information: https://pve.proxmox.com/pve-docs/pct.1.html#cli_pct_snapshot.

- Create a snapshot:

```
pct {{[sn|snapshot]}} {{100}} {{snapshot_name}}
```

- Add a description to the snapshot:

```
pct {{[sn|snapshot]}} {{100}} {{snapshot_name}} --description
"{{description_text}}"
```

pct start

Start a container.

More information: https://pve.proxmox.com/pve-docs/pct.1.html#cli_pct_start.

- Start a container:

```
pct start {{100}}
```

pct status

Display the status of a container.

More information: https://pve.proxmox.com/pve-docs/pct.1.html#cli_pct_status.

- Display if the container is running:

```
pct status {{100}}
```

- Display detailed container information:

```
pct status {{100}} --verbose
```

pct stop

Abruptly stop a container without waiting for processes to exit.

See also: **`pct shutdown`**.

More information: https://pve.proxmox.com/pve-docs/pct.1.html#cli_pct_stop.

- Stop a container:

```
pct stop {{100}}
```

pct template

Convert a container into a template.

More information: https://pve.proxmox.com/pve-docs/pct.1.html#cli_pct_template.

- Convert a container into a template:

```
pct {{[t|template]}} {{100}}
```

pct unmount

Unmount a container's filesystem from the host.

More information: https://pve.proxmox.com/pve-docs/pct.1.html#cli_pct_unmount.

- Unmount the filesystem of a specific container:

```
pct {{[unm|unmount]}} {{100}}
```

pct

Manage LXC containers in Proxmox.

More information: https://pve.proxmox.com/pve-docs/pct.1.html.

- List all containers:

```
pct list
```

- Start/Stop/Reboot a specific container:

```
pct {{start|stop|reboot}} {{100}}
```

- Access a specific container's shell:

```
pct {{[en|enter]}} {{100}}
```

- Create a container from template with 4GB size:

```
pct {{[cr|create]}} {{100}} {{local:vztmpl/distro-
name.tar.zst}} --rootfs {{local-lvm}}:4
```

- Resize the container's disk to 20G:

```
pct {{[resi|resize]}} {{100}} {{rootfs|mpX}} {{20G}}
```

- Show the configuration of a container, specifying its ID:

```
pct {{[conf|config]}} {{100}}
```

- Snapshot a specific container with description:

```
pct {{[sn|snapshot]}} {{100}} {{my-snapshot}} --description
{{My snapshot description}}
```

- Destroy a container and remove all related resources:

```
pct {{[des|destroy]}} {{100}} --purge
```

pdbedit

Edit the Samba user database.

For simple user add/remove/password, you can also use **`smbpasswd`**.

More information: https://manned.org/pdbedit.

- List all Samba users:

```
sudo pdbedit {{[-L|--list]}}
```

- List all Samba users and their settings:

```
sudo pdbedit {{[-L|--list]}} {{[-v|--verbose]}}
```

- Add an existing Unix user to Samba (will prompt for password):

```
sudo pdbedit {{[-u|--user]}} {{username}} {{[-a|--create]}}
```

- Remove a Samba user:

```
sudo pdbedit {{[-u|--user]}} {{username}} {{[-x|--delete]}}
```

- Reset a Samba user's failed password counter:

```
sudo pdbedit {{[-u|--user]}} {{username}} {{[-z|--bad-password-count-reset]}}
```

pdfattach

Add a new attachment (embedded file) to an existing PDF file.

See also: **`pdfdetach`**, **`pdfimages`**, **`pdfinfo`**.

More information: https://manned.org/pdfattach.

- Add a new attachment to an existing PDF file:

```
pdfattach {{path/to/input.pdf}} {{path/to/file_to_attach}}
{{path/to/output.pdf}}
```

- Replace attachment with same name if it exists:

```
pdfattach -replace {{path/to/input.pdf}} {{path/to/
file_to_attach}} {{path/to/output.pdf}}
```

- Display help:

```
pdfattach {{[-h|--help]}}
```

- Display version:

```
pdfattach -v
```

pdfbook2

Create a double sided printable PDF booklet from a PDF.

Note: The booklet needs to be printed double-sided in landscape mode, flipped on the long edge.

More information: https://github.com/jenom/pdfbook2#examples.

- Create a booklet named `file-book.pdf` with sane defaults:

```
pdfbook2 {{path/to/file.pdf}}
```

- Create a booklet with the paper size set to A4:

```
pdfbook2 {{[-p|--paper]}} a4paper {{path/to/file.pdf}}
```

- Create a booklet that has the inner margin reduced to 50 pixels (default = 150px):

```
pdfbook2 {{[-p|--paper]}} a4paper {{[-i|--inner-margin]}} 50 {{path/to/file.pdf}}
```

- Organize a large file with print signatures for binding into a larger booklet (signatures must be divisible by 4):

```
pdfbook2 {{[-p|--paper]}} a4paper --signature {{24}} {{path/to/file.pdf}}
```

pdfcrop

Detect and remove margins in each page in a PDF file.

More information: https://github.com/ho-tex/pdfcrop.

- Automatically detect and remove the margin for each page in a PDF file:

```
pdfcrop {{path/to/input_file.pdf}} {{path/to/
output_file.pdf}}
```

- Set the margins of each page to a specific value:

```
pdfcrop {{path/to/input_file.pdf}} --margins '{{left}}
{{top}} {{right}} {{bottom}}' {{path/to/output_file.pdf}}
```

- Set the margins of each page to a specific value, using the same value for left, top, right, and bottom:

```
pdfcrop {{path/to/input_file.pdf}} --margins {{300}} {{path/
to/output_file.pdf}}
```

- Use a user-defined bounding box for cropping instead of automatically detecting it:

```
pdfcrop {{path/to/input_file.pdf}} --bbox '{{left}} {{top}}
{{right}} {{bottom}}' {{path/to/output_file.pdf}}
```

- Use different user-defined bounding boxes for odd and even pages:

```
pdfcrop {{path/to/input_file.pdf}} --bbox-odd '{{left}}
{{top}} {{right}} {{bottom}}' --bbox-even '{{left}} {{top}}
{{right}} {{bottom}}' {{path/to/output_file.pdf}}
```

- Automatically detect margins using a lower resolution for improved performance:

```
pdfcrop {{path/to/input_file.pdf}} --resolution {{72}}
{{path/to/output_file.pdf}}
```

pdfdetach

List or extract attachments (embedded files) from a PDF file.

See also: **`pdfattach`**, **`pdfimages`**, **`pdfinfo`**.

More information: https://manned.org/pdfdetach.

- List all attachments in a file with a specific text encoding:

```
pdfdetach list -enc {{UTF-8}} {{path/to/input.pdf}}
```

- Save specific embedded file by specifying its number:

```
pdfdetach -save {{number}} {{path/to/input.pdf}}
```

- Save specific embedded file by specifying its name:

```
pdfdetach -savefile {{name}} {{path/to/input.pdf}}
```

- Save the embedded file with a custom output filename:

```
pdfdetach -save {{number}} -o {{path/to/output}} {{path/to/
input.pdf}}
```

- Save the attachment from a file secured by owner/user password:

```
pdfdetach -save {{number}} {{-opw|-upw}} {{password}} {{path/
to/input.pdf}}
```

pdftohtml

Convert PDF files into HTML, XML, and PNG images.

More information: https://manned.org/pdftohtml.

- Convert a PDF file to an HTML file:

```
pdftohtml {{path/to/file.pdf}} {{path/to/output_file.html}}
```

- Ignore images in the PDF file:

```
pdftohtml -i {{path/to/file.pdf}} {{path/to/
output_file.html}}
```

- Generate a single HTML file that includes all PDF pages:

```
pdftohtml -s {{path/to/file.pdf}} {{path/to/
output_file.html}}
```

- Convert a PDF file to an XML file:

```
pdftohtml -xml {{path/to/file.pdf}} {{path/to/
output_file.xml}}
```

pdftoppm

Convert PDF document pages to portable Pixmap (image formats).

More information: https://manned.org/pdftoppm.

- Specify the range of pages to convert (`n` - first page, `m` - last page):

```
pdftoppm -f {{n}} -l {{m}} {{path/to/file.pdf}}
{{image_name_prefix}}
```

- Convert only the first page of a PDF:

```
pdftoppm -singlefile {{path/to/file.pdf}}
{{image_name_prefix}}
```

- Generate a monochrome PBM file (instead of a color PPM file):

```
pdftoppm -mono {{path/to/file.pdf}} {{image_name_prefix}}
```

- Generate a grayscale PGM file (instead of a color PPM file):

```
pdftoppm -gray {{path/to/file.pdf}} {{image_name_prefix}}
```

- Generate a PNG file instead a PPM file:

```
pdftoppm -png {{path/to/file.pdf}} {{image_name_prefix}}
```

pdfxup

N-up PDF pages.

N-upping means putting multiple pages onto one page by scaling and rotating them into a grid.

More information: https://ctan.org/pkg/pdfxup.

- Create a 2-up PDF:

```
pdfxup {{[-o|--output]}} {{path/to/output.pdf}} {{path/to/input.pdf}}
```

- Create a PDF with 3 columns and 2 lines per page:

```
pdfxup {{[-x|--columns]}} {{3}} {{[-y|--rows]}} {{2}} {{[-o|--output]}} {{path/to/output.pdf}} {{path/to/input.pdf}}
```

- Create a PDF in booklet mode (2-up, and pages are sorted to form a book when folded):

```
pdfxup {{[-b|--booklet]}} {{[-o|--output]}} {{path/to/output.pdf}} {{path/to/input.pdf}}
```

perf

Framework for Linux performance counter measurements.

More information: https://perfwiki.github.io/main/.

- Display basic performance counter stats for a command:

```
perf stat {{gcc hello.c}}
```

- Display system-wide real-time performance counter profile:

```
sudo perf top
```

- Run a command and record its profile into `perf.data`:

```
sudo perf record {{command}}
```

- Record the profile of an existing process into `perf.data`:

```
sudo perf record {{[-p|--pid]}} {{process_id}}
```

- Read `perf.data` (created by `perf record`) and display the profile:

```
sudo perf report
```

pg

View files one page at a time.

More information: https://manned.org/pg.

- View a file:

```
pg {{path/to/file}}
```

- Display help:

```
pg {{[-h|--help]}}
```

pgrep

Find or signal processes by name.

See also: **`pidof`**.

More information: https://manned.org/pgrep.

- Return PIDs of any running processes with a matching command string:

```
pgrep {{process_name}}
```

- Also display the full command:

```
pgrep {{[-a|--list-full]}} {{process_name}}
```

- Search for processes including their command-line options:

```
pgrep {{[-f|--full]}} "{{process_name}} {{parameter}}"
```

- Search for processes run by a specific user:

```
pgrep {{[-u|--euid]}} {{username}} {{process_name}}
```

phar

Create, update, or extract PHP archives (PHAR).

More information: https://manned.org/phar.

- Add one or more files or directories to a Phar file:

```
phar add -f {{path/to/phar_file}} {{path/to/
file_or_directory1 path/to/file_or_directory2 ...}}
```

- Display the contents of a Phar file:

```
phar list -f {{path/to/phar_file}}
```

- Delete the specified file or directory from a Phar file:

```
phar delete -f {{path/to/phar_file}} -e {{file_or_directory}}
```

- Compress or uncompress files and directories in a Phar file:

```
phar compress -f {{path/to/phar_file}} -c {{algorithm}}
```

- Get information about a Phar file:

```
phar info -f {{path/to/phar_file}}
```

- Sign a Phar file with a specific hash algorithm:

```
phar sign -f {{path/to/phar_file}} -h {{algorithm}}
```

- Sign a Phar file with an OpenSSL private key:

```
phar sign -f {{path/to/phar_file}} -h openssl -y {{path/to/
private_key}}
```

- Display help and available hashing/compression algorithms:

```
phar help
```

photorec

Deleted file recovery tool.

It is recommended to write recovered files to a disk separate to the one being recovered from.

More information: https://www.cgsecurity.org/wiki/PhotoRec_Step_By_Step.

- Run PhotoRec on a specific device:

```
sudo photorec {{/dev/sdb}}
```

- Run PhotoRec on a disk image (`image.dd`):

```
sudo photorec {{path/to/image.dd}}
```

phpdismod

Disable PHP extensions on Debian-based OSes.

More information: https://salsa.debian.org/php-team/php-defaults.

- Disable the JSON extension for every SAPI of every PHP version:

```
sudo phpdismod {{json}}
```

- Disable the JSON extension for PHP 7.3 with the cli SAPI:

```
sudo phpdismod -v {{7.3}} -s {{cli}} {{json}}
```

phpenmod

Enable PHP extensions on Debian-based OSes.

More information: https://salsa.debian.org/php-team/php-defaults.

- Enable the JSON extension for every SAPI of every PHP version:

```
sudo phpenmod {{json}}
```

- Enable the JSON extension for PHP 7.3 with the cli SAPI:

```
sudo phpenmod -v {{7.3}} -s {{cli}} {{json}}
```

phpquery

PHP extension manager for Debian-based OSes.

More information: https://code.google.com/archive/p/phpquery/wikis/CommandLineInterface.wiki.

- List available PHP versions:

```
sudo phpquery -V
```

- List available SAPIs for PHP 7.3:

```
sudo phpquery -v {{7.3}} -S
```

- List enabled extensions for PHP 7.3 with the cli SAPI:

```
sudo phpquery -v {{7.3}} -s {{cli}} -M
```

- Check if the JSON extension is enabled for PHP 7.3 with the apache2 SAPI:

```
sudo phpquery -v {{7.3}} -s {{apache2}} -m {{json}}
```

physlock

Lock all consoles and virtual terminals.

More information: https://github.com/xyb3rt/physlock#usage.

- Lock every console (require current user or root to unlock):

```
physlock
```

- Mute kernel messages on console while locked:

```
physlock -m
```

- Disable SysRq mechanism while locked:

```
physlock -s
```

- Display a message before the password prompt:

```
physlock -p "{{Locked!}}"
```

- Fork and detach physlock (useful for suspend or hibernate scripts):

```
physlock -d
```

pi

Compute decimal Archimedes' constant Pi.

More information: https://manned.org/pi.

- Display 100 decimal digits of Archimedes' constant Pi:

```
pi
```

- Display a specified number of decimal digits of Archimedes' constant Pi:

```
pi {{number}}
```

- Display recommended readings:

```
pi --bibliography
```

- Display help:

```
pi --help
```

- Display version:

```
pi --version
```

pidof

Get the ID of a process using its name.

See also: **`pgrep`**.

More information: https://manned.org/pidof.

- List all process IDs with given name:

```
pidof {{bash}}
```

- List a single process ID with given name:

```
pidof -s {{bash}}
```

- List process IDs including scripts with given name:

```
pidof -x {{script.py}}
```

- Kill all processes with given name:

```
kill $(pidof {{name}})
```

pidstat

Show system resource usage, including CPU, memory, IO etc.

More information: https://manned.org/pidstat.

- Show CPU statistics at a 2 second interval for 10 times:

```
pidstat {{2}} {{10}}
```

- Show page faults and memory utilization:

```
pidstat -r
```

- Show input/output usage per process ID:

```
pidstat -d
```

- Show information on a specific PID:

```
pidstat -p {{process_id}}
```

- Show memory statistics for all processes whose command name include "fox" or "bird":

```
pidstat -C "{{fox|bird}}" -r -p ALL
```

pihole

Manage the Pi-hole ad-blocking DNS server.

More information: https://docs.pi-hole.net/main/pihole-command/.

- Check Pi-hole's status:

```
pihole status
```

- Update Pi-hole and Gravity:

```
sudo pihole {{[-up|updatePihole]}}
```

- Start or stop the daemon:

```
pihole {{enable|disable}}
```

- Update the lists and flush the cache without restarting the DNS server:

```
pihole reloaddns
```

- Update the list of ad-serving domains:

```
pihole {{[-g|updateGravity]}}
```

- Allow or deny the specified domain:

```
pihole {{allow|deny}} {{example.com}}
```

- Search the lists for a domain:

```
pihole {{[-q|query]}} {{example.com}}
```

- Open a real-time log of connections:

```
pihole {{[-t|tail]}}
```

pikman

PikaOS package manager utility.

More information: https://wiki.pika-os.com/en/custom-utils-wiki/pikman-manager-cli.

- Install a package:

```
pikman {{[i|install]}} {{package}}
```

- List installed packages:

```
pikman {{[l|list]}}
```

- Search for a package:

```
pikman {{[s|search]}} {{package}}
```

- Update the list of available packages:

```
pikman update
```

- Remove a package:

```
pikman {{[r|remove]}} {{package}}
```

- Remove all unused packages:

```
pikman autoremove
```

- List available package updates:

```
pikman upgrades
```

- Install available package updates:

```
pikman upgrade
```

pinout

View the current Raspberry Pi's GPIO pin-out information on the terminal with an ASCII diagram.

More information: https://www.raspberrypi.com/documentation/computers/raspberry-pi.html#view-a-gpio-pinout-for-your-raspberry-pi.

- View the pinout information and GPIO header diagram for the current Raspberry Pi:

  ```
  pinout
  ```

- Open https://pinout.xyz/ in the default browser:

  ```
  pinout {{[-x|--xyz]}}
  ```

pipetron

Electron node manager for PipeWire.

More information: https://codeberg.org/ponleou/pipetron#usage.

- Start daemon specified in config file (defaults to volume daemon if not specified):

```
pipetron {{[-d|--daemon]}}
```

- Start volume daemon (mirror volume settings):

```
pipetron {{[-vd|--volume-daemon]}}
```

- Start audio daemon (mirror audio data):

```
pipetron {{[-ad|--audio-daemon]}}
```

pipewire-aes67

This command is an alias of **pipewire**.

Note: It starts the PipeWire daemon using the AES67 network audio profile.

- View documentation for the original command:

```
tldr pipewire
```

pipewire-avb

This command is an alias of **`pipewire`**.

Note: It starts the PipeWire daemon using the Audio Video Bridging (AVB) profile.

- View documentation for the original command:

  ```
  tldr pipewire
  ```

pipewire-pulse

Start a PulseAudio-compatible daemon for PipeWire.

More information: https://docs.pipewire.org/page_man_pipewire-pulse_1.html.

- Start the daemon with default settings:

```
pipewire-pulse
```

- Start the daemon with a specific configuration file:

```
pipewire-pulse {{[-c|--config]}} {{path/to/pipewire-pulse.conf}}
```

- Increase the verbosity level (use multiple times for more verbosity, e.g. `-vvv`):

```
pipewire-pulse {{[-v|--verbose]}}
```

- Display help:

```
pipewire-pulse {{[-h|--help]}}
```

pipewire

Start the PipeWire daemon.

More information: https://docs.pipewire.org/page_man_pipewire_1.html.

- Start the PipeWire daemon:

```
pipewire
```

- Use a different configuration file:

```
pipewire --config {{path/to/file.conf}}
```

- Set the verbosity level (error, warn, info, debug, or trace):

```
pipewire -{{v|vv|...|vvvvv}}
```

- Display help:

```
pipewire --help
```

pirut

Graphical frontend for **`yum`**.

See also: **`yum`**.

More information: https://manned.org/pirut.

- Launch `pirut`:

```
pirut
```

pivot_root

Change the root filesystem to a new directory and move the current root to a subdirectory of the new root.

Commonly used during system initialization (e.g., in **`initramfs`**) to switch from a temporary root to the real root filesystem.

More information: https://manned.org/pivot_root.8.

- Make `/new_root` the new root (`/`) and move current root to a subdirectory of it:

```
sudo pivot_root {{path/to/new_root}} {{path/to/new_root/old_root}}
```

- Display help:

```
pivot_root {{[-h|--help]}}
```

pivpn

Easy security-hardened OpenVPN setup and manager.

Originally designed for the Raspberry Pi, but works on other Linux devices too.

More information: https://docs.pivpn.io/openvpn/.

- Add a new client device:

  ```
  sudo pivpn add
  ```

- List all client devices:

  ```
  sudo pivpn list
  ```

- List currently connected devices and their statistics:

  ```
  sudo pivpn clients
  ```

- Revoke a previously authenticated device:

  ```
  sudo pivpn revoke
  ```

- Uninstall PiVPN:

  ```
  sudo pivpn uninstall
  ```

pkcon

PackageKit client used by Discover and Gnome software and alternative to **`apt`**.

More information: https://manned.org/pkcon.

- Install a package:

```
pkcon install {{package}}
```

- Remove a package:

```
pkcon remove {{package}}
```

- Refresh the package cache:

```
pkcon refresh
```

- Update packages:

```
pkcon update
```

- Search for a specific package:

```
pkcon search {{package}}
```

- List all available packages:

```
pkcon get-packages
```

pkexec

Execute commands as another user.

Asks for password in a GUI if available.

See also: **`sudo`**, **`run0`**, **`doas`**.

More information: https://polkit.pages.freedesktop.org/polkit/pkexec.1.html.

- Run command as root:

```
pkexec {{command}}
```

- Switch user to root:

```
pkexec
```

- Run command as a specific user:

```
pkexec --user {{username}} {{command}}
```

pkgadd

Add a package to a CRUX system.

More information: https://docs.oracle.com/cd/E88353_01/html/E72487/pkgadd-8.html.

- Install a local software package:

```
pkgadd {{package}}
```

- Update an already installed package from a local package:

```
pkgadd -u {{package}}
```

pkgctl auth

Authenticate **`pkgctl`** with services like GitLab.

More information: https://manned.org/pkgctl-auth.

- Authenticate `pkgctl` with the GitLab instance:

  ```
  pkgctl auth login
  ```

- View authentication status:

  ```
  pkgctl auth status
  ```

pkgctl build

Build packages inside a clean **`chroot`**.

More information: https://manned.org/pkgctl-build.

- Automatically choose the right build script to build packages in a clean `chroot`:

```
pkgctl build
```

- Manually build packages in a clean `chroot`:

```
pkgctl build --arch {{architecture}} --repo {{repository}} --clean
```

pkgctl db update

Update the **pacman** database as final release step for packages that have been transferred and staged on https://repos.archlinux.org.

More information: https://manned.org/pkgctl-db-update.

- Update the binary repository as final release step:

```
pkgctl db update
```

pkgctl diff

Compare package files using different modes.

More information: https://manned.org/pkgctl-diff.

- Compare package files in tar content list different mode (default):

```
pkgctl diff {{[-l|--list]}} {{path/to/file|pkgname}}
```

- Compare package files in diffoscope different mode:

```
pkgctl diff {{[-d|--diffoscope]}} {{path/to/file|pkgname}}
```

- Compare package files in `.PKGINFO` different mode:

```
pkgctl diff {{[-p|--pkginfo]}} {{path/to/file|pkgname}}
```

- Compare package files in `.BUILDINFO` different mode:

```
pkgctl diff {{[-b|--buildinfo]}} {{path/to/file|pkgname}}
```

pkgctl release

Release step to commit, tag, and upload build artifacts.

More information: https://manned.org/pkgctl-release.

- Release a build artifact:

```
pkgctl release --repo {{repository}} --message
{{commit_message}}
```

pkgctl repo

Manage Git packaging repositories and their configuration for Arch Linux.

More information: https://manned.org/pkgctl-repo.

- Clone a package repository (requires setting an SSH key in your Arch Linux GitLab account):

```
pkgctl repo clone {{pkgname}}
```

- Clone a package repository over HTTPS:

```
pkgctl repo clone --protocol https {{pkgname}}
```

- Create a new GitLab package repository and clone it after creation (requires valid GitLab API authentication):

```
pkgctl repo create {{pkgbase}}
```

- Switch a package repository to a specified version:

```
pkgctl repo switch {{version}} {{pkgbase}}
```

- Open a package repository's website:

```
pkgctl repo web {{pkgbase}}
```

pkgctl

Unified frontend for Arch Linux devtools.

More information: https://manned.org/pkgctl.

- View documentation for authenticating `pkgctl` with services like GitLab:

```
tldr pkgctl auth
```

- View documentation for building packages inside a clean `chroot`:

```
tldr pkgctl build
```

- View documentation for updating the binary repository as final release step:

```
tldr pkgctl db update
```

- View documentation for comparing package files using different modes:

```
tldr pkgctl diff
```

- View documentation for releasing build artifacts:

```
tldr pkgctl release
```

- View documentation for managing Git packaging repositories and their configuration:

```
tldr pkgctl repo
```

- Display version:

```
pkgctl version
```

pkgdiff

Compare the file contents of two Slackware packages.

More information: https://slackware.nl/slackware/slackware64-current/source/a/pkgtools/manpages/pkgdiff.8.

- Compare two packages and display differences:

```
pkgdiff {{path/to/package1.txz}} {{path/to/package2.txz}}
```

- Compare two packages with colorized output:

```
pkgdiff -c {{path/to/package1.txz}} {{path/to/package2.txz}}
```

- Compare two packages and output a simple unified diff:

```
pkgdiff -a {{path/to/package1.txz}} {{path/to/package2.txz}}
```

pkgfile

Search files from packages in the official repositories on Arch-based systems.

See also: **`pacman files`**.

More information: https://manned.org/pkgfile.

- Synchronize the pkgfile database:

```
sudo pkgfile --update
```

- Search for a package that owns a specific file:

```
pkgfile {{filename}}
```

- List all files provided by a package:

```
pkgfile --list {{package}}
```

- List executables provided by a package:

```
pkgfile --list --binaries {{package}}
```

- Search for a package that owns a specific file using case-insensitive matching:

```
pkgfile --ignorecase {{filename}}
```

- Search for a package that owns a specific file in the `bin` or `sbin` directory:

```
pkgfile --binaries {{filename}}
```

- Search for a package that owns a specific file, displaying the package version:

```
pkgfile --verbose {{filename}}
```

- Search for a package that owns a specific file in a specific repository:

```
pkgfile --repo {{repository_name}} {{filename}}
```

pkginfo

Query the package database on a CRUX system.

More information: https://crux.nu/Main/Handbook3-6#ntoc19.

- List installed packages and their versions:

```
pkginfo {{[-i|--installed]}}
```

- List files owned by a package:

```
pkginfo {{[-l|--list]}} {{package}}
```

- List the owner(s) of files matching a pattern:

```
pkginfo {{[-o|--owner]}} {{pattern}}
```

- Print the footprint of a file:

```
pkginfo -f {{path/to/file}}
```

pkgmk

Make a binary package for use with pkgadd on CRUX.

More information: https://docs.oracle.com/cd/E88353_01/html/E37839/pkgmk-1.html.

- Make and download a package:

```
pkgmk -d
```

- Install the package after making it:

```
pkgmk -d -i
```

- Upgrade the package after making it:

```
pkgmk -d -u
```

- Ignore the footprint when making a package:

```
pkgmk -d -if
```

- Ignore the MD5 sum when making a package:

```
pkgmk -d -im
```

- Update the package's footprint:

```
pkgmk -uf
```

pkgrm

Remove a package from a CRUX system.

More information: https://docs.oracle.com/cd/E88353_01/html/E72487/pkgrm-8.html.

- Remove an installed package:

```
pkgrm {{package}}
```

pkgstats

Submit and view Arch Linux package popularity statistics.

More information: https://github.com/archlinux-de/pkgstats-cli#usage.

- Send installed package data:

```
pkgstats submit
```

- View the sent data:

```
pkgstats submit {{[-d|--dump-json]}}
```

- Search for packages:

```
pkgstats search {{search_term}}
```

- Limit search result count (10 by default):

```
pkgstats search {{search_term}} {{[-l|--limit]}} {{count}}
```

- Pick packages for comparison:

```
pkgstats show {{package1 package2 ...}}
```

- Display help:

```
pkgstats {{[-h|--help]}}
```

pkgtool

Interactive menu-driven tool for managing Slackware packages.

See also: **`installpkg`**, **`removepkg`**, **`upgradepkg`**, **`makepkg`**.

More information: https://www.slackbook.org/html/book.html#PACKAGE-MANAGEMENT-PACKAGE-UTILITIES-PKGTOOL.

- Launch the interactive package tool:

```
sudo pkgtool
```

- Remove packages interactively:

```
sudo pkgtool --remove_menu
```

- View installed packages:

```
pkgtool --view_menu
```

- Install packages from the current directory:

```
sudo pkgtool --install_menu
```

- Set up packages interactively (run `doinst.sh` scripts):

```
sudo pkgtool --setup_menu
```

plasma-apply-colorscheme

Switch Plasma color scheme.

More information: https://invent.kde.org/plasma/plasma-workspace.

- List available color schemes:

```
plasma-apply-colorscheme --list-schemes
```

- Apply a color scheme:

```
plasma-apply-colorscheme {{BreezeLight}}
```

- Display help:

```
plasma-apply-colorscheme --help
```

plasma-apply-cursortheme

Switch Plasma cursor theme.

More information: https://invent.kde.org/plasma/plasma-workspace.

- List available cursor themes:

```
plasma-apply-cursortheme --list-themes
```

- Apply a cursor theme:

```
plasma-apply-cursortheme {{breeze_cursors}}
```

- Display help:

```
plasma-apply-cursortheme --help
```

plasma-apply-desktoptheme

Switch Plasma desktop theme.

More information: https://invent.kde.org/plasma/plasma-workspace.

- List available desktop themes:

```
plasma-apply-desktoptheme --list-themes
```

- Apply a desktop theme:

```
plasma-apply-desktoptheme {{default}}
```

- Display help:

```
plasma-apply-desktoptheme --help
```

plasma-apply-lookandfeel

Switch Plasma global themes.

More information: https://userbase.kde.org/System_Settings/Look_And_Feel.

- List available global themes:

```
plasma-apply-lookandfeel --list
```

- Apply a global theme:

```
plasma-apply-lookandfeel --apply
{{org.example.theme.desktop}}
```

- Operate `plasma-apply-lookandfeel` without a display server:

```
plasma-apply-lookandfeel --platform offscreen
```

- Display help:

```
plasma-apply-lookandfeel --help
```

plasma-apply-wallpaperimage

Switch Plasma wallpaper.

More information: https://invent.kde.org/plasma/plasma-workspace.

- Apply a wallpaper:

```
plasma-apply-wallpaperimage /{{path/to/image}}
```

- Apply a wallpaper with a fill mode:

```
plasma-apply-wallpaperimage --fill-mode {{stretch|
preserveAspectFit|preserveAspectCrop|tile|tileVertically|
tileHorizontally|pad}} /{{path/to/image}}
```

- Display help:

```
plasma-apply-wallpaperimage --help
```

plasmashell

Start and restart Plasma Desktop.

More information: https://invent.kde.org/plasma/plasma-desktop.

- Restart `plasmashell`:

```
systemctl restart --user plasma-plasmashell
```

- Restart `plasmashell` without systemd:

```
plasmashell --replace & disown
```

- Display help:

```
plasmashell {{[-h|--help]}}
```

- Display help, including Qt options:

```
plasmashell --help-all
```

playerctl

Control media players via MPRIS.

More information: https://github.com/altdesktop/playerctl#using-the-cli.

- Toggle play:

```
playerctl play-pause
```

- Skip to the next track:

```
playerctl next
```

- Go back to the previous track:

```
playerctl previous
```

- List all players:

```
playerctl {{[-l|--list-all]}}
```

- Send a command to a specific player:

```
playerctl {{[-p|--player]}} {{player_name}} {{play-pause|
next|previous|...}}
```

- Send a command to all players:

```
playerctl {{[-a|--all-players]}} {{play-pause|next|
previous|...}}
```

- Display metadata about the current track:

```
playerctl metadata {{[-f|--format]}} "{{Now playing: \{\
{artist\}\} - \{\{album\}\} - \{\{title\}\}}}"
```

pluma

Edit files in MATE desktop environment.

More information: https://manned.org/pluma.

- Start the editor:

```
pluma
```

- Open specific documents:

```
pluma {{path/to/file1 path/to/file2 ...}}
```

- Open documents using a specific encoding:

```
pluma --encoding {{WINDOWS-1252}} {{path/to/file1 path/to/
file2 ...}}
```

- Print all supported encodings:

```
pluma --list-encodings
```

- Open document and go to a specific line:

```
pluma +{{10}} {{path/to/file}}
```

pmap

Report memory map of a process or processes.

More information: https://manned.org/pmap.

- Print memory map for a specific process ID (PID):

```
pmap {{process_id}}
```

- Show the extended format:

```
pmap --extended {{process_id}}
```

- Show the device format:

```
pmap --device {{process_id}}
```

- Limit results to a memory address range specified by `low` and `high`:

```
pmap --range {{low}},{{high}}
```

- Print memory maps for multiple processes:

```
pmap {{process_id1 process_id2 ...}}
```

pmount

Mount arbitrary hotpluggable devices as a normal user.

More information: https://manned.org/pmount.

- Mount a device below `/media/` (using device as mount point):

```
pmount {{/dev/to/block/device}}
```

- Mount a device with a specific filesystem type to `/media/label`:

```
pmount {{[-t|--type]}} {{filesystem}} {{/dev/to/block/device}} {{label}}
```

- Mount a CD-ROM (filesystem type ISO9660) in read-only mode:

```
pmount {{[-t|--type]}} iso9660 {{[-r|--read-only]}} {{/dev/cdrom}}
```

- Mount an NTFS-formatted disk, forcing read-write access:

```
pmount {{[-t|--type]}} ntfs {{[-w|--read-write]}} {{/dev/sdX}}
```

- Display all mounted removable devices:

```
pmount
```

po4a-gettextize

Convert a file to a PO file.

More information: https://www.po4a.org/man/man1/po4a-gettextize.1.php.

- Convert a text file to PO file:

```
po4a-gettextize --format {{text}} --master {{path/to/master.txt}} --po {{path/to/result.po}}
```

- List all available formats:

```
po4a-gettextize --help-format
```

- Convert a text file along with a translated document to a PO file (`-l` option can be provided multiple times):

```
po4a-gettextize --format {{text}} --master {{path/to/master.txt}} --localized {{path/to/translated.txt}} --po {{path/to/result.po}}
```

po4a-translate

Convert a PO file back to documentation format.

The provided PO file should be the translation of the POT file which was produced by **po4a-gettextize**.

More information: https://www.po4a.org/man/man1/po4a-translate.1.php.

- Convert a translated PO file back to a document:

```
po4a-translate --format {{text}} --master {{path/to/master.doc}} --po {{path/to/result.po}} --localized {{path/to/translated.txt}}
```

- List all available formats:

```
po4a-translate --help-format
```

po4a-updatepo

Update the translation (in PO format) of a documentation.

More information: https://www.po4a.org/man/man1/po4a-updatepo.1.php.

- Update a PO file according to the modification of its origin file:

```
po4a-updatepo --format {{text}} --master {{path/to/
master.txt}} --po {{path/to/result.po}}
```

- List available formats:

```
po4a-updatepo --help-format
```

- Update several PO files according to the modification of their origin file:

```
po4a-updatepo --format {{text}} --master {{path/to/
master.txt}} --po {{path/to/po1.po}} --po {{path/to/po2.po}}
```

po4a

Update both PO files and translated documents.

More information: https://www.po4a.org/man/man1/po4a.1.php.

- Update PO files and documents according to the specified configuration file:

```
po4a {{path/to/config_file}}
```

podlet

Generate Podman Quadlet files from a Podman command, compose file, or existing object.

See also: **podman**.

More information: https://github.com/containers/podlet.

- Generate the equivalent Quadlet for a podman command:

```
podlet {{podman_command}}
```

- Generate a Quadlet with a custom name and a description:

```
podlet {{[-n|--name]}} {{name}} {{[-d|--description]}}
{{description}} {{podman_command}}
```

- Add startup dependency and ordering declarations to the generated Quadlet:

```
podlet {{[-i|--install]}} --wanted-by {{unit}} --after
{{unit}} {{podman_command}}
```

- Generate Quadlets from a compose file in the current directory:

```
podlet compose
```

- Generate Quadlets for a compose file into the unit directory of the current user:

```
podlet {{[-u|--unit-directory]}} compose {{path/to/
compose.yaml}}
```

pokego

Display Pokémon sprites in color directly in your terminal.

Inspired by Phoney badger's **`pokemon-colorscripts`** but offers enhanced speed and efficiency.

More information: https://github.com/rubiin/pokego#usage.

- Print a specific Pokémon:

```
pokego --name charizard
```

- Print a specific shiny Pokémon:

```
pokego --name spheal {{[-s|-shiny]}}
```

- Print an alternative form of a Pokémon:

```
pokego --name blastoise --form mega
```

- Print random Pokémon from generations 1-3 (range):

```
pokego --random 1-3
```

- Do not display Pokémon name (default: false):

```
pokego --random 1-3 --no-title
```

portablectl

A systemd utility for managing and deploying portable service images on Linux systems.

More information: https://www.freedesktop.org/software/systemd/man/latest/portablectl.html.

- List available portable service images discovered in the portable image search paths:

```
portablectl list
```

- Attach a portable service image to the host system:

```
portablectl attach {{path/to/image}}
```

- Detach a portable service image from the host system:

```
portablectl detach {{path/to/image|image_name}}
```

- Display details and metadata about a specified portable service image:

```
portablectl inspect {{path/to/image}}
```

- Check if a portable service image is attached to the host system:

```
portablectl is-attached {{path/to/image|image_name}}
```

portageq

Query for information about Portage, the Gentoo Linux package manager.

Queryable Portage-specific environment variables are listed in **`/var/db/repos/gentoo/profiles/info_vars`**.

More information: https://wiki.gentoo.org/wiki/Portageq.

- Display the value of a Portage-specific environment variable:

  ```
  portageq envvar {{variable}}
  ```

- Display a detailed list of repositories configured with Portage:

  ```
  portageq repos_config /
  ```

- Display a list of repositories sorted by priority (highest first):

  ```
  portageq get_repos /
  ```

- Display a specific piece of metadata about an atom (i.e. package name including the version):

  ```
  portageq metadata / {{ebuild|porttree|binary|...}}
  {{category}}/{{package}} {{BDEPEND|DEFINED_PHASES|
  DEPEND|...}}
  ```

ports

Update/list the ports tree on a CRUX system.

More information: https://manned.org/ports.

- Update the ports tree:

```
ports -u
```

- List the ports in the current tree:

```
ports -l
```

- Check the differences between installed packages and the ports tree:

```
ports -d
```

postconf

Postfix configuration utility.

This command displays the values of the **`main.cf`** configuration parameters by default and warns about possible mistyped parameter names. It can also change the **`main.cf`** configuration parameter values.

More information: https://manned.org/postconf.

- Specify the directory of the `main.cf` configuration file instead of the default configuration directory:

```
postconf -c {{path/to/configuration_directory}}
```

- Edit the `main.cf` configuration file and update parameter settings with the "name=value" pairs:

```
postconf -e
```

- Print the default parameter settings of the `main.cf` instead of the actual settings:

```
postconf -d
```

- Display parameters only from the specified class:

```
postconf -C {{builtin|service|user|all}}
```

- List available SASL plug-in types for the Postfix SMTP server. The plug-in type is selected with the `smtpd_sasl_type` configuration parameter by specifying `cyrus` or `dovecot` as the name:

```
postconf -a
```

- List the names of all supported lookup table types. Lookup tables are specified as `type:name` in configuration files where the type can be `btree`, `cdb`, `hash`, `mysql`, etc.:

```
postconf -m
```

postfix

Postfix mail transfer agent (MTA) control program.

More information: https://www.postfix.org/postfix.1.html.

- Check the configuration:

```
sudo postfix check
```

- Check the status of the Postfix daemon:

```
sudo postfix status
```

- Start Postfix:

```
sudo postfix start
```

- Gracefully stop Postfix:

```
sudo postfix stop
```

- Flush the mail queue:

```
sudo postfix flush
```

- Reload the configuration files:

```
sudo postfix reload
```

poweroff

Power off the system.

See also: **`shutdown`**.

More information: https://manned.org/poweroff.

- Power off the system:

  `poweroff`

- Halt the system (same as `halt`):

  `poweroff --halt`

- Reboot the system (same as `reboot`):

  `poweroff --reboot`

- Shut down immediately without contacting the system manager:

  `poweroff {{[-f|--force]}}`

- Write the wtmp shutdown entry without shutting down the system:

  `poweroff {{[-w|--wtmp-only]}}`

powerprofilesctl

Make power profiles handling available over D-Bus.

More information: https://gitlab.freedesktop.org/upower/power-profiles-daemon#how-to-use.

- List available power profiles:

```
powerprofilesctl
```

- Set a specific power profile:

```
powerprofilesctl set {{profile_name}}
```

powerstat

Measure the power consumption of a computer that has a battery power source or supports the RAPL interface.

More information: https://manned.org/powerstat.

- Measure power with the default of 10 samples with an interval of 10 seconds:

```
powerstat
```

- Measure power with custom number of samples and interval duration:

```
powerstat {{interval}} {{number_of_samples}}
```

- Measure power using Intel's RAPL interface:

```
powerstat -R {{interval}} {{number_of_samples}}
```

- Show a histogram of the power measurements:

```
powerstat -H {{interval}} {{number_of_samples}}
```

- Enable all statistics gathering options:

```
powerstat -a {{interval}} {{number_of_samples}}
```

powertop

Optimize battery power usage.

More information: https://github.com/fenrus75/powertop.

- Calibrate power usage measurements:

```
sudo powertop --calibrate
```

- Generate HTML power usage report in the current directory:

```
sudo powertop --html={{power_report.html}}
```

- Tune to optimal settings:

```
sudo powertop --auto-tune
```

- Generate a report for a specified number of seconds (instead of 20 by default):

```
sudo powertop --time={{5}}
```

powertop2tuned

Create TuneD profiles from PowerTOP recommendations.

Part of **tuned-utils**.

See also: **powertop**, **tuned-adm**.

More information: https://docs.fedoraproject.org/en-US/quick-docs/automatic-power-management-power2top/.

- Create a new TuneD profile based on current PowerTOP recommendations:

```
sudo powertop2tuned {{profile_name}}
```

- Create a new profile and enable most recommendations automatically:

```
sudo powertop2tuned {{[-e|--enable]}} {{profile_name}}
```

- Create a profile from an existing PowerTOP HTML report:

```
sudo powertop2tuned {{[-i|--input]}} {{path/to/report.html}}
{{profile_name}}
```

- Create a new profile in a specific directory:

```
sudo powertop2tuned {{[-o|--output]}} {{path/to/directory}}
{{profile_name}}
```

- Create a new profile without merging the active profile:

```
sudo powertop2tuned {{[-n|--new-profile]}} {{profile_name}}
```

- Merge recommendations with a specific existing profile:

```
sudo powertop2tuned {{[-m|--merge-profile]}}
{{existing_profile}} {{profile_name}}
```

- Force overwrite an existing profile directory:

```
sudo powertop2tuned {{[-f|--force]}} {{profile_name}}
```

ppa-purge

Disable a PPA and revert its packages to the official versions.

More information: https://manned.org/ppa-purge.

- Disable a PPA and downgrade its packages to the official versions:

```
sudo ppa-purge ppa:{{owner}}/{{ppa_name}}
```

- Disable a PPA given only its [o]wner (the PPA name defaults to `ppa`):

```
sudo ppa-purge -o {{owner}}
```

- Disable a PPA given its [o]wner and [p]PA name:

```
sudo ppa-purge -o {{owner}} -p {{ppa_name}}
```

- Answer [y]es to all package manager prompts:

```
sudo ppa-purge -y ppa:{{owner}}/{{ppa_name}}
```

- Use a specific [d]istribution instead of the detected one:

```
sudo ppa-purge -d {{distribution}} ppa:{{owner}}/{{ppa_name}}
```

- Display [h]elp:

```
ppa-purge -h
```

pridecat

Like cat but more colorful.

More information: https://github.com/lunasorcery/pridecat#flags.

- Print the contents of a file in pride colors to `stdout`:

```
pridecat {{path/to/file}}
```

- Print contents of a file in trans colors:

```
pridecat {{path/to/file}} {{[--trans|--transgender]}}
```

- Alternate between lesbian and bisexual pride flags:

```
pridecat {{path/to/file}} --lesbian {{[--bi|--bisexual]}}
```

- Print contents of a file with the background colors changed:

```
pridecat {{path/to/file}} {{[-b|--background]}}
```

- List directory contents in pride flag colors:

```
ls | pridecat --{{flag}}
```

prime-run

Run a program using an alternative Nvidia graphics card.

More information: https://wiki.archlinux.org/title/PRIME#PRIME_render_offload.

- Run a program using a dedicated Nvidia GPU:

```
prime-run {{command}}
```

- Validate whether the Nvidia card is being used:

```
prime-run glxinfo | grep "OpenGL renderer"
```

prlimit

Get or set process resource soft and hard limits.

Given a process ID and one or more resources, prlimit tries to retrieve and/or modify the limits.

More information: https://manned.org/prlimit.

- Display limit values for all current resources for the running parent process:

```
prlimit
```

- Display limit values for all current resources of a specified process:

```
prlimit {{[-p|--pid]}} {{process_id_number}}
```

- Run a command with a custom number of open files limit:

```
prlimit {{[-n|--nofile=]}}{{10}} {{command}}
```

pro

Manage Ubuntu Pro services.

More information: https://manned.org/ubuntu-advantage.

- Connect your system to the Ubuntu Pro support contract:

```
sudo pro attach
```

- Display the status of Ubuntu Pro services:

```
pro status
```

- Check if the system is affected by a specific vulnerability (and apply a fix if possible):

```
pro fix {{CVE-number}}
```

- Display the number of unsupported packages:

```
pro security-status
```

- List packages that are no longer available for download:

```
pro security-status --unavailable
```

- List third-party packages:

```
pro security-status --thirdparty
```

proctl

Manage projects licenses and languages, switch between templated licenses.

More information: https://github.com/CreativeCodeCat/proctl.

- List available licenses:

```
proctl {{[-ll|-list-licenses]}}
```

- List available languages:

```
proctl {{[-lL|-list-languages]}}
```

- Pick a license in a FZF menu:

```
proctl {{[-pl|-pick-license]}}
```

- Pick a language in a FZF menu:

```
proctl {{[-pL|-pick-language]}}
```

- Remove all licenses from the current project:

```
proctl {{[-r|-remove-license]}}
```

- Create a new license template:

```
proctl {{[-t|-new-template]}}
```

- Delete a license from templates:

```
proctl {{[-R|-delete-license]}} {{@license_name1
@license_name2 ...}}
```

- Display help:

```
proctl {{[-h|-help]}}
```

Project Zomboid

Start a headless Project Zomboid server.

More information: https://pzwiki.net/wiki/Dedicated_server.

- Start the server:

  ```
  {{path/to}}/start-server.sh
  ```

- Start a server with a specific name:

  ```
  {{path/to}}/start-server.sh -servername {{server_name}}
  ```

protontricks

A simple wrapper that runs Winetricks commands for Proton enabled games.

More information: https://github.com/Matoking/protontricks#usage.

- Run the protontricks GUI:

```
protontricks --gui
```

- Run Winetricks for a specific game:

```
protontricks {{appid}} {{winetricks_args}}
```

- Run a command within a game's installation directory:

```
protontricks {{[-c|--command]}} {{command}} {{appid}}
```

- List all installed games:

```
protontricks {{[-l|--list]}}
```

- Search for a game's App ID by name:

```
protontricks {{[-s|--search]}} {{game_name}}
```

- Run an executable in the proton environment of a specific game:

```
protontricks-launch --appid {{appid}} {{path/to/
executable.exe}}
```

- Display help:

```
protontricks {{[-h|--help]}}
```

protonvpn connect

Connect to Proton VPN.

More information: https://protonvpn.com/support/linux-cli#how-to-use-the-cli-for-linux.

- Connect to Proton VPN using the fastest server available:

```
protonvpn connect
```

- Connect to the fastest server in a specific country:

```
protonvpn connect --country "{{country_code_or_name}}"
```

- Connect to the fastest server in a specific city:

```
protonvpn connect --city "{{city_name}}"
```

- Connect to a specific server:

```
protonvpn connect {{server_name}}
```

- Display help:

```
protonvpn connect {{[-h|--help]}}
```

protonvpn

Official Proton VPN client.

Some subcommands such as **`connect`** have their own usage documentation.

More information: https://protonvpn.com/support/linux-cli#how-to-use-the-cli-for-linux.

- Initialize Proton VPN profile:

```
protonvpn signin
```

- Remove account credentials:

```
protonvpn signout
```

- Display Proton VPN account information:

```
protonvpn info
```

- Connect to Proton VPN interactively:

```
protonvpn connect
```

- Disconnect from Proton VPN:

```
protonvpn disconnect
```

- Display help:

```
protonvpn {{[-h|--help]}}
```

prt-get

The CRUX package manager.

More information: https://crux.nu/doc/prt-get%20-%20User%20Manual.html.

- Install a package:

```
prt-get install {{package}}
```

- Install a package with dependency handling:

```
prt-get depinst {{package}}
```

- Update a package manually:

```
prt-get upgrade {{package}}
```

- Remove a package:

```
prt-get remove {{package}}
```

- Upgrade the system from the local ports tree:

```
prt-get sysup
```

- Search the ports tree:

```
prt-get search {{query}}
```

- Search for a file in a package:

```
prt-get fsearch {{file}}
```

pstoedit

Convert PDF files into various image formats.

More information: http://www.calvina.de/pstoedit/pstoedit.htm.

- Convert a PDF page to PNG or JPEG format:

```
pstoedit -page {{page_number}} -f magick {{path/to/file.pdf}} {{page.png|page.jpg}}
```

- Convert multiple PDF pages to numbered images:

```
pstoedit -f magick {{path/to/file}} {{page%d.png|page%d.jpg}}
```

pstree

A convenient tool to show running processes as a tree.

More information: https://manned.org/pstree.

- Display a tree of all processes (rooted at init):

```
pstree
```

- Display a tree of processes with PIDs:

```
pstree {{[-p|--show-pids]}}
```

- Display all process trees rooted at processes owned by specified user:

```
pstree {{user}}
```

- Display command line arguments:

```
pstree {{[-a|--arguments]}}
```

- Display children of a specified process:

```
pstree {{process_id}}
```

- Display parents of a specified process:

```
pstree {{[-s|--show-parents]}} {{process_id}}
```

ptx

Generate a permuted index of words from text files.

More information: https://www.gnu.org/software/coreutils/manual/html_node/ptx-invocation.html.

- Generate a permuted index where the first field of each line is an index reference:

```
ptx {{[-r|--references]}} {{path/to/file}}
```

- Generate a permuted index with automatically generated index references:

```
ptx {{[-A|--auto-reference]}} {{path/to/file}}
```

- Generate a permuted index with a fixed width:

```
ptx {{[-w|--width]}} {{width_in_columns}} {{path/to/file}}
```

- Generate a permuted index with a list of filtered words:

```
ptx {{[-o|--only-file]}} {{path/to/filter}} {{path/to/file}}
```

- Generate a permuted index with SYSV-style behaviors:

```
ptx {{[-G|--traditional]}} {{path/to/file}}
```

ptyxis

A container-oriented terminal for GNOME.

More information: https://gitlab.gnome.org/chergert/ptyxis#basic-usage--command-line-options.

- Open a new Ptyxis window:

```
ptyxis --new-window
```

- Execute a specific command in a new terminal window:

```
ptyxis {{[-x|--execute]}} {{command}}
```

- Open new tab in the last opened window:

```
ptyxis --tab
```

- Set the title for a new:

```
ptyxis --tab {{[-T|--title]}} {{title}}
```

- Specify the working directory for a new tab, window, or command execution:

```
ptyxis {{[-d|--working-directory]}} {{path/to/directory}} --tab
```

pulseaudio-ctl

Control PulseAudio volume.

More information: https://github.com/graysky2/pulseaudio-ctl.

- Increase volume by 5%:

```
pulseaudio-ctl up
```

- Increase volume by a specific amount:

```
pulseaudio-ctl up {{amount}}
```

- Decrease volume by 5%:

```
pulseaudio-ctl down
```

- Decrease volume by a specific amount:

```
pulseaudio-ctl down {{amount}}
```

- Set volume to a specific percentage:

```
pulseaudio-ctl set {{percentage}}
```

- Set volume to a specific percentage if the current volume is higher than the provided value:

```
pulseaudio-ctl atmost {{percentage}}
```

- Toggle mute:

```
pulseaudio-ctl mute
```

- Toggle microphone mute:

```
pulseaudio-ctl mute-input
```

pulseaudio

The PulseAudio sound system daemon and manager.

More information: https://manned.org/pulseaudio.

- Check if PulseAudio is running (a non-zero exit code means it is not running):

```
pulseaudio --check
```

- Start the PulseAudio daemon in the background:

```
pulseaudio --start
```

- Kill the running PulseAudio daemon:

```
pulseaudio {{[-k|--kill]}}
```

- List available modules:

```
pulseaudio --dump-modules
```

- Load a module into the currently running daemon with the specified arguments:

```
pulseaudio {{[-L|--load]}} "{{module_name}} {{arguments}}"
```

pvchange

Change attributes of physical volume(s).

More information: https://manned.org/pvchange.

- Allow allocation on a physical volume:

```
sudo pvchange {{[-x|--allocatable]}} y {{/dev/sdXN}}
```

- Disallow allocation on a physical volume:

```
sudo pvchange {{[-x|--allocatable]}} n {{/dev/sdXN}}
```

- Ignore metadata areas on a physical volume:

```
sudo pvchange --metadataignore y {{/dev/sdXN}}
```

- Stop ignoring metadata areas on a physical volume:

```
sudo pvchange --metadataignore n {{/dev/sdXN}}
```

- Add a tag to a physical volume:

```
sudo pvchange --addtag {{tag}} {{/dev/sdXN}}
```

- Generate a new UUID for a physical volume (use with care):

```
sudo pvchange --uuid {{/dev/sdXN}}
```

- Change all visible physical volumes (combine with other options such as allocatable):

```
sudo pvchange {{[-a|--all]}} {{[-x|--allocatable]}} y
```

pvck

Check and repair LVM metadata on physical volumes.

More information: https://manned.org/pvck.

- Print LVM on-disk headers and structures (label, PV header, MDA header, metadata area):

```
sudo pvck {{/dev/sdXN}} --dump headers
```

- Print the current VG metadata text:

```
sudo pvck {{/dev/sdXN}} --dump metadata
```

- List all metadata versions found in the metadata area:

```
sudo pvck {{/dev/sdXN}} --dump metadata_all
```

- Search common locations for metadata when headers may be damaged, and save it to a file:

```
sudo pvck {{/dev/sdXN}} --dump metadata_search {{[-f|--file]}} {{path/to/metadata.txt}}
```

- Select the second metadata area (mda2) when printing metadata:

```
sudo pvck {{/dev/sdXN}} --dump metadata --settings "mda_num=2"
```

- Repair headers and metadata using a metadata input file (use with care):

```
sudo pvck {{/dev/sdXN}} --repair {{[-f|--file]}} {{path/to/metadata_file}}
```

- Repair only the PV header and label header:

```
sudo pvck {{/dev/sdXN}} --repairtype pv_header
```

pvcreate

Initialize a disk or partition for use as a physical volume.

See also: **`lvm`**.

More information: https://manned.org/pvcreate.

- Initialize the `/dev/sda1` volume for use by LVM:

```
sudo pvcreate {{/dev/sdXY}}
```

- Force the creation without any confirmation prompts:

```
sudo pvcreate {{[-f|--force]}} {{/dev/sdXY}}
```

pvdisplay

Display information about Logical Volume Manager (LVM) physical volumes.

See also: **`lvm`**.

More information: https://manned.org/pvdisplay.

- Display information about all physical volumes:

```
sudo pvdisplay
```

- Display information about the physical volume on drive `/dev/sdXY`:

```
sudo pvdisplay {{/dev/sdXY}}
```

pve-firewall

Manage Proxmox VE Firewall.

More information: https://pve.proxmox.com/wiki/Firewall.

- Compile and print all firewall rules:

  ```
  pve-firewall {{[c|compile]}}
  ```

- Show information about the local network:

  ```
  pve-firewall {{[l|localnet]}}
  ```

- Restart the Proxmox VE Firewall service:

  ```
  pve-firewall {{[r|restart]}}
  ```

- Start the Proxmox VE Firewall service:

  ```
  pve-firewall start
  ```

- Stop the Proxmox VE Firewall service:

  ```
  pve-firewall stop
  ```

- Simulate all firewall rules:

  ```
  pve-firewall {{[si|simulate]}}
  ```

- Show the status of Proxmox VE Firewall:

  ```
  pve-firewall status
  ```

pveam

Manage LXC container templates.

More information: https://pve.proxmox.com/pve-docs/pveam.1.html.

- Update container template database:

```
pveam {{[u|update]}}
```

- List available templates:

```
pveam {{[a|available]}}
```

- Download a template:

```
pveam {{[d|download]}} {{local}} {{template_name}}
```

- List downloaded templates:

```
pveam {{[l|list]}} {{local}}
```

- List available templates in a specific section:

```
pveam {{[a|available]}} --section {{system|turnkeylinux|
mail}}
```

- Remove a template:

```
pveam {{[r|remove]}} {{local}}:{{vztmpl}}/{{template_name}}
```

pvecm

Proxmox VE Cluster Manager.

More information: https://pve.proxmox.com/pve-docs/pvecm.1.html.

- Add the current node to an existing cluster:

```
pvecm add {{hostname_or_ip}}
```

- Add a node to the cluster configuration (internal use):

```
pvecm {{[addn|addnode]}} {{node}}
```

- Display the version of the cluster join API available on this node:

```
pvecm {{[ap|apiver]}}
```

- Generate new cluster configuration:

```
pvecm {{[c|create]}} {{clustername}}
```

- Remove a node from the cluster configuration:

```
pvecm {{[d|delnode]}} {{node}}
```

- Display the local view of the cluster nodes:

```
pvecm {{[n|nodes]}}
```

- Display the local view of the cluster status:

```
pvecm {{[s|status]}}
```

pvenode config

Get and set node configuration.

More information: https://pve.proxmox.com/pve-docs/pvenode.1.html#cli_pvenode_config_get.

- Display the whole configuration located in `/etc/pve/nodes/node_name/config`:

```
pvenode {{[co|config]}} {{[g|get]}}
```

- Display a specific property:

```
pvenode {{[co|config]}} {{[g|get]}} --property {{property_name}}
```

- Set the node description shown in the "Notes" tab:

```
pvenode {{[co|config]}} {{[s|set]}} --description {{description_text}}
```

- Set the location information of a node:

```
pvenode {{[co|config]}} {{[s|set]}} --location latitude={{latitude}},longitude={{longitude}}
```

- Delete a setting:

```
pvenode {{[co|config]}} {{[s|set]}} --delete {{property_name}}
```

pveperf

A benchmarking tool in Proxmox Server. Gather CPU and hard disk performance data for the hard disk.

More information: https://pve.proxmox.com/pve-docs/pveperf.1.html.

- Show CPU and hard disk performance data for the hard disk mounted at `/`:

```
pveperf
```

pvesh

Interface with the Proxmox VE API.

More information: https://pve.proxmox.com/pve-docs/pvesh.1.html.

- List available nodes:

```
pvesh {{[g|get]}} /nodes
```

- Display detailed information about containers or virtual machines:

```
pvesh {{[g|get]}} /nodes/{{node_name}}/{{lxc|qemu}}
```

- Discover API paths:

```
pvesh {{[l|ls]}} {{/}}
```

- Display API path usage instructions:

```
pvesh {{[u|usage]}} {{/pools}}
```

- Add a new thinpool to Proxmox:

```
pvesh create /storage --storage {{storage_id}} --vgname
{{volume_group}} --type lvmthin --thinpool {{thinpool_name}}
--content {{content_type1,content_type2,...}}
```

pvesm add

Add storages.

More information: https://pve.proxmox.com/pve-docs/pvesm.1.html#cli_pvesm_add.

- Add a directory storage:

```
pvesm {{[ad|add]}} dir {{storage_name}} --path {{path/to/directory}}
```

- Add an LVM storage:

```
pvesm {{[ad|add]}} lvm {{storage_name}} --vgname {{volume_group_name}}
```

- Add an LVM-Thin storage:

```
pvesm {{[ad|add]}} lvmthin {{storage_name}} --vgname {{volume_group_name}} --thinpool {{logical_volume_name}}
```

pvesm

Manage Proxmox storage.

More information: https://pve.proxmox.com/pve-docs/pvesm.1.html.

- Get status for all datastores:

```
pvesm {{[st|status]}}
```

- List storage contents:

```
pvesm {{[l|list]}} {{storage_name}}
```

- View the path of a stored file:

```
pvesm {{[pa|path]}} {{storage_name}}:{{content_type}}/
{{file_name}}
```

- Add a directory storage:

```
pvesm {{[ad|add]}} dir {{storage_name}} --path {{path/to/
directory}}
```

- Set a storage to contain specific content:

```
pvesm {{[se|set]}} {{storage_name}} --content
{{iso,images,backup,vztmpl,rootdir,snippets,import}}
```

- Delete a file from storage:

```
pvesm {{[f|free]}} {{local:iso/archlinux-2025.08.01-
x86_64.iso}}
```

- Remove a storage:

```
pvesm {{[r|remove]}} {{storage_name}}
```

pvesubscription

Manage Proxmox subscription keys.

More information: https://pve.proxmox.com/pve-docs/pvesubscription.1.html.

- Display subscription information:

  `pvesubscription {{[g|get]}}`

- Set the subscription key:

  `pvesubscription set {{subscription_key}}`

- Update subscription information:

  `pvesubscription {{[u|update]}}`

- Delete the subscription key from the current node:

  `pvesubscription {{[d|delete]}}`

pveum

Manage proxmox users.

More information: https://pve.proxmox.com/pve-docs/pveum.1.html.

- List users:

```
pveum {{[u|user]}} {{[l|list]}}
```

- Add a user:

```
pveum {{[u|user]}} {{[a|add]}} {{username}}@pve
```

- Add a user with an email, description, and password:

```
pveum {{[u|user]}} {{[a|add]}} {{username}}@pve --email
{{email_address}} --comment {{description}} --password
{{password}}
```

- Change user password:

```
pveum {{[pa|passwd]}} {{username}}@pve
```

- Delete a user:

```
pveum {{[u|user]}} {{[d|delete]}} {{username}}@pve
```

- Give a user access to a specific VM with specific permissions:

```
pveum {{[a|acl]}} {{[m|modify]}} /vms/{{1000}} --user
{{username}}@pve --role {{PVEVMUser}}
```

pveversion

Proxmox VE version info.

More information: https://pve.proxmox.com/wiki/Command_Line_Tools#Software_version_check.

- Print system version:

```
pveversion
```

- Print Proxmox subpackage versions:

```
pveversion {{[-v|--verbose]}}
```

pvremove

Remove LVM labels from physical volume(s).

More information: https://manned.org/pvremove.

- Remove a LVM label from a physical volume:

```
sudo pvremove {{/dev/sdXY}}
```

- Display detailed output during the operation:

```
sudo pvremove {{[-v|--verbose]}} {{/dev/sdXY}}
```

- Remove a LVM label without asking for confirmation:

```
sudo pvremove {{[-y|--yes]}} {{/dev/sdXY}}
```

- Forcefully remove a LVM label:

```
sudo pvremove {{[-f|--force]}} {{/dev/sdXY}}
```

- Display output in JSON format:

```
sudo pvremove --reportformat json {{/dev/sdXY}}
```

pvs

Display information about physical volumes.

See also: **`lvm`**.

More information: https://manned.org/pvs.

- Display information about physical volumes:

```
sudo pvs
```

- Display non-physical volumes:

```
sudo pvs {{[-a|--all]}}
```

- Change default display to show more details:

```
sudo pvs {{[-v|--verbose]}}
```

- Display only specific fields:

```
sudo pvs {{[-o|--options]}} {{field_name_1,field_name_2,...}}
```

- Append field to default display:

```
sudo pvs {{[-o|--options]}} +{{field_name}}
```

- Suppress heading line:

```
sudo pvs --noheadings
```

- Use separator to separate fields:

```
sudo pvs --separator {{special_character}}
```

pvscan

List all physical volumes and manage their online status.

More information: https://manned.org/pvscan.

- List all physical volumes:

```
sudo pvscan
```

- Show the volume group that uses a specific physical volume:

```
sudo pvscan --cache --listvg {{/dev/sdX}}
```

- Show logical volumes that use a specific physical volume:

```
sudo pvscan --cache --listlvs {{/dev/sdX}}
```

- Display detailed information in JSON format:

```
sudo pvscan --reportformat json
```

pw-cat

Play and record audio files through PipeWire.

See also: **`wpctl`**, **`pw-cli`**.

More information: https://docs.pipewire.org/page_man_pw-cat_1.html.

- Play a WAV file over the default target:

```
pw-cat {{[-p|--playback]}} {{path/to/file.wav}}
```

- Play a MIDI file:

```
pw-cat {{[-pm|--playback --midi]}} {{path/to/file.mid}}
```

- Play a DSD file:

```
pw-cat {{[-pd|--playback --dsd]}} {{path/to/file.dsf}}
```

- Play a compressed audio file using passthrough (requires FFmpeg integration):

```
pw-cat {{[-po|--playback --encoded]}} {{path/to/file.ac3}}
```

- Play a WAV file with a specified resampler quality (4 by default):

```
pw-cat {{[-p|--playback]}} {{[-q|--quality]}} {{0..15}} {{path/to/file.wav}}
```

- Record a MIDI file:

```
pw-cat {{[-rm|--record --midi]}} {{path/to/file.mid}}
```

- Record a sample recording at a volume level of 125%:

```
pw-cat {{[-r|--record]}} --volume {{1.25}} {{path/to/file.wav}}
```

- Record a sample recording using a different sample rate:

```
pw-cat {{[-r|--record]}} --rate {{6000}} {{path/to/file.wav}}
```

pw-cli

Manage a PipeWire instance's modules, objects, nodes, devices, links, and much more.

See also: **`wpctl`**.

More information: https://docs.pipewire.org/page_man_pw-cli_1.html.

- Print information of all object of a specific type:

```
pw-cli {{[ls|list-objects]}} {{Node|Link|Port|Client|Device|
Metadata|Factory|Module|Profiler|SecurityContext|Core}}
```

- Print information about an object with a specific ID:

```
pw-cli {{[i|info]}} {{4}}
```

- Print all objects' information:

```
pw-cli {{[i|info]}} all
```

- Monitor for object changes:

```
pw-cli {{[-m|--monitor]}}
```

- Display help:

```
pw-cli {{[h|help]}}
```

pw-config

List configuration paths and sections that will be used by the PipeWire server and clients.

More information: https://docs.pipewire.org/page_man_pw-config_1.html.

- List all configuration files that will be used:

```
pw-config
```

- List all configuration files that will be used by the PipeWire PulseAudio server:

```
pw-config {{[-n|--name]}} pipewire-pulse.conf
```

- List all configuration sections used by the PipeWire PulseAudio server:

```
pw-config {{[-n|--name]}} pipewire-pulse.conf list
```

- List the `context.properties` fragments used by the JACK clients:

```
pw-config {{[-n|--name]}} jack.conf list context.properties
```

- List the merged `context.properties` used by the JACK clients:

```
pw-config {{[-n|--name]}} jack.conf merge context.properties
```

- List the merged `context.modules` used by the PipeWire server and reformat:

```
pw-config {{[-n|--name]}} pipewire.conf {{[-r|--recurse]}} merge context.modules
```

- Display help:

```
pw-config {{[-h|--help]}}
```

pw-container

Run a program in a new security context.

More information: https://docs.pipewire.org/page_man_pw-container_1.html.

- Create a new security context and print its socket address to `stdout`:

```
pw-container
```

- Run a specific program within a new security context:

```
pw-container {{command}} {{argument1 argument2 ...}}
```

- Run a program, connecting to a specific remote PipeWire instance:

```
pw-container {{[-r|--remote]}} {{remote_instance_name}}
{{command}}
```

- Run a program in a new context with specific properties using a JSON object:

```
pw-container {{[-P|--properties]}} '{{{"key":
"value"}}}' {{command}}
```

- Display help:

```
pw-container {{[-h|--help]}}
```

pw-dot

Create **`.dot`** files of the PipeWire graph.

See also: **`dot`**.

More information: https://docs.pipewire.org/page_man_pw-dot_1.html.

- Generate a graph to `pw.dot` file:

```
pw-dot
```

- Read objects from `pw-dump` JSON file:

```
pw-dot {{[-j|--json]}} {{path/to/file.json}}
```

- Specify an output file, showing all object types:

```
pw-dot {{[-o|--output]}} {{path/to/file.dot}} {{[-a|--all]}}
```

- Print `.dot` graph to `stdout`, showing all object properties:

```
pw-dot {{[-o|--output]}} - {{[-d|--detail]}}
```

- Generate a graph from a remote instance, showing only linked objects:

```
pw-dot {{[-r|--remote]}} {{remote_name}} {{[-s|--smart]}}
```

- Lay the graph from left to right, instead of dot's default top to bottom:

```
pw-dot {{[-L|--lr]}}
```

- Lay the graph using 90-degree angles in edges:

```
pw-dot {{[-9|--90]}}
```

- Display help:

```
pw-dot {{[-h|--help]}}
```

pw-dsdplay

This command is an alias of **`pw-cat --playback --dsd`**.

- View documentation for the original command:

  ```
  tldr pw-cat
  ```

pw-dump

Dump PipeWire's current state as JSON, including the information on nodes, devices, modules, ports, and other objects.

See also: **pw-mon**.

More information: https://docs.pipewire.org/page_man_pw-dump_1.html.

- Print a JSON representation of the default PipeWire instance's current state:

```
pw-dump
```

- Print a JSON representation of an object:

```
pw-dump {{object_id}}
```

- Dump the current state monitoring changes, printing it again:

```
pw-dump {{[-m|--monitor]}}
```

- Dump the current state of a remote instance to a file:

```
pw-dump {{[-r|--remote]}} {{remote_name}} > {{path/to/dump_file.json}}
```

- Set a color configuration:

```
pw-dump {{[-C|--color]}} {{never|always|auto}}
```

- Display help:

```
pw-dump {{[-h|--help]}}
```

pw-encplay

This command is an alias of **`pw-cat --playback --encoded`**.

- View documentation for the original command:

  ```
  tldr pw-cat
  ```

pw-jack

Run a JACK application with PipeWire.

More information: https://docs.pipewire.org/page_man_pw-jack_1.html.

- Run a command with its arguments, using PipeWire:

```
pw-jack {{command}} {{argument1 argument2 ...}}
```

- Run a command in verbose mode:

```
pw-jack -v {{command}}
```

- Connect to a specific remote PipeWire instance:

```
pw-jack -r {{remote_instance_name}} {{command}}
```

- Display help:

```
pw-jack -h
```

pw-link

Manage links between ports in PipeWire.

More information: https://gitlab.freedesktop.org/pipewire/pipewire/-/wikis/Virtual-Devices.

- List all audio output and input ports with their IDs:

```
pw-link {{[-oiI|--output --input --id]}}
```

- Create a link between an output and an input port:

```
pw-link {{output_port_name}} {{input_port_name}}
```

- Disconnect two ports:

```
pw-link {{[-d|--disconnect]}} {{output_port_name}} {{input_port_name}}
```

- List all links with their IDs:

```
pw-link {{[-lI|--links --id]}}
```

- Display help:

```
pw-link {{[-h|--help]}}
```

pw-loopback

Create loopback devices in PipeWire.

More information: https://docs.pipewire.org/page_man_pw-loopback_1.html.

- Create a loopback device with the default loopback behavior:

```
pw-loopback
```

- Create a loopback device that automatically connects to the speakers:

```
pw-loopback {{[-i|--capture-props]}} '{{media.class=Audio/Sink}}'
```

- Create a loopback device that automatically connects to the microphone:

```
pw-loopback {{[-o|--playback-props]}} '{{media.class=Audio/Source}}'
```

- Create a dummy loopback device that doesn't automatically connect to anything:

```
pw-loopback {{[-i|--capture-props]}} '{{media.class=Audio/Sink}}' {{[-o|--playback-props]}} '{{media.class=Audio/Source}}'
```

- Force the nodes to have specific ports:

```
pw-loopback {{[-m|--channel-map]}} '[{{FL FR}}]'
```

- Create a loopback device that automatically connects to the speakers and swaps the left and right channels between the sink and source:

```
pw-loopback {{[-i|--capture-props]}} '{{media.class=Audio/Sink audio.position=[FL FR]}}' {{[-o|--playback-props]}} '{{audio.position=[FR FL]}}'
```

- Create a loopback device that automatically connects to the microphone and swaps the left and right channels between the sink and source:

```
pw-loopback {{[-i|--capture-props]}} '{{audio.position=[FR FL]}}' {{[-o|--playback-props]}} '{{media.class=Audio/Source audio.position=[FL FR]}}'
```

- Give the loopback node a name:

```
pw-loopback {{[-n|--name]}} "{{node_name}}"
```

pw-metadata

Monitor, set, and delete metadata on PipeWire objects.

See also: **`pipewire`**, **`pw-mon`**, **`pw-cli`**.

More information: https://docs.pipewire.org/page_man_pw-metadata_1.html.

- Show metadata in `default` name:

```
pw-metadata
```

- Show metadata with ID 0 in `settings`:

```
pw-metadata {{[-n|--name]}} {{settings}} {{0}}
```

- List all available metadata objects:

```
pw-metadata {{[-l|--list]}}
```

- Keep running and log the changes to the metadata:

```
pw-metadata {{[-m|--monitor]}}
```

- Delete all metadata:

```
pw-metadata {{[-d|--delete]}}
```

- Set `log.level` to 1 in `settings`:

```
pw-metadata {{[-n|--name]}} {{settings}} {{0}} {{log.level}} {{1}}
```

- Display help:

```
pw-metadata {{[-h|--help]}}
```

pw-midi2play

Play MIDI 2.0 clips through PipeWire.

Note: This command is an alias of **`pw-cat --playback --midi-clip`**.

See also: **`pw-cat`**, **`pw-midi2record`**, **`pw-midiplay`**.

More information: https://docs.pipewire.org/page_man_pw-cat_1.html.

- Play a MIDI 2.0 clip file over the default target:

```
pw-midi2play {{path/to/file.mid}}
```

- Play a MIDI clip, forcing the MIDI format to use (defaults to `ump`):

```
pw-midi2play {{[-M|--force-midi]}} {{midi|ump}} {{path/to/file.mid}}
```

- Display help:

```
pw-midi2play {{[-h|--help]}}
```

pw-midi2record

Record MIDI 2.0 clips through PipeWire.

Note: This command is an alias of **`pw-cat --record --midi-clip`**.

See also: **`pw-cat`**, **`pw-midi2play`**, **`pw-midirecord`**.

More information: https://docs.pipewire.org/page_man_pw-cat_1.html.

- Record a MIDI 2.0 clip file from the default source:

```
pw-midi2record {{path/to/file.mid}}
```

- Record a MIDI clip, forcing the MIDI format to use (defaults to ump):

```
pw-midi2record {{[-M|--force-midi]}} {{midi|ump}} {{path/to/file.mid}}
```

- Display help:

```
pw-midi2record {{[-h|--help]}}
```

pw-mididump

Dump MIDI messages to **`stdout`**.

More information: https://docs.pipewire.org/page_man_pw-mididump_1.html.

- Listen for and dump all incoming MIDI events:

```
pw-mididump
```

- Dump MIDI events from a specific file:

```
pw-mididump {{path/to/file.mid}}
```

- Connect to a specific remote PipeWire instance:

```
pw-mididump {{[-r|--remote]}} {{remote_instance_name}}
```

- Display help:

```
pw-mididump {{[-h|--help]}}
```

pw-midiplay

This command is an alias of **`pw-cat --playback --midi`**.

- View documentation for the original command:

  ```
  tldr pw-cat
  ```

pw-midirecord

This command is an alias of **`pw-cat --record --midi`**.

- View documentation for the original command:

  ```
  tldr pw-cat
  ```

pw-mon

Monitor objects on the PipeWire instance.

More information: https://docs.pipewire.org/page_man_pw-mon_1.html.

- Monitor the default PipeWire instance:

```
pw-mon
```

- Monitor a specific remote instance:

```
pw-mon {{[-r|--remote]}} {{remote_name}}
```

- Monitor the default instance specifying a color configuration:

```
pw-mon {{[-N|--color]}} {{never|always|auto}}
```

- Display help:

```
pw-mon {{[-h|--help]}}
```

pw-play

This command is an alias of **`pw-cat --playback`**.

- View documentation for the original command:

  ```
  tldr pw-cat
  ```

pw-profiler

Profile a local or remote instance.

More information: https://docs.pipewire.org/page_man_pw-profiler_1.html.

- Profile the default instance, logging to `profile.log` (`gnuplot` files and a HTML file for result visualizing are also generated):

```
pw-profiler
```

- Change the log output file:

```
pw-profiler {{[-o|--output]}} {{path/to/file.log}}
```

- Profile a remote instance:

```
pw-profiler {{[-r|--remote]}} {{remote_name}}
```

- Display help:

```
pw-profiler {{[-h|--help]}}
```

pw-record

This command is an alias of **`pw-cat --record`**.

- View documentation for the original command:

  ```
  tldr pw-cat
  ```

pw-reserve

Reserve a device for PipeWire.

More information: https://docs.pipewire.org/page_man_pw-reserve_1.html.

- Reserve a device (currently only supports audio devices):

```
pw-reserve {{[-n|--name]}} {{audioN}}
```

- Monitor a device instead of reserving it:

```
pw-reserve {{[-n|--name]}} {{audioN}} {{[-m|--monitor]}}
```

- Display help:

```
pw-reserve {{[-h|--help]}}
```

pw-top

View the PipeWire nodes and devices statistics in real-time.

See also: **`pipewire`**, **`pw-dump`**, **`pw-cli`**, **`pw-profiler`**.

More information: https://docs.pipewire.org/page_man_pw-top_1.html.

- Display an interactive view of PipeWire nodes and devices:

```
pw-top
```

- Monitor a remote instance:

```
pw-top {{[-r|--remote]}} {{remote_name}}
```

- Print information periodically instead of running in interactive mode:

```
pw-top {{[-b|--batch-mode]}}
```

- Print information periodically for a specific number of times:

```
pw-top {{[-b|--batch-mode]}} {{[-n|--iterations]}} {{3}}
```

pw-v4l2

Use v4l2 programs within PipeWire.

More information: https://docs.pipewire.org/page_man_pw-v4l2_1.html.

- Run a program:

```
pw-v4l2 {{program}}
```

- Display help:

```
pw-v4l2 -h
```

pwdx

Print working directory of a process.

More information: https://manned.org/pwdx.

- Print current working directory of a process:

```
pwdx {{process_id}}
```

pwn

Exploit Development Library designed for rapid prototyping.

More information: https://docs.pwntools.com/en/stable/commandline.html.

- Convert the given assembly code to `bytes`:

```
pwn asm "{{xor edi, edi}}"
```

- Create a cyclic pattern of the specific number of characters:

```
pwn cyclic {{number}}
```

- Encode the given data into the hexadecimal system:

```
pwn hex {{deafbeef}}
```

- Decode the given data from hexadecimal:

```
pwn unhex {{6c4f7645}}
```

- Print a x64 Linux shellcode for running a shell:

```
pwn shellcraft {{amd64.linux.sh}}
```

- Check the binary security settings for the given ELF file:

```
pwn checksec {{path/to/file}}
```

- Check for Pwntools updates:

```
pwn update
```

- Display version:

```
pwn version
```

pyrit

WPA/WPA2 cracking tool using computational power.

More information: https://manned.org/pyrit.

- Display system cracking speed:

```
pyrit benchmark
```

- List available cores:

```
pyrit list_cores
```

- Set [e]SSID:

```
pyrit -e "{{extended_ssid}}" create_essid
```

- [r]ead and analyze a specific packet capture file:

```
pyrit -r {{path/to/file.cap|path/to/file.pcap}} analyze
```

- Read and [i]mport passwords to the current database:

```
pyrit -i {{path/to/file}} {{import_unique_passwords|
unique_passwords|import_passwords}}
```

- Exp[o]rt passwords from database to a specific file:

```
pyrit -o {{path/to/file}} export_passwords
```

- Translate passwords with Pired Master Keys:

```
pyrit batch
```

- [r]ead the capture file and crack the password:

```
pyrit -r {{path/to/file}} attack_db
```

qjoypad

Translate input from gamepads or joysticks into keyboard strokes or mouse actions.

More information: https://qjoypad.sourceforge.net/doc/doc_index.html.

- Start QJoyPad:

```
qjoypad
```

- Start QJoyPad and look for devices in a specific directory:

```
qjoypad --device={{path/to/directory}}
```

- Start QJoyPad but don't show a system tray icon:

```
qjoypad --notray
```

- Start QJoyPad and force the window manager to use a system tray icon:

```
qjoypad --force-tray
```

- Force a running instance of QJoyPad to update its list of devices and layouts:

```
qjoypad --update
```

- Load the given layout in an already running instance of QJoyPad, or start QJoyPad using the given layout:

```
qjoypad "{{layout}}"
```

qm agent

This command is an alias of **`qm guest cmd`**.

- View documentation for the original command:

```
tldr qm guest
```

qm cleanup

Clean up resources on QEMU/KVM Virtual Machine Manager like tap devices, VGPUs, etc.

Called after a VM shuts down, crashes, etc.

More information: https://pve.proxmox.com/pve-docs/qm.1.html#cli_qm_cleanup.

- Clean up resources:

```
qm {{[cle|cleanup]}} {{100}} {{true|false}} {{true|false}}
```

- Indicate to the system that the VM was not shut down cleanly:

```
qm {{[cle|cleanup]}} {{100}} false {{true|false}}
```

- Indicate to the system that the shutdown was requested by the guest:

```
qm {{[cle|cleanup]}} {{100}} {{true|false}} true
```

qm clone

Create a copy of virtual machine on QEMU/KVM Virtual Machine Manager.

More information: https://pve.proxmox.com/pve-docs/qm.1.html#cli_qm_clone.

- Copy a virtual machine:

```
qm clone {{100}} {{101}}
```

- Copy a virtual machine using a specific name:

```
qm clone {{100}} {{101}} --name {{name}}
```

- Copy a virtual machine using a specific description:

```
qm clone {{100}} {{101}} --description {{description}}
```

- Copy a virtual machine creating a full copy of all disks:

```
qm clone {{100}} {{101}} --full
```

- Copy a virtual machine using a specific format for file storage (requires `--full`):

```
qm clone {{100}} {{101}} --full --format {{qcow2|raw|vmdk}}
```

- Copy a virtual machine then add it to a specific pool:

```
qm clone {{100}} {{101}} --pool {{pool_name}}
```

qm cloudinit

Manage Cloud-Init settings.

More information: https://pve.proxmox.com/pve-docs/qm.1.html#cli_qm_cloudinit_dump.

- Generate a cloudinit file for a specific configuration type:

```
qm {{[clou|cloudinit]}} {{[d|dump]}} {{100}} {{meta|network|user}}
```

qm config

Display the virtual machine configuration with pending configuration changes applied.

More information: https://pve.proxmox.com/pve-docs/qm.1.html#cli_qm_config.

- Display the virtual machine configuration:

  ```
  qm {{[co|config]}} {{100}}
  ```

- Display the current configuration values instead of pending values for the virtual machine:

  ```
  qm {{[co|config]}} --current {{true}} {{100}}
  ```

- Fetch the configuration values from the given snapshot:

  ```
  qm {{[co|config]}} --snapshot {{snapshot_name}} {{100}}
  ```

qm create

Create or restore a virtual machine on QEMU/KVM Virtual Machine Manager.

More information: https://pve.proxmox.com/pve-docs/qm.1.html#cli_qm_create.

- Create a virtual machine with access to 512MiB of memory and 1 CPU core:

```
qm {{[cr|create]}} {{100}}
```

- Give the virtual machine a name and automatically start the machine after creation:

```
qm {{[cr|create]}} {{100}} --name {{vm_name}} --start
```

- Give a virtual machine specified amount of memory and CPUs:

```
qm {{[cr|create]}} {{100}} --memory {{8192}} --cores {{4}}
```

- Specify the type of operating system on the machine:

```
qm {{[cr|create]}} {{100}} --ostype {{win10}}
```

- Replace an existing machine (requires archiving it):

```
qm {{[cr|create]}} {{100}} --archive {{path/to/
backup_file.tar}} --force 1
```

- Specify a script that is executed automatically depending on the state of the virtual machine:

```
qm {{[cr|create]}} {{100}} --hookscript {{path/to/script.pl}}
```

- Specify the install media:

```
qm {{[cr|create]}} {{100}} --cdrom {{local:iso/install-
media.iso}}
```

- Create a VM that bridges itself to the host network:

```
qm {{[cr|create]}} {{100}} --net{{0}} virtio,bridge=vmbr{{0}}
```

qm delsnapshot

Delete virtual machine snapshots.

More information: https://pve.proxmox.com/pve-docs/qm.1.html#cli_qm_delsnapshot.

- Delete a snapshot:

```
qm {{[del|delsnapshot]}} {{100}} {{snapshot_name}}
```

- Delete a snapshot from a configuration file (even if removing the disk snapshot fails):

```
qm {{[del|delsnapshot]}} {{100}} {{snapshot_name}} --force 1
```

qm destroy

Destroy a virtual machine in QEMU/KVM Virtual Machine Manager.

More information: https://pve.proxmox.com/pve-docs/qm.1.html#cli_qm_destroy.

- Destroy a specific virtual machine:

```
qm {{[des|destroy]}} {{100}}
```

- Destroy all disks that are not explicitly referenced in a specific virtual machine's configuration:

```
qm {{[des|destroy]}} {{100}} --destroy-unreferenced-disks
```

- Destroy a virtual machine and remove from all locations (inventory, backup jobs, high availability managers, etc.):

```
qm {{[des|destroy]}} {{100}} --purge
```

- Destroy a specific virtual machine ignoring locks and forcing destroy:

```
sudo qm {{[des|destroy]}} {{100}} --skiplock
```

qm disk

Manage disk images.

More information: https://pve.proxmox.com/pve-docs/qm.1.html#cli_qm_disk_import.

- Add n gigabytes to a virtual disk:

```
qm {{[di|disk]}} {{[resi|resize]}} {{100}} {{disk_name}} +{{n}}G
```

- Move a virtual disk:

```
qm {{[di|disk]}} {{[m|move]}} {{100}} {{scic0}} {{destination_storage_name}}
```

- Delete the previous copy of the virtual disk:

```
qm {{[di|disk]}} {{[m|move]}} {{100}} {{scic0}} {{destination_storage_name}} --delete
```

- Import a VMDK/.qcow2/raw disk image using a specific storage name:

```
qm {{[di|disk]}} {{[i|import]}} {{100}} {{path/to/disk}} {{storage_name}} --format {{qcow2|raw|vmdk}}
```

- Rescan all storages and update disk sizes and unused disk images:

```
qm {{[di|disk]}} {{[resc|rescan]}}
```

- Simulate a rescan without writing any changes to configurations:

```
qm {{[di|disk]}} {{[resc|rescan]}} --dryrun
```

- Specify a virtual machine by its ID:

```
qm {{[di|disk]}} {{[resc|rescan]}} --vmid {{100}}
```

- Delete a disk:

```
qm {{[di|disk]}} {{[u|unlink]}} {{100}} --idlist {{unused0,unused1,scsi1,...}}
```

qm guest exec

Execute a specific command via a guest agent.

More information: https://pve.proxmox.com/pve-docs/qm.1.html#cli_qm_guest_exec.

- Execute a specific command via a guest agent:

```
qm {{[g|guest]}} exec {{100}} {{command}} {{argument1 argument2 ...}}
```

- Execute a specific command via a guest agent asynchronously:

```
qm {{[g|guest]}} exec {{100}} {{argument1 argument2 ...}} --synchronous 0
```

- Execute a specific command via a guest agent with a specified timeout of 10 seconds:

```
qm {{[g|guest]}} exec {{100}} {{argument1 argument2...}} --timeout {{10}}
```

- Execute a specific command via a guest agent and forward input from `stdin` until EOF to the guest agent:

```
qm {{[g|guest]}} exec {{100}} {{argument1 argument2 ...}} --pass-stdin 1
```

qm guest

Manage a VM guest agent.

More information: https://pve.proxmox.com/pve-docs/qm.1.html#cli_qm_guest_cmd.

- Print the status of a specific PID:

```
qm {{[g|guest]}} {{[exec-s|exec-status]}} {{100}} {{process_id}}
```

- Set a password for a specific user in a virtual machine interactively:

```
qm {{[g|guest]}} {{[p|passwd]}} {{100}} {{username}}
```

- Set an already hashed password for a specific user in a virtual machine interactively:

```
qm {{[g|guest]}} {{[p|passwd]}} {{100}} {{username}} --crypted 1
```

- Execute a specific QEMU Guest Agent command:

```
qm {{[g|guest]}} {{[c|cmd]}} {{100}} {{fsfreeze-freeze|fsfreeze-status|fsfreeze-thaw|fstrim|get-fsinfo|...}}
```

- Execute a specific command via a guest agent:

```
qm {{[g|guest]}} exec {{100}} {{command}} {{argument1 argument2 ...}}
```

- Execute a specific command via a guest agent asynchronously:

```
qm {{[g|guest]}} exec {{100}} {{argument1 argument2 ...}} --synchronous 0
```

- Execute a specific command via a guest agent with a specified timeout of 10 seconds:

```
qm {{[g|guest]}} exec {{100}} {{argument1 argument2...}} --timeout {{10}}
```

- Execute a specific command via a guest agent and forward input from `stdin` until EOF to the guest agent:

```
qm {{[g|guest]}} exec {{100}} {{argument1 argument2 ...}} --pass-stdin 1
```

qm help

Display help for a command.

More information: https://pve.proxmox.com/pve-docs/qm.1.html#cli_qm_help.

- Display help for a specific command:

```
qm {{[h|help]}} {{command}}
```

- Display help for a specific command with detailed information:

```
qm {{[h|help]}} {{command}} --verbose {{true|false}}
```

qm import

Import supported images from VMware, VirtualBox, etc.

More information: https://pve.proxmox.com/pve-docs/qm.1.html#cli_qm_import.

- Import an image:

```
qm {{[i|import]}} {{100}} {{storage_name}}:{{import}}/
{{file_name}} --storage {{destination_storage}}
```

qm importdisk

This command is an alias of **`qm disk import`**.

- View documentation for the original command:

```
tldr qm disk
```

qm importovf

Import a virtual machine from an Open Virtualization Format manifest.

More information: https://pve.proxmox.com/pve-docs/qm.1.html#cli_qm_importovf.

- Import from an OVF manifest and its accompanying files:

```
qm importovf {{100}} {{path/to/manifest}}.ovf {{storage_name}}
```

qm list

List all virtual machines.

More information: https://pve.proxmox.com/pve-docs/qm.1.html#cli_qm_list.

- List all virtual machines:

  ```
  qm list
  ```

- List all virtual machines with a full status about the ones which are currently running:

  ```
  qm list --full 1
  ```

qm listsnapshot

List snapshots of virtual machines.

More information: https://pve.proxmox.com/pve-docs/qm.1.html#cli_qm_listsnapshot.

- List all snapshots of a specific virtual machine:

```
qm {{[lists|listsnapshot]}} {{100}}
```

qm migrate

Migrate a virtual machine.

Used to create a new migration task.

More information: https://pve.proxmox.com/pve-docs/qm.1.html#cli_qm_migrate.

- Migrate a specific virtual machine:

```
qm {{[mi|migrate]}} {{100}} {{target}}
```

- Override the current I/O bandwidth limit with 10 KiB/s:

```
qm {{[mi|migrate]}} {{100}} {{target}} --bwlimit 10
```

- Allow migration of virtual machines using local devices (root only):

```
qm {{[mi|migrate]}} {{100}} {{target}} --force true
```

- Use online/live migration if a virtual machine is running:

```
qm {{[mi|migrate]}} {{100}} {{target}} --online true
```

- Enable live storage migration for local disks:

```
qm {{[mi|migrate]}} {{100}} {{target}} --with-local-disks
true
```

qm monitor

Enter the QEMU Monitor interface.

More information: https://pve.proxmox.com/pve-docs/qm.1.html#cli_qm_monitor.

- Enter the QEMU Monitor interface of a specific virtual machine:

```
qm {{[mo|monitor]}} {{100}}
```

qm move-disk

This command is an alias of **`qm disk move`**.

- View documentation for the original command:

```
tldr qm disk
```

qm move_disk

This command is an alias of **`qm disk move`**.

- View documentation for the original command:

```
tldr qm disk
```

qm mtunnel

Used by **`qmigrate`**.

Note: It should not be invoked manually.

More information: https://pve.proxmox.com/pve-docs/qm.1.html#cli_qm_mtunnel.

- Open a tunnel for `qmigrate` during data migration from a VM to another host:

  ```
  qm {{[mt|mtunnel]}}
  ```

qm nbdstop

Stop embedded nbd server.

More information: https://pve.proxmox.com/pve-docs/qm.1.html#cli_qm_nbdstop.

- Stop embedded nbd server:

```
qm {{[n|nbdstop]}} {{100}}
```

qm pending

Get the virtual machine configuration with both current and pending values.

More information: https://pve.proxmox.com/pve-docs/qm.1.html#cli_qm_pending.

- Get the virtual machine configuration of a specific virtual machine:

```
qm {{[p|pending]}} {{100}}
```

qm reboot

Reboot a virtual machine by shutting it down, and starting it again after applying pending changes.

More information: https://pve.proxmox.com/pve-docs/qm.1.html#cli_qm_reboot.

- Reboot a virtual machine:

```
qm {{[reb|reboot]}} {{100}}
```

- Reboot a virtual machine after wait for at most 10 seconds:

```
qm {{[reb|reboot]}} {{100}} --timeout {{10}}
```

qm remote-migrate

Migrate a virtual machine to a remote Proxmox host or cluster.

More information: https://pve.proxmox.com/pve-docs/qm.1.html#cli_qm_remote-migrate.

- Migrate a VM to a remote host:

```
qm remote-migrate {{vmid}} {{target_vmid}}
'apitoken=PVEAPIToken={{user}}@{{realm}}!{{token}}
={{secret}},host={{address}},fingerprint={{fingerprint}}' --
target-bridge {{bridge}} --target-storage {{storage}}
```

- Migrate a running VM with live migration:

```
qm remote-migrate {{vmid}} {{target_vmid}}
'apitoken=PVEAPIToken={{user}}@{{realm}}!{{token}}
={{secret}},host={{address}},fingerprint={{fingerprint}}' --
target-bridge {{bridge}} --target-storage {{storage}} --
online
```

- Delete the source VM after a successful migration:

```
qm remote-migrate {{vmid}} {{target_vmid}}
'apitoken=PVEAPIToken={{user}}@{{realm}}!{{token}}
={{secret}},host={{address}},fingerprint={{fingerprint}}' --
target-bridge {{bridge}} --target-storage {{storage}} --
delete 1
```

- Limit migration bandwidth:

```
qm remote-migrate {{vmid}} {{target_vmid}}
'apitoken=PVEAPIToken={{user}}@{{realm}}!{{token}}
={{secret}},host={{address}},fingerprint={{fingerprint}}' --
target-bridge {{bridge}} --target-storage {{storage}} --
bwlimit {{value}}
```

- Use the same bridge and storage names on the target:

```
qm remote-migrate {{vmid}} {{target_vmid}}
'apitoken=PVEAPIToken={{user}}@{{realm}}!{{token}}
={{secret}},host={{address}},fingerprint={{fingerprint}}' --
target-bridge 1 --target-storage 1
```

- Connect to a remote API on a custom port:

```
qm remote-migrate {{vmid}} {{target_vmid}}
'apitoken=PVEAPIToken={{user}}@{{realm}}!{{token}}
```

```
    ={{secret}},host={{address}},fingerprint={{fingerprint}},port={{porta}
    --target-bridge {{bridge}} --target-storage {{storage}}
```

qm rescan

This command is an alias of **`qm disk rescan`**.

- View documentation for the original command:

```
tldr qm disk
```

qm reset

Reset a virtual machine on QEMU/KVM Virtual Machine Manager.

More information: https://pve.proxmox.com/pve-docs/qm.1.html#cli_qm_reset.

- Reset a virtual machine:

```
qm reset {{100}}
```

- Reset a virtual machine and skip lock (only root can use this option):

```
qm reset {{100}} --skiplock {{true}}
```

qm resize

This command is an alias of **`qm disk resize`**.

- View documentation for the original command:

```
tldr qm disk
```

qm resume

Resume a virtual machine.

More information: https://pve.proxmox.com/pve-docs/qm.1.html#cli_qm_resume.

- Resume a specific virtual machine:

```
qm {{[resu|resume]}} {{100}}
```

- Resume a specific virtual machine ignoring locks (requires root):

```
sudo qm {{[resu|resume]}} {{100}} --skiplock true
```

qm rollback

Roll back the VM state to a specified snapshot.

More information: https://pve.proxmox.com/pve-docs/qm.1.html#cli_qm_rollback.

- Roll back the state of a specific VM to a specified snapshot:

```
qm {{[ro|rollback]}} {{100}} {{snapshot_name}}
```

qm sendkey

Send QEMU monitor encoding key event to a virtual machine.

More information: https://pve.proxmox.com/pve-docs/qm.1.html#cli_qm_sendkey.

- Send the specified key event to a specific virtual machine:

```
qm {{[sen|sendkey]}} {{100}} {{key}}
```

- Allow root user to send key event and ignore locks:

```
qm {{[sen|sendkey]}} --skiplock {{true}} {{100}} {{key}}
```

qm set

Set virtual machine options.

More information: https://pve.proxmox.com/pve-docs/qm.1.html#cli_qm_set.

- Set a name for a VM in the GUI:

```
qm {{[se|set]}} {{100}} --name {{vm_name}}
```

- Set a VM to autostart on boot:

```
qm {{[se|set]}} {{100}} --autostart {{0|1}}
```

- Set the allotted core count of a VM:

```
qm {{[se|set]}} {{100}} --cores {{4}}
```

- Set the allotted amount of memory:

```
qm {{[se|set]}} {{100}} --memory {{8192}}
```

- Give a VM a network device and bridge it to the host network:

```
qm {{[se|set]}} {{100}} --net{{0}} {{virtio|e1000|rtl8139|
vmxnet3}},bridge=vmbr{{0}}
```

- Delete a device:

```
qm {{[se|set]}} {{100}} --delete
{{device_name0,device_name1,...}}
```

- Passthrough a GPU device to the guest:

```
qm {{[se|set]}} {{100}} --hostpci{{0}} {{0000:00:02}},x-vga=1
--bios ovmf
```

qm showcmd

Show command-line which is used to start the VM (debug info).

More information: https://pve.proxmox.com/pve-docs/qm.1.html#cli_qm_showcmd.

- Show command-line for a specific virtual machine:

```
qm {{[sho|showcmd]}} {{100}}
```

- Put each option on a new line to enhance human readability:

```
qm {{[sho|showcmd]}} {{100}} --pretty {{true}}
```

- Fetch configuration values from a specific snapshot:

```
qm {{[sho|showcmd]}} {{100}} --snapshot {{string}}
```

qm shutdown

Shut down a virtual machine on QEMU/KVM Virtual Machine Manager.

More information: https://pve.proxmox.com/pve-docs/qm.1.html#cli_qm_shutdown.

- Shut down a virtual machine:

```
qm {{[shu|shutdown]}} {{100}}
```

- Shut down a virtual machine after wait for at most 10 seconds:

```
qm {{[shu|shutdown]}} {{100}} --timeout 10
```

- Shut down a virtual machine and do not deactivate storage volumes:

```
qm {{[shu|shutdown]}} {{100}} --keepActive true
```

- Shut down a virtual machine and skip lock (only root can use this option):

```
qm {{[shu|shutdown]}} {{100}} --skiplock true
```

- Stop and shut down a virtual machine:

```
qm {{[shu|shutdown]}} {{100}} --forceStop true
```

qm snapshot

Create virtual machine snapshots.

More information: https://pve.proxmox.com/pve-docs/qm.1.html#cli_qm_snapshot.

- Create a snapshot of a specific virtual machine (name must start with a letter):

```
qm {{[sn|snapshot]}} {{100}} {{snapshot_name}}
```

- Create a snapshot with a specific description:

```
qm {{[sn|snapshot]}} {{100}} {{snapshot_name}} --description
{{description}}
```

- Create a snapshot including the running virtual machine state:

```
qm {{[sn|snapshot]}} {{100}} {{snapshot_name}} --description
{{description}} --vmstate 1
```

- List snapshots of a VM:

```
qm {{[lists|listsnapshot]}} {{100}}
```

- Roll back the state of a specific VM to a specified snapshot:

```
qm {{[ro|rollback]}} {{100}} {{snapshot_name}}
```

qm start

Start a virtual machine on QEMU/KVM Virtual Machine Manager.

More information: https://pve.proxmox.com/pve-docs/qm.1.html#cli_qm_start.

- Start a specific virtual machine:

```
qm start {{100}}
```

- Specify the QEMU machine type (i.e. the CPU to emulate):

```
qm start {{100}} --machine {{q35}}
```

- Start a specific virtual machine with a timeout in 60 seconds:

```
qm start {{100}} --timeout {{60}}
```

qm status

Show virtual machine status.

More information: https://pve.proxmox.com/pve-docs/qm.1.html#cli_qm_status.

- Display the status of a specific virtual machine:

```
qm {{[stat|status]}} {{100}}
```

- Display detailed status of a specific virtual machine:

```
qm {{[stat|status]}} {{100}} --verbose {{true}}
```

qm stop

Stop a virtual machine.

More information: https://pve.proxmox.com/pve-docs/qm.1.html#cli_qm_stop.

- Stop a virtual machine immediately:

```
qm stop {{100}}
```

- Stop a virtual machine and wait for at most 10 seconds:

```
qm stop {{100}} --timeout 10
```

- Stop a virtual machine and skip lock (only root can use this option):

```
qm stop {{100}} --skiplock true
```

- Stop a virtual machine and don't deactivate storage volumes:

```
qm stop {{100}} --keepActive true
```

qm suspend

Suspend a virtual machine (VM) in the Proxmox Virtual Environment (PVE).

Use **`--skiplock`** and **`--skiplockstorage`** flags with caution, as they may lead to data corruption in certain situations.

More information: https://pve.proxmox.com/pve-docs/qm.1.html#cli_qm_suspend.

- Suspend a virtual machine by ID:

```
qm {{[su|suspend]}} {{100}} {{integer}}
```

- Skip the lock check when suspending the VM:

```
qm {{[su|suspend]}} {{100}} {{integer}} --skiplock
```

- Skip the lock check for storage when suspending the VM:

```
qm {{[su|suspend]}} {{100}} {{integer}} --skiplockstorage
```

qm template

Create a Proxmox VM template.

More information: https://pve.proxmox.com/pve-docs/qm.1.html#cli_qm_template.

- Create a template out of a specific virtual machine:

```
qm {{[tem|template]}} {{100}}
```

qm terminal

Attach to the serial console of a VM.

More information: https://pve.proxmox.com/pve-docs/qm.1.html#cli_qm_terminal.

- Attach to a terminal:

```
qm {{[ter|terminal]}} {{100}}
```

- Detach from a terminal:

```
<Ctrl o>
```

qm unlink

This command is an alias of **`qm disk unlink`**.

- View documentation for the original command:

```
tldr qm disk
```

qm unlock

Unlock a virtual machine in QEMU/KVM Virtual Machine Manager.

More information: https://pve.proxmox.com/pve-docs/qm.1.html#cli_qm_unlock.

- Unlock a specific virtual machine:

```
qm {{[u|unlock]}} {{100}}
```

qm vncproxy

Proxy Virtual Machine VNC (Virtual network computing) traffic to **`stdin`** or **`stdout`**.

More information: https://pve.proxmox.com/pve-docs/qm.1.html#cli_qm_vncproxy.

- Proxy a specific virtual machine:

```
qm {{[v|vncproxy]}} {{100}}
```

qm wait

Wait until the virtual machine is stopped.

More information: https://pve.proxmox.com/pve-docs/qm.1.html#cli_qm_wait.

- Wait until the virtual machine is stopped:

```
qm {{[w|wait]}} {{100}}
```

- Wait until the virtual machine is stopped with a 10 second timeout:

```
qm {{[w|wait]}} {{100}} --timeout {{10}}
```

- Send a shutdown request, then wait until the virtual machine is stopped with a 10 second timeout:

```
qm {{[shu|shutdown]}} {{100}} && qm {{[w|wait]}} {{100}} --timeout {{10}}
```

qm

QEMU/KVM Virtual Machine Manager.

Some subcommands such as **`list`**, **`start`**, **`stop`**, **`clone`**, etc. have their own usage documentation.

More information: https://pve.proxmox.com/pve-docs/qm.1.html.

- List all virtual machines:

```
qm list
```

- Create a virtual machine with a 4 GB SCSI disk on the `local-lvm` storage and an ID of 100 using an ISO file uploaded on the `local` storage:

```
qm {{[cr|create]}} 100 --scsi0 local-lvm:4 --net0 {{e1000}}
--cdrom local:{{iso/proxmox-mailgateway_2.1.iso}}
```

- Show the configuration of a virtual machine, specifying its ID:

```
qm {{[co|config]}} {{100}}
```

- Start a specific virtual machine:

```
qm start {{100}}
```

- Send a shutdown request, then wait until the virtual machine is stopped:

```
qm {{[shu|shutdown]}} {{100}} && qm {{[w|wait]}} {{100}}
```

- Destroy a virtual machine and remove all related resources:

```
qm {{[des|destroy]}} {{100}} --purge
```

qmrestore

Restore QemuServer **vzdump** backups.

More information: https://pve.proxmox.com/pve-docs/qmrestore.1.html.

- Restore virtual machine from given backup file on the original storage:

```
qmrestore {{path/to/vzdump-qemu-100.vma.lzo}} {{100}}
```

- Overwrite existing virtual machine from a given backup file on the original storage:

```
qmrestore {{path/to/vzdump-qemu-100.vma.lzo}} {{100}} --force true
```

- Restore the virtual machine from a given backup file on specific storage:

```
qmrestore {{path/to/vzdump-qemu-100.vma.lzo}} {{100}} --storage {{local}}
```

- Start virtual machine immediately from the backup while restoring in the background (only on Proxmox Backup Server):

```
qmrestore {{path/to/vzdump-qemu-100.vma.lzo}} {{100}} --live-restore true
```

qrcp

A file transfer tool.

More information: https://github.com/claudiodangelis/qrcp#usage.

- Send a file or directories:

```
qrcp send {{path/to/file_or_directory1 path/to/
file_directory2 ...}}
```

- Receive files:

```
qrcp receive
```

- Compress content before transferring:

```
qrcp send --zip {{path/to/file_or_directory}}
```

- Use a specific port:

```
qrcp {{send|receive}} {{[-p|--port]}} {{port_number}}
```

- Use a specific network interface:

```
qrcp {{send|receive}} {{[-i|--interface]}} {{interface}}
```

- Keep the server alive:

```
qrcp {{send|receive}} --keep-alive
```

qsub

Submit a script to the queue management system TORQUE.

More information: https://manned.org/qsub.1.

- Submit a script with default settings (depends on TORQUE settings):

```
qsub {{script.sh}}
```

- Submit a script with a specified wallclock runtime limit of 1 hour 2 minutes and 3 seconds:

```
qsub -l walltime={{1}}:{{2}}:{{3}} {{script.sh}}
```

- Submit a script that is executed on 2 nodes using 4 cores per node:

```
qsub -l nodes={{2}}:ppn={{4}} {{script.sh}}
```

- Submit a script to a specific queue. Note that different queues can have different maximum and minimum runtime limits:

```
qsub -q {{queue_name}} {{script.sh}}
```

qtchooser

A wrapper used to select between Qt development binary versions.

More information: https://manned.org/qtchooser.

- List available Qt versions from the configuration files:

```
qtchooser --list-versions
```

- Print environment information:

```
qtchooser --print-env
```

- Run the specified tool using the specified Qt version:

```
qtchooser --run-tool={{tool}} --qt={{version_name}}
```

- Add a Qt version entry to be able to choose from:

```
qtchooser --install {{version_name}} {{path/to/qmake}}
```

- Display help:

```
qtchooser --help
```

qtgrace

Display, plot, analyze 2D data.

A Qt reimplementation of Grace (https://plasma-gate.weizmann.ac.il/Grace/), sharing its command-line interface.

More information: https://sourceforge.net/projects/qtgrace/.

- Plot one or more data files, plotting only the first two columns in each file as X Y:

```
qtgrace {{path/to/file1.dat path/to/file2.dat ...}}
```

- Plot one or more data files, plotting all columns in each file as X Y1 Y2 ...:

```
qtgrace {{-nxy path/to/file1.dat -nxy path/to/file2.dat ...}}
```

- Plot one or more data files with a logarithmically scaled x-axis:

```
qtgrace -log x {{path/to/file1.dat path/to/file2.dat ...}}
```

- Plot a data file with a logarithmic scale on both axes, with data formatted as X Y DY:

```
qtgrace -log xy -settype xydy {{path/to/file.dat}}
```

- Display help:

```
qtgrace -help
```

qtile

A full-featured, hackable tiling window manager written and configured in Python.

More information: https://docs.qtile.org/en/latest/manual/commands/shell/index.html.

- Start the window manager, if it is not running already (should ideally be run from `.xsession` or similar):

```
qtile start
```

- Check the configuration file for any compilation errors (default location is `~/.config/qtile/config.py`):

```
qtile check
```

- Show current resource usage information:

```
qtile top --force
```

- Open the program `xterm` as a floating window on the group named `test-group`:

```
qtile run-cmd --group {{test_group}} --float {{xterm}}
```

- Restart the window manager:

```
qtile cmd-obj --object cmd --function restart
```

quickemu

Build and manage highly optimized desktop virtual machines quickly.

Note: Virtual machine must be in stopped state when working with snapshots.

See also: **`quickget`**.

More information: https://github.com/quickemu-project/quickemu.

- Create and run a virtual machine from a configuration file:

```
quickemu --vm {{path/to/file.conf}}
```

- Do not commit any changes to disk/snapshot but write any changes to temporary files:

```
quickemu --status-quo --vm {{path/to/file.conf}}
```

- Start the virtual machine in full-screen mode (`<Ctrl Alt f>` to exit) and select the display backend (`sdl` by default):

```
quickemu --fullscreen --display {{sdl|gtk|spice|spice-app|
none}} --vm {{path/to/file.conf}}
```

- Select a virtual audio device to emulate and create a desktop shortcut:

```
quickemu --sound-card {{intel-hda|ac97|es1370|sb16|none}} --
shortcut --vm {{path/to/file.conf}}
```

- Create/restore/delete a snapshot:

```
quickemu --snapshot {{create|apply|delete}} {{tag}} --vm
{{path/to/file.conf}}
```

- List available snapshots:

```
quickemu --snapshot info --vm {{path/to/file.conf}}
```

- Delete the entire virtual machine and its configuration:

```
quickemu --delete-vm --vm {{path/to/file.conf}}
```

- Delete the virtual machine's disk image and EFI variables:

```
quickemu --delete-disk --vm {{path/to/file.conf}}
```

quickget

Download and prepare materials for building a Quickemu virtual machine.

Note: The parameter "edition" is sometimes optional.

See also: **`quickemu`**.

More information: https://github.com/quickemu-project/quickemu.

- Display the list of all supported guest operating systems, versions, and variants in various formats:

```
quickget {{--list|--list-csv|--list-json}}
```

- Download and create the virtual machine configuration for building a Quickemu virtual machine for an OS:

```
quickget {{os}} {{release}} {{edition}}
```

- Download configuration for a Windows 11 VM with VirtIO drivers for Windows:

```
quickget windows 11
```

- Download a macOS recovery image and creates a virtual machine configuration:

```
quickget macos {{mojave|catalina|big-sur|monterey|ventura|sonoma}}
```

- Show an ISO URL for an operating system:

```
quickget --url {{os}} {{release}} {{edition}}
```

- Test if an ISO file is available for an operating system:

```
quickget --check {{os}} {{release}} {{edition}}
```

- Download an image without building any VM configuration:

```
quickget --download {{os}} {{release}} {{edition}}
```

- Create a VM configuration for an OS image (this will move the ISO from the source directory):

```
quickget --create-config {{os}} {{path/to/iso}}
```

quotacheck

Scan a filesystem for disk usage; create, check, and repair quota files.

It is best to run quota check with quotas turned off to prevent damage or loss to quota files.

More information: https://manned.org/quotacheck.

- Check quotas on all mounted non-NFS filesystems:

```
sudo quotacheck --all
```

- Force check even if quotas are enabled (this can cause damage or loss to quota files):

```
sudo quotacheck --force {{path/to/mount_point}}
```

- Check quotas on a given filesystem in debug mode:

```
sudo quotacheck --debug {{path/to/mount_point}}
```

- Check quotas on a given filesystem, displaying the progress:

```
sudo quotacheck --verbose {{path/to/mount_point}}
```

- Check user quotas:

```
sudo quotacheck --user {{user}} {{path/to/mount_point}}
```

- Check group quotas:

```
sudo quotacheck --group {{group}} {{path/to/mount_point}}
```

qwen-vl

The examples for this command have been moved together with **`inference-snap`**.

More information: https://github.com/canonical/qwen-vl-snap.

- View documentation for `inference-snap`:

```
tldr inference-snap
```

radeontop

Show utilization of AMD GPUs.

May require root privileges depending on your system.

See also: **`nvtop`**, **`amdgpu_top`**.

More information: https://github.com/clbr/radeontop/blob/master/radeontop.asc.

- Show the utilization of the default AMD GPU:

```
radeontop
```

- Enable colored output:

```
radeontop {{[-c|--color]}}
```

- Select a specific GPU (the bus number is the first number in the output of `lspci`):

```
radeontop {{[-b|--bus]}} {{bus_number}}
```

- Specify the display refresh rate (higher means more GPU overhead):

```
radeontop {{[-t|--ticks]}} {{samples_per_second}}
```

rankmirrors

Rank a list of Pacman mirrors by connection and opening speed.

Writes the new mirrorlist to **`stdout`**.

More information: https://manned.org/rankmirrors.

- Rank a mirror list:

```
rankmirrors {{/etc/pacman.d/mirrorlist}}
```

- Output only a given number of the top ranking servers:

```
rankmirrors -n {{number}} {{/etc/pacman.d/mirrorlist}}
```

- Be verbose when generating the mirrorlist:

```
rankmirrors {{[-v|--verbose]}} {{/etc/pacman.d/mirrorlist}}
```

- Test only a specific URL:

```
rankmirrors {{[-u|--url]}} {{url}}
```

- Output only the response times instead of a full mirrorlist:

```
rankmirrors {{[-t|--times]}} {{/etc/pacman.d/mirrorlist}}
```

raspi-config

An **`ncurses`** terminal GUI to config a Raspberry Pi.

More information: https://www.raspberrypi.com/documentation/computers/configuration.html.

- Start `raspi-config`:

```
sudo raspi-config
```

raspinfo

Display Raspberry Pi system information.

More information: https://github.com/raspberrypi/utils/tree/master/raspinfo.

- Display system information:

```
raspinfo
```

rauc

Lightweight update client for Embedded Linux devices to create, inspect, and install update bundles.

More information: https://manned.org/rauc.

- Display the current system status and slot overview:

```
rauc status
```

- Install an update bundle:

```
rauc install {{path/to/bundle.raucb|https://example.com/bundle.raucb}}
```

- Show information about a specific update bundle:

```
rauc info {{path/to/bundle.raucb}}
```

- Create a signed update bundle from a directory:

```
rauc bundle --cert {{path/to/cert.pem}} --key {{path/to/key.pem}} {{path/to/input_dir}} {{path/to/output.raucb}}
```

- Extract the contents of an update bundle:

```
rauc extract {{path/to/bundle.raucb}} {{path/to/output_directory}}
```

- Mark the currently booted slot as good to confirm successful update:

```
rauc status mark-good
```

- Mark a specific slot as bad to prevent it from booting:

```
rauc status mark-bad {{slot_name}}
```

- Switch the active boot slot to the other available slot:

```
rauc status mark-active other
```

raw

Bind a Unix raw character device.

More information: https://manned.org/raw.8.

- Bind a raw character device to a block device:

```
raw /dev/raw/raw{{1}} {{/dev/block_device}}
```

- Query an existing binding instead of setting a new one:

```
raw /dev/raw/raw{{1}}
```

- Query all bound raw devices:

```
raw {{[-qa|--query --all]}}
```

rc-service

Locate and run OpenRC services with arguments.

See also: **`openrc`**.

More information: https://manned.org/rc-service.

- Show a service's status:

```
rc-service {{service_name}} status
```

- Start a service:

```
sudo rc-service {{service_name}} start
```

- Stop a service:

```
sudo rc-service {{service_name}} stop
```

- Restart a service:

```
sudo rc-service {{service_name}} restart
```

- Simulate running a service's custom command:

```
sudo rc-service {{[-Z|--dry-run]}} {{service_name}}
{{command_name}}
```

- Actually run a service's custom command:

```
sudo rc-service {{service_name}} {{command_name}}
```

- Resolve the location of a service definition on disk:

```
sudo rc-service {{[-r|--resolve]}} {{service_name}}
```

rc-status

Show status info about runlevels.

See also: **`openrc`**.

More information: https://manned.org/rc-status.

- Show a summary of services and their status:

```
rc-status
```

- Include services in all runlevels in the summary:

```
rc-status {{[-a|--all]}}
```

- List services that have crashed:

```
rc-status {{[-c|--crashed]}}
```

- List manually started services:

```
rc-status {{[-m|--manual]}}
```

- List supervised services:

```
rc-status {{[-S|--supervised]}}
```

- Display the current runlevel:

```
rc-status {{[-r|--runlevel]}}
```

- List all runlevels:

```
rc-status {{[-l|--list]}}
```

rc-update

Add and remove OpenRC services to and from runlevels.

See also: **`openrc`**.

More information: https://manned.org/rc-update.

- List enabled services and the runlevels they are added to:

```
rc-update
```

- List all services:

```
rc-update {{[-v|--verbose]}}
```

- Add a service to a runlevel:

```
sudo rc-update add {{service_name}} {{runlevel}}
```

- Delete a service from a runlevel:

```
sudo rc-update {{[del|delete]}} {{service_name}} {{runlevel}}
```

- Delete a service from all runlevels:

```
sudo rc-update {{[-a|--all]}} {{[del|delete]}}
{{service_name}}
```

rcp

Copy files between local and remote systems.

It mimics the behavior of the **cp** command but operates across different machines.

More information: https://www.gnu.org/software/inetutils/manual/inetutils.html#rcp-invocation.

- Copy a file to a remote host:

```
rcp {{path/to/local_file}} {{username}}@{{remote_host}}:/{{path/to/destination}}/
```

- Copy a directory recursively:

```
rcp {{[-r|--recursive]}} {{path/to/local_directory}} {{username}}@{{remote_host}}:/{{path/to/destination}}/
```

- Preserve the file attributes:

```
rcp {{[-p|--preserve]}} {{path/to/local_file}} {{username}}@{{remote_host}}:/{{path/to/destination}}/
```

- Force copy without a confirmation:

```
rcp {{[-f|--from]}} {{path/to/local_file}} {{username}}@{{remote_host}}:/{{path/to/destination}}/
```

rdesktop

Remote Desktop Protocol client.

It can be used to connect the remote computer using the RDP protocol.

More information: https://manned.org/rdesktop.

- Connect to a remote computer (default port is 3389):

```
rdesktop -u {{username}} -p {{password}} {{host:port}}
```

- Connect to a remote computer as `Administrator` with a specific password:

```
rdesktop -u Administrator -p passwd123 192.168.1.111:3389
```

- Connect to a remote computer with full screen (press `<Ctrl Alt Enter>` to exist):

```
rdesktop -u {{username}} -p {{password}} -f {{host:port}}
```

- Use a custom resolution (use the letter `x` between the numbers):

```
rdesktop -u {{username}} -p {{password}} -g {{1366}}x{{768}} {{host:port}}
```

- Connect to a remote computer using domain user:

```
rdesktop -u {{username}} -p {{password}} -d {{domainname}} {{host:port}}
```

- Use the 16-bit color (speed up):

```
rdesktop -u {{username}} -p {{password}} -a 16 {{host:port}}
```

readcd

Read or write Compact Disc media data.

More information: https://manned.org/readcd.

- Read a cd and copy it to a file:

```
readcd dev={{/dev/srX}} f={{path/to/file.iso}}
```

readelf

Display information about ELF files.

More information: https://manned.org/readelf.

- Display all information about the ELF file:

```
readelf {{[-a|--all]}} {{path/to/binary}}
```

- Display all the headers present in the ELF file:

```
readelf {{[-e|--headers]}} {{path/to/binary}}
```

- Display the entries in symbol table section of the ELF file, if it has one:

```
readelf {{[-s|--symbols]}} {{path/to/binary}}
```

- Display ELF header information:

```
readelf {{[-h|--file-header]}} {{path/to/binary}}
```

- Display ELF section header information:

```
readelf {{[-S|--section-headers]}} {{path/to/binary}}
```

- Display DWARF information:

```
readelf {{[-w|--debug-dump]}} {{path/to/binary}}
```

readpe

Display information about PE files.

More information: https://manned.org/readpe.

- Display all information about a PE file:

```
readpe {{path/to/executable}}
```

- Display all the headers present in a PE file:

```
readpe --all-headers {{path/to/executable}}
```

- Display all the sections present in a PE file:

```
readpe --all-sections {{path/to/executable}}
```

- Display a specific header from a PE file:

```
readpe --header {{dos|coff|optional}} {{path/to/executable}}
```

- List all imported functions:

```
readpe --imports {{path/to/executable}}
```

- List all exported functions:

```
readpe --exports {{path/to/executable}}
```

reboot

Reboot the system.

More information: https://manned.org/reboot.8.

- Reboot the system:

  `reboot`

- Power off the system (same as `poweroff`):

  `reboot {{[-p|--poweroff]}}`

- Halt (terminates all processes and shuts down the CPU) the system (same as `halt`):

  `reboot --halt`

- Reboot immediately without contacting the system manager:

  `reboot {{[-f|--force]}}`

- Write the wtmp shutdown entry without rebooting the system:

  `reboot {{[-w|--wtmp-only]}}`

reflector

Arch script to fetch and sort mirrorlists.

More information: https://manned.org/reflector.

- Get all mirrors, sort for download speed, and save them:

```
sudo reflector --sort {{rate}} --save {{/etc/pacman.d/mirrorlist}}
```

- Only get German HTTPS mirrors:

```
reflector {{[-c|--country]}} Germany {{[-p|--protocol]}} https
```

- Only get the 10 recently synced mirrors:

```
reflector {{[-l|--latest]}} 10
```

- Use a configuration file to fetch mirrors:

```
sudo reflector @{{/etc/xdg/reflector/reflector.conf}}
```

- Display help:

```
reflector {{[-h|--help]}}
```

register_new_matrix_user

Register new users in a home server when registration has been disabled.

More information: https://manned.org/register_new_matrix_user.

- Create a user interactively:

```
register_new_matrix_user --config {{path/to/homeserver.yaml}}
```

- Create an admin user interactively:

```
register_new_matrix_user --config {{path/to/homeserver.yaml}}
--admin
```

- Create an admin user non-interactively (not recommended):

```
register_new_matrix_user --config {{path/to/homeserver.yaml}}
--user {{username}} --password {{password}} --admin
```

remote-viewer

View desktops remotely.

More information: https://manned.org/remote-viewer.

- View a remote using a `virt-viewer` file:

```
remote-viewer {{path/to/virt_viewer_file}}
```

removepkg

Remove a specified Slackware package.

More information: https://www.slackbook.org/html/book.html#PACKAGE-MANAGEMENT-PACKAGE-UTILITIES-REMOVEPKG.

- Remove a package:

```
sudo removepkg {{package_name}}
```

- Generate a report of a simulated removal to `stdout`:

```
removepkg -warn {{package_name}}
```

- Reconstruct the package subtree in `/tmp/preserved_packages/package_name` and remove the package:

```
sudo removepkg -preserve {{package_name}}
```

- Copy package under `/tmp/preserved_packages/package_name` without removing:

```
removepkg -copy {{package_name}}
```

- Save temporary files created by `removepkg` for debugging:

```
sudo removepkg -keep {{package_name}}
```

rename

rename can refer to multiple commands with the same name.

- View documentation for the Perl version:

  ```
  tldr {{[-p|--platform]}} common rename
  ```

- View documentation for the `util-linux` version:

  ```
  tldr rename.util
  ```

rename.ul

This command is an alias of **`rename.util`**.

- View documentation for the original command:

```
tldr rename.util
```

rename

Rename multiple files.

WARNING: This command will overwrite files without prompting unless the **`--no-act`** option is used.

Note: This page refers to the command from the **`util-linux`** package.

More information: https://manned.org/rename.

- Rename files using simple substitutions (substitute a string with a replacement wherever found):

```
rename {{string}} {{replacement}} {{*}}
```

- Simulate running the program without doing anything:

```
rename {{[-vn|--verbose --no-act]}} {{string}} {{replacement}} {{*}}
```

- Do not overwrite existing files:

```
rename {{[-o|--no-overwrite]}} {{string}} {{replacement}} {{*}}
```

- Change file extensions:

```
rename {{.ext}} {{.bak}} {{*.ext}}
```

- Prepend a prefix to all filenames in the current directory:

```
rename '' '{{prefix}}' {{*}}
```

- Rename a group of increasingly numbered files zero-padding the numbers up to 3 digits:

```
rename {{prefix}} {{prefix00}} {{prefix?}} && rename {{prefix}} {{prefix0}} {{prefix??}}
```

renice

Alter the scheduling priority/niceness of running processes.

Niceness values range from -20 (most favorable to the process) to 19 (least favorable to the process).

See also: **`nice`**.

More information: https://manned.org/renice.

- Set the absolute priority of a running process:

```
renice --priority {{3}} {{[-p|--pid]}} {{process_id}}
```

- Increase the priority of a running process:

```
sudo renice --relative {{-4}} {{[-p|--pid]}} {{process_id}}
```

- Decrease the priority of all processes owned by a user:

```
renice --relative {{4}} {{[-u|--user]}} {{user_id|username}}
```

- Set the priority of all processes that belong to a process group:

```
sudo renice {{-5}} {{[-g|--pgrp]}} {{process_group}}
```

repo-add

Package database maintenance utility which enables installation of said package via Pacman.

See also: **`repo-remove`**.

More information: https://manned.org/repo-add.

- Create an empty repository:

```
repo-add {{path/to/database.db.tar.gz}}
```

- Add packages to the repository:

```
repo-add {{path/to/database.db.tar.gz}}
{{package1.pkg.tar.zst package2.pkg.tar.zst ...}}
```

- Add all package binaries in the current directory and remove any outdated package files:

```
repo-add {{[-R|--remove]}} {{path/to/database.db.tar.gz}}
{{*.pkg.tar.zst}}
```

- Add all package binaries in the current directory in silent mode except for warning and error messages:

```
repo-add {{[-q|--quiet]}} {{path/to/database.db.tar.gz}}
{{*.pkg.tar.zst}}
```

- Add all package binaries in the current directory without showing color:

```
repo-add --nocolor {{path/to/database.db.tar.gz}}
{{*.pkg.tar.zst}}
```

repo-remove

Package database maintenance utility which removes packages from a local repository.

See also: **repo-add**.

More information: https://manned.org/repo-remove.

- Remove a package from a local repository:

```
repo-remove {{path/to/database.db.tar.gz}} {{package}}
```

- Also remove the package file:

```
repo-remove {{[-R|--remove]}} {{path/to/database.db.tar.gz}}
{{package}}
```

reportbug

Bug report tool of Debian distribution.

More information: https://manned.org/reportbug.

- Generate a bug report about a specific package, then send it by e-mail:

```
reportbug {{package}}
```

- Report a bug that is not about a specific package (general problem, infrastructure, etc.):

```
reportbug other
```

- Write the bug report to a file instead of sending it by e-mail:

```
reportbug {{[-o|--output]}} {{filename}} {{package}}
```

repquota

Display a summary of existing file quotas for a filesystem.

More information: https://manned.org/repquota.

- Report stats for all quotas in use:

```
sudo repquota {{[-a|--all]}}
```

- Report quota stats for all users, even those who aren't using any of their quota:

```
sudo repquota {{[-v|--verbose]}} {{filesystem}}
```

- Report on quotas for users only:

```
repquota {{[-u|--user]}} {{filesystem}}
```

- Report on quotas for groups only:

```
sudo repquota {{[-g|--group]}} {{filesystem}}
```

- Report on used quota and limits in a human-readable format:

```
sudo repquota {{[-s|--human-readable]}} {{filesystem}}
```

- Report on all quotas for users and groups in a human-readable format:

```
sudo repquota {{[-augs|--all --user --group --human-readable]}}
```

reptyr

Move a running process to a new terminal.

Best used when you forget to start a long running task in **`screen`**.

More information: https://github.com/nelhage/reptyr#usage.

- Move a running process to your current terminal:

```
reptyr {{process_id}}
```

- Attach to a process using its name:

```
reptyr $(pidof {{htop}})
```

reset

Reinitialize the current terminal.

Clears the entire terminal screen.

More information: https://manned.org/reset.

- Reinitialize the current terminal:

```
reset
```

- Display the terminal type instead:

```
reset -q
```

resize

Resize terminal size to the window size.

More information: https://manned.org/resize.

- Resize the terminal:

```
resize
```

- Print terminal size:

```
resize -s
```

resize2fs

Resize an ext2, ext3, or ext4 filesystem.

Does not resize the underlying partition. The filesystem may have to be unmounted first, read the man page for more details.

More information: https://manned.org/resize2fs.

- Automatically resize a filesystem to its maximum possible size:

```
resize2fs {{/dev/sdXN}}
```

- Resize the filesystem to a size of 40G, displaying a progress bar:

```
resize2fs -p {{/dev/sdXN}} {{40G}}
```

- Shrink the filesystem to its minimum possible size:

```
resize2fs -M {{/dev/sdXN}}
```

resolvectl

Resolve domain names, IPv4 and IPv6 addresses, DNS resource records, and services.

Note: **`systemd-resolved.service`** must be running.

See also: **`dig`**, **`nslookup`**, **`host`**.

More information: https://www.freedesktop.org/software/systemd/man/latest/resolvectl.html.

- Show DNS settings:

```
resolvectl
```

- Resolve the IPv4 and IPv6 addresses for one or more domains:

```
resolvectl query {{domain1 domain2 ...}}
```

- Retrieve the domain of a specified IP address:

```
resolvectl query {{ip_address}}
```

- Flush all local DNS caches:

```
resolvectl flush-caches
```

- Display DNS statistics (transactions, cache, and DNSSEC verdicts):

```
resolvectl statistics
```

- Retrieve an MX record of a domain:

```
resolvectl --legend {{no}} {{[-t|--type]}} MX query {{domain}}
```

- Resolve an SRV record, for example `_xmpp-server._tcp gmail.com`:

```
resolvectl service _{{service}}._{{protocol}} {{name}}
```

- Retrieve a TLS key:

```
resolvectl tlsa tcp {{domain}}:443
```

resolveip

Resolve hostnames to their IP addresses and vice versa.

More information: https://mariadb.com/docs/server/clients-and-utilities/networking-tools/resolveip.

- Resolve a hostname to an IP address:

```
resolveip {{example.org}}
```

- Resolve an IP address to a hostname:

```
resolveip {{1.1.1.1}}
```

- Resolve a hostname to an IP address with less output:

```
resolveip {{[-s|--silent]}} {{example.org}}
```

restorecon

Restore SELinux security context on files/directories according to persistent rules.

See also: **`semanage fcontext`**.

More information: https://manned.org/restorecon.

- View the current security context of a file or directory:

```
ls {{[-dlZ|--directory -l --context]}} {{path/to/file_or_directory}}
```

- Restore the security context of a file or directory:

```
restorecon {{path/to/file_or_directory}}
```

- Restore the security context of a directory recursively, and show all changed labels:

```
restorecon -R -v {{path/to/directory}}
```

- Restore the security context of a directory recursively, using all available threads, and show progress:

```
restorecon -R -T {{0}} -p {{path/to/directory}}
```

- Preview the label changes that would happen without applying them:

```
restorecon -R -n -v {{path/to/directory}}
```

restorecond

Daemon that monitors file creation and automatically restores SELinux contexts.

Useful for directories where files are frequently created with incorrect contexts.

See also: **`restorecon`**, **`semanage fcontext`**.

More information: https://manned.org/restorecond.

- Start the `restorecond` daemon:

```
sudo restorecond
```

- Run `restorecond` in [v]erbose mode to see restoration events:

```
sudo restorecond -v
```

- Run `restorecond` in [d]ebug mode:

```
sudo restorecond -d
```

- Use alternative `restorecond.conf` file:

```
sudo restorecond -f restorecond_file
```

- Check the status of the restorecond service:

```
sudo systemctl status restorecond
```

- Enable restorecond to start at boot:

```
sudo systemctl enable restorecond --now
```

retroarch

A frontend for emulators, game engines, and media players.

The reference implementation of the libretro API.

More information: https://manned.org/retroarch.

- Start in the menu mode:

```
retroarch
```

- Start in full screen mode:

```
retroarch {{[-f|--fullscreen]}}
```

- List all compiled features:

```
retroarch --features
```

- Set the path of a configuration file:

```
retroarch {{[-c|--config]}} {{path/to/config_file}}
```

- Display help:

```
retroarch {{[-h|--help]}}
```

- Display version:

```
retroarch --version
```

rev

Reverse a line of text or a file.

More information: https://manned.org/rev.

- Reverse text typed into terminal:

```
rev
```

- Reverse the text string "hello":

```
echo "hello" | rev
```

- Reverse an entire file and print to `stdout`:

```
rev {{path/to/file}}
```

- Use '\0' as a line separator (zero termination):

```
rev {{[-0|--zero]}} {{path/to/file}}
```

- Display help:

```
rev {{[-h|--help]}}
```

- Display version:

```
rev {{[-V|--version]}}
```

rexec

Execute a command on a remote host.

Note: Use **rexec** with caution, as it transmits data in plain text. Consider secure alternatives like SSH for encrypted communication.

More information: https://www.gnu.org/software/inetutils/manual/inetutils.html#rexec-invocation.

- Execute a command on a remote host:

```
rexec {{[-h|--host]}} {{remote_host}} {{ls -l}}
```

- Specify the remote username on a remote host:

```
rexec {{[-u|--username]}} {{username}} {{[-h|--host]}} {{remote_host}} {{ps aux}}
```

- Redirect `stdin` from `/dev/null` on a remote host:

```
rexec {{[-n|--noerr]}} {{[-h|--host]}} {{remote_host}} {{ls -l}}
```

- Specify the remote port on a remote host:

```
rexec {{[-P|--port]}} {{1234}} {{[-h|--host]}} {{remote_host}} {{ls -l}}
```

rfkill

Enable and disable wireless devices.

More information: https://manned.org/rfkill.

- List devices:

```
rfkill
```

- Filter by columns:

```
rfkill {{[-o|--output]}} {{ID,TYPE,DEVICE,...}}
```

- Block devices by type:

```
rfkill block {{bluetooth|wifi|gps|nfc|...}}
```

- Unblock devices by type:

```
rfkill unblock {{bluetooth|wifi|gps|nfc|...}}
```

- Output in JSON format:

```
rfkill {{[-J|--json]}}
```

rig

Utility to piece together a random first name, last name, street number, and address, along with a geographically consistent (i.e. they all match the same area) city, state, ZIP code, and area code.

More information: https://manned.org/rig.

- Display a random name (male or female) and address:

```
rig
```

- Display a [m]ale (or [f]emale) random name and address:

```
rig {{-m|-f}}
```

- Use [d]ata files from a specific directory (default is `/usr/share/rig`):

```
rig -d {{path/to/directory}}
```

- Display a specific number of identities:

```
rig -c {{number}}
```

- Display a specific number of [f]emale identities:

```
rig -f -c {{number}}
```

ripmime

Extract attachments out of a MIME encoded email package.

More information: https://pldaniels.com/ripmime/.

- Extract file contents in the current directory:

```
ripmime -i {{path/to/file}}
```

- Extract file contents in a specific directory:

```
ripmime -i {{path/to/file}} -d {{path/to/directory}}
```

- Extract file contents and print verbose output:

```
ripmime -i {{path/to/file}} -v
```

- Get detailed information about the whole decoding process:

```
ripmime -i {{path/to/file}} --debug
```

rkhunter

Search for rootkits and malware.

More information: https://manned.org/rkhunter.

- Check a system for rootkits and malware:

```
sudo rkhunter --check
```

- Update rkhunter:

```
sudo rkhunter --update
```

- Print all available tests:

```
sudo rkhunter --list
```

- Display help:

```
sudo rkhunter --help
```

- Display version:

```
sudo rkhunter --versioncheck
```

rlogin

Log in to a remote host.

More information: https://www.gnu.org/software/inetutils/manual/inetutils.html#rlogin-invocation.

- Log in to a remote host:

```
rlogin {{remote_host}}
```

- Log in to a remote host with a specific username:

```
rlogin {{[-l|--user]}} {{username}} {{remote_host}}
```

rmmod

Remove modules from the Linux kernel.

See also: **kmod**.

More information: https://manned.org/rmmod.

- Remove a module from the kernel:

```
sudo rmmod {{module_name}}
```

- Remove a module from the kernel and display verbose information:

```
sudo rmmod --verbose {{module_name}}
```

- Remove a module from the kernel and send errors to syslog instead of `stderr`:

```
sudo rmmod --syslog {{module_name}}
```

- Display help:

```
rmmod --help
```

- Display version:

```
rmmod --version
```

rmpc

A terminal music player client for the Music Player Daemon, with album art support.

See also: **`mpd`**, **`mpc`**, **`ncmpcpp`**.

More information: https://rmpc.mierak.dev/reference/cli-command-mode/.

- Start the TUI client:

```
rmpc
```

- Connect to a specific MPD instance:

```
rmpc {{[-a|--address]}} {{host:port}}
```

- Print the default configuration to use as a starting point:

```
rmpc config
```

- Scan the music directory for changes:

```
rmpc update
```

- Save the currently playing song's album art to a file:

```
rmpc albumart {{[-o|--output]}} {{path/to/cover.jpg}}
```

- Toggle playback control functions (consume plays the song and deletes it from the queue afterwards):

```
rmpc {{next|prev|stop|consume|togglerepeat|pause|unpause}}
```

- View the currently playing song:

```
rmpc song
```

rnm

Bulk Rename Utility.

More information: https://github.com/neurobin/rnm#basic-options.

- Replace a search string with a replacement string in filenames:

```
rnm -ss {{old}} -rs {{new}} {{path/to/directory}}
```

- Use a fixed (literal) search and replace string instead of `regex`:

```
rnm -ssf {{old}} -rs {{new}} {{path/to/files}}
```

- Add an auto-incremented index to filenames starting from 1:

```
rnm -i 1 -inc 1 -rs {{_}} {{path/to/files}}
```

- Rename files using a list of new names from a text file:

```
rnm -ns/f {{path/to/names.txt}} {{path/to/files}}
```

- Rename only files (ignoring directories and links):

```
rnm -fo -ss {{pattern}} -rs {{replacement}} {{path/to/files}}
```

- Sort input files by modification time before renaming:

```
rnm -s/mt -ss {{pattern}} -rs {{replacement}} {{path/to/
files}}
```

- Run a simulation without making actual changes:

```
rnm -sim -ss {{pattern}} -rs {{replacement}} {{path/to/
files}}
```

- Undo the last renaming operation:

```
rnm -u
```

rofi

An application launcher and window switcher.

More information: https://github.com/davatorium/rofi#manpage.

- Show the list of apps:

```
rofi -show drun
```

- Show the list of all commands:

```
rofi -show run
```

- Switch between windows:

```
rofi -show window
```

- Pipe a list of items to `stdin` and print the selected item to `stdout`:

```
printf "{{Choice1\nChoice2\nChoice3}}" | rofi -dmenu
```

rolldice

Roll virtual dice.

More information: https://manned.org/rolldice.

- Roll a single 20 sided dice:

```
rolldice d20
```

- Roll two six sided dice and drop the lowest roll:

```
rolldice 2d6s1
```

- Roll two 20 sided dice and add a modifier value:

```
rolldice 2d20{{+5}}
```

- Roll a 20 sided dice two times:

```
rolldice 2xd20
```

routel

List IP routing in a human readable format.

See also: **`ip route`**, **`route`**.

More information: https://manned.org/routel.

- Display the default routing table:

```
routel
```

- Display a specific routing table:

```
routel {{table_number|main|local|default}}
```

- Display only IPv4 routes:

```
routel {{[-4|--family inet]}}
```

- Display only IPv6 routes:

```
routel {{[-6|--family inet6]}}
```

rpcclient

MS-RPC client tool (part of the samba suite).

More information: https://www.samba.org/samba/docs/current/man-html/rpcclient.1.html.

- Connect to a remote host:

```
rpcclient {{[-U|--user]}} {{domain}}\{{username}}%{{password}} {{ip_address}}
```

- Connect to a remote host on a domain without a password:

```
rpcclient {{[-U|--user]}} {{username}} {{[-W|--workgroup]}} {{domain}} {{[-N|--no-pass]}} {{ip_address}}
```

- Connect to a remote host, passing the password hash:

```
rpcclient {{[-U|--user]}} {{domain}}\{{username}} --pw-nt-hash {{ip_address}}
```

- Execute shell commands on a remote host:

```
rpcclient {{[-U|--user]}} {{domain}}\{{username}}%{{password}} {{[-c|--command]}} {{semicolon_separated_commands}} {{ip_address}}
```

- [Interactive] Display domain users:

```
enumdomusers
```

- [Interactive] Display privileges:

```
enumprivs
```

- [Interactive] Display information about a specific user:

```
queryuser {{username|rid}}
```

- [Interactive] Create a new user in the domain:

```
createdomuser {{username}}
```

rpcinfo

Make an RPC call to an RPC server and reports what it finds.

More information: https://manned.org/rpcinfo.

- Show full table of all RPC services registered on localhost:

```
rpcinfo
```

- Show concise table of all RPC services registered on localhost:

```
rpcinfo -s localhost
```

- Display table of statistics of rpcbind operations on localhost:

```
rpcinfo -m
```

- Display list of entries of given service name (mountd) and version number (2) on a remote nfs share:

```
rpcinfo -l {{remote_nfs_server_ip}} {{mountd}} {{2}}
```

- Delete the registration for version 1 of the mountd service for all transports:

```
rpcinfo -d {{mountd}} {{1}}
```

rpi-eeprom-update

Update EEPROM and view other EEPROM information.

More information: https://www.raspberrypi.com/documentation/computers/raspberry-pi.html#rpi-eeprom-update.

- Print information about the current raspberry pi EEPROM installed:

```
sudo rpi-eeprom-update
```

- Update a raspberry pi EEPROM:

```
sudo rpi-eeprom-update -a
```

- Cancel the pending update:

```
sudo rpi-eeprom-update -r
```

- Display help:

```
rpi-eeprom-update -h
```

rpi-otp-private-key

Display the One-Time Programmable (OTP) private key of a Raspberry Pi.

More information: https://www.raspberrypi.com/documentation/computers/raspberry-pi.html#program-a-key-into-otp-with-rpi-otp-private-key.

- Read the OTP private key:

```
rpi-otp-private-key
```

rpicam-hello

View a live camera stream using a Raspberry Pi camera.

More information: https://www.raspberrypi.com/documentation/computers/camera_software.html#rpicam-hello.

- Display a camera preview stream for a specific amount of time (in milliseconds):

```
rpicam-hello {{[-t|--timeout]}} {{time}}
```

- Tune the configuration for a particular camera sensor:

```
rpicam-hello --tuning-file {{/usr/share/libcamera/ipa/rpi/path/to/config.json}}
```

rpicam-jpeg

Capture and store a JPEG image using a Raspberry Pi camera.

More information: https://www.raspberrypi.com/documentation/computers/camera_software.html#rpicam-jpeg.

- Capture an image and name the file:

```
rpicam-jpeg {{[-o|--output]}} {{path/to/file.jpg}}
```

- Capture an image with set dimensions:

```
rpicam-jpeg {{[-o|--output]}} {{path/to/file.jpg}} --width {{1920}} --height {{1080}}
```

- Capture an image with an exposure of 20 seconds and a gain of 150%:

```
rpicam-jpeg {{[-o|--output]}} {{path/to/file.jpg}} --shutter 20000 --gain 1.5
```

rpicam-raw

Capture a raw video on a Raspberry Pi camera.

More information: https://www.raspberrypi.com/documentation/computers/camera_software.html#rpicam-raw.

- Capture a video for a specific amount of seconds:

```
rpicam-raw {{[-t|--timeout]}} {{2000}} {{[-o|--output]}} {{path/to/file.raw}}
```

- Change video dimensions and framerate:

```
rpicam-raw {{[-t|--timeout]}} {{5000}} --width {{4056}} --height {{3040}} {{[-o|--output]}} {{path/to/file.raw}} --framerate {{8}}
```

rpicam-still

Capture and store a photo using a Raspberry Pi camera with legacy features missing from **`rpicam-jpeg`**.

More information: https://www.raspberrypi.com/documentation/computers/camera_software.html#rpicam-still.

- Capture a photo with different encoding:

```
rpicam-still {{[-e|--encoding]}} {{bmp|png|rgb|yuv420}} {{[-o|--output]}} {{path/to/file.ext}}
```

- Capture a raw image:

```
rpicam-still {{[-r|--raw]}} {{[-o|--output]}} {{path/to/file.jpg}}
```

- Capture a 100 second exposure image:

```
rpicam-still {{[-o|--output]}} {{path/to/file.jpg}} --shutter 100000
```

rpicam-vid

Capture a video using a Raspberry Pi camera.

See also: **`vlc`**.

More information: https://www.raspberrypi.com/documentation/computers/camera_software.html#rpicam-vid.

- Capture a 10 second video:

```
rpicam-vid {{[-t|--timeout]}} 10000 {{[-o|--output]}} {{path/to/file.h264}}
```

rpm-ostree

A hybrid image/package system.

Manage ostree deployments, package layers, filesystem overlays, and boot configuration.

More information: https://coreos.github.io/rpm-ostree/administrator-handbook/.

- Show rpm-ostree deployments in the order they will appear in the bootloader:

```
rpm-ostree status
```

- Show packages which are outdated and can be updated:

```
rpm-ostree upgrade --preview
```

- Prepare a new ostree deployment with upgraded packages and reboot into it:

```
rpm-ostree upgrade {{[-r|--reboot]}}
```

- Reboot into the previous ostree deployment:

```
rpm-ostree rollback {{[-r|--reboot]}}
```

- Install a package into a new ostree deployment and reboot into it:

```
rpm-ostree install {{package}} {{[-r|--reboot]}}
```

rpm

RPM Package Manager.

For equivalent commands in other package managers, see https://wiki.archlinux.org/title/Pacman/Rosetta.

More information: https://rpm-software-management.github.io/rpm/man/rpm.8.

- Show version of httpd package:

```
rpm {{[-q|--query]}} httpd
```

- List versions of all matching packages:

```
rpm {{[-qa|--query --all]}} '{{mariadb*}}'
```

- Forcibly install a package regardless of currently installed versions:

```
rpm {{[-U|--upgrade]}} {{path/to/package.rpm}} --force
```

- Identify owner of a file and show version of the package:

```
rpm {{[-qf|--query --file]}} {{/etc/postfix/main.cf}}
```

- List package-owned files:

```
rpm {{[-ql|--query --list]}} {{kernel}}
```

- Show scriptlets from an RPM file:

```
rpm {{[-qp|--query --package]}} --scripts {{package.rpm}}
```

- Show changed, missing and/or incorrectly installed files of matching packages:

```
rpm {{[-Va|--verify --all]}} '{{php-*}}'
```

- Display the changelog of a specific package:

```
rpm {{[-q|--query]}} --changelog {{package}}
```

rpm2cpio

Convert an RPM package to a **`cpio`** archive.

More information: http://ftp.rpm.org/max-rpm/s1-rpm-miscellania-rpm2cpio.html.

- Convert an RPM package to a `cpio` archive and save it as `file.cpio` in the current directory:

```
rpm2cpio {{path/to/file.rpm}}
```

rpmbuild

RPM Package Build tool.

More information: https://manned.org/rpmbuild.

- Build binary and source packages:

```
rpmbuild -ba {{path/to/spec_file}}
```

- Build a binary package without source package:

```
rpmbuild -bb {{path/to/spec_file}}
```

- Specify additional variables when building a package:

```
rpmbuild -bb {{path/to/spec_file}} --define "{{variable1}} {{value1}}" --define "{{variable2}} {{value2}}"
```

rpmconf

Handle **`.rpmnew`**, **`.rpmsave`**, and **`.rpmorig`** files left over by package upgrades.

See also: **`rpm`**.

More information: https://manned.org/rpmconf.8.

- List leftover files and interactively choose what to do with each of them:

```
sudo rpmconf {{[-a|--all]}}
```

- Delete orphaned `.rpmnew` and `.rpmsave` files:

```
sudo rpmconf {{[-a|--all]}} {{[-c|--clean]}}
```

rpmkeys

Tool to import and remove RPM keys for RPM repositories.

When adding an RPM repository, you must also import the corresponding RPM key.

More information: https://rpm-software-management.github.io/rpm/man/rpmkeys.8.

- List all imported RPM keys. Also outputs its Key ID needed for deleting an imported RPM key:

```
sudo rpmkeys --list
```

- Remove/Delete a previously imported RPM key, given by its 16-Number/Letters Key ID:

```
sudo rpmkeys --delete {{5a278d9c-5bbc73cb}}
```

- Import an RPM key of repository:

```
sudo rpmkeys --import {{path/to/rpm_key}}
```

rpmspec

Query a RPM spec file.

More information: https://manned.org/rpmspec.

- List binary packages which would be generated from a RPM spec file:

```
rpmspec --query {{path/to/rpm.spec}}
```

- List all options for `--queryformat`:

```
rpmspec --querytags
```

- Get summary information for single binary packages generated from a RPM spec file:

```
rpmspec --query --queryformat "{{%{name}: %{summary}
\n}}" {{path/to/rpm.spec}}
```

- Get the source package which would be generated from a RPM spec file:

```
rpmspec --query --srpm {{path/to/rpm.spec}}
```

- Parse a RPM spec file to `stdout`:

```
rpmspec --parse {{path/to/rpm.spec}}
```

rsh

Execute commands on a remote host.

More information: https://www.gnu.org/software/inetutils/manual/inetutils.html#rsh-invocation.

- Execute a command on a remote host:

```
rsh {{remote_host}} {{ls -l}}
```

- Execute a command on a remote host with a specific username:

```
rsh {{remote_host}} {{[-l|--user]}} {{username}} {{ls -l}}
```

- Redirect `stdin` to `/dev/null` when executing a command on a remote host:

```
rsh {{remote_host}} --no-err {{ls -l}}
```

rspamc

Client for **`rspamd`** servers.

More information: https://manned.org/rspamc.

- Train the bayesian filter to recognize an email as spam:

  ```
  rspamc learn_spam {{path/to/email_file}}
  ```

- Train the bayesian filter to recognize an email as ham:

  ```
  rspamc learn_ham {{path/to/email_file}}
  ```

- Generate a manual report on an email:

  ```
  rspamc symbols {{path/to/email_file}}
  ```

- Show server statistics:

  ```
  rspamc stat
  ```

rtcwake

Enter a system sleep state until specified wakeup time relative to your BIOS clock.

More information: https://manned.org/rtcwake.

- Show whether an alarm is set or not:

```
sudo rtcwake {{[-m|--mode]}} show {{[-v|--verbose]}}
```

- Suspend to RAM and wake up after 10 seconds:

```
sudo rtcwake {{[-m|--mode]}} mem {{[-s|--seconds]}} {{10}}
```

- Suspend to disk (higher power saving) and wake up 15 minutes later:

```
sudo rtcwake {{[-m|--mode]}} disk --date +{{15}}min
```

- Freeze the system (more efficient than suspend-to-RAM but version 3.9 or newer of the Linux kernel is required) and wake up at a given date and time:

```
sudo rtcwake {{[-m|--mode]}} freeze --date {{YYYYMMDDhhmm}}
```

- Disable a previously set alarm:

```
sudo rtcwake {{[-m|--mode]}} disable
```

- Simulate waking up the computer at a given time. (Press `<Ctrl c>` to abort):

```
sudo rtcwake {{[-m|--mode]}} on --date {{hh:ss}}
```

rtmon

Save network state changes to a file.

More information: https://manned.org/rtmon.

- Save all network state changes to a file:

```
sudo rtmon {{[f|file]}} {{path/to/file}}
```

- Specify the type of change to log:

```
sudo rtmon {{[f|file]}} {{link|address|route}}
```

rtorrent

Download torrents.

More information: https://github.com/rakshasa/rtorrent/wiki/User-Guide#adding-and-removing-torrents.

- Add a torrent file or magnet to be downloaded:

  `rtorrent {{torrent_or_magnet}}`

- Start the download:

  `<Ctrl s>`

- View details about downloading torrent:

  `<ArrowRight>`

- Close rtorrent safely:

  `<Ctrl q>`

ruget

Alternative to **`wget`** written in Rust.

More information: https://github.com/ksk001100/ruget.

- Download the contents of a URL to a file:

```
ruget {{https://example.com/file}}
```

- Download the contents of a URL to a specified output file:

```
ruget {{[-o|--output]}} {{file_name}} {{https://example.com/file}}
```

run-mailcap

Execute programs via entries in the mailcap file.

More information: https://manned.org/run-mailcap.

- Compose any existing file or new on default `mailcap` edit tool:

```
run-mailcap --action=compose {{path/to/file}}
```

- View any file on default `mailcap` explorer:

```
run-mailcap --action=edit {{path/to/file}}
```

- Print a file using the default `mailcap` print tool:

```
run-mailcap --action=print {{path/to/file}}
```

- View any file (usually image) on default `mailcap` explorer:

```
run-mailcap --action=view {{path/to/file}}
```

- Invoke individual actions/programs on run-mailcap:

```
run-mailcap --action={{view|cat|compose|composetyped|edit|
print}} {{path/to/file}}
```

- Turn on extra information:

```
run-mailcap --action={{action}} --debug {{path/to/file}}
```

- Ignore any "copiousoutput" directive and forward output to `stdout`:

```
run-mailcap --action={{action}} --nopager {{path/to/file}}
```

- Display the found command without actually executing it:

```
run-mailcap --action={{action}} --norun {{path/to/file}}
```

run0

Elevate privileges interactively.

Similar to **sudo**, but it's not a SUID binary, authentication takes place via polkit, and commands are invoked from a **systemd** service.

See also: **sudo**, **pkexec**, **doas**.

More information: https://www.freedesktop.org/software/systemd/man/latest/run0.html.

- Run a command as root:

```
run0 {{command}}
```

- Run a command as another user and/or group:

```
run0 {{[-u|--user]}} {{username|user_id}} {{[-g|--group]}} {{group_name|group_id}} {{command}}
```

run_init

Run init scripts in the proper SELinux context.

Typically used to run system service scripts with correct SELinux domains.

See also: **runcon**, **semanage**.

More information: https://manned.org/run_init.

- Run a script in the init script context:

```
sudo run_init {{path/to/script}}
```

- Run a script with arguments:

```
sudo run_init {{path/to/script}} {{start|stop|restart}}
```

- Run a script and specify the init script context explicitly:

```
sudo run_init {{[-t|--type]}} {{context_type}} {{path/to/
script}}
```

- Simulate running a script, displaying the context that would be used:

```
sudo run_init {{[-n|--dry-run]}} {{path/to/script}}
```

runcon

Run a program in a different SELinux security context.

See also: **secon**.

More information: https://www.gnu.org/software/coreutils/manual/html_node/runcon-invocation.html.

- Print the security context of the current execution context:

```
runcon
```

- Specify the domain to run a command in:

```
runcon {{[-t|--type]}} {{domain}}_t {{command}}
```

- Specify the context role to run a command with:

```
runcon {{[-r|--role]}} {{role}}_r {{command}}
```

- Specify the full context to run a command with:

```
runcon {{user}}_u:{{role}}_r:{{domain}}_t {{command}}
```

runlevel

SysV runlevel utility.

See also: **`init`**.

More information: https://manned.org/runlevel.

- Return previous and current SysV runlevel:

```
runlevel
```

- Display help:

```
runlevel --help
```

runlim

Sample and limit time and memory usage of a program and its child processes using the proc filesystem on Linux.

More information: https://fmv.jku.at/runlim/.

- Print the time and memory usage of a command:

```
runlim {{command}} {{command_arguments}}
```

- Log statistics to a file instead of `stdout`:

```
runlim --output-file={{path/to/file}} {{command}}
{{command_arguments}}
```

- Limit time to an upper bound (in seconds):

```
runlim --time-limit={{number}} {{command}}
{{command_arguments}}
```

- Limit real-time to an upper bound (in seconds):

```
runlim --real-time-limit={{number}} {{command}}
{{command_arguments}}
```

- Limit space to an upper bound (in MB):

```
runlim --space-limit={{number}} {{command}}
{{command_arguments}}
```

runuser

Run commands as a user and group without asking for password.

More information: https://manned.org/runuser.

- Run command as a different user:

```
sudo runuser {{user}} {{[-c|--command]}} '{{command}}'
```

- Run command as a different user and group:

```
sudo runuser {{user}} {{[-g|--group]}} {{group}} {{[-c|--command]}} '{{command}}'
```

- Start a login shell as a specific user:

```
sudo runuser {{user}} {{[-l|--login]}}
```

- Specify a shell for running instead of the default shell (also works for login):

```
sudo runuser {{user}} {{[-s|--shell]}} {{/bin/sh}}
```

- Preserve the entire environment of root (only if `--login` is not specified):

```
sudo runuser {{user}} {{[-p|--preserve-environment]}} {{[-c|--command]}} '{{command}}'
```

rusnapshot

BTRFS snapshotting utility written in Rust.

More information: https://github.com/Edu4rdSHL/rusnapshot.

- Create a snapshot using a configuration file:

```
sudo rusnapshot {{[-c|--config]}} {{path/to/config.toml}} --cr
```

- List created snapshots:

```
sudo rusnapshot {{[-c|--config]}} {{path/to/config.toml}} {{[-l|--list]}}
```

- Delete a snapshot by ID or the name of the snapshot:

```
sudo rusnapshot {{[-c|--config]}} {{path/to/config.toml}} --del --id {{snapshot_id}}
```

- Delete all `hourly` snapshots:

```
sudo rusnapshot {{[-c|--config]}} {{path/to/config.toml}} {{[-l|--list]}} {{[-k|--keep]}} {{0}} --clean --kind {{hourly}}
```

- Create a read-write snapshot:

```
sudo rusnapshot {{[-c|--config]}} {{path/to/config.toml}} --cr {{[-r|--rw]}}
```

- Restore a snapshot:

```
sudo rusnapshot {{[-c|--config]}} {{path/to/config.toml}} --id {{snapshot_id}} {{[-r|--restore]}}
```

sa

Summarize accounting information about commands called by users, including basic information on CPU time spent processing and I/O rates.

Part of the **`acct`** package.

More information: https://manned.org/sa.8.

- Display executable invocations per user (username not displayed):

```
sudo sa
```

- Display executable invocations per user, showing responsible usernames:

```
sudo sa --print-users
```

- List resources used recently per user:

```
sudo sa --user-summary
```

sacct

Display accounting data from the Slurm service.

More information: https://slurm.schedmd.com/sacct.html.

- Display job ID, job name, partition, account, number of allocated cpus, job state, and job exit codes for recent jobs:

```
sacct
```

- Display job ID, job state, job exit code for recent jobs:

```
sacct {{[-b|--brief]}}
```

- Display the allocations of a job:

```
sacct {{[-j|--jobs]}} {{job_id}} {{[-X|--allocations]}}
```

- Display elapsed time, job name, number of requested CPUs, and memory requested of a job:

```
sacct {{[-j|--jobs]}} {{job_id}} {{[-o|--format]}}
Elapsed,JobName,ReqCPUS,ReqMem
```

- Display recent jobs that occurred from one week ago up to the present day:

```
sacct {{[-S|--starttime]}} $(date {{[-d|--date]}} "1 week
ago" +'%F')
```

- Output a larger number of characters for an attribute:

```
sacct {{[-o|--format]}} JobID,JobName%100
```

sacctmgr

View, set up, and manage Slurm accounts.

More information: https://slurm.schedmd.com/sacctmgr.html.

- Show current configuration:

```
sacctmgr show configuration
```

- Add a cluster to the slurm database:

```
sacctmgr add cluster {{cluster_name}}
```

- Add an account to the slurm database:

```
sacctmgr add account {{account_name}}
cluster={{cluster_of_account}}
```

- Show details of user/association/cluster/account using a specific format:

```
sacctmgr show {{user|association|cluster|account}}
format="Account%10" format="GrpTRES%30"
```

salloc

Start an interactive shell session or execute a command by allocating one or more nodes in a cluster.

More information: https://slurm.schedmd.com/salloc.html.

- Start an interactive shell session on a node in the cluster:

```
salloc
```

- Execute the specified command synchronously on a node in the cluster:

```
salloc {{ls --all}}
```

- Only allocate nodes fulfilling the specified constraints:

```
salloc {{[-C|--constraint]}} {{(amd|intel)&gpu}}
```

sam

AWS Serverless Application Model (SAM) CLI.

More information: https://docs.aws.amazon.com/serverless-application-model/latest/developerguide/using-sam-cli-corecommands.html.

- Initialize a serverless application:

```
sam init
```

- Initialize a serverless application with a specific runtime:

```
sam init {{[-r|--runtime]}} {{python3.7}}
```

- Package a SAM application:

```
sam package
```

- Build your Lambda function code:

```
sam build
```

- Run your serverless application locally:

```
sam local start-api
```

- Deploy an AWS SAM application:

```
sam deploy
```

sar

Monitor performance of various Linux subsystems.

More information: https://manned.org/sar.

- Report I/O and transfer rate issued to physical devices, one per second (press <Ctrl c> to quit):

```
sar -b {{1}}
```

- Report a total of 10 network device statistics, one per 2 seconds:

```
sar -n DEV {{2}} {{10}}
```

- Report CPU utilization, one per 2 seconds:

```
sar -u ALL {{2}}
```

- Report a total of 20 memory utilization statistics, one per second:

```
sar -r ALL {{1}} {{20}}
```

- Report the run queue length and load averages, one per second:

```
sar -q {{1}}
```

- Report paging statistics, one per 5 seconds:

```
sar -B {{5}}
```

sattach

Attach to a Slurm job step.

More information: https://slurm.schedmd.com/sattach.html.

- Redirect the IO streams (`stdout`, `stderr`, and `stdin`) of a Slurm job step to the current terminal:

```
sattach {{jobid}}.{{stepid}}
```

- Use the current console's input as `stdin` to the specified task:

```
sattach --input-filter {{task_number}}
```

- Only redirect `stdin`/`stderr` of the specified task:

```
sattach --{{output|error}}-filter {{task_number}}
```

sbatch

Submit a batch job to the SLURM scheduler.

More information: https://manned.org/sbatch.

- Submit a batch job:

```
sbatch {{path/to/job.sh}}
```

- Submit a batch job with a custom name:

```
sbatch --job-name={{myjob}} {{path/to/job.sh}}
```

- Submit a batch job with a time limit of 30 minutes:

```
sbatch --time={{00:30:00}} {{path/to/job.sh}}
```

- Submit a job and request multiple nodes:

```
sbatch --nodes={{3}} {{path/to/job.sh}}
```

sbcast

Send a file to a job's allocated nodes.

This command should only be used from within a Slurm batch job.

More information: https://slurm.schedmd.com/sbcast.html.

- Send a file to all nodes allocated to the current job:

```
sbcast {{path/to/file}} {{path/to/destination}}
```

- Autodetect shared libraries the transmitted file depends upon and transmit them as well:

```
sbcast --send-libs={{yes}} {{path/to/executable}} {{path/to/destination}}
```

sbctl

A user-friendly secure boot key manager.

Note: Not enrolling Microsoft's certificates can brick your system. See https://github.com/Foxboron/sbctl/wiki/FAQ#option-rom.

More information: https://github.com/Foxboron/sbctl#usage.

- Show the current secure boot status:

  ```
  sbctl status
  ```

- Create custom secure boot keys (by default, everything is stored in `/var/lib/sbctl`):

  ```
  sbctl create-keys
  ```

- Enroll the custom secure boot keys and Microsoft's UEFI vendor certificates:

  ```
  sbctl enroll-keys {{[-m|--microsoft]}}
  ```

- Automatically run `create-keys` and `enroll-keys` based on the settings in `/etc/sbctl/sbctl.conf`:

  ```
  sbctl setup --setup
  ```

- Sign an EFI binary with the created key and save the file to the database:

  ```
  sbctl sign {{[-s|--save]}} {{path/to/efi_binary}}
  ```

- Re-sign all the saved files:

  ```
  sbctl sign-all
  ```

- Verify that all EFI executables on the EFI system partition have been signed:

  ```
  sbctl verify
  ```

sbpctl

Manage the systemd-boot-password boot manager, a systemd-boot fork with a password-protected editor.

See also: **`bootctl`**.

More information: https://github.com/kitsunyan/systemd-boot-password#boot-manager-installing-and-configuration.

- Install the boot manager into the EFI system partition:

```
sudo sbpctl install /{{path/to/efi_system_partition}}
```

- Install the boot manager only as the default EFI loader (`/EFI/BOOT/BOOT*.EFI`):

```
sudo sbpctl install {{[-d|--default]}} /{{path/to/efi_system_partition}}
```

- Install the boot manager with `/etc/sbp/loader.conf` included in the EFI binary:

```
sudo sbpctl install {{[-i|--include]}} /{{path/to/efi_system_partition}}
```

- Install the boot manager and sign it for Secure Boot with the keys in `/etc/sbp`:

```
sudo sbpctl install {{[-s|--sign]}} /{{path/to/efi_system_partition}}
```

- Generate a SHA-512 hash of a password for the `password` option in `loader.conf`:

```
sbpctl generate
```

- Create a standalone EFI application from a Linux EFI application and an initramfs:

```
sudo sbpctl standalone {{[-i|--initrd]}} {{path/to/initramfs.img}} {{path/to/vmlinuz}} {{path/to/output.efi}}
```

scalpel

Recover files from a disk image based on file headers and footers.

File patterns must be enabled in the configuration file (all are commented out by default).

More information: https://manned.org/scalpel.

- Carve files from a disk image using a specific configuration file:

```
scalpel -c {{path/to/scalpel.conf}} -o {{path/to/
output_directory}} {{path/to/disk_image.dd}}
```

- Preview which files would be carved, without actually carving them:

```
scalpel -p -c {{path/to/scalpel.conf}} -o {{path/to/
output_directory}} {{path/to/disk_image.dd}}
```

- Skip the first N bytes of the disk image before carving:

```
scalpel -s {{number}} -c {{path/to/scalpel.conf}} -o {{path/
to/output_directory}} {{path/to/disk_image.dd}}
```

- Carve files without organizing them into subdirectories by type:

```
scalpel -O -c {{path/to/scalpel.conf}} -o {{path/to/
output_directory}} {{path/to/disk_image.dd}}
```

- Display help:

```
scalpel -h
```

- Display version:

```
scalpel -V
```

scancel

Cancel a Slurm job.

More information: https://slurm.schedmd.com/scancel.html.

- Cancel a job using its ID:

```
scancel {{job_id}}
```

- Cancel all jobs from a user:

```
scancel {{user_name}}
```

scanimage

Scan images with the Scanner Access Now Easy API.

More information: http://sane-project.org/man/scanimage.1.html.

- List available scanners to ensure the target device is connected and recognized:

```
scanimage {{[-L|--list-devices]}}
```

- Scan an image and save it to a file:

```
scanimage --format {{pnm|tiff|png|jpeg|pdf|...}} > {{path/to/new_image}}
```

- Specify the device to scan from:

```
scanimage {{[-d|--device]}} {{device_name}} > {{path/to/new_image}}
```

- Specify resolution for the scanned image (default resolution is 75dpi):

```
scanimage --resolution {{300}} > {{path/to/new_image}}
```

schroot

Run a command or start an interactive shell with a different root directory. More customizable than **`chroot`**.

More information: https://wiki.debian.org/Schroot.

- List available chroots:

```
schroot --list
```

- Run a command in a specific chroot:

```
schroot --chroot {{chroot}} {{command}}
```

- Run a command with options in a specific chroot:

```
schroot --chroot {{chroot}} {{command}} --
{{command_options}}
```

- Run a command in all available chroots:

```
schroot --all {{command}}
```

- Start an interactive shell within a specific chroot as a specific user:

```
schroot --chroot {{chroot}} --user {{user}}
```

- Begin a new session (a unique session ID is returned on `stdout`):

```
schroot --begin-session --chroot {{chroot}}
```

- Connect to an existing session:

```
schroot --run-session --chroot {{session_id}}
```

- End an existing session:

```
schroot --end-session --chroot {{session_id}}
```

scontrol

View information about and modify jobs.

More information: https://slurm.schedmd.com/scontrol.html.

- Show information for job:

```
scontrol show job {{job_id}}
```

- Suspend a comma-separated list of running jobs:

```
scontrol suspend {{job_id1,job_id2,...}}
```

- Resume a comma-separated list of suspended jobs:

```
scontrol resume {{job_id1,job_id2,...}}
```

- Hold a comma-separated list of queued jobs (Use `release` command to permit the jobs to be scheduled):

```
scontrol hold {{job_id1,job_id2,...}}
```

- Release a comma-separated list of suspended job:

```
scontrol release {{job_id1,job_id2,...}}
```

screenkey

A screencast tool to display keys pressed.

More information: https://www.thregr.org/wavexx/software/screenkey/.

- Display keys which are currently being pressed on the screen:

```
screenkey
```

- Display keys and mouse buttons which are currently being pressed on the screen:

```
screenkey {{[-M|--mouse]}}
```

- Launch the settings menu of screenkey:

```
screenkey --show-settings
```

- Launch screenkey at a specific position:

```
screenkey {{[-p|--position]}} {{top|center|bottom|fixed}}
```

- Change the format of the key modifiers displayed on screen:

```
screenkey --mods-mode {{normal|emacs|mac|win|tux}}
```

- Change the appearance of screenkey:

```
screenkey --bg-color "{{#a1b2c3}}" {{[-f|--font]}} {{Hack}}
--font-color {{yellow}} --opacity {{0.8}}
```

- Drag and select a window on screen to display screenkey:

```
screenkey {{[-p|--position]}} fixed {{[-g|--geometry]}} {{$
(slop --nodecorations --format '%g')}}
```

script

Record all terminal output to a typescript file.

More information: https://manned.org/script.

- Record a new session to a file named `typescript` in the current directory:

```
script
```

- Stop recording:

```
exit
```

- Record a new session to a custom filepath:

```
script {{path/to/session.out}}
```

- Append to an existing file:

```
script {{[-a|--append]}} {{logfile.log}}
```

- Record timing information (data is outputted to `stderr`):

```
script {{[-t|--timing]}} 2> {{path/to/timing_file}}
```

- Write out data as soon as it happens:

```
script {{[-f|--flush]}} {{path/to/file}}
```

- Execute quietly without start and done messages:

```
script {{[-q|--quiet]}} {{logfile.log}}
```

- Display help:

```
script {{[-h|--help]}}
```

scriptlive

Execute a typescript created by the **`script`** command in real-time.

See also: **`script`**.

More information: https://manned.org/scriptlive.

- Execute a typescript in real-time:

```
scriptlive {{path/to/timing_file}} {{path/to/typescript}}
```

- Execute a typescript at double the original speed:

```
scriptlive {{path/to/timing_file}} {{path/to/typescript}} --
divisor 2
```

- Execute a typescript created using `--log-in` option of `script`:

```
scriptlive --log-in {{path/to/stdin_log_file}} {{path/to/
typescript}}
```

- Execute a typescript waiting at most 2 seconds between each command:

```
scriptlive {{path/to/timing_file}} {{path/to/typescript}} --
maxdelay 2
```

scriptreplay

Replay a typescript created by the **`script`** command to **`stdout`**.

More information: https://manned.org/scriptreplay.

- Replay a typescript at the speed it was recorded:

```
scriptreplay {{path/to/timing_file}} {{path/to/typescript}}
```

- Replay a typescript at double the original speed:

```
scriptreplay {{path/to/timingfile}} {{path/to/typescript}} 2
```

- Replay a typescript at half the original speed:

```
scriptreplay {{path/to/timingfile}} {{path/to/typescript}}
0.5
```

scrontab

Manage Slurm crontab files.

More information: https://slurm.schedmd.com/scrontab.html.

- Install a new crontab from the specified file:

```
scrontab {{path/to/file}}
```

- [e]dit the crontab of the current user:

```
scrontab -e
```

- [e]dit the crontab of the specified user:

```
scrontab --user={{user_id}} -e
```

- [r]emove the current crontab:

```
scrontab -r
```

- Print the crontab of the current user to `stdout`:

```
scrontab -l
```

scrot

Screen capture utility.

More information: https://manned.org/scrot.

- Capture a screenshot and save it to the current directory with the current date as the filename:

```
scrot
```

- Capture a screenshot and save it as `capture.png`:

```
scrot capture.png
```

- Capture a screenshot interactively:

```
scrot {{[-s|--select]}}
```

- Capture a screenshot interactively without exiting on keyboard input, press `<Esc>` to exit:

```
scrot {{[-is|--ignorekeyboard --select]}}
```

- Capture a screenshot interactively delimiting the region with a colored line:

```
scrot {{[-s|--select]}} {{[-l|--line]}} color={{x11_color|
rgb_color}}
```

- Capture a screenshot from the currently focused window:

```
scrot {{[-u|--focused]}}
```

- Display a countdown of 10 seconds before taking a screenshot:

```
scrot {{[-c|--count]}} {{[-d|--delay]}} 10
```

scrub

Securely overwrite files, block devices, or free disk space.

More information: https://manned.org/scrub.

- Securely overwrite a file using the default overwrite pattern:

```
scrub {{path/to/file}}
```

- Securely overwrite multiple files:

```
scrub {{path/to/file1 path/to/file2 ...}}
```

- Securely overwrite a block device or partition:

```
sudo scrub {{/dev/sdX}}
```

- Securely overwrite a file with a single-pass overwrite pattern:

```
scrub {{[-p|--pattern]}} random {{path/to/file}}
```

- Securely overwrite a file using the DoD 5220.22-M overwrite pattern:

```
scrub {{[-p|--pattern]}} dod {{path/to/file}}
```

- Securely overwrite a file using the Gutmann overwrite pattern:

```
scrub {{[-p|--pattern]}} gutmann {{path/to/file}}
```

- Remove a file after successfully overwriting it:

```
scrub {{[-r|--remove]}} {{path/to/file}}
```

- Securely overwrite free space in a directory:

```
scrub {{[-X|--freespace]}} {{path/to/directory}}
```

scrun

An OCI runtime proxy for Slurm that runs containers as jobs.

More information: https://slurm.schedmd.com/scrun.html.

- Create a new container with a specific ID:

```
scrun create {{container_id}}
```

- Start a previously created container:

```
scrun start {{container_id}}
```

- Query the state of a container:

```
scrun state {{container_id}}
```

- Send a signal to a container (default: SIGTERM):

```
scrun kill {{container_id}}
```

- Send a specific signal to a container:

```
scrun kill {{container_id}} {{SIGKILL}}
```

- Delete a container and release its resources:

```
scrun delete {{container_id}}
```

- Enable debug logging:

```
scrun {{create|start|kill|delete}} {{container_id}} --debug
```

- Display version:

```
scrun --version
```

sdiag

Show information about the execution of **`slurmctld`**.

More information: https://slurm.schedmd.com/sdiag.html.

- Show all performance counters related to the execution of `slurmctld`:

```
sdiag {{[-a|--all]}}
```

- Reset performance counters related to the execution of `slurmctld`:

```
sdiag {{[-r|--reset]}}
```

- Specify the output format:

```
sdiag {{[-a|--all]}} --{{json|yaml}}
```

- Specify the cluster to send commands to:

```
sdiag {{[-a|--all]}} {{[-M|--cluster]}} {{cluster_name}}
```

sealert

Analyze and explain SELinux AVC denial messages.

Part of the **`setroubleshoot-server`** package.

See also: **`audit2why`**, **`ausearch`**, **`audit2allow`**.

More information: https://manned.org/sealert.

- Analyze all recent SELinux denials:

```
sudo sealert {{[-a|--analyze]}} {{/var/log/audit/audit.log}}
```

- Analyze a specific alert ID from system logs:

```
sudo sealert {{[-l|--lookupid]}} {{alert_id}}
```

- Display a summary of recent SELinux alerts:

```
sudo sealert {{[-b|--browser]}}
```

- Monitor audit log in real-time for new alerts:

```
sudo tail {{[-f|--follow]}} {{/var/log/audit/audit.log}} |
sealert {{[-l|--lookupid]}} -
```

secon

Get the SELinux security context of a file, pid, current execution context, or a context specification.

See also: **`semanage`**, **`runcon`**, **`chcon`**.

More information: https://manned.org/secon.

- Get the security context of the current execution context:

```
secon
```

- Get the current security context of a process:

```
secon {{[-p|--pid]}} {{1}}
```

- Get the current security context of a file, resolving all intermediate symlinks:

```
secon {{[-f|--file]}} {{path/to/file_or_directory}}
```

- Get the current security context of a symlink itself (i.e. do not resolve):

```
secon {{[-L|--link]}} {{path/to/symlink}}
```

- Parse and explain a context specification:

```
secon {{system_u:system_r:container_t:s0:c899,c900}}
```

secret-tool

Store and retrieve passwords, part of the **`libsecret`** package.

Communicates with Freedesktop secret service implementations such as **`gnome-keyring`**.

More information: https://gnome.pages.gitlab.gnome.org/libsecret/.

- Store a secret with an optional label:

```
secret-tool store --label={{label}} {{key}} {{value}}
```

- Retrieve a secret:

```
secret-tool lookup key {{key}}
```

- Get more information about a secret:

```
secret-tool search key {{key}}
```

- Delete a stored secret:

```
secret-tool clear key {{key}}
```

sed

GNU stream editor for filtering and transforming text.

See also: **awk**, **ed**.

More information: https://www.gnu.org/software/sed/manual/sed.html.

- [s]ubstitute all occurrences of "apple" with "mango" on all lines, print to `stdout`:

```
{{command}} | sed 's/apple/mango/g'
```

- Replace "apple" with "mango" in-place in a file (overwriting original file):

```
sed {{[-i|--in-place]}} 's/apple/mango/g' {{path/to/file}}
```

- Run multiple substitutions in one command:

```
{{command}} | sed -e '{{s/apple/mango/g}}' -e '{{s/orange/lime/g}}'
```

- Use a custom delimiter (useful when the pattern contains slashes):

```
{{command}} | sed '{{s#////#____#g}}'
```

- [d]elete lines 1 to 5 of a file and back up the original file with a `.orig` extension:

```
sed {{[-i|--in-place=]}}.orig '1,5d' {{path/to/file}}
```

- [p]rint only the first line to `stdout`:

```
{{command}} | sed {{[-n|--quiet]}} '1p'
```

- [i]nsert a new line at the beginning of a file, overwriting the original file:

```
sed {{[-i|--in-place]}} '1i\your new line text\' {{path/to/file}}
```

- Delete blank lines (with or without spaces/tabs) from a file, overwriting the original file:

```
sed {{[-i|--in-place]}} '/^[[:space:]]*$/d' {{path/to/file}}
```

see

This command is an alias of **`run-mailcap --action=view`**.

- View documentation for the original command:

  `tldr run-mailcap`

selinuxenabled

Check whether SELinux is enabled.

Returns exit code 0 if SELinux is enabled, and 1 if it is not.

See also: **`getenforce`**, **`setenforce`**, **`sestatus`**.

More information: https://manned.org/selinuxenabled.

- Check if SELinux is enabled (no output; check exit code with `echo $?`):

```
selinuxenabled
```

- Check if SELinux is enabled and print the result:

```
selinuxenabled && echo "SELinux is enabled" || echo "SELinux is disabled"
```

- Use in a shell script to conditionally execute commands:

```
if selinuxenabled; then echo "SELinux is running"; fi
```

semanage boolean

Manage persistent SELinux boolean settings.

See also: **`getsebool`**, **`setsebool`**.

More information: https://manned.org/semanage-boolean.

- List all booleans settings:

```
sudo semanage boolean {{[-l|--list]}}
```

- List all user-defined boolean settings without headings:

```
sudo semanage boolean {{[-l|--list]}} {{[-C|--locallist]}}
{{[-n|--noheading]}}
```

- Set or unset a boolean persistently:

```
sudo semanage boolean {{[-m|--modify]}} {{-1|--on|-0|--off}}
{{haproxy_connect_any}}
```

semanage fcontext

Manage persistent SELinux security context rules on files/directories.

See also: **`matchpathcon`**, **`secon`**, **`chcon`**, **`restorecon`**.

More information: https://manned.org/semanage-fcontext.

- List all file labeling rules:

```
sudo semanage fcontext {{[-l|--list]}}
```

- List all user-defined file labeling rules without headings:

```
sudo semanage fcontext {{[-lCn|--list --locallist --
noheading]}}
```

- Add a user-defined rule that labels any path which matches a PCRE `regex`:

```
sudo semanage fcontext {{[-a|--add]}} {{[-t|--type]}}
{{samba_share_t}} '{{/mnt/share(/.*)?}}'
```

- Add a user-defined rule that creates a labeling equivalence between two subpaths:

```
sudo semanage fcontext {{[-a|--add]}} {{[-e|--equal]}} /
{{path/to/ref}} /{{path/to/target}}
```

- Delete a user-defined rule using its PCRE `regex`:

```
sudo semanage fcontext {{[-d|--delete]}} '{{/mnt/
share(/.*)?}}'
```

- Relabel a directory recursively by applying the new rules:

```
restorecon -Rv {{path/to/directory}}
```

semanage interface

Manage SELinux network interface type definitions.

See also: **`semanage port`**.

More information: https://manned.org/semanage-interface.

- List all interface type definitions:

```
sudo semanage interface {{[-l|--list]}}
```

- Add a network interface type definition:

```
sudo semanage interface {{[-a|--add]}} {{[-t|--type]}}
{{type_name}} {{interface_name}}
```

- Delete a network interface type definition:

```
sudo semanage interface {{[-d|--delete]}} {{interface_name}}
```

- Modify a network interface type definition:

```
sudo semanage interface {{[-m|--modify]}} {{[-t|--type]}}
{{type_name}} {{interface_name}}
```

- List interface type definitions in a customized format:

```
sudo semanage interface {{[-l|--list]}} {{[-C|--locallist]}}
```

semanage login

Manage SELinux login mappings between Linux users and SELinux users.

See also: **`semanage user`**.

More information: https://manned.org/semanage-login.

- List all login mappings:

```
sudo semanage login {{[-l|--list]}}
```

- Add a login mapping (map Linux user to SELinux user):

```
sudo semanage login {{[-a|--add]}} {{[-s|--seuser]}}
{{selinux_user}} {{linux_username}}
```

- Delete a login mapping:

```
sudo semanage login {{[-d|--delete]}} {{linux_username}}
```

- Modify an existing login mapping:

```
sudo semanage login {{[-m|--modify]}} {{[-s|--seuser]}}
{{selinux_user}} {{linux_username}}
```

- Add a login mapping with a specific MLS/MCS range:

```
sudo semanage login {{[-a|--add]}} {{[-s|--seuser]}}
{{user_u}} {{[-r|--range]}} {{s0-s0:c0.c1023}}
{{linux_username}}
```

- List only customized login mappings:

```
sudo semanage login {{[-l|--list]}} {{[-C|--locallist]}}
```

semanage permissive

Manage persistent SELinux permissive domains.

Note that this effectively makes the process unconfined. For long-term use, it is recommended to configure SELinux properly.

See also: **`getenforce`**, **`setenforce`**.

More information: https://manned.org/semanage-permissive.

- List all process types (a.k.a domains) that are in permissive mode:

```
sudo semanage permissive {{[-l|--list]}}
```

- Set permissive mode for a domain:

```
sudo semanage permissive {{[-a|--add]}} {{httpd_t}}
```

- Unset permissive mode for a domain:

```
sudo semanage permissive {{[-d|--delete]}} {{httpd_t}}
```

semanage port

Manage persistent SELinux port definitions.

More information: https://manned.org/semanage-port.

- List all port labeling rules:

```
sudo semanage port {{[-l|--list]}}
```

- List all user-defined port labeling rules without headings:

```
sudo semanage port {{[-l|--list]}} {{[-C|--locallist]}} {{[-n|--noheading]}}
```

- Add a user-defined rule that assigns a label to a protocol-port pair:

```
sudo semanage port {{[-a|--add]}} {{[-t|--type]}} {{ssh_port_t}} {{[-p|--proto]}} {{tcp}} {{22000}}
```

- Add a user-defined rule that assigns a label to a protocol-port-range pair:

```
sudo semanage port {{[-a|--add]}} {{[-t|--type]}} {{http_port_t}} {{[-p|--proto]}} {{tcp}} {{80-88}}
```

- Delete a user-defined rule using its protocol-port pair:

```
sudo semanage port {{[-d|--delete]}} {{[-p|--proto]}} {{udp}} {{11940}}
```

semanage user

Manage SELinux user mappings.

See also: **`semanage login`**.

More information: https://manned.org/semanage-user.

- List all SELinux users:

```
sudo semanage user {{[-l|--list]}}
```

- Add a new SELinux user:

```
sudo semanage user {{[-a|--add]}} {{[-R|--roles]}}
{{role_name}} {{selinux_user}}
```

- Delete a SELinux user:

```
sudo semanage user {{[-d|--delete]}} {{selinux_user}}
```

- Modify an existing SELinux user's roles:

```
sudo semanage user {{[-m|--modify]}} {{[-R|--roles]}}
{{role_name}} {{selinux_user}}
```

- Add a SELinux user with a specific default level:

```
sudo semanage user {{[-a|--add]}} {{[-R|--roles]}}
{{role_name}} {{[-L|--level]}} {{s0}} {{selinux_user}}
```

- Add a SELinux user with a specific MLS/MCS range:

```
sudo semanage user {{[-a|--add]}} {{[-R|--roles]}}
{{role_name}} {{[-r|--range]}} {{s0-s0:c0.c1023}}
{{selinux_user}}
```

- List only customized SELinux users:

```
sudo semanage user {{[-l|--list]}} {{[-C|--locallist]}}
```

semanage

SELinux persistent policy management tool.

Some subcommands such as **`boolean`**, **`fcontext`**, **`port`**, etc. have their own usage documentation.

More information: https://manned.org/semanage.

- Set or unset a SELinux boolean. Booleans allow the administrator to customize how policy rules affect confined process types (a.k.a domains):

```
sudo semanage boolean {{[-m|--modify]}} {{--on|--off}} {{haproxy_connect_any}}
```

- Add a user-defined file context labeling rule. File contexts define what files confined domains are allowed to access:

```
sudo semanage fcontext {{[-a|--add]}} {{[-t|--type]}} {{samba_share_t}} '/mnt/share(/.*)?'
```

- Add a user-defined port labeling rule. Port labels define what ports confined domains are allowed to listen on:

```
sudo semanage port {{[-a|--add]}} {{[-t|--type]}} {{ssh_port_t}} {{[-p|--proto]}} {{tcp}} {{22000}}
```

- Set or unset permissive mode for a confined domain. Per-domain permissive mode allows more granular control compared to `setenforce`:

```
sudo semanage permissive {{--add|--delete}} {{httpd_t}}
```

- Output local customizations in the default store:

```
sudo semanage export {{[-f|--output_file]}} {{path/to/file}}
```

- Import a file generated by `semanage export` into local customizations (CAREFUL: may remove current customizations!):

```
sudo semanage import {{[-f|--input_file]}} {{path/to/file}}
```

semodule

Manage SELinux policy modules.

See also: **`audit2allow`**, **`semanage`**.

More information: https://manned.org/semodule.

- List all installed policy modules:

```
sudo semodule {{[-l|--list]}}
```

- Install a new policy module:

```
sudo semodule {{[-i|--install]}} {{path/to/module.pp}}
```

- Remove a policy module:

```
sudo semodule {{[-r|--remove]}} {{module_name}}
```

- Enable a policy module:

```
sudo semodule {{[-e|--enable]}} {{module_name}}
```

- Disable a policy module:

```
sudo semodule {{[-d|--disable]}} {{module_name}}
```

- Reload all policy modules:

```
sudo semodule {{[-R|--reload]}}
```

- Display the version of installed policy modules:

```
sudo semodule {{[-l|--list]}} {{[-v|--verbose]}}
```

sensible-browser

Open the default browser.

More information: https://manned.org/sensible-browser.

- Open a new window of the default browser:

```
sensible-browser
```

- Open a URL in the default browser:

```
sensible-browser {{url}}
```

sensible-editor

Open the default editor.

More information: https://manned.org/sensible-editor.

- Open a file in the default editor:

```
sensible-editor {{path/to/file}}
```

- Open a file in the default editor, with the cursor at the end of the file:

```
sensible-editor + {{path/to/file}}
```

- Open a file in the default editor, with the cursor at the beginning of line 10:

```
sensible-editor +10 {{path/to/file}}
```

- Open 3 files in vertically split editor windows at the same time:

```
sensible-editor -O3 {{path/to/file1 path/to/file2 path/to/
file3}}
```

sensors

Report sensors information.

See also: **`btm`**, **`btop`**.

More information: https://manned.org/sensors.

- Show the current readings of all sensor chips:

```
sensors
```

- Show temperatures in degrees Fahrenheit:

```
sensors {{[-f|--fahrenheit]}}
```

- Show the readings of a specific sensor chip (run `sensors` to find chip name, e.g. coretemp-isa-0000):

```
sensors {{chip_name}}
```

- Output sensor data in JSON format:

```
sensors -j
```

- Show raw sensor output for scripting or debugging purposes:

```
sensors -u
```

- Show sensor readings using a specific configuration file:

```
sensors {{[-c|--config-file]}} {{path/to/sensors.conf}}
```

- List all detected hardware communication buses (like I2C or ISA):

```
sensors --bus-list
```

service

Manage services by running init scripts.

The full script path should be omitted (**`/etc/init.d/`** is assumed).

More information: https://manned.org/service.

- List the name and status of all services:

```
service --status-all
```

- Start/Stop/Restart/Reload service (start/stop should always be available):

```
service {{service_name}} {{start|stop|restart|reload}}
```

- Do a full restart (runs script twice with start and stop):

```
service {{service_name}} --full-restart
```

- Show the current status of a service:

```
service {{service_name}} status
```

sesearch

Search SELinux policy rules.

Part of the **`setools`** package.

See also: **`semodule`**.

More information: https://manned.org/sesearch.

- Search for all allow rules:

```
sesearch --allow
```

- Search for rules related to a specific type:

```
sesearch --allow {{[-t|--target]}} {{type_name}}
```

- Search for rules related to a specific source type:

```
sesearch --allow {{[-s|--source]}} {{source_type}}
```

- Search for rules that allow a specific class and permission:

```
sesearch --allow {{[-c|--class]}} {{class_name}} {{[-p|--perm]}} {{permission}}
```

- Search for rules with a specific target type and class:

```
sesearch --allow {{[-t|--target]}} {{type_name}} {{[-c|--class]}} {{class_name}}
```

- Display more detailed information about matched rules:

```
sesearch --allow {{[-t|--target]}} {{type_name}} {{[-v|--verbose]}}
```

sestatus

Print the current SELinux status.

More information: https://manned.org/sestatus.

- Print the current status:

```
sestatus
```

- Print the current states of all policy booleans:

```
sestatus -b
```

- Print the current file and process contexts:

```
sestatus -v
```

setarch

Change the reported architecture for a program's execution, primarily used to modify how programs behave based on system architecture.

Useful for compatibility testing or running legacy applications.

More information: https://manned.org/setarch.

- Run a command as if the machine architecture is `i686` (useful for running 32-bit apps on a 64-bit kernel):

```
setarch i686 {{command}}
```

- Run a shell with the `x86_64` architecture:

```
setarch x86_64 {{bash}}
```

- Disable randomization of the virtual address space:

```
setarch {{linux32}} {{[-R|--addr-no-randomize]}} {{command}}
```

- List supported architectures:

```
setarch --list
```

- Display help:

```
setarch {{[-h|--help]}}
```

setcap

Set capabilities of specified file.

See also: **`getcap`**.

More information: https://manned.org/setcap.

- Set capability `cap_net_raw` (to use RAW and PACKET sockets) for a given file:

```
setcap 'cap_net_raw' {{path/to/file}}
```

- Set multiple capabilities on a file (`ep` behind the capability means "effective permitted"):

```
setcap
'{{cap_dac_read_search,cap_sys_tty_config+ep}}' {{path/to/
file}}
```

- Remove all capabilities from a file:

```
setcap -r {{path/to/file}}
```

- Verify that the specified capabilities are currently associated with the specified file:

```
setcap -v '{{cap_net_raw}}' {{path/to/file}}
```

- Set the file capability for use only in a user namespace with a specific root user ID owner:

```
setcap -n {{root_uid}} '{{cap_net_admin}}' {{path/to/file}}
```

setenforce

Toggle SELinux between enforcing and permissive modes.

To enable or disable SELinux, edit **`/etc/selinux/config`** instead.

See also: **`getenforce`**, **`semanage permissive`**.

More information: https://manned.org/setenforce.

- Put SELinux in enforcing mode:

```
setenforce {{1|Enforcing}}
```

- Put SELinux in permissive mode:

```
setenforce {{0|Permissive}}
```

setfacl

Set file access control lists (ACL).

More information: https://manned.org/setfacl.

- Modify ACL of a file for user with read and write access:

```
setfacl {{[-m|--modify]}} u:{{username}}:rw {{path/to/file_or_directory}}
```

- Modify default ACL of a file for all users:

```
setfacl {{[-d|--default]}} {{[-m|--modify]}} u::rw {{path/to/file_or_directory}}
```

- Remove ACL of a file for a user:

```
setfacl {{[-x|--remove]}} u:{{username}} {{path/to/file_or_directory}}
```

- Remove all ACL entries of a file:

```
setfacl {{[-b|--remove-all]}} {{path/to/file_or_directory}}
```

setfattr

Set extended file attributes.

See also: **`getfattr`**.

More information: https://manned.org/setfattr.

- Set name of attribute for file:

```
setfattr {{[-n|--name]}} user.{{attribute_name}} {{path/to/file}}
```

- Set a user-defined value of an extended attribute on a file:

```
setfattr {{[-n|--name]}} user.{{attribute_name}} {{[-v|--value]}} "{{value}}" {{path/to/file}}
```

- Remove a specific attribute of a file:

```
setfattr {{[-x|--remove]}} user.{{attribute_name}} {{path/to/file}}
```

setfiles

Set SELinux file security contexts based on policy rules.

Similar to **`restorecon`** but reads contexts from a file_contexts file.

See also: **`restorecon`**, **`semanage fcontext`**, **`fixfiles`**.

More information: https://manned.org/setfiles.

- Set file contexts according to the default policy file:

```
sudo setfiles /etc/selinux/targeted/contexts/files/
file_contexts {{path/to/directory}}
```

- Set file contexts recursively and show changes:

```
sudo setfiles /etc/selinux/targeted/contexts/files/
file_contexts {{path/to/directory}} {{[-v|--verbose]}}
```

- Preview what would be changed without actually modifying contexts:

```
sudo setfiles /etc/selinux/targeted/contexts/files/
file_contexts {{path/to/directory}} {{[-n|--nochange]}}
```

- Set file contexts and verify them:

```
sudo setfiles /etc/selinux/targeted/contexts/files/
file_contexts {{path/to/directory}} {{[-v|--verbose]}} {{[-
F|--force]}}
```

- Use a specific root path for context matching:

```
sudo setfiles /etc/selinux/targeted/contexts/files/
file_contexts {{path/to/new_directory}} {{[-r|--rootpath]}}
{{path/to/old_directory}}
```

setfont

Set the terminal font for TTYs.

More information: https://manned.org/setfont.

- Change the terminal font:

```
setfont {{font}}.gz
```

- Change the terminal font by specifying a path:

```
setfont /usr/share/kbd/{{mapping}}/{{font.ext}}
```

- Double font size:

```
setfont {{[-d|--double]}}
```

- Reset to the default font:

```
setfont
```

setleds

Set lock key and LED states.

More information: https://manned.org/setleds.

- Print current key and LED states:

```
setleds
```

- Turn a lock key and its LED off:

```
setleds -{{num|caps|scroll}}
```

- Turn a lock key and its LED on:

```
setleds +{{num|caps|scroll}}
```

- Unpair key and LED states and only set the LED:

```
setleds -L {{+scroll}}
```

- Restore key and LED pairing:

```
setleds -L
```

setsebool

Set SELinux boolean value.

See also: **`semanage boolean`**, **`getsebool`**.

More information: https://manned.org/setsebool.

- Show the current setting of [a]ll booleans:

```
getsebool -a
```

- Set or unset a boolean temporarily (non-persistent across reboot):

```
sudo setsebool {{httpd_can_network_connect}} {{1|true|on|0|false|off}}
```

- Set or unset a boolean [P]ersistently:

```
sudo setsebool -P {{container_use_devices}} {{1|true|on|0|false|off}}
```

- Set or unset multiple booleans at once [P]ersistently:

```
sudo setsebool -P {{key1 1 key2 0 ...}}
```

- Set or unset a boolean persistently (alternative method using `semanage-boolean`):

```
sudo semanage boolean {{[-m|--modify]}} {{-1|--on|-0|--off}} {{haproxy_connect_any}}
```

setserial

Read and modify serial port information.

More information: https://manned.org/setserial.

- Print all information about a specific serial device:

```
setserial -a {{/dev/cuaN}}
```

- Print the configuration summary of a specific serial device (useful for printing during bootup process):

```
setserial -b {{device}}
```

- Set a specific configuration parameter to a device:

```
sudo setserial {{device}} {{parameter}}
```

- Print the configuration of a list of devices:

```
setserial -g {{device1 device2 ...}}
```

setsid

Run a program in a new session if the calling process is not a process group leader.

The created session is by default not controlled by the current terminal.

More information: https://manned.org/setsid.

- Run a program in a new session:

```
setsid {{program}}
```

- Run a program in a new session discarding the resulting output and error:

```
setsid {{program}} > /dev/null 2>&1
```

- Run a program creating a new process:

```
setsid {{[-f|--fork]}} {{program}}
```

- Return the exit code of a program as the exit code of setsid when the program exits:

```
setsid {{[-w|--wait]}} {{program}}
```

- Run a program in a new session setting the current terminal as the controlling terminal:

```
setsid {{[-c|--ctty]}} {{program}}
```

setup-alpine

Install Alpine Linux.

More information: https://docs.alpinelinux.org/user-handbook/0.1a/Installing/setup_alpine.html.

- Run the full setup:

```
setup-alpine
```

- Use default configurations:

```
setup-alpine -q
```

setxkbmap

Set the keyboard using the X Keyboard Extension.

More information: https://manned.org/setxkbmap.

- Set the keyboard in French AZERTY:

```
setxkbmap {{fr}}
```

- Set multiple keyboard layouts, their variants, and switching option:

```
setxkbmap -layout {{us,de}} -variant {{,qwerty}} -option
'{{grp:alt_caps_toggle}}'
```

- List all layouts:

```
localectl list-x11-keymap-layouts
```

- List variants for the layout:

```
localectl list-x11-keymap-variants {{de}}
```

- List available switching options:

```
localectl list-x11-keymap-options | grep grp:
```

- Display help:

```
setxkbmap -help
```

sfdisk

Display or manipulate a disk partition table.

More information: https://manned.org/sfdisk.

- Back up the partition layout to a file:

```
sudo sfdisk {{[-d|--dump]}} {{/dev/sdX}} > {{path/to/file.dump}}
```

- Restore a partition layout:

```
sudo sfdisk < {{path/to/file.dump}} {{/dev/sdX}}
```

- Set the type of a partition:

```
sudo sfdisk --part-type {{/dev/sdX}} {{partition_number}} {{swap}}
```

- Delete a partition:

```
sudo sfdisk --delete {{/dev/sdX}} {{partition_number}}
```

- Display help:

```
sfdisk {{[-h|--help]}}
```

sfill

Securely overwrite the free space and inodes of the partition where the specified directory resides.

More information: https://manned.org/sfill.

- Overwrite free space and inodes of a disk with 38 writes (slow but secure):

```
sfill /{{path/to/mounted_disk_directory}}
```

- Overwrite free space and inodes of a disk with 6 writes (fast but [l]ess secure) and show status ([v]erbose):

```
sfill -l -v /{{path/to/mounted_disk_directory}}
```

- Overwrite free space and inodes of a disk with 1 write (very fast but [l]ess secure [v]erbose) and show status:

```
sfill -ll -v /{{path/to/mounted_disk_directory}}
```

- Overwrite only free space of a d[I]sk:

```
sfill -I /{{path/to/mounted_disk_directory}}
```

- Overwrite only free [i]nodes of a disk:

```
sfill -i /{{path/to/mounted_disk_directory}}
```

sh5util

Merge HDF5 files produced by the **`sacct_gather_profile`** plugin.

More information: https://slurm.schedmd.com/sh5util.html.

- Merge HDF5 files produced on each allocated node for the specified job or step:

```
sh5util {{[-j|--jobs]}} {{job_id|job_id.step_id}}
```

- Extract one or more data series from a merged job file:

```
sh5util {{[-j|--jobs]}} {{job_id|job_id.step_id}} {{[-E|--
extract]}} {{[-i|--input]}} {{path/to/file.h5}} {{[-s|--
series]}} {{Energy|Filesystem|Network|Task}}
```

- Extract one data item from all nodes in a merged job file:

```
sh5util {{[-j|--jobs]}} {{job_id|job_id.step_id}} {{[-I|--
item-extract]}} {{[-s|--series]}} {{Energy|Filesystem|
Network|Task}} {{[-d|--data]}} {{data_item}}
```

shar

Create a shell archive.

More information: https://www.gnu.org/software/sharutils/manual/sharutils.html.

- Create a shell script that when executed extracts the given files from itself:

```
shar {{[-V|--vanilla-operation]}} {{path/to/file1 path/to/
file2 ...}} > {{path/to/archive.sh}}
```

- Compress the files in the archive:

```
shar {{[-C|--compactor]}} {{xz}} {{path/to/file1 path/to/
file2 ...}} > {{path/to/archive.sh}}
```

- Treat all files as binary (i.e. `uuencode` everything):

```
shar {{[-B|--uuencode]}} {{path/to/file1 path/to/file2 ...}}
> {{path/to/archive.sh}}
```

- Treat all files as text (i.e. `uuencode` nothing):

```
shar {{[-T|--text-files]}} {{path/to/file1 path/to/
file2 ...}} > {{path/to/archive.sh}}
```

- Include a name and cut mark in the header comment of the archive:

```
shar {{[-n|--archive-name]}} "{{My files}}" {{[-c|--cut-
mark]}} {{path/to/file1 path/to/file2 ...}} > {{path/to/
archive.sh}}
```

shelly

A modern, unified package manager for Arch Linux.

See also: **pacman**, **paru**, **yay**.

More information: https://www.seafoam-labs.org/shelly-alpm/docs/cli-reference/.

- Upgrade all packages from every source (repo, AUR, Flatpak, AppImage):

```
shelly {{[-Ux|upgrade all]}}
```

- Install a package:

```
shelly {{package}}
```

- Remove an installed package and its orphaned dependencies:

```
shelly {{[-Rs|remove standard]}} {{[-c|--cascade]}} {{package}}
```

- Search for a package in the standard repositories:

```
shelly {{[-Ss|search standard]}} {{[-v|--available]}} {{search_term}}
```

- Search for a package specifically in the AUR:

```
shelly {{[-Sa|search aur]}} {{search_term}}
```

- Remove orphaned packages (installed as dependencies but no longer required):

```
shelly {{[-Zs|purify standard]}} {{[-o|--orphans]}}
```

shiny-mirrors

Generate a **pacman** mirror list for Manjaro Linux.

Every run of shiny-mirrors requires you to synchronize your database and update your system using **sudo pacman -Syyu**.

More information: https://gitlab.com/Arisa_Snowbell/shiny-mirrors/-/blob/domina/shiny-mirrors/man/shiny-mirrors.md.

- Get the status of the current mirrors:

```
shiny-mirrors status
```

- Generate a mirror list using the default behavior:

```
sudo shiny-mirrors refresh
```

- Display the current configuration file:

```
shiny-mirrors config show
```

- Switch to a different branch interactively:

```
sudo shiny-mirrors config --branch
```

shnsplit

Split audio files according to a **`.cue`** file.

More information: http://shnutils.freeshell.org/shntool/.

- Split a `.wav` + `.cue` file into multiple files:

```
shnsplit -f {{path/to/file.cue}} {{path/to/file.wav}}
```

- Show supported formats:

```
shnsplit -a
```

- Split a `.flac` file into multiple files:

```
shnsplit -f {{path/to/file.cue}} -o flac {{path/to/
file.flac}}
```

- Split a `.wav` file into files of the form "track-number - album - title":

```
shnsplit -f {{path/to/file.cue}} {{path/to/file.wav}} -t "%n
- %a - %t"
```

shntool split

This command is an alias of **`shnsplit`**.

- View documentation for the original command:

  ```
  tldr shnsplit
  ```

showkey

Display the keycode of pressed keys on the keyboard, helpful for debugging keyboard-related issues and key remapping.

More information: https://manned.org/showkey.

- View keycodes in decimal:

```
sudo showkey
```

- Display scancodes in hexadecimal:

```
sudo showkey {{[-s|--scancodes]}}
```

- Display keycodes in decimal (default):

```
sudo showkey {{[-k|--keycodes]}}
```

- Display keycodes in ASCII, decimal, and hexadecimal:

```
sudo showkey {{[-a|--ascii]}}
```

- Exit the program:

```
<Ctrl d>
```

shutdown

Shut down and reboot the system.

See also: **`poweroff`**.

More information: https://manned.org/shutdown.8.

- Power off ([h]alt) immediately:

```
shutdown -h now
```

- Reboot immediately:

```
shutdown {{[-r|--reboot]}} now
```

- Reboot in 5 minutes:

```
shutdown {{[-r|--reboot]}} +5 &
```

- Shut down at 1:00 pm (Uses 24h clock):

```
shutdown -h 13:00
```

- [c]ancel a pending shutdown/reboot operation:

```
shutdown -c
```

sic

Simple IRC client.

Part of the suckless tools.

More information: https://manned.org/sic.

- Connect to the default host (irc.ofct.net) with the nickname set in the $USER environment variable:

```
sic
```

- Connect to a given host, using a given nickname:

```
sic -h {{host}} -n {{nickname}}
```

- Connect to a given host, using a given nickname and password:

```
sic -h {{host}} -n {{nickname}} -k {{password}}
```

- Join a channel:

```
:j #{{channel}}<Enter>
```

- Send a message to a channel or user:

```
:m #{{channel|user}}<Enter>
```

- Set default channel or user:

```
:s #{{channel|user}}<Enter>
```

silentcast

Silent screencast creator. Saves in `.mkv` and animated GIF formats.

More information: https://github.com/colinkeenan/silentcast.

- Launch silentcast:

```
silentcast
```

- Launch silentcast on a specific display:

```
silentcast --display={{display}}
```

sinfo

View information about Slurm nodes and partitions.

See also: **`squeue`**, **`sbatch`**.

More information: https://slurm.schedmd.com/sinfo.html.

- Show a quick summary overview of the cluster:

```
sinfo {{[-s|--summarize]}}
```

- View the detailed status of all partitions across the entire cluster:

```
sinfo
```

- View the detailed status of a specific partition:

```
sinfo {{[-p|--partition]}} {{partition_name}}
```

- View information about idle nodes:

```
sinfo {{[-t|--states]}} {{idle}}
```

- Summarize dead nodes:

```
sinfo {{[-d|--dead]}}
```

- List dead nodes and the reasons why:

```
sinfo {{[-R|--list-reasons]}}
```

size

Display the sizes of sections inside binary files.

More information: https://sourceware.org/binutils/docs/binutils/size.html.

- Display the size of sections in a given object or executable file:

```
size {{path/to/file}}
```

- Display the size of sections in a given object or executable file in [o]ctal:

```
size {{[-o|--radix=8]}} {{path/to/file}}
```

- Display the size of sections in a given object or executable file in [d]ecimal:

```
size {{[-d|--radix=10]}} {{path/to/file}}
```

- Display the size of sections in a given object or executable file in he[x]adecimal:

```
size {{[-x|--radix=16]}} {{path/to/file}}
```

slabtop

Display kernel slab cache information in real time.

See also: **`top`**, **`htop`**, **`atop`**.

More information: https://manned.org/slabtop.

- Start `slabtop`:

```
sudo slabtop
```

- Sort by [c]ache size:

```
sudo slabtop {{[-s|--sort]}} c
```

- Sort by number of [o]bjects:

```
sudo slabtop {{[-s|--sort]}} o
```

- Sort by object [s]ize:

```
sudo slabtop {{[-s|--sort]}} s
```

- Display once and then exit:

```
sudo slabtop {{[-o|--once]}}
```

- Display help:

```
slabtop {{[-h|--help]}}
```

slapt-get

An **apt** like system for Slackware package management.

Package sources need to be configured in the slapt-getrc file.

More information: https://software.jaos.org/git/slapt-get/plain/README.

- Update the list of available packages and versions:

```
slapt-get --update
```

- Install a package, or update it to the latest available version:

```
slapt-get --install {{package}}
```

- Remove a package:

```
slapt-get --remove {{package}}
```

- Upgrade all installed packages to their latest available versions:

```
slapt-get --upgrade
```

- Locate packages by the package name, disk set, or version:

```
slapt-get --search {{query}}
```

- Show information about a package:

```
slapt-get --show {{package}}
```

slapt-src

A utility to automate building of slackbuilds.

SlackBuild sources need to be configured in the slapt-srcrc file.

More information: https://github.com/jaos/slapt-src.

- Update the list of available slackbuilds and versions:

  `slapt-src {{[-u|--update]}}`

- List all available slackbuilds:

  `slapt-src {{[-l|--list]}}`

- Fetch, build, and install the specified slackbuild(s):

  `slapt-src {{[-i|--install]}} {{slackbuild_name}}`

- Locate slackbuilds by their name or description:

  `slapt-src {{[-s|--search]}} {{search_term}}`

- Display information about a slackbuild:

  `slapt-src {{[-w|--show]}} {{slackbuild_name}}`

sleep

Delay for a specified amount of time.

More information: https://www.gnu.org/software/coreutils/manual/html_node/sleep-invocation.html.

- Delay in seconds:

```
sleep {{seconds}}
```

- Delay in [m]inutes. (Other units [d]ay, [h]our, [s]econd, [inf]inity can also be used):

```
sleep {{minutes}}m
```

- Delay for 1 [d]ay 3 [h]ours:

```
sleep 1d 3h
```

- Execute a specific command after 20 [m]inutes delay:

```
sleep 20m && {{command}}
```

- Delay forever:

```
sleep {{[inf|infinity]}}
```

- Display help:

```
sleep --help
```

slop

Get a selection of the screen.

More information: https://manned.org/slop.

- Wait for the user to make a selection and output its geometry to `stdout`:

```
slop
```

- Double click, rather than click and drag, to draw a selection:

```
slop {{[-D|--nodrag]}}
```

- Highlight the selection rather than outlining it:

```
slop {{[-l|--highlight]}}
```

- Specify the output format:

```
slop {{[-f|--format]}} {{format_string}}
```

- Specify the selection rectangle's color:

```
slop {{[-c|--color]}} {{red}},{{green}},{{blue}},{{alpha}}
```

slurmctld

Monitor all other Slurm daemons and resources, accept work (jobs), and allocate resources to those jobs.

More information: https://slurm.schedmd.com/slurmctld.html.

- Clear all previous `slurmctld` states from its last checkpoint:

```
slurmctld -c
```

- Set the daemon's nice value to the specified value, typically a negative number:

```
slurmctld -n {{value}}
```

- Write log messages to the specified file:

```
slurmctld -L {{path/to/output_file}}
```

- Display help:

```
slurmctld -h
```

- Display version:

```
slurmctld -V
```

slurmd

Monitor all tasks running on the compute node, accept tasks, launch tasks, and kill running tasks upon request.

More information: https://slurm.schedmd.com/slurmd.html.

- Report node rebooted when daemon restarted (Used for testing purposes):

```
slurmd -b
```

- Run the daemon with the given nodename:

```
slurmd -N {{nodename}}
```

- Write log messages to the specified file:

```
slurmd -L {{path/to/output_file}}
```

- Read configuration from the specified file:

```
slurmd -f {{path/to/file}}
```

- Display help:

```
slurmd -h
```

slurmdbd

A secure enterprise-wide interface to a database for Slurm.

More information: https://slurm.schedmd.com/slurmdbd.html.

- Set the daemon's nice value to the specified value, typically a negative number:

```
slurmdbd -n {{value}}
```

- Change the working directory of `slurmdbd` to the LogFile path or to `/var/tmp`:

```
slurmdbd -s
```

- Display help:

```
slurmdbd -h
```

- Display version:

```
slurmdbd -V
```

slurmrestd

Interface to Slurm via REST API.

Note: Can be used in two modes: Inetd Mode and Listen Mode.

More information: https://slurm.schedmd.com/slurmrestd.html.

- Change the [g]roup ID (and drop supplemental groups) before processing client requests:

```
slurmrestd -g {{group_id}} {{host:port|unix:/path/to/socket}}
```

- Specify a comma-delimited list of [a]uthentication plugins to load:

```
slurmrestd -a {{authentication_plugins}} {{host:port|unix:/path/to/socket}}
```

- Read Slurm configuration from the specified [f]ile:

```
slurmrestd -f {{path/to/file}}
```

- Change [u]ser ID before processing client request:

```
slurmrestd -u {{user_id}}
```

- Display [h]elp:

```
slurmrestd -h
```

- Display [V]ersion:

```
slurmrestd -V
```

slurmstepd

Slurm daemon for managing and monitoring individual job steps within a multi-step job.

Note: It should not be invoked manually.

More information: https://slurm.schedmd.com/slurmstepd.html.

- Start the daemon:

```
slurmstepd
```

slurp

Select a region in a Wayland compositor.

More information: https://github.com/emersion/slurp/blob/master/slurp.1.scd.

- Select a region and print it to `stdout`:

```
slurp
```

- Select a region and print it to `stdout`, while displaying the dimensions of the selection:

```
slurp -d
```

- Select a single point instead of a region:

```
slurp -p
```

- Select an output and print its name:

```
slurp -o -f '%o'
```

- Select a specific region and take a borderless screenshot of it, using `grim`:

```
grim -g "$(slurp -w 0)"
```

- Select a specific region and take a borderless video of it, using `wf-recorder`:

```
wf-recorder {{[-g|--geometry]}} "$(slurp -w 0)"
```

sm

Display a short message fullscreen.

More information: https://github.com/nomeata/screen-message.

- Display a message in full-screen:

```
sm "{{Hello World!}}"
```

- Display a message with inverted colors:

```
sm {{[-i|--invert]}} "{{Hello World!}}"
```

- Display a message with a custom foreground color:

```
sm {{[-f|--foreground]}} {{blue}} "{{Hello World!}}"
```

- Display a message with a custom background color:

```
sm {{[-b|--background]}} {{#008888}} "{{Hello World!}}"
```

- Display a message rotated 3 times (in steps of 90 degrees, counterclockwise):

```
sm {{[-r|--rotate]}} {{3}} "{{Hello World!}}"
```

- Display a message using the output from another command:

```
{{echo "Hello World!"}} | sm -
```

smbcacls

View and manipulate Windows ACLs on SMB shares.

Part of the Samba suite.

More information: https://www.samba.org/samba/docs/current/man-html/smbcacls.1.html.

- Display the ACLs for a file or directory on a remote SMB share:

```
smbcacls //{{server}}/{{share}} {{path/to/file_or_directory}} --user {{domain\\username}}%{{password}}
```

- Set a new ACL for a file on a remote SMB share (replace `"ACL:..."` with a valid Windows ACL specification):

```
smbcacls //{{server}}/{{share}} {{path/to/file}} --user {{domain\\username}}%{{password}} "ACL:{{DACL}}"
```

- Remove all existing ACL entries and set a new ACL:

```
smbcacls //{{server}}/{{share}} {{path/to/file}} --user {{domain\\username}}%{{password}} "RESET" "ACL:{{DACL}}"
```

- Specify an alternative workgroup (or domain) and have the program prompt for a password interactively:

```
smbcacls //{{server}}/{{share}} {{path/to/file}} --user {{username}} --workgroup {{workgroup}}
```

smbget

wget-like utility for downloading files from SMB servers.

More information: https://www.samba.org/samba/docs/current/man-html/smbget.1.html.

- Download a file from a server:

```
smbget {{smb://server/share/file}}
```

- Download a share or directory recursively:

```
smbget --recursive {{smb://server/share}}
```

- Connect with a username and password:

```
smbget {{smb://server/share/file}} {{[-U|--user]}} {{username%password}}
```

- Require encrypted transfers:

```
smbget {{smb://server/share/file}} {{[-e|--encrypt]}}
```

smbnetfs

Mount SMB shares interactively.

More information: https://sourceforge.net/projects/smbnetfs/.

- Make shares available at `mountpoint`:

```
smbnetfs {{path/to/mount_point}}
```

smbpasswd

Add/remove a Samba user or change its password.

Samba users must have an existing local Unix account.

More information: https://manned.org/smbpasswd.8.

- Change the current user's SMB password:

  ```
  smbpasswd
  ```

- Add a specified user to Samba and set password (user should already exist in system):

  ```
  sudo smbpasswd -a {{username}}
  ```

- Modify an existing Samba user's password:

  ```
  sudo smbpasswd {{username}}
  ```

- Delete a Samba user (use `pdbedit` instead if the Unix account has been deleted):

  ```
  sudo smbpasswd -x {{username}}
  ```

smem

Print memory usage for programs.

More information: https://manned.org/smem.

- Print memory usage for current processes:

```
smem
```

- Print memory usage for current processes for every user on a system:

```
smem --users
```

- Print memory usage for current processes for a specified user:

```
smem --userfilter {{username}}
```

- Print system memory information:

```
smem --system
```

snake4

Snake game in the terminal.

More information: https://manned.org/snake4.

- Start a snake game:

  ```
  snake4
  ```

- Choose level:

  ```
  {{<1>|<2>|<3>|<4>|<5>}}
  ```

- Navigate the snake:

  ```
  {{<ArrowUp>|<ArrowDown>|<ArrowLeft>|<ArrowRight>}}
  ```

- Pause game:

  ```
  <Space>
  ```

- Quit game:

  ```
  <q>
  ```

- Show the high scores:

  ```
  snake4 --highscores
  ```

snake4scores

Show the high scores from the snake4 game.

More information: https://manned.org/snake4.

- Show the highscores:

  ```
  snake4scores
  ```

snap

Sentinel Application Platform (SNAP) for processing satellite data from the European Space Agency (ESA).

More information: https://step.esa.int/main/download/snap-download/.

- Display all updates:

```
snap --nosplash --nogui --modules --list --refresh
```

- Display help:

```
snap --help
```

snap

snap can refer to multiple commands with the same name.

- View documentation for the packaging solution:

  ```
  tldr snap.pkg
  ```

- View documentation for the European Space Agency Earth observation data processing tool:

  ```
  tldr snap.esa
  ```

snap

Manage the "snap" self-contained software packages.

Similar to what **`apt`** is for **`.deb`**.

More information: https://manned.org/snap.

- Search for a package:

```
snap find {{query}}
```

- Install a package:

```
snap install {{package}}
```

- Update a package:

```
snap refresh {{package}}
```

- Update a package to another channel (track, risk, or branch):

```
snap refresh {{package}} --channel={{channel}}
```

- Update all packages:

```
snap refresh
```

- Display basic information about installed snap software:

```
snap list
```

- Uninstall a package:

```
snap remove {{package}}
```

- Check for recent snap changes in the system:

```
snap changes
```

snapper

Filesystem snapshot management tool.

More information: http://snapper.io/manpages/snapper.html.

- List snapshot configs:

```
snapper list-configs
```

- Create snapper config:

```
snapper {{[-c|--config]}} {{config}} create-config {{path/to/directory}}
```

- Create a snapshot with a description:

```
snapper {{[-c|--config]}} {{config}} create {{[-d|--description]}} "{{snapshot_description}}"
```

- List snapshots for a config:

```
snapper {{[-c|--config]}} {{config}} list
```

- Delete a snapshot:

```
snapper {{[-c|--config]}} {{config}} delete {{snapshot_number}}
```

- Delete a range of snapshots:

```
snapper {{[-c|--config]}} {{config}} delete {{snapshot1}}-{{snapshot2}}
```

sockstat

List open Internet or UNIX domain sockets.

See also: **`netstat`**.

More information: https://manned.org/sockstat.

- Show information for IPv4 and IPv6 sockets for both listening and connected sockets:

```
sockstat
```

- Show information for IPv[4]/IPv[6] sockets [l]istening on specific [p]orts using a specific p[R]otocol:

```
sockstat -{{4|6}} -l -R {{tcp|udp|raw|unix}} -p {{port1,port2...}}
```

- Also show [c]onnected sockets and [u]nix sockets:

```
sockstat -cu
```

- Only show sockets of the specified `process_id` or process:

```
sockstat -P {{process_id|process_name}}
```

- Only show sockets of the specified `user_id` or user:

```
sockstat -U {{user_id|username}}
```

- Only show sockets of the specified `group_id` or group:

```
sockstat -G {{group_id|group_name}}
```

spa-acp-tool

Debug ALSA card profile probing without running PipeWire.

More information: https://docs.pipewire.org/page_man_spa-acp-tool_1.html.

- List all ALSA objects:

```
spa-acp-tool {{[l|list]}}
```

- Probe a specific ALSA card by ID:

```
spa-acp-tool {{[c|card]}} {{card_id}}
```

- List available ALSA profiles for a card:

```
spa-acp-tool {{[lpr|list-profiles]}} {{card_id}}
```

- Set the active ALSA profile by ID:

```
spa-acp-tool {{[spr|set-profile]}} {{profile_id}}
```

- List available devices for a card:

```
spa-acp-tool {{[ld|list-devices]}} {{card_id}}
```

- Get volume from a device:

```
spa-acp-tool {{[gv|get-volume]}} {{device_id}}
```

- Set volume on a device:

```
spa-acp-tool {{[v|set-volume]}} {{device_id}}
{{volume_level}}
```

- Toggle mute state on a device:

```
spa-acp-tool {{[m|toggle-mute]}} {{device_id}}
```

spa-inspect

Display SPA plugin information, list and try to instantiate available factories.

More information: https://docs.pipewire.org/page_man_spa-inspect_1.html.

- Display information about a SPA plugin:

```
spa-inspect {{path/to/plugin.so}}
```

spa-json-dump

Convert a SPA JSON file to standard JSON.

More information: https://docs.pipewire.org/page_man_spa-json-dump_1.html.

- Convert a SPA JSON file to standard JSON:

```
spa-json-dump {{path/to/file.conf}}
```

- Convert SPA JSON from `stdin` to standard JSON:

```
echo "{{spa_json_string}}" | spa-json-dump
```

spa-monitor

Load a SPA plugin and instantiate a device from it.

Note: This utility is primarily intended for debugging device plugins.

More information: https://docs.pipewire.org/page_man_spa-monitor_1.html.

- Load a specific SPA plugin:

```
spa-monitor {{path/to/plugin.so}}
```

spa-resample

Resample an audio file using the PipeWire resampler.

Note: This utility is primarily intended for testing and debugging the resampler.

More information: https://docs.pipewire.org/page_man_spa-resample_1.html.

- Resample an audio file:

```
spa-resample {{path/to/input.wav}} {{path/to/output.wav}}
```

- Resample an audio file to a specific sample rate:

```
spa-resample {{[-r|--rate]}} {{48000}} {{path/to/input.wav}}
{{path/to/output.wav}}
```

- Resample an audio file to a specific format:

```
spa-resample {{[-f|--format]}} {{s8|s16|s32|f32|f64}} {{path/
to/input.wav}} {{path/to/output.wav}}
```

- Resample an audio file with a specific quality (0 is lowest, 14 is highest):

```
spa-resample {{[-q|--quality]}} {{0..14}} {{path/to/
input.wav}} {{path/to/output.wav}}
```

- Display help:

```
spa-resample -h
```

speaker-test

Speaker test tone generator for ALSA.

See also: **aplay**, **arecord**, **amixer**.

More information: https://manned.org/speaker-test.

- Test the default speakers with pink noise:

```
speaker-test
```

- Test the default speakers with a predefined WAV file:

```
speaker-test {{[-t|--test]}} wav
```

- Test multichannel speaker configurations:

```
speaker-test {{[-t|--test]}} wav {{[-c|--channels]}} {{1..8}}
```

- Test the default speakers with a specific WAV file:

```
speaker-test {{[-t|--test]}} wav {{[-w|--wavfile]}} {{path/
to/file.wav}}
```

- Test the default speakers with a sine wave:

```
speaker-test {{[-t|--test]}} sine {{[-f|--frequency]}}
{{frequency}}
```

spectre-meltdown-checker

Spectre and Meltdown mitigation detection tool.

More information: https://manned.org/spectre-meltdown-checker.

- Check the currently running kernel for Spectre or Meltdown:

```
sudo spectre-meltdown-checker
```

- Check the currently running kernel and show an explanation of the actions to take to mitigate a vulnerability:

```
sudo spectre-meltdown-checker --explain
```

- Check for specific variants (defaults to all):

```
sudo spectre-meltdown-checker --variant {{1|2|3|3a|4|l1tf|
msbds|mfbds|mlpds|mdsum|taa|mcespc|srbds}}
```

- Display output using a specific output format:

```
sudo spectre-meltdown-checker --batch {{text|json|nrpe|
prometheus|short}}
```

- Don't use the `/sys` interface even if present:

```
sudo spectre-meltdown-checker --no-sysfs
```

- Check a non-running kernel:

```
sudo spectre-meltdown-checker --kernel {{path/to/
kernel_file}}
```

speedometer

Python script that shows a network traffic graph in the terminal.

More information: https://excess.org/speedometer/.

- Show graph for a specific interface:

```
speedometer -r {{eth0}} -t {{eth0}}
```

speedread

A Spritz-alike speed reader.

Show text using per-word Rapid Serial Visual Presentation (RSVP).

More information: https://github.com/pasky/speedread.

- Read a text file at a specific speed:

```
cat {{path/to/file.txt}} | speedread -wpm {{250}}
```

- Resume from a specific line:

```
cat {{path/to/file.txt}} | speedread -resume {{5}}
```

- Show multiple words at a time:

```
cat {{path/to/file.txt}} | speedread -multiword
```

- Slow down by 10% during the reading session:

```
<[>
```

- Speed up by 10% during the reading session:

```
<]>
```

- Pause, and show the last few lines as context:

```
<Space>
```

spi

A meta package manager that handles both packages and slackbuilds.

More information: https://github.com/gapan/spi/blob/master/man/spi.t2t.

- Update the list of available packages and slackbuilds:

```
spi {{[-u|--update]}}
```

- Install a package or slackbuild:

```
spi {{[-i|--install]}} {{package/slackbuild_name}}
```

- Upgrade all installed packages to the latest versions available:

```
spi {{[-U|--upgrade]}}
```

- Locate packages or slackbuilds by package name or description:

```
spi {{search_terms}}
```

- Display information about a package or slackbuild:

```
spi --show {{package/slackbuild_name}}
```

- Purge the local package and slackbuild caches:

```
spi --clean
```

sport

Search and install SlackBuilds.

More information: http://slackermedia.info/handbook/doku.php?id=slackbuilds.

- Pull the list of SlackBuilds to run `sport` for the first time:

```
sudo mkdir {{[-p|--parents]}} /usr/ports && sudo rsync {{[-av|--archive --verbose]}} rsync://slackbuilds.org /slackbuilds/$(awk '{print $2}' /etc/slackware-version)/ /usr/ports/
```

- Pull in any updates to the system's tree via `rsync`:

```
sudo sport rsync
```

- Search for a package by name:

```
sport search "{{keyword}}"
```

- Check if a package is installed:

```
sport check {{package}}
```

- Display README and `.info` files of a package:

```
sport cat {{package}}
```

- Install a package once the dependencies are resolved:

```
sudo sport install {{package}}
```

- Install a list of packages from a file (format: packages separated by spaces):

```
sudo sport install $(< {{path/to/list}})
```

sprio

View the factors determining a job's scheduling priority.

More information: https://slurm.schedmd.com/sprio.html.

- View the factors determining the scheduling priority of all jobs:

```
sprio
```

- View the factors determining the specified job's scheduling priority:

```
sprio {{[-j|--jobs]}} {{job_id_1,job_id_2,...}}
```

- Output additional information:

```
sprio {{[-l|--long]}}
```

- View information for the jobs of specified users:

```
sprio {{[-u|--user]}} {{user_name_1,user_name_2,...}}
```

- Print the weights for each factor determining job scheduling priority:

```
sprio {{[-w|--weights]}}
```

sprof

Read and display shared object profiling data.

Note: Requires profile data generated via the **`$LD_PROFILE`** environment variable.

More information: https://manned.org/sprof.

- Generate a flat profile and call graph (default output):

```
sprof {{path/to/library.so}} {{path/to/library.so.profile}}
```

- Generate a flat profile with counts and ticks:

```
sprof {{[-p|--flat-profile]}} {{path/to/library.so}} {{path/to/library.so.profile}}
```

- Generate a call graph:

```
sprof {{[-q|--graph]}} {{path/to/library.so}} {{path/to/library.so.profile}}
```

- Print call pairs and their usage counts:

```
sprof {{[-c|--call-pairs]}} {{path/to/library.so}} {{path/to/library.so.profile}}
```

- Use profile data from current directory (auto-detected by soname):

```
sprof {{path/to/library.so}}
```

sqfscat

Concatenate files from a squashfs filesystem and print them to **`stdout`**.

More information: https://manned.org/sqfscat.

- Display the contents of one or more files from a squashfs filesystem:

```
sqfscat {{filesystem.squashfs}} {{file1 file2 ...}}
```

sqfstar

Create a squashfs filesystem from a **`.tar`** archive.

More information: https://manned.org/sqfstar.

- Create a squashfs filesystem (compressed using `gzip` by default) from an uncompressed `.tar` archive:

```
sqfstar < {{archive.tar}} {{filesystem.squashfs}}
```

- Create a squashfs filesystem from a `.tar` archive compressed with `gzip`, and [comp]ress the filesystem using a specific algorithm:

```
zcat {{archive.tar.gz}} | sqfstar -comp {{gzip|lzo|lz4|xz|zstd|lzma}} {{filesystem.squashfs}}
```

- Create a squashfs filesystem from a `.tar` archive compressed with `xz`, excluding some of the files:

```
xzcat {{archive.tar.xz}} | sqfstar {{filesystem.squashfs}} {{file1 file2 ...}}
```

- Create a squashfs filesystem from a `.tar` archive compressed with `zstd`, excluding files ending with `.gz`:

```
zstdcat {{archive.tar.zst}} | sqfstar {{filesystem.squashfs}} "{{*.gz}}"
```

- Create a squashfs filesystem from a `.tar` archive compressed with `lz4`, excluding files matching a `regex`:

```
lz4cat {{archive.tar.lz4}} | sqfstar {{filesystem.squashfs}} -regex "{{regex}}"
```

squeue

View the jobs queued in the SLURM scheduler.

More information: https://manned.org/squeue.

- View the queue:

```
squeue
```

- View jobs queued by a specific user:

```
squeue {{[-u|--user]}} {{username}}
```

- View the queue and refresh every 5 seconds:

```
squeue {{[-i|--iterate]}} {{5}}
```

- View the queue with expected start times:

```
squeue --start
```

sreport

Generate reports on jobs, users, and clusters from accounting data.

More information: https://slurm.schedmd.com/sreport.html.

- Show pipe delimited cluster utilization data:

```
sreport {{[-p|--parsable]}} cluster utilization
```

- Show number of jobs run:

```
sreport job sizes printjobcount
```

- Show users with the highest CPU time use:

```
sreport user topuser
```

srun

Create an interactive slurm job or connect to an existing job.

More information: https://slurm.schedmd.com/srun.html.

- Submit a basic interactive job:

```
srun --pty /bin/bash
```

- Submit an interactive job with different attributes:

```
srun --ntasks-per-node {{num_cores}} --mem-per-cpu
{{memory_MB}} --pty /bin/bash
```

- Connect to a worker node with a job running:

```
srun --jobid {{job_id}} --pty /bin/bash
```

ss

Utility to investigate sockets.

More information: https://manned.org/ss.

- Show all TCP/UDP/RAW/UNIX sockets:

```
ss {{[-a|--all]}} {{--tcp|--udp|--raw|--unix}}
```

- Filter TCP sockets by states, only/exclude:

```
ss {{state|exclude}} {{bucket|big|connected|
synchronized|...}}
```

- Show all TCP sockets connected to the local HTTPS port (443):

```
ss {{[-t|--tcp]}} src :443
```

- Show all TCP sockets listening on the local 8080 port:

```
ss {{[-lt|--listening --tcp]}} src :8080
```

- Show all TCP sockets along with processes connected to a remote SSH port:

```
ss {{[-pt|--processes --tcp]}} dst :ssh
```

- Show all UDP sockets connected on specific source and destination ports:

```
ss {{[-u|--udp]}} 'sport == :{{source_port}} and dport == :
{{destination_port}}'
```

- Show all TCP IPv4 sockets locally connected on the subnet 192.168.0.0/16:

```
ss {{[-4t|--ipv4 --tcp]}} src 192.168/16
```

- Kill IPv4 or IPv6 Socket Connection with a specific destination IP and port:

```
ss {{[-K|--kill]}} dst {{ip_address}} dport = {{port}}
```

sshare

List the shares of associations to a cluster.

More information: https://slurm.schedmd.com/sshare.html.

- List Slurm share information:

```
sshare
```

- Control the output format:

```
sshare --{{parsable|parsable2|json|yaml}}
```

- Control the fields to display:

```
sshare {{[-o|--format]}} {{format_string}}
```

- Display information for the specified users only:

```
sshare {{[-u|--users]}} {{user_id_1,user_id_2,...}}
```

sslstrip

Perform Moxie Marlinspike's Secure Sockets Layer (SSL) stripping attacks.

Perform an ARP spoofing attack in conjunction.

More information: https://www.kali.org/tools/sslstrip/.

- Log only HTTPS POST traffic on port 10000 by default:

```
sslstrip
```

- Log only HTTPS POST traffic on port 8080:

```
sslstrip --listen=8080
```

- Log all SSL traffic to and from the server on port 8080:

```
sslstrip --ssl --listen=8080
```

- Log all SSL and HTTP traffic to and from the server on port 8080:

```
sslstrip --listen=8080 --all
```

- Specify the file path to store the logs:

```
sslstrip --listen={{8080}} --write={{path/to/file}}
```

- Display help:

```
sslstrip --help
```

sstat

View information about running jobs.

More information: https://slurm.schedmd.com/sstat.html.

- Display status information of a comma-separated list of jobs:

```
sstat {{[-j|--jobs]}} {{job_id}}
```

- Display job ID, average CPU, and average virtual memory size of a comma-separated list of jobs, with pipes as column delimiters:

```
sstat {{[-p|--parsable]}} {{[-j|--jobs]}} {{job_id}} {{[-o|--format]}} {{JobID,AveCPU,AveVMSize}}
```

- Display list of fields available:

```
sstat {{[-e|--helpformat]}}
```

st

A simple terminal emulator for the X Window System.

More information: https://manned.org/st.

- Open a terminal:

```
st
```

- Open a terminal with a specific title:

```
st -T {{title}}
```

- Open a terminal, execute a given command, and write the output to a file:

```
st -o {{path/to/file}} -e {{command argument1 argument2}}
```

- Increase/decrease the font size:

```
<Ctrl Shift {{PageUp|PageDown}}>
```

- Copy/paste from the clipboard:

```
<Ctrl Shift {{c|v}}>
```

startx

A front-end to **`xinit`** that provides a nice user interface for running a single session of the X Window System.

More information: https://www.x.org/releases/X11R7.6/doc/man/man1/startx.1.xhtml.

- Start an X session:

```
startx
```

- Start an X session with a predefined depth value:

```
startx -- -depth {{value}}
```

- Start an X session with a predefined dpi value:

```
startx -- -dpi {{value}}
```

- Override the settings in the `.xinitrc` file and start a new X session:

```
startx /{{path/to/window_manager_or_desktop_environment}}
```

steamos-add-to-steam

Add a program to Steam library.

More information: https://gitlab.com/users/evlaV/projects.

- Add a program to Steam library:

```
steamos-add-to-steam {{path/to/file}}
```

steamos-boot-install

This command is an alias of **`steamos-finalize-install`**.

- View documentation for the original command:

  ```
  tldr steamos-finalize-install
  ```

steamos-bootdebug

Manage the SteamOS boot process.

More information: https://gitlab.com/users/evlaV/projects.

- Change what SteamOS shows on boot:

```
sudo steamos-bootdebug {{kernel-debug|kernel-quiet|menu|verbose|quiet|status}}
```

- Show kernel logging only on the next boot:

```
sudo steamos-bootdebug {{kernel-debug-once}}
```

- Set if the boot process should log to a file:

```
sudo steamos-bootdebug log {{enable|disable}}
```

- Display the recorded log file:

```
sudo steamos-bootdebug log show
```

steamos-chroot

Switch root directory in a SteamOS environment.

More information: https://gitlab.com/users/evlaV/projects.

- Switch to the other A/B partition:

```
steamos-chroot {{[-p|--partset]}} other
```

- Switch to a partition on another drive:

```
steamos-chroot {{[-d|--disk]}} {{/dev/sdX}} {{[-p|--
partset]}} {{A|B}}
```

- Display help:

```
steamos-chroot {{[-h|--help]}}
```

steamos-devmode

Enable SteamOS developer mode.

Note: Developer mode disables read-only protections and initializes the package manager.

More information: https://gitlab.com/users/evlaV/projects.

- Enable developer mode:

```
sudo steamos-devmode enable
```

- Enable developer mode without confirmation prompt:

```
sudo steamos-devmode enable --no-prompt
```

- Check if developer mode is currently enabled:

```
sudo steamos-devmode status
```

steamos-dump-info

View SteamOS system information.

More information: https://gitlab.com/users/evlaV/projects.

- View SteamOS system information:

```
sudo steamos-dump-info
```

steamos-factory-reset-config

Generate configuration files required by **`steamos-factory-reset`**.

This command is typically called internally and not meant to be run manually.

More information: https://gitlab.com/users/evlaV/projects.

- Generate factory reset configuration data:

  `steamos-factory-reset-config`

steamos-factory-reset

Reset SteamOS to factory settings.

More information: https://gitlab.com/users/evlaV/projects.

- Begin a factory reset (requires confirmation):

```
steamos-factory-reset
```

- Display help:

```
steamos-factory-reset --help
```

steamos-finalize-install

Complete a SteamOS installation by setting up bootloaders and applying system updates.

More information: https://gitlab.com/users/evlaV/projects.

- Finalize the installation:

```
sudo steamos-finalize-install
```

- Finalize without updating bootloaders or kernel:

```
sudo steamos-finalize-install --no-bootloaders --no-kernel
```

- Skip all migration steps:

```
sudo steamos-finalize-install --no-migrate
```

- Set a specific root hash during finalization:

```
sudo steamos-finalize-install --roothash {{hash}}
```

- Force system migration steps regardless of environment:

```
sudo steamos-finalize-install --force
```

steamos-readonly

Set the readonly status of the filesystem.

More information: https://gitlab.com/users/evlaV/projects.

- View the filesystem mutability status:

```
steamos-readonly status
```

- Set the filesystem to be mutable:

```
sudo steamos-readonly disable
```

- Set the filesystem to be read only:

```
sudo steamos-readonly enable
```

- Toggle the filesystem mutability:

```
sudo steamos-readonly toggle
```

steamos-select-branch

Select a SteamOS system release branch.

Note: This command is deprecated, use **`atomupd-manager`** instead.

More information: https://gitlab.com/users/evlaV/projects.

- View the current branch:

```
steamos-select-branch -c
```

- List all available branches:

```
steamos-select-branch -l
```

- Switch to the beta branch:

```
steamos-select-branch beta
```

- Switch back to the stable release:

```
steamos-select-branch stable
```

- Switch to the bleeding edge branch:

```
steamos-select-branch main
```

steamos-session-select

Manipulate which session is currently in use.

Note: This command is deprecated, use **`steamosctl`** instead.

More information: https://gitlab.com/users/evlaV/projects.

- Change to desktop mode:

  `steamos-session-select plasma`

- Change to gamemode (sets the system to boot into gamemode if `-persistent` arguments were selected previously):

  `steamos-session-select`

- Change to Wayland desktop mode:

  `steamos-session-select plasma-wayland`

- Change to Wayland desktop mode and have the device boot to desktop:

  `steamos-session-select plasma-wayland-persistent`

- Change to X11 desktop mode and have the device boot to desktop:

  `steamos-session-select plasma-x11-persistent`

steamos-update

Update SteamOS.

Note: This command is deprecated, use **`atomupd-manager`** instead.

More information: https://gitlab.com/users/evlaV/projects.

- Update the operating system:

  ```
  sudo steamos-update
  ```

- Check if there is an update available:

  ```
  sudo steamos-update check
  ```

steamosctl

Control the SteamOS system.

More information: https://gitlab.com/evlaV/steamos-manager.

- Change to desktop mode:

```
steamosctl switch-to-desktop-mode
```

- Change to gamemode:

```
steamosctl switch-to-game-mode
```

- Change whether the system opens gamemode or desktop during boot:

```
steamosctl set-default-login-mode {{game|desktop}}
```

- Get currently used CPU scheduler:

```
steamosctl get-cpu-scheduler
```

- Set the system to use a specific CPU scheduler:

```
steamosctl set-cpu-scheduler {{none|lavd|...}}
```

- Display available desktop sessions:

```
steamosctl get-valid-desktop-sessions
```

- Set the default desktop session:

```
steamosctl set-default-desktop-session {{plasma.desktop|
plasmax11.desktop|...}}
```

- Display help:

```
steamosctl
```

steghide

Steganography tool for JPEG, BMP, WAV, and AU file formats.

More information: https://manned.org/steghide.

- Embed data in a PNG, prompting for a passphrase:

```
steghide embed {{[-cf|--coverfile]}} {{path/to/image.png}}
{{[-ef|--embedfile]}} {{path/to/data.txt}}
```

- Extract data from a WAV audio file:

```
steghide extract {{[-sf|--stegofile]}} {{path/to/sound.wav}}
```

- Display file information, trying to detect an embedded file:

```
steghide info {{path/to/file.jpg}}
```

- Embed data in a JPEG image, using maximum compression:

```
steghide embed {{[-cf|--coverfile]}} {{path/to/image.jpg}}
{{[-ef|--embedfile]}} {{path/to/data.txt}} {{[-z|--
compress]}} {{9}}
```

- Get the list of supported encryption algorithms and modes:

```
steghide encinfo
```

- Embed encrypted data in a JPEG image, e.g. with Blowfish in CBC mode:

```
steghide embed {{[-cf|--coverfile]}} {{path/to/image.jpg}}
{{[-ef|--embedfile]}} {{path/to/data.txt}} {{[-e|--
encryption]}} {{blowfish|...}} {{cbc|...}}
```

stegsnow

Steganography tool for concealing and extracting messages in text files encoded as tabs and spaces.

More information: https://darkside.com.au/snow/manual.html.

- Extract [m]essage from file:

```
stegsnow {{path/to/file.txt}}
```

- Extract [C]ompressed and [p]assword protected [m]essage from file:

```
stegsnow -C -p {{password}} {{path/to/file.txt}}
```

- Determine approximate [S]torage capacity with line [l]ength less than 72 for file:

```
stegsnow -S -l 72 {{path/to/file.txt}}
```

- Conceal [m]essage in text from file and save to result:

```
stegsnow -m '{{message}}' {{path/to/file.txt}} {{path/to/result.txt}}
```

- Conceal message [f]ile content [C]ompressed in text from file and save to result:

```
stegsnow -C -f '{{path/to/message.txt}}' {{path/to/file.txt}} {{path/to/result.txt}}
```

- Conceal [m]essage [C]ompressed and [p]assword protected in text from file and save to result:

```
stegsnow -C -p {{password}} -m '{{message}}' {{path/to/file.txt}} {{path/to/result.txt}}
```

storagectl

Enumerate and mount storage volumes.

More information: https://www.freedesktop.org/software/systemd/man/latest/storagectl.html.

- List available storage volumes:

```
storagectl
```

strace

Troubleshooting tool for tracing system calls.

See also: **`fatrace`**.

More information: https://manned.org/strace.

- Start tracing a specific process by its PID:

```
sudo strace {{[-p|--attach]}} {{process_id}}
```

- Trace a process and filter output by system call [e]xpression:

```
sudo strace {{[-p|--attach]}} {{process_id}} -e
{{system_call,system_call2,...}}
```

- Count time, calls, and errors for each system call and report a summary on program exit:

```
sudo strace {{[-p|--attach]}} {{process_id}} {{[-c|--summary-
only]}}
```

- Show the time spent in every system call and specify the maximum string size to print:

```
sudo strace {{[-p|--attach]}} {{process_id}} {{[-T|--syscall-
times]}} {{[-s|--string-limit]}} {{32}}
```

- Start tracing a program by executing it:

```
strace {{program}}
```

- Start tracing file operations of a program:

```
strace -e trace=file {{program}}
```

- Start tracing network operations of a program as well as all its forked and child processes, saving the output to a file:

```
strace {{[-f|--follow-forks]}} -e trace=network {{[-o|--
output]}} {{trace.txt}} {{program}}
```

stratis

Manage local storage pools and volumes using the Stratis storage manager.

Stratis volumes use the XFS filesystem and require the **`stratisd`** service.

More information: https://stratis-storage.github.io/howto/.

- Start the Stratis service (must be active before managing pools or volumes):

```
sudo systemctl start stratisd
```

- Create a storage pool from one or more devices:

```
sudo stratis pool create {{pool_name}} {{/dev/sdX /dev/
sdY ...}}
```

- Create a filesystem (volume) in a pool:

```
sudo stratis filesystem create {{pool_name}} {{volume_name}}
```

- List all Stratis filesystems:

```
sudo stratis filesystem list
```

- Format and mount a Stratis volume manually:

```
sudo mkfs.xfs /dev/stratis/{{pool_name}}/{{volume_name}} &&
sudo mount /dev/stratis/{{pool_name}}/{{volume_name}} {{/mnt/
target}}
```

- Add a volume to `/etc/fstab` for mounting at boot:

```
echo /dev/stratis/{{pool_name}}/{{volume_name}} {{/mnt/
target}} xfs defaults,x-systemd.requires=stratisd.service 0 0
| sudo tee {{[-a|--append]}} /etc/fstab
```

- Extend an existing pool by adding a new device:

```
sudo stratis pool add-data {{pool_name}} {{/dev/sdZ}}
```

- Delete a volume:

```
sudo stratis filesystem destroy {{pool_name}} {{volume_name}}
```

stress

Stress test CPU, memory, and IO on a Linux system.

More information: https://manned.org/stress.

- Spawn 4 workers to stress test CPU:

```
stress {{[-c|--cpu]}} {{4}}
```

- Spawn 2 workers to stress test IO and timeout after 5 seconds:

```
stress {{[-i|--io]}} {{2}} {{[-t|--timeout]}} {{5}}
```

- Spawn 2 workers to stress test memory (each worker allocates 256M bytes):

```
stress {{[-m|--vm]}} {{2}} --vm-bytes {{256M}}
```

- Spawn 2 workers spinning on write()/unlink() (each worker writes 1G bytes):

```
stress {{[-d|--hdd]}} {{2}} --hdd-bytes {{1GB}}
```

strigger

View or modify Slurm trigger information.

Triggers are actions that are automatically run when an event occurs on a Slurm cluster.

More information: https://slurm.schedmd.com/strigger.html.

- Register a new trigger. Execute the specified program when the specified event occurs:

```
strigger --set --{{primary_database_failure|
primary_slurmdbd_failure|primary_slurmctld_acct_buffer_full|
primary_slurmctld_failure|...}} {{[-p|--program]}} {{path/to/
executable}}
```

- Execute the specified program when the specified job terminated:

```
strigger --set {{[-j|--jobid]}} {{job_id}} {{[-f|--fini]}}
{{[-p|--program]}} "{{path/to/executable}} {{argument1
argument2 ...}}"
```

- View active triggers:

```
strigger --get
```

- View active triggers regarding the specified job:

```
strigger --get {{[-j|--jobid]}} {{job_id}}
```

- Clear the specified trigger:

```
strigger --clear {{trigger_id}}
```

strip

Discard symbols from executables or object files.

More information: https://manned.org/strip.

- Replace the input file with its stripped version:

```
strip {{path/to/file}}
```

- Strip symbols from a file, saving the output to a specific file:

```
strip {{path/to/input_file}} -o {{path/to/output_file}}
```

- Strip debug symbols only:

```
strip {{[-d|--strip-debug]}} {{path/to/file.o}}
```

su

Switch shell to another user.

More information: https://manned.org/su.

- Switch to superuser (requires the root password):

```
su
```

- Switch to a given user (requires the user's password):

```
su {{username}}
```

- Switch to a given user and simulate a full login shell:

```
su - {{username}}
```

- Execute a command as another user:

```
su - {{username}} {{[-c|--command]}} "{{command}}"
```

- Switch to a given user and use a specific shell (e.g., Zsh, fish, Bash):

```
su {{[-s|--shell]}} /{{path/to/shell}} {{username}}
```

- Display help:

```
su {{[-h|--help]}}
```

- Display version:

```
su {{[-V|--version]}}
```

sulogin

Log in as root during single-user mode.

More information: https://manned.org/sulogin.

- Start `sulogin` on the default console:

```
sudo sulogin
```

- Start `sulogin` on a specific TTY device:

```
sudo sulogin {{/dev/ttyX}}
```

- Set a maximum timeout(in seconds) for entering the root password before continuing normal boot:

```
sudo sulogin {{[-t|--timeout]}} {{timeout}}
```

- Start root's shell as a login shell:

```
sudo sulogin {{[-p|--login-shell]}}
```

- Force a root shell without asking for a password when default methods of obtaining the password fail:

```
sudo sulogin {{[-e|--force]}}
```

sview

Start a GUI to view and modify the state of Slurm.

More information: https://slurm.schedmd.com/sview.html.

- Start a GUI to view and modify the state of Slurm:

```
sview
```

swaks

Swiss Army Knife SMTP, the all-purpose SMTP transaction tester.

More information: https://github.com/jetmore/swaks/blob/develop/doc/base.pod.

- Deliver a standard test email to `user@example.com` on port 25 of `test-server.example.net`:

```
swaks {{[-t|--to]}} {{user@example.com}} {{[-s|--server]}} {{test-server.example.net}}
```

- Deliver a standard test email, requiring CRAM-MD5 authentication as user `me@example.com`. An "X-Test" header will be added to the email body:

```
swaks {{[-t|--to]}} {{user@example.com}} {{[-f|--from]}} {{me@example.com}} {{[-a|--auth]}} {{CRAM-MD5}} {{[-au|--auth-user]}} {{me@example.com}} --header-X-Test "{{test_email}}"
```

- Test a virus scanner using EICAR in an attachment. Don't show the message DATA part:

```
swaks {{[-t|--to]}} {{user@example.com}} --attach - {{[-s|--server]}} {{test-server.example.com}} {{[-n|--suppress-data]}} {{path/to/eicar.txt}}
```

- Test a spam scanner using GTUBE in the body of an email, routed via the MX records for `example.com`:

```
swaks {{[-t|--to]}} {{user@example.com}} --body {{path/to/gtube_file}}
```

- Deliver a standard test email to `user@example.com` using the LMTP protocol via a UNIX domain socket file:

```
swaks {{[-t|--to]}} {{user@example.com}} --socket {{/var/lda.sock}} --protocol {{LMTP}}
```

swaplabel

Print or change the label or UUID of a swap area.

Note: **`path/to/file`** can either point to a regular file or a swap partition.

More information: https://manned.org/swaplabel.

- Display the current label and UUID of a swap area:

```
swaplabel {{path/to/file}}
```

- Set the label of a swap area:

```
swaplabel {{[-L|--label]}} {{new_label}} {{path/to/file}}
```

- Set the UUID of a swap area (you can generate a UUID using `uuidgen`):

```
swaplabel {{[-U|--uuid]}} {{new_uuid}} {{path/to/file}}
```

swapoff

Disable devices and files for swapping.

Note: **`path/to/file`** can either point to a regular file or a swap partition.

More information: https://manned.org/swapoff.8.

- Disable a given swap area:

```
sudo swapoff {{path/to/file}}
```

- Disable all swap areas in `/proc/swaps`:

```
sudo swapoff {{[-a|--all]}}
```

- Disable a swap partition by its label:

```
sudo swapoff -L {{label}}
```

swapon

Enable devices and files for swapping.

Note: **`path/to/file`** can either point to a regular file or a swap partition.

More information: https://manned.org/swapon.8.

- Show swap information:

  `swapon`

- Enable a given swap area:

  `sudo swapon {{path/to/file}}`

- Enable all swap areas specified in `/etc/fstab` except those with the `noauto` option:

  `sudo swapon {{[-a|--all]}}`

- Enable a swap partition by its label:

  `sudo swapon -L {{label}}`

switch_root

Use a different filesystem as the root of the mount tree.

Note: **`switch_root`** will fail to function if the new root is not the root of a mount. Use bind-mounting as a workaround.

See also: **`chroot`**, **`mount`**.

More information: https://manned.org/switch_root.

- Move `/proc`, `/dev`, `/sys`, and `/run` to the specified filesystem, use this filesystem as the new root, and start the specified init process:

```
switch_root {{new_root}} {{/sbin/init}}
```

- Display help:

```
switch_root {{[-h|--help]}}
```

switcherooctl

Launch a command on a specific GPU.

More information: https://manned.org/switcherooctl.

- Enable the switcheroo service:

```
systemctl start switcheroo-control
```

- List known GPUs:

```
switcherooctl
```

- Launch a command on the first discrete GPU:

```
switcherooctl launch {{command}}
```

- Launch a command on a specific GPU:

```
switcherooctl launch {{[-g|--gpu]}} {{device_number}}
{{command}}
```

- Display help:

```
switcherooctl help
```

swupd

Package management utility for Clear Linux.

More information: https://github.com/clearlinux/clear-linux-documentation/blob/master/source/guides/clear/swupd.rst.

- Update to the latest version:

```
sudo swupd update
```

- Show current version, and check whether a newer one exists:

```
swupd check-update
```

- List installed bundles:

```
swupd bundle-list
```

- Locate the bundle where a wanted package exists:

```
swupd search -b {{package}}
```

- Install a new bundle:

```
sudo swupd bundle-add {{bundle}}
```

- Remove a bundle:

```
sudo swupd bundle-remove {{bundle}}
```

- Correct broken or missing files:

```
sudo swupd verify
```

swww

This command has been renamed to **`awww`**.

- View documentation for the command under its current name:

  ```
  tldr awww
  ```

sxiv

Simple X Image Viewer.

More information: https://manned.org/sxiv.

- Open an image:

```
sxiv {{path/to/image}}
```

- Open an image in fullscreen mode:

```
sxiv -f {{path/to/file}}
```

- Open a newline-separated list of images, reading filenames from `stdin`:

```
echo {{path/to/file}} | sxiv -i
```

- Open one or more images as a slideshow:

```
sxiv -S {{seconds}} {{path/to/image1 path/to/image2 ...}}
```

- Open one or more images in thumbnail mode:

```
sxiv -t {{path/to/image1 path/to/image2 ...}}
```

sync

Flush all pending write operations to the appropriate disks.

More information: https://www.gnu.org/software/coreutils/manual/html_node/sync-invocation.html.

- Flush all pending write operations on all disks:

```
sync
```

- Flush all pending write operations on a single file to disk:

```
sync {{path/to/file}}
```

- Flush writes and drop filesystem caches:

```
sync; echo 3 | sudo tee /proc/sys/vm/drop_caches
```

synopkg

Package management utility for Synology DiskStation Manager.

More information: https://www.synology.com/dsm.

- List the names of installed packages:

```
synopkg list --name
```

- List packages which depend on a specific package:

```
synopkg list --depend-on {{package}}
```

- Start/Stop a package:

```
sudo synopkg {{start|stop}} {{package}}
```

- Print the status of a package:

```
synopkg status {{package}}
```

- Uninstall a package:

```
sudo synopkg uninstall {{package}}
```

- Check if updates are available for a package:

```
synopkg checkupdate {{package}}
```

- Upgrade all packages to the latest version:

```
sudo synopkg upgradeall
```

- Install a package from a synopkg file:

```
sudo synopkg install {{path/to/package.spk}}
```

synoupgrade

Upgrade Synology DiskStation Manager (DSM) - the Synology NAS operating system.

More information: https://www.synology.com/dsm.

- Check if upgrades are available:

```
sudo synoupgrade --check
```

- Check for patches without upgrading the DSM version:

```
sudo synoupgrade --check-smallupdate
```

- Download the latest upgrade available (use `--download-smallupdate` for patches):

```
sudo synoupgrade --download
```

- Start the upgrade process:

```
sudo synoupgrade --start
```

- Upgrade to the latest version automatically:

```
sudo synoupgrade --auto
```

- Apply patches without upgrading the DSM version automatically:

```
sudo synoupgrade --auto-smallupdate
```

- Upgrade the DSM using a patch file (should be an absolute path):

```
sudo synoupgrade --patch /{{path/to/file.pat}}
```

- Display help:

```
synoupgrade
```

sysctl

List and change kernel runtime variables.

More information: https://manned.org/sysctl.8.

- Show all available variables and their values:

```
sysctl {{[-a|--all]}}
```

- Set a changeable kernel state variable:

```
sysctl {{[-w|--write]}} {{section.tunable}}={{value}}
```

- Get currently open file handlers:

```
sysctl fs.file-nr
```

- Get limit for simultaneous open files:

```
sysctl fs.file-max
```

- Get the value of any runtime variable:

```
sysctl {{variable_name}}
```

- Print only the value without the variable name:

```
sysctl {{[-n|--values]}} {{variable_name}}
```

- Apply changes from `/etc/sysctl.conf`:

```
sysctl {{[-p|--load]}}
```

sysdig

System troubleshooting, analysis, and exploration.

Capture, filter, and store systemcalls.

More information: https://github.com/draios/sysdig/wiki.

- Capture all the events from the live system and print them to screen:

```
sysdig
```

- Capture all the events from the live system and save them to disk:

```
sysdig {{[-w|--write]}} {{path/to/file}}.scap
```

- Read events from a file and print them to screen:

```
sysdig {{[-r|--read]}} {{path/to/file}}.scap
```

- Filter and Print all the open system calls invoked by cat:

```
sysdig proc.name=cat and evt.type=open
```

- Register any found plugin and use dummy as input source passing to it open params:

```
sysdig -I dummy:'{{parameter}}'
```

- List the available chisels:

```
sysdig {{[-cl|--list-chisels]}}
```

- Use the spy_ip chisel to look at the data exchanged with ip address:

```
sysdig {{[-c|--chisel]}} spy_ip {{ip_address}}
```

systemctl add-requires

Add **`Requires`** dependencies to a target for one or more units.

More information: https://www.freedesktop.org/software/systemd/man/latest/systemctl.html#add-wants%20TARGET%20UNIT%E2%80%A6.

- Add a `Requires` dependency from a target to a unit:

```
systemctl add-requires {{target}} {{unit}}
```

- Add multiple `Requires` dependencies at once:

```
systemctl add-requires {{target}} {{unit1 unit2 ...}}
```

- Add a user-level `Requires` dependency:

```
systemctl add-requires {{target}} {{unit}} --user
```

systemctl add-wants

Add **`Wants`** dependencies to a target for one or more units.

More information: https://www.freedesktop.org/software/systemd/man/latest/systemctl.html#add-wants%20TARGET%20UNIT%E2%80%A6.

- Add a `Wants` dependency from a target to a unit:

```
systemctl add-wants {{target}} {{unit}}
```

- Add multiple `Wants` dependencies at once:

```
systemctl add-wants {{target}} {{unit1 unit2 ...}}
```

- Add a user-level `Wants` dependency:

```
systemctl add-wants {{target}} {{unit}} --user
```

systemctl bind

Ephemerally bind-mount a file or directory from the host into a unit's mount namespace.

More information: https://www.freedesktop.org/software/systemd/man/latest/systemctl.html#bind%20UNIT%20PATH%20%5BPATH%5D.

- Bind-mount a host path into the same location inside the unit:

```
systemctl bind {{unit}} /{{path/to/host_directory}}
```

- Bind-mount a host path into a different location inside the unit:

```
systemctl bind {{unit}} /{{path/to/host_directory}} /{{path/to/unit_directory}}
```

- Bind-mount a path as read-only inside the unit:

```
systemctl bind {{unit}} /{{path/to/host_directory}} --read-only
```

- Create the destination path inside the unit before binding:

```
systemctl bind {{unit}} /{{path/to/host_directory}} /{{path/to/unit_directory}} --mkdir
```

systemctl cancel

Cancel one or more pending jobs in the system manager or user manager.

More information: https://www.freedesktop.org/software/systemd/man/latest/systemctl.html#cancel%20JOB%E2%80%A6.

- Cancel a job by its numeric ID:

```
systemctl cancel {{job_id}}
```

- Cancel multiple jobs:

```
systemctl cancel {{job_id1 job_id2 ...}}
```

- Cancel all pending jobs:

```
systemctl cancel
```

- Cancel a job in the user service manager:

```
systemctl cancel {{job_id}} --user
```

systemctl cat

Show the full contents of unit files as systemd sees them.

More information: https://www.freedesktop.org/software/systemd/man/latest/systemctl.html#cat%20PATTERN%E2%80%A6.

- Show the contents and absolute path of a unit file:

```
systemctl cat {{unit}}
```

- Show the contents of multiple unit files:

```
systemctl cat {{unit1 unit2 ...}}
```

- Show the contents of a unit file for a template:

```
systemctl cat {{template@}}
```

- Show the contents of a user unit file:

```
systemctl cat {{unit}} --user
```

systemctl condreload

This command is an alias of **`systemctl try-reload-or-restart`**.

- View documentation for the original command:

```
tldr systemctl try-reload-or-restart
```

systemctl condrestart

This command is an alias of **`systemctl try-restart`**.

- View documentation for the original command:

```
tldr systemctl try-restart
```

systemctl condstop

This command is an alias of **`systemctl stop`**.

- View documentation for the original command:

```
tldr systemctl stop
```

systemctl daemon-reexec

Reexecute systemd while preserving current unit states.

See also: **`systemctl daemon-reload`**.

More information: https://www.freedesktop.org/software/systemd/man/latest/systemctl.html#daemon-reexec.

- Reexecute systemd:

```
systemctl daemon-reexec
```

systemctl daemon-reload

Reload systemd manager configuration.

Use this after creating, modifying, or deleting unit files.

See also: **`systemctl reload`**.

More information: https://www.freedesktop.org/software/systemd/man/latest/systemctl.html#daemon-reload.

- Reload systemd to apply changes in unit files:

```
systemctl daemon-reload
```

systemctl default

Enter system default mode.

More information: https://www.freedesktop.org/software/systemd/man/latest/systemctl.html#default.

- Enter default mode as a blocking operation:

```
systemctl default
```

- Enter default mode as asynchronous operation:

```
systemctl default --no-block
```

systemctl disable

Disable systemd services.

See also: **`systemctl revert`**.

More information: https://www.freedesktop.org/software/systemd/man/latest/systemctl.html#disable%20UNIT%E2%80%A6.

- Stop a service from running on boot:

```
systemctl disable {{unit}}
```

- Stop a service from running on boot and stop its current execution:

```
systemctl disable {{unit}} --now
```

- Stop a user service from running on login:

```
systemctl disable {{unit}} --user
```

systemctl edit

Edit systemd unit files.

See also: **`systemctl revert`**.

More information: https://www.freedesktop.org/software/systemd/man/latest/systemctl.html#edit%20UNIT%E2%80%A6.

- Overlay a unit file non-destructively:

```
sudo systemctl edit {{unit_file}}
```

- Edit a unit file:

```
sudo systemctl edit {{unit_file}} {{[-l|--full]}}
```

- Create a new unit file:

```
sudo systemctl edit {{unit_file}} {{[-lf|--full --force]}}
```

- Overlay a user unit file:

```
systemctl edit {{unit_file}} --user
```

systemctl emergency

Enter emergency mode **`emergency.target`**.

More information: https://www.freedesktop.org/software/systemd/man/latest/systemctl.html#emergency.

- Enter emergency mode:

```
systemctl emergency
```

- Enter emergency mode without blocking (return immediately):

```
systemctl emergency --no-block
```

systemctl enable

Enable systemd services.

See also: **`systemctl revert`**.

More information: https://www.freedesktop.org/software/systemd/man/latest/systemctl.html#enable%20UNIT%E2%80%A6.

- Enable a service to run on boot:

```
systemctl enable {{unit}}
```

- Enable a service to run on boot and start it now:

```
systemctl enable {{unit}} --now
```

- Enable a user unit to run on login:

```
systemctl enable {{unit}} --user
```

systemctl exit

Ask the service manager to quit.

More information: https://www.freedesktop.org/software/systemd/man/latest/systemctl.html#exit%20EXIT_CODE.

- Exit the user service manager:

```
systemctl exit --user
```

- Exit the user service manager with a specific exit code:

```
systemctl exit {{code}} --user
```

- Ask the container's service manager to exit (equivalent of `systemctl poweroff` if not in a container):

```
systemctl exit
```

systemctl force-reload

This command is an alias of **`systemctl try-reload-or-restart`**.

- View documentation for the original command:

```
tldr systemctl try-reload-or-restart
```

systemctl freeze

Freeze one or more units.

Frozen units can be resumed with **`systemctl thaw`**.

More information: https://www.freedesktop.org/software/systemd/man/latest/systemctl.html#freeze%20PATTERN%E2%80%A6.

- Freeze a specific unit:

```
systemctl freeze {{unit}}
```

- Freeze multiple units:

```
systemctl freeze {{unit1 unit2 ...}}
```

- Freeze all running units:

```
systemctl freeze '*'
```

systemctl get-default

Display the default target (runlevel) that the system will boot into.

More information: https://www.freedesktop.org/software/systemd/man/latest/systemctl.html#get-default.

- Check the default target on your system:

```
systemctl get-default
```

systemctl-halt

Shut down and halt the system (stop the OS kernel but keep hardware powered on).

See also: **`halt`**.

More information: https://www.freedesktop.org/software/systemd/man/latest/systemctl.html#halt.

- Halt the system:

```
systemctl halt
```

- Halt the system immediately without asking services to stop gracefully:

```
systemctl halt {{[-f|--force]}}
```

- Halt the system immediately without sending notifications to logged-in users:

```
systemctl halt {{[-f|--force]}} --no-wall
```

- Halt the system immediately without terminating any processes or unmounting filesystems (dangerous, may cause data loss):

```
systemctl halt {{[-ff|--force --force]}}
```

- Schedule a halt at a specific time (e.g., 23:00):

```
systemctl halt --when 23:00
```

- Schedule a halt after a certain duration (e.g., 2 hours):

```
systemctl halt --when +2h
```

- Cancel a scheduled halt:

```
systemctl halt --when cancel
```

systemctl help

Show the manual pages for one or more units, or for the unit a process belongs to (by PID).

More information: https://www.freedesktop.org/software/systemd/man/latest/systemctl.html#help%20PATTERN%E2%80%A6%7CPID%E2%80%A6.

- Show the manual page for a specific unit:

```
systemctl help {{unit}}
```

- Show the manual pages for multiple units:

```
systemctl help {{unit1 unit2 ...}}
```

- Show the manual page for a user unit:

```
systemctl help {{unit}} --user
```

- Show the manual page without a pager (all at once):

```
systemctl help {{unit}} --no-pager
```

- Show the manual page for the unit of a process by PID:

```
systemctl help {{process_id}}
```

systemctl hibernate

Hibernate the system by saving the current state to disk and powering off.

More information: https://www.freedesktop.org/software/systemd/man/latest/systemctl.html#hibernate.

- Hibernate the system immediately:

```
systemctl hibernate
```

- Force hibernation even if inhibitors are present:

```
systemctl hibernate {{[-f|--force]}}
```

- Hibernate the system without sending a message to logged-in users:

```
systemctl hibernate --no-wall
```

systemctl hybrid-sleep

Put the system into hybrid sleep, which combines suspend-to-RAM and hibernate.

More information: https://www.freedesktop.org/software/systemd/man/latest/systemctl.html#hybrid-sleep.

- Put the system into hybrid sleep immediately:

```
systemctl hybrid-sleep
```

- Force hybrid sleep even if inhibitors are present:

```
systemctl hybrid-sleep {{[-f|--force]}}
```

- Put the system into hybrid sleep without sending a wall message to logged-in users:

```
systemctl hybrid-sleep --no-wall
```

systemctl import-environment

Import environment variables from the shell into systemd's environment.

See also: **`systemctl show-environment`**, **`systemctl unset-environment`**.

More information: https://www.freedesktop.org/software/systemd/man/latest/systemctl.html#import-environment%20VARIABLE%E2%80%A6.

- Import a variable:

```
systemctl import-environment {{variable}}
```

- Import multiple variables:

```
systemctl import-environment {{variable_1 variable_2 ...}}
```

- Import variables for user services:

```
systemctl import-environment {{variable}} --user
```

systemctl is-active

Check if one or more systemd units are active.

More information: https://www.freedesktop.org/software/systemd/man/latest/systemctl.html#is-active%20PATTERN%E2%80%A6.

- Check whether a unit is active:

```
systemctl is-active {{unit}}
```

- Check whether multiple units are active:

```
systemctl is-active {{unit1 unit2 ...}}
```

- Check whether a unit is active without printing the state to `stdout`:

```
systemctl is-active {{unit}} {{[-q|--quiet]}}
```

- Check whether a user unit is active:

```
systemctl is-active {{unit}} --user
```

systemctl is-enabled

Check whether unit files are enabled.

See also: **`systemctl enable`**, **`systemctl disable`**.

More information: https://www.freedesktop.org/software/systemd/man/latest/systemctl.html#is-enabled%20UNIT%E2%80%A6.

- Show the enablement state:

```
systemctl is-enabled {{unit1 unit2 ...}}
```

- Suppress output and return only the exit code:

```
systemctl is-enabled {{unit}} {{[-q|--quiet]}}
```

- Show installation targets and symlink paths:

```
systemctl is-enabled {{unit}} {{[-l|--full]}}
```

systemctl is-failed

Check if one or more systemd units have failed.

See also: **`systemctl is-active`**, **`systemctl status`**.

More information: https://www.freedesktop.org/software/systemd/man/latest/systemctl.html#is-failed%20PATTERN%E2%80%A6.

- Check if there are any failed units:

```
systemctl is-failed
```

- Check if a unit or multiple units have failed:

```
systemctl is-failed {{unit1 unit2 ...}}
```

- Suppress output and return only the exit code:

```
systemctl is-failed {{unit}} {{[-q|--quiet]}}
```

- Check if a user unit has failed:

```
systemctl is-failed {{unit}} --user
```

systemctl is-system-running

Check the current state of the system.

More information: https://www.freedesktop.org/software/systemd/man/latest/systemctl.html#is-system-running.

- Check whether the system is operational and print the current state:

```
systemctl is-system-running
```

- Check and print the current state quietly (no output, only exit status):

```
systemctl is-system-running {{[-q|--quiet]}}
```

- Wait until the boot process is completed before printing the current state:

```
systemctl is-system-running --wait
```

systemctl isolate

Start the specified unit with its dependencies and stop all others.

Ignores the units which have **`IgnoreOnIsolate=yes`**.

More information: https://www.freedesktop.org/software/systemd/man/latest/systemctl.html#isolate%20UNIT.

- Switch to a target (assumed `.target` if no extension provided):

```
systemctl isolate {{target}}
```

- Switch to graphical target explicitly:

```
systemctl isolate graphical.target
```

- Switch to rescue (single-user) mode:

```
systemctl isolate rescue.target
```

- Switch to emergency mode:

```
systemctl isolate emergency.target
```

systemctl kexec

Reboot the system via kexec.

More information: https://www.freedesktop.org/software/systemd/man/latest/systemctl.html#kexec.

- Fast reboot using kexec (if kernel is pre-loaded):

```
systemctl kexec
```

- Force normal reboot even if kexec is available:

```
systemctl kexec {{[-f|--force]}}
```

systemctl kill

Send a signal to one or more processes of a unit.

More information: https://www.freedesktop.org/software/systemd/man/latest/systemctl.html#kill%20PATTERN%E2%80%A6.

- Send the `SIGTERM` signal to a unit to terminate it:

```
systemctl kill {{unit}}
```

- Send a specific signal to a unit:

```
systemctl kill {{[-s|--signal]}} {{signal_number|signal_name}} {{unit}}
```

- Send a `SIGHUP` signal to only the main process of a unit:

```
systemctl kill {{[-s|--signal]}} {{[1|SIGHUP]}} --kill-whom main {{unit}}
```

- List all available signals:

```
systemctl kill {{[-s|--signal]}} help
```

systemctl link

Link a unit file located outside the unit file search path into the search path.

See also: **`systemctl disable`**.

More information: https://www.freedesktop.org/software/systemd/man/latest/systemctl.html#link%20PATH%E2%80%A6.

- Link a unit file to make it available for systemd commands:

```
systemctl link {{path/to/service}}
```

- Link multiple unit files at once:

```
systemctl link {{path/to/service1 path/to/service2 ...}}
```

systemctl list-automounts

List automount units currently in memory, showing mount paths and unit names.

See also: **`systemctl list-units`**, **`systemctl list-unit-files`**.

More information: https://www.freedesktop.org/software/systemd/man/latest/systemctl.html#list-automounts%20PATTERN%E2%80%A6.

- List automount units currently in memory:

```
systemctl list-automounts
```

- List all automount units, including inactive ones:

```
systemctl list-automounts {{[-a|--all]}}
```

- Filter automount units by state:

```
systemctl list-automounts --state {{active|inactive|failed|...}}
```

- Filter automount units by name pattern:

```
systemctl list-automounts {{pattern1 pattern2 ...}}
```

systemctl list-dependencies

Show a unit's dependency tree in systemd.

See also: **`systemctl list-units`**.

More information: https://www.freedesktop.org/software/systemd/man/latest/systemctl.html#list-dependencies%20UNIT%E2%80%A6.

- Show the dependency tree of `default.target`:

```
systemctl list-dependencies
```

- Show the dependency tree of a specific unit:

```
systemctl list-dependencies {{unit}}
```

- Include all dependency types (not only `Requires=` and `Wants=`):

```
systemctl list-dependencies {{unit}} {{[-a|--all]}}
```

- Limit the tree to a specific unit type:

```
systemctl list-dependencies {{unit}} {{[-t|--type]}} {{service|socket|target|mount|...}}
```

- Reverse the direction to show units that depend on the specified unit:

```
systemctl list-dependencies {{unit}} --reverse
```

- Print output without headers or footers (for scripts):

```
systemctl list-dependencies {{unit}} --no-legend
```

systemctl list-jobs

List of active systemd jobs that are currently queued or running on the system.

More information: https://www.freedesktop.org/software/systemd/man/latest/systemctl.html#list-jobs%20PATTERN%E2%80%A6.

- List all active jobs:

```
systemctl list-jobs
```

- Filter jobs for a specific unit:

```
systemctl list-jobs {{unit}}
```

systemctl list-machines

List the host and all running local virtual machines or containers with their state.

More information: https://www.freedesktop.org/software/systemd/man/latest/systemctl.html#list-machines%20PATTERN%E2%80%A6.

- Show all machines (host and running containers/VMs):

```
systemctl list-machines
```

- List a specific machine:

```
systemctl list-machines {{machine}}
```

- List multiple matching machines:

```
systemctl list-machines {{machine_1 machine_2 ...}}
```

- Filter machines using wildcard patterns i.e. a `glob`:

```
systemctl list-machines {{pattern}}
```

systemctl list-paths

List path units currently in memory, ordered by path.

More information: https://www.freedesktop.org/software/systemd/man/latest/systemctl.html#list-paths%20PATTERN%E2%80%A6.

- Show all path units currently in memory:

```
systemctl list-paths
```

- List path units matching specific wildcard pattern i.e. a `glob`:

```
systemctl list-paths {{pattern}}
```

- List path units that match with multiple patterns:

```
systemctl list-paths {{pattern_1 pattern_2 ...}}
```

- Show all path units, including inactive ones:

```
systemctl list-paths {{[-a|--all]}}
```

- Filter path units by state:

```
systemctl list-paths --state {{state}}
```

- Also show unit types in the output:

```
systemctl list-paths --show-types
```

systemctl list-sockets

List active socket units currently in memory, ordered by listening address.

See also: **`systemctl list-units`**, **`systemctl list-unit-files`**.

More information: https://www.freedesktop.org/software/systemd/man/latest/systemctl.html#list-sockets%20PATTERN%E2%80%A6.

- List active socket units currently in memory:

```
systemctl list-sockets
```

- List active socket units with their socket types:

```
systemctl list-sockets --show-types
```

- List all socket units, including inactive and failed ones:

```
systemctl list-sockets {{[-a|--all]}}
```

- List socket units filtered by state:

```
systemctl list-sockets --state {{active|inactive|failed|...}}
```

- List socket units matching a name pattern:

```
systemctl list-sockets {{pattern1 pattern2 ...}}
```

systemctl list-timers

List all active systemd timers.

More information: https://www.freedesktop.org/software/systemd/man/latest/systemctl.html#list-timers%20PATTERN%E2%80%A6.

- List all active timers:

```
systemctl list-timers
```

- List all timers, including inactive ones:

```
systemctl list-timers {{[-a|--all]}}
```

- List timers matching a pattern:

```
systemctl list-timers {{pattern}}
```

- List timers matching a specific state:

```
systemctl list-timers --state {{active|inactive|failed|...}}
```

systemctl list-unit-files

List installed unit files and their enablement states.

See also: **`systemctl list-units`**.

More information: https://www.freedesktop.org/software/systemd/man/latest/systemctl.html#list-unit-files%20PATTERN%E2%80%A6.

- List installed unit files and their states:

```
systemctl list-unit-files
```

- Filter by state:

```
systemctl list-unit-files --state {{enabled|disabled|static|...}}
```

- Filter by unit type:

```
systemctl list-unit-files {{[-t|--type]}} {{service|socket|timer|...}}
```

- Filter by a name pattern:

```
systemctl list-unit-files '{{sshd*}}'
```

- Print output directly to `stdout`:

```
systemctl list-unit-files --no-pager
```

- Print output without headers or footers:

```
systemctl list-unit-files --no-legend
```

systemctl list-units

List units that systemd currently has in memory.

See also: **`systemctl list-unit-files`**.

More information: https://www.freedesktop.org/software/systemd/man/latest/systemctl.html#list-units%20PATTERN%E2%80%A6.

- List units which are active, have pending jobs, or have failed:

```
systemctl list-units
```

- List all units, including inactive ones:

```
systemctl list-units {{[-a|--all]}}
```

- Filter by unit type:

```
systemctl list-units {{[-t|--type]}} {{service|socket|timer|...}}
```

- Filter by state:

```
systemctl list-units --state {{running|listening|dead|...}}
```

- Filter by a name pattern:

```
systemctl list-units 'systemd*'
```

- Print output directly to `stdout`:

```
systemctl list-units --no-pager
```

- Print output without headers or footers (for scripts):

```
systemctl list-units --no-legend
```

systemctl log-level

Get or set the log level of the systemd manager.

More information: https://www.freedesktop.org/software/systemd/man/latest/systemctl.html#log-level%20%5BLEVEL%5D.

- Show the current log level of the systemd manager:

```
systemctl log-level
```

- Set the manager's log level:

```
systemctl log-level {{emerg|alert|crit|err|warning|notice|info|debug}}
```

systemctl log-target

Get or set the log target for the systemd manager.

More information: https://www.freedesktop.org/software/systemd/man/latest/systemctl.html#log-target%20%5BTARGET%5D.

- Show the current log target of the systemd manager:

```
systemctl log-target
```

- Set the manager's log target:

```
systemctl log-target {{journal-or-kmsg|journal|kmsg|console|syslog|null|auto}}
```

systemctl mask

Link units to **`/dev/null`** so that they cannot be started.

See also: **`systemctl revert`**.

More information: https://www.freedesktop.org/software/systemd/man/latest/systemctl.html#mask%20UNIT%E2%80%A6.

- Mask a service:

```
systemctl mask {{service_name}}
```

- Ensure that the service is shut down while masking:

```
systemctl mask {{service_name}} --now
```

- Mask a user service:

```
systemctl mask {{service_name}} --user
```

systemctl mount-image

Mount an image file into a unit's mount namespace.

Only supported for the units that run within a mountspace i.e. with **`RootImage=`**, **`PrivateMounts=`**, etc.

More information: https://www.freedesktop.org/software/systemd/man/latest/systemctl.html#mount-image%20UNIT%20IMAGE%20%5BPATH%20%5BPARTITION_NAME:MOUNT_OPTIONS%5D%5D

- Mount an image at a specific path inside the unit's mount namespace:

```
systemctl mount-image {{unit}} /{{path/to/image}} /{{path/to/directory_inside_unit}}
```

- Mount the image's `root` partition with read-only and no-setuid options:

```
systemctl mount-image {{unit}} /{{path/to/image}} /{{path/to/directory_inside_unit}} root:ro,nosuid
```

- Create the destination directory before mounting:

```
systemctl mount-image --mkdir {{unit}} /{{path/to/image}} /{{path/to/directory_inside_unit}}
```

- Mount an image as read-only:

```
systemctl mount-image --read-only {{unit}} /{{path/to/image}} /{{path/to/directory_inside_unit}}
```

systemctl-poweroff

Power off the system.

See also: **`poweroff`**.

More information: https://www.freedesktop.org/software/systemd/man/latest/systemctl.html#poweroff.

- Power off the system:

```
systemctl poweroff
```

- Power off the system immediately without asking services to stop gracefully:

```
systemctl poweroff {{[-f|--force]}}
```

- Power off the system immediately without sending notifications to logged-in users:

```
systemctl poweroff {{[-f|--force]}} --no-wall
```

systemctl preset-all

Reset the enablement state of all installed units to the defaults specified in preset policy files.

See also: **`systemctl preset`**, **`systemctl list-unit-files`**.

More information: https://www.freedesktop.org/software/systemd/man/latest/systemctl.html#preset-all.

- Reset the enablement state of all installed units:

```
sudo systemctl preset-all
```

- Enable only if marked as enabled in the preset policy:

```
sudo systemctl preset-all --preset-mode enable-only
```

- Disable only if marked as disabled in the preset policy:

```
sudo systemctl preset-all --preset-mode disable-only
```

- Suppress output and return only the exit code:

```
sudo systemctl preset-all {{[-q|--quiet]}}
```

systemctl preset

Reset the enablement state of unit files to the defaults specified in preset policy files.

See also: **`systemctl preset-all`**, **`systemctl list-unit-files`**.

More information: https://www.freedesktop.org/software/systemd/man/latest/systemctl.html#preset%20UNIT%E2%80%A6.

- Reset the enablement state to preset defaults:

```
systemctl preset {{unit1 unit2 ...}}
```

- Enable only if marked as enabled in the preset policy:

```
systemctl preset {{unit}} --preset-mode enable-only
```

- Disable only if marked as disabled in the preset policy:

```
systemctl preset {{unit}} --preset-mode disable-only
```

- Suppress output and return only the exit code:

```
systemctl preset {{unit}} {{[-q|--quiet]}}
```

systemctl reboot

Reboot the system.

More information: https://www.freedesktop.org/software/systemd/man/latest/systemctl.html#reboot.

- Reboot the system:

```
systemctl reboot
```

- Reboot into the BIOS/UEFI menu:

```
systemctl reboot --firmware-setup
```

systemctl reenable

Re-enable one or more units.

Used when targets of a service change.

More information: https://www.freedesktop.org/software/systemd/man/latest/systemctl.html#reenable%20UNIT%E2%80%A6.

- Re-enable a unit, restoring its default symlinks:

```
systemctl reenable {{unit}}
```

- Re-enable multiple units at once:

```
systemctl reenable {{unit1 unit2 ...}}
```

- Re-enable a unit and start it immediately:

```
systemctl reenable {{unit}} --now
```

systemctl reload-or-restart

Reload **`systemd`** unit(s) otherwise restart them.

More information: https://www.freedesktop.org/software/systemd/man/latest/systemctl.html#reload-or-restart%20PATTERN%E2%80%A6.

- Reload or restart a unit:

```
systemctl reload-or-restart {{unit}}
```

- Reload or restart multiple units matching a pattern:

```
systemctl reload-or-restart {{pattern}}
```

- Run the command without waiting for the operation to complete:

```
systemctl reload-or-restart {{unit}} --no-block
```

- Apply the command only to user units:

```
systemctl reload-or-restart {{unit}} --user
```

systemctl reload-or-try-restart

This command is an alias of **`systemctl try-reload-or-restart`**.

- View documentation for the original command:

```
tldr systemctl try-reload-or-restart
```

systemctl reload

Reload a service's configuration without restarting it.

This reloads the service itself (like Apache or **`nginx`** configs), not the systemd unit file.

To reload unit files, use **`systemctl daemon-reload`**.

More information: https://www.freedesktop.org/software/systemd/man/latest/systemctl.html#reload%20PATTERN%E2%80%A6.

- Reload a service:

```
systemctl reload {{nginx}}
```

- Reload multiple services:

```
systemctl reload {{unit1 unit2 ...}}
```

- Reload a service for the current user:

```
systemctl reload {{pipewire}} --user
```

systemctl rescue

Enter rescue mode.

See also: **`systemctl emergency`**.

More information: https://www.freedesktop.org/software/systemd/man/latest/systemctl.html#rescue.

- Enter rescue mode:

```
systemctl rescue
```

- Enter rescue mode asynchronously:

```
systemctl rescue --no-block
```

systemctl reset-failed

Reset the "failed" state of one or more units.

More information: https://www.freedesktop.org/software/systemd/man/latest/systemctl.html#reset-failed%20%5BPATTERN%E2%80%A6%5D.

- Reset the failed state of all units:

```
systemctl reset-failed
```

- Reset the failed state of a specific unit:

```
systemctl reset-failed {{unit}}
```

- Reset multiple units at once:

```
systemctl reset-failed {{unit_1 unit_2 ...}}
```

systemctl restart

Stop and then start one or more systemd units.

Can be used in place of **`systemctl start`** on a stopped unit, but **`start`** is safer so that a running unit isn't accidentally restarted.

More information: https://www.freedesktop.org/software/systemd/man/latest/systemctl.html#restart%20PATTERN%E2%80%A6.

- Restart a unit:

```
systemctl restart {{unit}}
```

- Restart more than one unit:

```
systemctl restart {{unit1 unit2 ...}}
```

- Restart a user unit:

```
systemctl restart {{unit}} --user
```

systemctl revert

Revert unit files to their vendor versions.

Undoes the effects of **`edit`**, **`enable`**, **`disable`**, **`set-property`**, and **`mask`**.

More information: https://www.freedesktop.org/software/systemd/man/latest/systemctl.html#revert%20UNIT%E2%80%A6.

- Revert unit files to their default settings:

```
systemctl revert {{unit1 unit2 ...}}
```

- Revert a user unit file:

```
systemctl revert {{unit}} --user
```

systemctl service-log-level

Get or set the runtime log level of a service via D-Bus.

More information: https://www.freedesktop.org/software/systemd/man/latest/systemctl.html#service-log-level%20SERVICE%20%5BLEVEL%5D.

- Show the current log level of a service:

```
systemctl service-log-level {{service_name}}
```

- Set the log level of a service (the level name can be replaced with a number from 0 to 7):

```
systemctl service-log-level {{service_name}} {{emerg|alert|crit|err|warning|notice|info|debug}}
```

systemctl service-log-target

Get or set the log target for a service.

Only works for D-Bus integrated services.

More information: https://www.freedesktop.org/software/systemd/man/latest/systemctl.html#service-log-target%20SERVICE%20%5BTARGET%5D.

- Show the current log target for a service:

```
systemctl service-log-target {{service_name}}
```

- Set the log target to `console` (send logs to `stderr`):

```
systemctl service-log-target {{service_name}} console
```

- Set the log target to `journal` (send logs to `systemd-journald`):

```
systemctl service-log-target {{service_name}} journal
```

- Set the log target to `syslog` (send logs to `/dev/log`):

```
systemctl service-log-target {{service_name}} syslog
```

- Allow systemd to choose an appropriate log target:

```
systemctl service-log-target {{service_name}} auto
```

- Disable all log output:

```
systemctl service-log-target {{service_name}} null
```

systemctl service-watchdogs

Get or set the global state of service runtime watchdogs.

More information: https://www.freedesktop.org/software/systemd/man/latest/systemctl.html#service-watchdogs%20%5Byes%7Cno%5D.

- Show whether service watchdogs are currently enabled:

```
systemctl service-watchdogs
```

- Enable service runtime watchdogs:

```
systemctl service-watchdogs yes
```

- Disable service runtime watchdogs:

```
systemctl service-watchdogs no
```

systemctl set-default

Symlink the **`default.target`** alias to the given target unit.

More information: https://www.freedesktop.org/software/systemd/man/latest/systemctl.html#set-default%20TARGET.

- Set `systemd`'s default boot mode:

```
systemctl set-default {{target_name.target}}
```

- Set `systemd` to boot to GUI mode by default:

```
systemctl set-default graphical.target
```

- Set `systemd` to boot to CLI mode by default:

```
systemctl set-default multi-user.target
```

systemctl set-environment

Set one or more service manager environment variables.

More information: https://www.freedesktop.org/software/systemd/man/latest/systemctl.html#set-environment%20VARIABLE=VALUE%E2%80%A6.

- Set a single environment variable:

```
systemctl set-environment {{variable}} {{value}}
```

- Set multiple environment variables at once:

```
systemctl set-environment {{variable1 value1 variable2 value2 ...}}
```

- Set an environment variable for the user service manager:

```
systemctl set-environment {{variable}} {{value}} --user
```

systemctl set-property

Set the specified unit properties at runtime.

See also: **`systemctl revert`**.

More information: https://www.freedesktop.org/software/systemd/man/latest/systemctl.html#set-property%20UNIT%20PROPERTY=VALUE%E2%80%A6.

- Set a property for a running service:

```
systemctl set-property {{unit}} {{property}}={{value}}
```

- Set multiple properties at once:

```
systemctl set-property {{unit}} {{property_1=value_1 property_2=value_2 ...}}
```

- Set a property only for the current runtime session (not persistent):

```
systemctl set-property {{unit}} {{property}}={{value}} --runtime
```

- Reset a property to its default value:

```
systemctl set-property {{unit}} {{property}}=
```

- Reset multiple properties to its default values:

```
systemctl set-property {{unit}} {{property_1= property_2= ...}}
```

systemctl show-environment

Display systemd environment blocks.

More information: https://www.freedesktop.org/software/systemd/man/latest/systemctl.html#show-environment.

- Display the environment block for the system:

```
systemctl show-environment
```

- Display the environment block for the current user:

```
systemctl show-environment --user
```

systemctl show

Show properties of units or systemd itself.

More information: https://www.freedesktop.org/software/systemd/man/latest/systemctl.html#show%20PATTERN%E2%80%A6%7CJOB%E2%80%A6.

- Show properties of the system service manager:

```
systemctl show
```

- Show properties of the user service manager:

```
systemctl show --user
```

- Show properties of a specific unit:

```
systemctl show {{unit}}
```

- Show properties of a specific user unit:

```
systemctl show {{unit}} --user
```

- Include empty properties in the list:

```
systemctl show {{[-a|--all]}}
```

- Only show the specified properties:

```
systemctl show {{unit}} {{[-p|--property]}}
{{Wants,Conflicts,...}}
```

systemctl soft-reboot

Shut down and reboot userspace, leaving the kernel running.

More information: https://www.freedesktop.org/software/systemd/man/latest/systemctl.html#soft-reboot.

- Perform a soft reboot immediately:

```
systemctl soft-reboot
```

- Force a soft reboot:

```
systemctl soft-reboot {{[-f|--force]}}
```

- Schedule a soft reboot for a specific time:

```
systemctl soft-reboot --when "{{timestamp}}"
```

- Cancel a scheduled soft reboot:

```
systemctl soft-reboot --when cancel
```

systemctl start

Start systemd units.

More information: https://www.freedesktop.org/software/systemd/man/latest/systemctl.html#start%20PATTERN%E2%80%A6.

- Start a unit:

```
systemctl start {{unit}}
```

- Start a user unit:

```
systemctl start {{unit}} --user
```

systemctl status

Display the status of systemd units.

More information: https://www.freedesktop.org/software/systemd/man/latest/systemctl.html#status%20PATTERN%E2%80%A6%7CPID%E2%80%A6%5D.

- Show the status of a systemd unit:

```
systemctl status {{unit}}.{{service|timer|socket|target|...}}
```

- Show the status of failed units:

```
systemctl status --failed
```

- List all running services:

```
systemctl status
```

- List all units in the system:

```
systemctl status {{[-a|--all]}}
```

- List all units of a specific type:

```
systemctl status {{[-t|--type]}} {{service|timer|socket|target|...}}
```

- List all units with a specific state:

```
systemctl status --state {{active|inactive|failed}}
```

- Show the status of a user unit:

```
systemctl status {{unit}} --user
```

systemctl stop

Stop systemd units.

More information: https://www.freedesktop.org/software/systemd/man/latest/systemctl.html#stop%20PATTERN%E2%80%A6.

- Stop a unit:

```
systemctl stop {{unit}}
```

- Stop a service and suppress warnings:

```
systemctl stop {{unit}} --no-warn
```

- Stop a user unit:

```
systemctl stop {{unit}} --user
```

systemctl suspend-then-hibernate

Suspend the system, then automatically hibernate after a period of inactivity.

More information: https://www.freedesktop.org/software/systemd/man/latest/systemctl.html#suspend-then-hibernate.

- Suspend the system and hibernate after the configured delay:

```
systemctl suspend-then-hibernate
```

- Force suspend-then-hibernate (bypass inhibitor locks):

```
systemctl suspend-then-hibernate {{[-f|--force]}}
```

systemctl suspend

Suspend the system.

More information: https://www.freedesktop.org/software/systemd/man/latest/systemctl.html#suspend.

- Suspend the system immediately:

```
systemctl suspend
```

- Schedule a suspend after a 5 minute delay:

```
sleep 300 && systemctl suspend
```

- Suspend the system and then hibernate after a delay:

```
systemctl hybrid-sleep
```

systemctl switch-root

Switch to a new root filesystem and execute a new system manager.

More information: https://www.freedesktop.org/software/systemd/man/latest/systemctl.html#switch-root%20ROOT%20INIT.

- Switch to a new root filesystem and execute its default init system:

```
systemctl switch-root {{path/to/new_root}}
```

- Switch to a new root filesystem and run a specific init binary:

```
systemctl switch-root {{path/to/new_root}} {{/sbin/init}}
```

- Switch to a new root filesystem with verbose output:

```
systemctl switch-root {{path/to/new_root}} {{[-v|--verbose]}}
```

systemctl thaw

Thaw (resume) one or more frozen units.

Units can be frozen with **`systemctl freeze`**.

More information: https://www.freedesktop.org/software/systemd/man/latest/systemctl.html#thaw%20PATTERN%E2%80%A6.

- Thaw a specific unit:

```
systemctl thaw {{unit}}
```

- Thaw multiple units:

```
systemctl thaw {{unit1 unit2 ...}}
```

- Thaw all currently frozen units:

```
systemctl thaw '*'
```

systemctl try-reload-or-restart

Reload one or more units if they support it; otherwise restart them.

More information: https://www.freedesktop.org/software/systemd/man/latest/systemctl.html#try-reload-or-restart%20PATTERN%E2%80%A6.

- Reload or restart a specific unit:

```
systemctl try-reload-or-restart {{unit}}
```

- Reload or restart multiple units:

```
systemctl try-reload-or-restart {{unit1 unit2 ...}}
```

- Reload or restart all units matching a pattern:

```
systemctl try-reload-or-restart '{{pattern}}'
```

systemctl try-restart

Restart one or more units only if they are currently running.

More information: https://www.freedesktop.org/software/systemd/man/latest/systemctl.html#try-restart%20PATTERN%E2%80%A6.

- Restart a specific unit if it is running:

```
systemctl try-restart {{unit}}
```

- Restart multiple units if they are running:

```
systemctl try-restart {{unit1 unit2 ...}}
```

- Restart all units matching a pattern if they are running:

```
systemctl try-restart '{{pattern}}'
```

systemctl unmask

Unmask units to make them startable again.

This undoes the effect of **`systemctl mask`**.

More information: https://www.freedesktop.org/software/systemd/man/latest/systemctl.html#unmask%20UNIT%E2%80%A6.

- Unmask a service:

```
systemctl unmask {{service_name}}
```

- Unmask and start a service immediately:

```
systemctl unmask {{service_name}} --now
```

- Unmask a user service:

```
systemctl unmask {{service_name}} --user
```

systemctl unset-environment

Unset one or more service manager environment variables.

This undoes the effect of **`systemctl set-environment`**.

More information: https://www.freedesktop.org/software/systemd/man/latest/systemctl.html#unset-environment%20VARIABLE%E2%80%A6.

- Unset a single environment variable:

```
systemctl unset-environment {{var}}
```

- Unset multiple environment variables at once:

```
systemctl unset-environment {{var1 var2 ...}}
```

- Unset an environment variable in the user service manager:

```
systemctl unset-environment {{var}} --user
```

systemctl whoami

Show units that processes belong to.

If no PID is specified, shows the unit the **`systemctl`** command itself is invoked in.

More information: https://www.freedesktop.org/software/systemd/man/latest/systemctl.html#whoami%20%5BPID%E2%80%A6%5D.

- Show the unit of the current shell (where `systemctl` is running):

```
systemctl whoami
```

- Show the unit of the current shell in user service manager (services managed for your login session):

```
systemctl whoami --user
```

- Show the unit a specific process belongs to:

```
systemctl whoami {{process_id}}
```

- Show the units for multiple processes:

```
systemctl whoami {{process_id1 process_id2 ...}}
```

systemctl

Control the systemd system and service manager.

Some subcommands such as **`disable`**, **`status`**, **`reboot`**, etc. have their own usage documentation.

More information: https://www.freedesktop.org/software/systemd/man/latest/systemctl.html.

- Show all running services:

```
systemctl status
```

- List failed units:

```
systemctl --failed
```

- Start/Stop/Restart/Reload/Show the status of a service:

```
systemctl {{start|stop|restart|reload|status}} {{unit}}
```

- Enable/Disable a unit to be started on bootup:

```
systemctl {{enable|disable}} {{unit}}
```

- Reload systemd, scan for new or changed units:

```
systemctl daemon-reload
```

- Check if a unit is active/enabled/failed:

```
systemctl {{is-active|is-enabled|is-failed}} {{unit}}
```

- List all service/socket/automount units filtering by running/failed state:

```
systemctl list-units {{[-t|--type]}} {{service|socket|
automount|...}} --state {{failed|running}}
```

- Show the contents & absolute path of a unit file or edit it:

```
systemctl {{cat|edit}} {{unit}}
```

systemd-ac-power

Report whether the computer is connected to an external power source.

More information: https://www.freedesktop.org/software/systemd/man/latest/systemd-ac-power.html.

- Silently check and return a 0 status code when running on AC power, and a non-zero code otherwise:

```
systemd-ac-power
```

- Additionally print `yes` or `no` to `stdout`:

```
systemd-ac-power {{[-v|--verbose]}}
```

systemd-analyze

Analyze and debug system manager.

Show timing details about the boot process of units (services, mount points, devices, sockets).

More information: https://www.freedesktop.org/software/systemd/man/latest/systemd-analyze.html.

- Print the last system startup time:

```
systemd-analyze
```

- List all running units, ordered by the time they took to initialize:

```
systemd-analyze blame
```

- Print a tree of the time-critical chain of bootup units:

```
systemd-analyze critical-chain
```

- Create an SVG file showing when each system service started, highlighting the time that they spent on initialization:

```
systemd-analyze plot > {{path/to/file.svg}}
```

- Plot a dependency graph and convert it to an SVG file:

```
systemd-analyze dot | dot -T {{svg}} > {{path/to/file.svg}}
```

- Show security scores of running units:

```
systemd-analyze security
```

- View all udev rules together without showing comments:

```
systemd-analyze cat-config udev/rules.d --tldr
```

systemd-ask-password

Query the user for a system password.

More information: https://www.freedesktop.org/software/systemd/man/latest/systemd-ask-password.html.

- Query a system password with a specific prompt:

```
systemd-ask-password "{{prompt}}"
```

- Specify an identifier for the password query:

```
systemd-ask-password --id {{identifier}} "{{prompt}}"
```

- Use a kernel keyring key name as a cache for the password:

```
systemd-ask-password --keyname {{key_name}} "{{prompt}}"
```

- Set a custom timeout for the password query:

```
systemd-ask-password --timeout {{seconds}} "{{prompt}}"
```

- Force the use of an agent system and never ask on current TTY:

```
systemd-ask-password --no-tty "{{prompt}}"
```

- Store a password in the kernel keyring without displaying it:

```
systemd-ask-password --no-output --keyname {{key_name}} "{{prompt}}"
```

- Pipe a password to a command, stripping the trailing newline:

```
systemd-ask-password -n | {{command}}
```

- Display help:

```
systemd-ask-password {{[-h|--help]}}
```

systemd-cat

Connect a pipeline or program's output streams with the systemd journal.

More information: https://www.freedesktop.org/software/systemd/man/latest/systemd-cat.html.

- Write the output of the specified command to the journal (both output streams are captured):

```
systemd-cat {{command}}
```

- Write the output of a pipeline to the journal (`stderr` stays connected to the terminal):

```
{{command}} | systemd-cat
```

- Use the specified identifier (default: `cat` when reading from a pipeline, executable name otherwise):

```
{{command}} | systemd-cat {{[-t|--identifier]}} {{id}}
```

- Use the specified default priority level for all logged messages:

```
systemd-cat {{[-p|--priority]}} {{emerg|alert|crit|err|
warning|notice|info|debug}} {{command}}
```

- Use the specified default priority level for the logged messages from the command's `stderr`:

```
systemd-cat --stderr-priority {{emerg|alert|crit|err|warning|
notice|info|debug}} {{command}}
```

systemd-cgls

Show the contents of the selected Linux control group hierarchy in a tree.

More information: https://www.freedesktop.org/software/systemd/man/latest/systemd-cgls.html.

- Display the whole control group hierarchy on your system:

```
systemd-cgls
```

- Display a control group tree of a specific resource controller:

```
systemd-cgls {{cpu|memory|io}}
```

- Display the control group hierarchy of one or more systemd units:

```
systemd-cgls {{[-u|--unit]}} {{unit1 unit2 ...}}
```

systemd-cgtop

Show the top control groups of the local Linux control group hierarchy, ordered by their CPU, memory, or disk I/O load.

See also: **`top`**.

More information: https://www.freedesktop.org/software/systemd/man/latest/systemd-cgtop.html.

- Start an interactive view:

```
systemd-cgtop
```

- Change the sort order:

```
systemd-cgtop --order {{cpu|memory|path|tasks|io}}
```

- Show the CPU usage by time instead of percentage:

```
systemd-cgtop --cpu=percentage
```

- Change the update interval in seconds (or one of these time units: `ms`, `us`, `min`):

```
systemd-cgtop {{[-d|--delay]}} {{interval}}
```

- Only count userspace processes (without kernel threads):

```
systemd-cgtop -P
```

systemd-confext

This command is an alias of **`systemd-sysext`**.

It follows the same principle as **`systemd-sysext`**, but instead of working on **`/usr`** and **`/opt`**, **`confext`** will extend only **`/etc`**.

- View documentation for the original command:

```
tldr systemd-sysext
```

systemd-creds

List, show, encrypt, and decrypt service credentials.

More information: https://www.freedesktop.org/software/systemd/man/latest/systemd-creds.html.

- Encrypt a file and set a specific name:

```
systemd-creds encrypt --name {{name}} {{path/to/input_file}} {{path/to/output}}
```

- Decrypt the file again:

```
systemd-creds decrypt {{path/to/input_file}} {{path/to/output_file}}
```

- Encrypt text from `stdin`:

```
echo -n {{text}} | systemd-creds encrypt --name {{name}} - {{path/to/output}}
```

- Encrypt the text and append it to the `.service` file (the credentials will be available in `$CREDENTIALS_DIRECTORY`):

```
echo -n {{text}} | systemd-creds encrypt --name {{name}} --pretty - - >> {{service}}
```

- Create a credential that is only valid until the given timestamp:

```
systemd-creds encrypt --not-after "{{timestamp}}" {{path/to/input_file}} {{path/to/output_file}}
```

systemd-cryptenroll

Interactively enroll or remove methods used to unlock LUKS2-encrypted devices. Uses a password to unlock the device unless otherwise specified.

In order to allow a partition to be unlocked during system boot, update the **`/etc/crypttab`** file or the initramfs.

More information: https://www.freedesktop.org/software/systemd/man/latest/systemd-cryptenroll.html.

- Enroll a new password (similar to `cryptsetup luksAddKey`):

```
systemd-cryptenroll --password {{path/to/luks2_block_device}}
```

- Enroll a new recovery key (i.e. a randomly generated passphrase that can be used as a fallback):

```
systemd-cryptenroll --recovery-key {{path/to/
luks2_block_device}}
```

- List available tokens, or enroll a new PKCS#11 token:

```
systemd-cryptenroll --pkcs11-token-uri {{list|auto|
pkcs11_token_uri}} {{path/to/luks2_block_device}}
```

- List available FIDO2 devices, or enroll a new FIDO2 device (`auto` can be used as the device name when there is only one token plugged in):

```
systemd-cryptenroll --fido2-device {{list|auto|path/to/
fido2_hidraw_device}} {{path/to/luks2_block_device}}
```

- Enroll a new FIDO2 device with user verification (biometrics):

```
systemd-cryptenroll --fido2-device {{auto|path/to/
fido2_hidraw_device}} --fido2-with-user-verification yes
{{path/to/luks2_block_device}}
```

- Unlock using a FIDO2 device, and enroll a new FIDO2 device:

```
systemd-cryptenroll --unlock-fido2-device {{path/to/
fido2_hidraw_unlock_device}} --fido2-device {{path/to/
fido2_hidraw_enroll_device}} {{path/to/luks2_block_device}}
```

- Enroll a TPM2 security chip (only secure-boot-policy PCR) and require an additional alphanumeric PIN:

```
systemd-cryptenroll --tpm2-device {{auto|path/to/
tpm2_block_device}} --tpm2-with-pin yes {{path/to/
luks2_block_device}}
```

- Remove all empty passwords/all passwords/all FIDO2 devices/all PKCS#11 tokens/all TPM2 security chips/all recovery keys/all methods:

```
systemd-cryptenroll --wipe-slot {{empty|password|fido2|
pkcs#11|tpm2|recovery|all}} {{path/to/luks2_block_device}}
```

systemd-cryptsetup

Create or remove decrypted mappings of encrypted volumes. Equivalent of **`cryptsetup open`** and **`cryptsetup close`**.

Arguments to this command are written exactly like a line in **`/etc/crypttab`**. It's used by systemd to unlock devices on boot.

See also: **`cryptsetup`**.

More information: https://www.freedesktop.org/software/systemd/man/latest/systemd-cryptsetup.html.

- Open a LUKS volume and create a decrypted mapping at `/dev/mapper/mapping_name`:

```
systemd-cryptsetup attach {{mapping_name}} {{/dev/sdXY}}
```

- Open a LUKS volume with additional options and create a decrypted mapping at `/dev/mapper/mapping_name`:

```
systemd-cryptsetup attach {{mapping_name}} {{/dev/sdXY}} none {{crypttab_options}}
```

- Open a LUKS volume with a keyfile and create a decrypted mapping at `/dev/mapper/mapping_name`:

```
systemd-cryptsetup attach {{mapping_name}} {{/dev/sdXY}} {{path/to/keyfile}} {{crypttab_options}}
```

- Remove an existing mapping:

```
systemd-cryptsetup detach {{mapping_name}}
```

systemd-delta

Find overridden systemd-related configuration files.

More information: https://www.freedesktop.org/software/systemd/man/latest/systemd-delta.html.

- Show all overridden configuration files:

```
systemd-delta
```

- Show only files of specific types (comma-separated list):

```
systemd-delta {{[-t|--type]}} {{masked|equivalent|redirected|overridden|extended|unchanged}}
```

- Show only files whose path starts with the specified prefix (Note: A prefix is a directory containing subdirectories with systemd configuration files):

```
systemd-delta {{/etc|/run|/usr/lib|...}}
```

- Further restrict the search path by adding a suffix (the prefix is optional):

```
systemd-delta {{prefix}}/{{tmpfiles.d|sysctl.d|systemd/system|...}}
```

systemd-detect-virt

Detect execution in a virtualized environment.

More information: https://www.freedesktop.org/software/systemd/man/latest/systemd-detect-virt.html.

- List detectable virtualization technologies:

```
systemd-detect-virt --list
```

- Detect virtualization, print the result, and return a zero status code when running in a VM or a container, and a non-zero code otherwise:

```
systemd-detect-virt
```

- Silently check without printing anything:

```
systemd-detect-virt {{[-q|--quiet]}}
```

- Only detect container virtualization:

```
systemd-detect-virt {{[-c|--container]}}
```

- Only detect hardware virtualization:

```
systemd-detect-virt {{[-v|--vm]}}
```

- Detect whether in a `chroot` environment:

```
systemd-detect-virt {{[-r|--chroot]}}
```

systemd-dissect

Introspect and interact with filesystem OS disk images, specifically Discoverable Disk Images (DDIs).

More information: https://www.freedesktop.org/software/systemd/man/latest/systemd-dissect.html.

- Show general image information about the OS image:

```
systemd-dissect {{path/to/image.raw}}
```

- Mount an OS image:

```
systemd-dissect {{[-m|--mount]}} {{path/to/image.raw}} {{/mnt/image}}
```

- Unmount an OS image:

```
systemd-dissect {{[-u|--umount]}} {{/mnt/image}}
```

- List files in an image:

```
systemd-dissect {{[-l|--list]}} {{path/to/image.raw}}
```

- Attach an OS image to an automatically allocated loopback block device and print its path:

```
systemd-dissect --attach {{path/to/image.raw}}
```

- Detach an OS image from a loopback block device:

```
systemd-dissect --detach {{path/to/device}}
```

systemd-escape

Escape strings for usage in systemd unit names.

More information: https://www.freedesktop.org/software/systemd/man/latest/systemd-escape.html.

- Escape the given text:

```
systemd-escape {{text}}
```

- Reverse the escaping process:

```
systemd-escape {{[-u|--unescape]}} {{text}}
```

- Treat the given text as a path:

```
systemd-escape {{[-p|--path]}} {{text}}
```

- Append the given suffix to the escaped text:

```
systemd-escape --suffix {{suffix}} {{text}}
```

- Use a template and inject the escaped text:

```
systemd-escape --template {{template}} {{text}}
```

systemd-firstboot

Initialize basic system settings on or before the first boot-up of a system.

More information: https://www.freedesktop.org/software/systemd/man/latest/systemd-firstboot.html.

- Operate on the specified directory instead of the root directory of the host system:

```
sudo systemd-firstboot --root {{path/to/root_directory}}
```

- Set the system keyboard layout:

```
sudo systemd-firstboot --keymap {{keymap}}
```

- Set the system hostname:

```
sudo systemd-firstboot --hostname {{hostname}}
```

- Set the root user's password:

```
sudo systemd-firstboot --root-password {{password}}
```

- Prompt the user interactively for a specific basic setting:

```
sudo systemd-firstboot --prompt {{setting}}
```

- Force writing configuration even if the relevant files already exist:

```
sudo systemd-firstboot --force
```

- Remove all existing files that are configured by `systemd-firstboot`:

```
sudo systemd-firstboot --reset
```

- Remove the password of the system's root user:

```
sudo systemd-firstboot --delete-root-password
```

systemd-hwdb

Hardware database management tool.

More information: https://www.freedesktop.org/software/systemd/man/latest/systemd-hwdb.html.

- Update the binary hardware database in `/etc/udev`:

```
sudo systemd-hwdb update
```

- Query the hardware database and print the result for a specific modalias:

```
systemd-hwdb query {{modalias}}
```

- Update the binary hardware database, returning a non-zero exit value on any parsing error:

```
sudo systemd-hwdb {{[-s|--strict]}} update
```

- Update the binary hardware database in `/usr/lib/udev`:

```
sudo systemd-hwdb --usr update
```

- Update the binary hardware database in the specified root path:

```
systemd-hwdb {{[-r|--root]}} {{path/to/root}} update
```

systemd-id128

Generate and print sd-128 identifiers.

More information: https://www.freedesktop.org/software/systemd/man/latest/systemd-id128.html.

- Generate a new random identifier:

```
systemd-id128 new
```

- Print the identifier of the current machine:

```
systemd-id128 machine-id
```

- Print the identifier of the current boot:

```
systemd-id128 boot-id
```

- Print the identifier of the current service invocation (this is available in systemd services):

```
systemd-id128 invocation-id
```

- Generate a new random identifier and print it as a UUID (five groups of digits separated by hyphens):

```
systemd-id128 new {{[-u|--uuid]}}
```

systemd-inhibit

Prohibit the system from entering certain power states.

Inhibitor locks may be used to block or delay system sleep and shutdown requests as well as automatic idle handling.

More information: https://www.freedesktop.org/software/systemd/man/latest/systemd-inhibit.html.

- List all active inhibition locks and the reasons for their creation:

```
systemd-inhibit
```

- Block system shutdown for a specified number of seconds with the `sleep` command:

```
systemd-inhibit --what shutdown sleep {{5}}
```

- Keep the system from sleeping or idling until the download is complete:

```
systemd-inhibit --what sleep:idle wget {{https://example.com/file}}
```

- Ignore lid close switch until the script exits:

```
systemd-inhibit --what sleep:handle-lid-switch {{path/to/script}}
```

- Ignore power button press while command is running:

```
systemd-inhibit --what handle-power-key {{command}}
```

- Describe who and why created the inhibitor (default: the command and its arguments for `--who` and `Unknown reason` for `--why`):

```
systemd-inhibit --who {{$USER}} --why {{reason}} --what {{operation}} {{command}}
```

systemd-machine-id-setup

Initialize the machine ID stored in **`/etc/machine-id`** at install time with a provisioned or randomly generated ID.

Note: Always use **`sudo`** to execute these commands as they require elevated privileges.

More information: https://www.freedesktop.org/software/systemd/man/latest/systemd-machine-id-setup.html.

- Print the generated or committed machine ID:

```
systemd-machine-id-setup --print
```

- Specify an image policy:

```
systemd-machine-id-setup --image-policy {{your_policy}}
```

- Display the output as JSON:

```
sudo systemd-machine-id-setup --json pretty
```

- Operate on a disk image instead of a directory tree:

```
systemd-machine-id-setup --image /{{path/to/image}}
```

systemd-mount

Establish and destroy transient mount or auto-mount points.

More information: https://www.freedesktop.org/software/systemd/man/latest/systemd-mount.html.

- Mount a filesystem (image or block device) at `/run/media/system/LABEL` where LABEL is the filesystem label or the device name if there is no label:

```
systemd-mount {{path/to/file_or_device}}
```

- Mount a filesystem (image or block device) at a specific location:

```
systemd-mount {{path/to/file_or_device}} {{path/to/mount_point}}
```

- List all local, known block devices with filesystems that may be mounted:

```
systemd-mount --list
```

- Create an automount point that mounts the actual filesystem at the time of first access:

```
systemd-mount --automount yes {{path/to/file_or_device}}
```

- Unmount one or more devices:

```
systemd-mount {{[-u|--umount]}} {{path/to/mount_point_or_device1 path/to/mount_point_or_device2 ...}}
```

- Mount a filesystem (image or block device) with a specific filesystem type:

```
systemd-mount {{[-t|--type]}} {{file_system_type}} {{path/to/file_or_device}} {{path/to/mount_point}}
```

- Mount a filesystem (image or block device) with additional mount options:

```
systemd-mount {{[-o|--options]}} {{mount_options}} {{path/to/file_or_device}} {{path/to/mount_point}}
```

systemd-notify

Notify the service manager about start-up completion and other daemon status changes.

This command is useless outside systemd service scripts.

More information: https://www.freedesktop.org/software/systemd/man/latest/systemd-notify.html.

- Notify systemd that the service has completed its initialization and is fully started. It should be invoked when the service is ready to accept incoming requests:

```
systemd-notify --booted
```

- Signal to systemd that the service is ready to handle incoming connections or perform its tasks:

```
systemd-notify --ready
```

- Provide a custom status message to systemd (this information is shown by `systemctl status`):

```
systemd-notify --status "{{Add custom status message here...}}"
```

systemd-nspawn

Spawn a command or OS in a lightweight container.

More information: https://www.freedesktop.org/software/systemd/man/latest/systemd-nspawn.html.

- Run a command in a container:

```
systemd-nspawn {{[-D|--directory]}} {{path/to/container_root}}
```

- Run a full Linux-based OS in a container:

```
systemd-nspawn {{[-b|--boot]}} {{[-D|--directory]}} {{path/to/container_root}}
```

- Run the specified command as PID 2 in the container (as opposed to PID 1) using a stub init process:

```
systemd-nspawn {{[-D|--directory]}} {{path/to/container_root}} {{[-a|--as-pid2]}}
```

- Specify the machine name and hostname:

```
systemd-nspawn {{[-M|--machine]}} {{container_name}} --hostname {{container_host}} {{[-D|--directory]}} {{path/to/container_root}}
```

systemd-path

List and query system and user paths.

More information: https://www.freedesktop.org/software/systemd/man/latest/systemd-path.html.

- Display a list of known paths and their current values:

```
systemd-path
```

- Query the specified path and display its value:

```
systemd-path "{{path_name}}"
```

- Suffix printed paths with `suffix_string`:

```
systemd-path --suffix {{suffix_string}}
```

- Display version:

```
systemd-path --version
```

systemd-repart

Automatically grow and add partitions.

Grows and adds partitions based on the configuration files described in repart.d.

Does not automatically resize filesystem on partition. See systemd-growfs to extend filesystem.

More information: https://www.freedesktop.org/software/systemd/man/latest/systemd-repart.html.

- Grow the root partition (/) to all available disk space:

```
systemd-repart
```

- Simulate repartitioning, showing the changes without applying them:

```
systemd-repart --dry-run yes
```

- Grow root partition size to 10 gigabytes:

```
systemd-repart --size 10G --root /
```

systemd-resolve

Resolve domain names, IPv4 and IPv6 addresses, DNS resource records, and services.

Note: This tool has been renamed to **`resolvectl`** in new versions of **`systemd`**.

More information: https://manned.org/systemd-resolve.

- View documentation for `resolvectl`:

```
tldr resolvectl
```

systemd-run

Run programs in transient scope units, service units, or path-, socket-, or timer-triggered service units.

More information: https://www.freedesktop.org/software/systemd/man/latest/systemd-run.html.

- Start a transient service:

```
sudo systemd-run {{command}} {{argument1 argument2 ...}}
```

- Start a transient service under the service manager of the current user (no privileges):

```
systemd-run --user {{command}} {{argument1 argument2 ...}}
```

- Start a transient service with a custom unit name and description:

```
sudo systemd-run {{[-u|--unit]}} {{name}} --description {{string}} {{command}} {{argument1 argument2 ...}}
```

- Start a transient service that does not get cleaned up after it terminates with a custom environment variable:

```
sudo systemd-run {{[-r|--remain-after-exit]}} --set-env={{name}}={{value}} {{command}} {{argument1 argument2 ...}}
```

- Start a transient timer that periodically runs its transient service (see `man systemd.time` for calendar event format):

```
sudo systemd-run --on-calendar={{calendar_event}} {{command}} {{argument1 argument2 ...}}
```

- Share the terminal with the program (allowing interactive input/output) and make sure the execution details remain after the program exits:

```
systemd-run {{[-r|--remain-after-exit]}} --pty {{command}}
```

- Set properties (e.g. CPUQuota, MemoryMax) of the process and wait until it exits:

```
systemd-run {{[-p|--property]}} MemoryMax={{memory_in_bytes}} {{[-p|--property]}} CPUQuota={{percentage_of_cpu_time}}% --wait {{command}}
```

- Use the program in a shell pipeline:

```
{{command1}} | systemd-run {{[-P|--pipe]}} {{command2}} |
{{command3}}
```

systemd-socket-activate

Socket activation for systemd services.

More information: https://www.freedesktop.org/software/systemd/man/latest/systemd-socket-activate.html.

- Activate a service when a specific socket is connected:

```
systemd-socket-activate {{path/to/socket.service}}
```

- Activate multiple sockets for a service:

```
systemd-socket-activate {{path/to/socket1.service}} {{path/to/socket2.service}}
```

- Pass environment variables to the service being activated:

```
{{SYSTEMD_SOCKET_ACTIVATION=1}} systemd-socket-activate {{path/to/socket.service}}
```

- Activate a service along with a notification socket:

```
systemd-socket-activate {{path/to/socket.socket}} {{path/to/service.service}}
```

- Activate a service with a specified port:

```
systemd-socket-activate {{path/to/socket.service}} {{[-l|--listen]}} {{8080}}
```

systemd-stdio-bridge

Implement a proxy between **`stdin`**/**`stdout`** and a D-Bus.

Note: It expects to receive an open connection via **`stdin`**/**`stdout`** when started, and will create a new connection to the specified bus.

More information: https://www.freedesktop.org/software/systemd/man/latest/systemd-stdio-bridge.html.

- Forward `stdin`/`stdout` to the local system bus:

```
systemd-stdio-bridge
```

- Forward `stdin`/`stdout` to a specific user's D-Bus:

```
systemd-stdio-bridge --{{user}}
```

- Forward `stdin`/`stdout` to the local system bus within a specific container:

```
systemd-stdio-bridge {{[-M|--machine]}} {{mycontainer}}
```

- Forward `stdin`/`stdout` to a custom D-Bus address:

```
systemd-stdio-bridge {{[-p|--bus-path]}} unix:path=/{{path/to/dbus_socket}}
```

systemd-sysext

Activate or deactivate system extension images.

More information: https://www.freedesktop.org/software/systemd/man/latest/systemd-sysext.html.

- List installed extension images:

```
systemd-sysext list
```

- Merge system extension images into `/usr/` and `/opt/`:

```
systemd-sysext merge
```

- Check the current merge status:

```
systemd-sysext
```

- Unmerge all currently installed system extension images from `/usr/` and `/opt/`:

```
systemd-sysext unmerge
```

- Refresh system extension images (a combination of `unmerge` and `merge`):

```
systemd-sysext refresh
```

systemd-sysusers

Create system users and groups.

If the config file is not specified, files in the **`sysusers.d`** directories are used.

More information: https://www.freedesktop.org/software/systemd/man/latest/systemd-sysusers.html.

- Create users and groups from a specific configuration file:

```
systemd-sysusers {{path/to/file}}
```

- Simulate processing configuration files, printing what would be done:

```
systemd-sysusers --dry-run {{path/to/file}}
```

- Print the contents of all configuration files (before each file, its name is printed as a comment):

```
systemd-sysusers --cat-config
```

- Create users based on files listed in the previous command:

```
systemd-sysusers
```

systemd-tmpfiles

Create, delete, and clean up volatile and temporary files and directories.

This command is automatically invoked on boot by systemd services and running it manually is usually not needed.

More information: https://www.freedesktop.org/software/systemd/man/latest/systemd-tmpfiles.html.

- Create files and directories as specified in the configuration:

```
sudo systemd-tmpfiles --create
```

- Create files and directories matching only a specific path prefix:

```
sudo systemd-tmpfiles --create --prefix {{/var/log/journal}}
```

- Clean up files and directories with age parameters configured:

```
sudo systemd-tmpfiles --clean
```

- Remove files and directories as specified in the configuration:

```
sudo systemd-tmpfiles --remove
```

- Apply operations for user-specific configurations:

```
sudo systemd-tmpfiles --create --user
```

- Execute lines marked for early boot:

```
sudo systemd-tmpfiles --create --boot
```

systemd-tty-ask-password-agent

List or process pending systemd password requests.

More information: https://www.freedesktop.org/software/systemd/man/latest/systemd-tty-ask-password-agent.html.

- List all currently pending system password requests:

```
systemd-tty-ask-password-agent --list
```

- Continuously process password requests:

```
systemd-tty-ask-password-agent --watch
```

- Process all currently pending system password requests by querying the user on the calling TTY:

```
systemd-tty-ask-password-agent --query
```

- Forward password requests to wall instead of querying the user on the calling TTY:

```
systemd-tty-ask-password-agent --wall
```

systemd-umount

This command is an alias of **`systemd-mount --umount`**.

- View documentation for the original command:

```
tldr systemd-mount
```

systemsettings

KDE central settings program.

More information: https://manned.org/systemsettings.

- Open the settings GUI:

```
systemsettings
```

- List all possible KCM modules for `systemsettings`:

```
systemsettings --list
```

- Open a specific KCM:

```
systemsettings {{kcm_name}}
```

- Display help:

```
systemsettings {{[-h|--help]}}
```

systool

View system device information by bus, and classes.

This command is part of the **`sysfs`** package.

More information: https://manned.org/systool.

- List all attributes of devices of a bus (eg. `pci`, `usb`). View all buses using `ls /sys/bus`:

```
systool -b {{bus}} -v
```

- List all attributes of a class of devices (eg. `drm`, `block`). View all classes using `ls /sys/class`:

```
systool -c {{class}} -v
```

- Show only device drivers of a bus (eg. `pci`, `usb`):

```
systool -b {{bus}} -D
```

tailf

This command has been superseded by **`tail -f`**.

More information: https://manned.org/tailf.

- View documentation for the recommended replacement:

  `tldr tail`

talk

A visual communication program which copies lines from your terminal to that of another user.

More information: https://www.gnu.org/software/inetutils/manual/inetutils.html#talk-invocation.

- Start a talk session with a user on the same machine:

```
talk {{username}}
```

- Start a talk session with a user on the same machine, who is logged in on tty3:

```
talk {{username}} {{tty3}}
```

- Start a talk session with a user on a remote machine:

```
talk {{username}}@{{hostname}}
```

- Clear text on both terminal screens:

```
<Ctrl d>
```

- Exit the talk session:

```
<Ctrl c>
```

taskset

Get or set a process' CPU affinity or start a new process with a defined CPU affinity.

More information: https://manned.org/taskset.

- Get a running process' CPU affinity by PID:

```
taskset {{[-p|--pid]}} {{[-c|--cpu-list]}} {{process_id}}
```

- Set a running process' CPU affinity by PID:

```
taskset {{[-p|--pid]}} {{[-c|--cpu-list]}} {{cpu_id}}
{{process_id}}
```

- Start a new process with affinity for a single CPU:

```
taskset {{[-c|--cpu-list]}} {{cpu_id}} {{command}}
```

- Start a new process with affinity for multiple non-sequential CPUs:

```
taskset {{[-c|--cpu-list]}}
{{cpu_id_1,cpu_id_2,cpu_id_3,...}}
```

- Start a new process with affinity for CPUs 1 through 4:

```
taskset {{[-c|--cpu-list]}} {{cpu_id_1}}-{{cpu_id_4}}
```

tc

Show/manipulate traffic control settings.

More information: https://manned.org/tc.

- Add constant network delay to outbound packages:

```
sudo tc {{[q|qdisc]}} {{[a|add]}} dev {{eth0}} root netem delay {{delay_in_milliseconds}}ms
```

- Add normal distributed network delay to outbound packages:

```
sudo tc {{[q|qdisc]}} {{[a|add]}} dev {{eth0}} root netem delay {{mean_delay_ms}}ms {{delay_std_ms}}ms
```

- Add package corruption/loss/duplication to a portion of packages:

```
sudo tc {{[q|qdisc]}} {{[a|add]}} dev {{eth0}} root netem {{corruption|loss|duplication}} {{effect_percentage}}%
```

- Limit bandwidth, burst rate, and max latency:

```
sudo tc {{[q|qdisc]}} {{[a|add]}} dev eth0 root tbf rate {{max_bandwidth_mb}}mbit burst {{max_burst_rate_kb}}kbit latency {{max_latency_before_drop_ms}}ms
```

- Show active traffic control policies:

```
tc {{[q|qdisc]}} {{[s|show]}} dev {{eth0}}
```

- Delete all traffic control rules:

```
sudo tc {{[q|qdisc]}} {{[d|delete]}} dev {{eth0}}
```

- Change traffic control rule:

```
sudo tc {{[q|qdisc]}} {{[c|change]}} dev {{eth0}} root netem {{policy}} {{policy_parameters}}
```

tcpflow

Capture TCP traffic for debugging and analysis.

More information: https://manned.org/tcpflow.

- Show all data on the given interface and port:

```
tcpflow -c -i {{eth0}} port {{80}}
```

tcpick

Packet sniffing and network traffic analysis tool.

It can capture and display TCP connections and data. It can also monitor network traffic on an interface, host, or port.

More information: https://manned.org/tcpick.

- Capture traffic on a specific interface, port, and host:

```
sudo tcpick {{[-i|--interface]}} {{interface}} {{[-C|--colors]}} -h {{host}} -p {{port}}
```

- Capture traffic on port 80 (HTTP) of a specific host:

```
sudo tcpick {{[-i|--interface]}} {{eth0}} {{[-C|--colors]}} -h {{192.168.1.100}} -p {{80}}
```

- Display help:

```
tcpick --help
```

tcpkill

Kill specified in-progress TCP connections.

More information: https://manned.org/tcpkill.

- Kill in-progress connections at a specified interface, host, and port:

```
tcpkill -i {{eth1}} host {{192.95.4.27}} and port {{2266}}
```

tcptraceroute

A traceroute implementation using TCP packets.

More information: https://manned.org/tcptraceroute.

- Trace the route to a host:

```
tcptraceroute {{host}}
```

- Specify the destination port and packet length in bytes:

```
tcptraceroute {{host}} {{destination_port}} {{packet_length}}
```

- Specify the local source port and source address:

```
tcptraceroute {{host}} -p {{source_port}} -s
{{source_address}}
```

- Set the first and maximum TTL:

```
tcptraceroute {{host}} -f {{first_ttl}} -m {{max_ttl}}
```

- Specify the wait time and number of queries per hop:

```
tcptraceroute {{host}} -w {{wait_time}} -q
{{number_of_queries}}
```

- Specify the interface:

```
tcptraceroute {{host}} -i {{interface}}
```

tegrastats

Monitor memory usage and processor usage for NVIDIA Jetson-based devices.

Note: Omitting **sudo** will leave out certain output.

More information: https://developer.nvidia.com/docs/drive/drive-os/7.0.3/public/drive-os-linux-sdk/development-workflow/NVIDIA_DRIVE_Utilities/tegrastats_Utility/tegrastatsOptions32.html.

- Repeatedly print system statistics:

```
sudo tegrastats
```

- Set a custom interval in milliseconds:

```
sudo tegrastats --interval {{1000}}
```

- Write the output to a file:

```
sudo tegrastats --logfile {{filename}}
```

telinit

Change SysV runlevel.

Since the concept SysV runlevels is obsolete the runlevel requests will be transparently translated into systemd unit activation requests.

More information: https://manned.org/telinit.

- Power off the machine:

```
telinit 0
```

- Reboot the machine:

```
telinit 6
```

- Change SysV run level:

```
telinit {{2|3|4|5}}
```

- Change to rescue mode:

```
telinit 1
```

- Reload daemon configuration:

```
telinit q
```

- Do not send a wall message before reboot/power-off (6/0):

```
telinit --no-wall {{value}}
```

terminator

Arrange multiple GNOME terminals in one window.

More information: https://gnome-terminator.readthedocs.io/en/latest/advancedusage.html.

- Start `terminator` window:

  ```
  terminator
  ```

- Start with a fullscreen window:

  ```
  terminator {{[-f|--fullscreen]}}
  ```

- Split terminals horizontally:

  ```
  <Ctrl Shift o>
  ```

- Split terminals vertically:

  ```
  <Ctrl Shift e>
  ```

- Open new tab:

  ```
  <Ctrl Shift t>
  ```

termshark

Terminal UI for **`tshark`**, but looks more like **`wireshark`**.

More information: https://github.com/gcla/termshark/blob/master/docs/UserGuide.md.

- Monitor the default network interface:

  ```
  sudo termshark
  ```

- Specify the interface to monitor:

  ```
  sudo termshark {{interface}}
  ```

termusic

A terminal music player written in Rust that uses vim-like key bindings.

See also: **`cmus`**, **`ncmpcpp`**, **`audacious`**.

More information: https://github.com/tramhao/termusic.

- Open termusic to a specific directory. (It can be set permanently in `~/.config/termusic/config.toml`):

```
termusic {{path/to/directory}}
```

- Disable showing the album cover for a specific file:

```
termusic -c {{path/to/music_file}}
```

- Display help:

```
termusic --help
```

Terraria

Create and start a headless Terraria server.

More information: https://terraria.wiki.gg/wiki/Server.

- Start an interactive server setup:

```
{{path/to}}/TerrariaServer
```

- Start a Terraria server:

```
{{path/to}}/TerrariaServer -world {{path/to/world.wld}}
```

tftp

Trivial File Transfer Protocol client.

More information: https://manned.org/tftp.

- Connect to a TFTP server with an interactive shell, specifying its IP address and port:

```
tftp {{server_ip}} {{port}}
```

- Connect to a TFTP server and execute a TFTP [c]ommand:

```
tftp {{server_ip}} -c {{command}}
```

- Connect to a TFTP server using IPv6 and force originating port to be in [R]ange:

```
tftp {{server_ip}} -6 -R {{port}}:{{port}}
```

- [Interactive] Set the transfer mode to binary or ASCII through the tftp client:

```
mode {{binary|ascii}}
```

- [Interactive] Download file from a server through the tftp client:

```
get {{file}}
```

- [Interactive] Upload file to a server through the tftp client:

```
put {{file}}
```

- [Interactive] Exit the tftp client:

```
quit
```

thunar

Graphical file manager for XFCE desktop environments.

See also: **`caja`**, **`dolphin`**, **`nautilus`**, **`mc`**.

More information: https://docs.xfce.org/xfce/thunar/start.

- Open a new window showing the current directory:

```
thunar
```

- Open the bulk rename utility:

```
thunar --bulk-rename
```

- Close all open thunar windows:

```
thunar --quit
```

tic

Compile terminfo and install for ncurses.

More information: https://manned.org/tic.

- Compile and install terminfo for a terminal:

```
tic -xe {{terminal}} {{path/to/terminal.info}}
```

- Check terminfo file for errors:

```
tic -c {{path/to/terminal.info}}
```

- Print database locations:

```
tic -D
```

timedatectl

Control the system time and date.

More information: https://www.freedesktop.org/software/systemd/man/latest/timedatectl.html.

- Check the current system clock time:

```
timedatectl
```

- Set the local time of the system clock directly:

```
timedatectl set-time "{{yyyy-MM-dd hh:mm:ss}}"
```

- List available timezones:

```
timedatectl list-timezones
```

- Set the system timezone:

```
timedatectl set-timezone {{timezone}}
```

- Enable Network Time Protocol (NTP) synchronization:

```
timedatectl set-ntp on
```

- Show information about time synchronization (only available when using `systemd-timesyncd`):

```
timedatectl timesync-status
```

- Change the hardware clock time standard to localtime:

```
timedatectl set-local-rtc 1
```

timekpra

Command-line administration client for Timekpr-nExT, a tool to manage and limit computer usage time per user account.

More information: https://mjasnik.gitlab.io/timekpr-next/.

- List all users known to Timekpr-nExT:

```
timekpra --getuserlist
```

- Show the stored configuration and time information for a user:

```
timekpra --getuserinfo {{username}}
```

- Show real-time configuration and time information for a user:

```
timekpra --getuserinfort {{username}}
```

- Set the allowed days of the week for a user (e.g. Monday to Friday):

```
timekpra --setalloweddays {{username}} '{{1;2;3;4;5}}'
```

- Set daily time limits for each allowed day:

```
timekpra --settimelimits {{username}} '{{2h;2h;2h;2h;3h}}'
```

- Set the weekly time limit for a user:

```
timekpra --settimelimitweek {{username}} {{13h53m20s}}
```

- Add, subtract, or set a user's remaining time for today:

```
timekpra --settimeleft {{username}} {{+|-|=}} {{30m}}
```

- Set the lockout action applied once a user's time runs out:

```
timekpra --setlockouttype {{username}} {{lock|suspend|
suspendwake|terminate|kill|shutdown}}
```

timeshift

System restore utility.

More information: https://manned.org/timeshift.

- List snapshots:

```
sudo timeshift --list
```

- Create a new snapshot (if scheduled):

```
sudo timeshift --check
```

- Create a new snapshot (even if not scheduled):

```
sudo timeshift --create
```

- Restore a snapshot (selecting which snapshot to restore interactively):

```
sudo timeshift --restore
```

- Restore a specific snapshot:

```
sudo timeshift --restore --snapshot '{{snapshot}}'
```

- Delete a specific snapshot:

```
sudo timeshift --delete --snapshot '{{snapshot}}'
```

tload

Show system load average using ASCII art.

See also: **`uptime`**, **`w`**, **`top`**, **`ps`**.

More information: https://manned.org/tload.

- Run tload:

```
tload
```

- Display a graph with a specific vertical scale (e.g. 10 for a 1:1 scale):

```
tload {{[-s|--scale]}} {{value}}
```

- Change the refresh rate for the graph:

```
tload {{[-d|--delay]}} {{seconds}}
```

- Display a graph for a specific terminal:

```
tload {{/dev/tty1}}
```

tlp-stat

Generate TLP status reports.

See also: **`tlp`**.

More information: https://linrunner.de/tlp/usage/tlp-stat.

- Generate status report with configuration and all active settings:

```
sudo tlp-stat
```

- Show information about various devices:

```
sudo tlp-stat --{{battery|disk|processor|graphics|pcie|rfkill|usb}}
```

- Show verbose information about devices that support verbosity:

```
sudo tlp-stat {{[-v|--verbose]}} --{{battery|processor|pcie|usb}}
```

- Show configuration:

```
sudo tlp-stat {{[-c|--config]}}
```

- Monitor [p]ower supply udev [ev]ents:

```
sudo tlp-stat {{[-P|--pev]}}
```

- Show [p]ower [sup]ply diagnostics:

```
sudo tlp-stat --psup
```

- Show [t]emperatures and fan speed:

```
sudo tlp-stat {{[-t|--temp]}}
```

- Show general system information:

```
sudo tlp-stat {{[-s|--system]}}
```

tlp

Advanced power management for Linux.

See also: **`tlp-stat`**.

More information: https://linrunner.de/tlp/usage/tlp.html.

- Apply settings (according to the actual power source):

```
sudo tlp start
```

- Apply battery settings (ignoring the actual power source):

```
sudo tlp bat
```

- Apply AC settings (ignoring the actual power source):

```
sudo tlp ac
```

tmt run

Execute **`tmt`** test steps. By default, all steps are run.

More information: https://tmt.readthedocs.io/en/stable/stories/cli.html#run.

- Run all test steps for each plan:

```
tmt run
```

- Run only the discover step to show what tests would be run:

```
tmt run discover {{[-v|--verbose]}}
```

- Run all steps and adjust the provision step options:

```
tmt run {{[-a|--all]}} provision {{[-h|--how]}} {{container}}
{{[-i|--image]}} {{fedora:rawhide}}
```

- Run only selected plans and tests:

```
tmt run plan {{[-n|--name]}} {{/plan/name}} test {{[-n|--
name]}} {{/test/name}}
```

- Show results from the last run in a web browser:

```
tmt run {{[-l|--last]}} report {{[-h|--how]}} {{html}} {{[-
o|--open]}}
```

- Run tests with the provided context:

```
tmt run {{[-c|--context]}} {{key=value}} {{[-c|--context]}}
{{distro=fedora}}
```

- Run tests interactively (debug test code in the middle of a test):

```
tmt run {{[-a|--all]}} execute {{[-h|--how]}} {{tmt}} --
interactive
```

- Simulate a run to see what actions would happen with the highest verbosity:

```
tmt run {{[-n|--dry]}} {{[-vvv|--verbose --verbose --
verbose]}}
```

tmt try

Quickly experiment with tests and environments.

More information: https://tmt.readthedocs.io/en/stable/stories/cli.html#try.

- Quickly experiment with the default provision method (no tests in the CWD):

```
tmt try
```

- Run a test in the current working directory:

```
cd {{path/to/test_directory}} && tmt try
```

- Use a specific operating system:

```
tmt try {{rhel-9}}
```

- Select both custom image and provision method:

```
tmt try {{fedora@container}}
```

- Select tests with custom filter:

```
tmt try {{[-t|--test]}} {{feature}}
```

- Provision guest and wait for instructions:

```
tmt try {{[-a|--ask]}}
```

- Directly log into the guest without asking:

```
tmt try {{[-l|--login]}}
```

- Display help:

```
tmt try --help
```

tmt

Test Management Tool for creating, running, and debugging tests.

Some subcommands such as **`run`**, **`try`**, etc. have their own usage documentation.

More information: https://tmt.readthedocs.io/en/stable/examples.html.

- List available tests, plans, and stories:

```
tmt
```

- Initialize tmt files/project structure:

```
tmt init
```

- Create a new test with a template and a link:

```
tmt test create {{[-t|--template]}} {{beakerlib}} --link
{{verifies:issue#1234}}
```

- List available tests, plans, or stories:

```
tmt {{test|plan|story}} ls {{pattern}}
```

- Show detailed test metadata in the given context:

```
tmt {{[-c|--context]}} {{arch=aarch64}} test show
```

- Validate tmt files against the specification:

```
tmt lint
```

- Use filter:

```
tmt tests ls {{[-f|--filter]}} {{tag:foo}} {{[-f|--filter]}}
{{tier:0}}
```

- Display help:

```
tmt --help
```

tod

A tiny Todoist client in Rust.

It takes simple input and dumps it in your inbox or another project. Taking advantage of natural language processing to assign due dates, tags, etc.

More information: https://github.com/tod-org/tod/blob/main/docs/usage.md#usage.

- Import your projects (this is necessary to enable project prompts):

```
tod project import
```

- Quickly create a task with due date:

```
tod --quickadd {{Buy more milk today}}
```

- Create a new task (you will be prompted for content and project):

```
tod task create
```

- Create a task in a project:

```
tod task create --content "{{Write more rust}}" --project {{code}}
```

- Get the next task for a project:

```
tod task next
```

- Get your work schedule:

```
tod task list --scheduled --project {{work}}
```

- Get all tasks for work:

```
tod task list --project {{work}}
```

togglesebool

Flip the current (non-persistent) values of SELinux booleans.

Note: This command is deprecated, use **`setsebool`** instead.

More information: https://manned.org/togglesebool.

- Flip the current (non-persistent) values of the specified booleans:

```
sudo togglesebool {{virt_use_samba|virt_use_usb|...}}
```

- Flip multiple booleans:

```
sudo togglesebool {{key1 key2 ...}}
```

toilet

Display ASCII-art fonts.

More information: http://caca.zoy.org/wiki/toilet.

- Generate ASCII art for a given text:

```
toilet {{input_text}}
```

- Generate ASCII art using a custom font file:

```
toilet {{input_text}} {{[-f|--font]}} {{font_filename}}
```

- Generate ASCII art using a filter:

```
toilet {{input_text}} {{[-F|--filter]}} {{filter_name}}
```

- Show available toilet filters:

```
toilet {{[-F|--filter]}} list
```

tomb

Manage encrypted storage directories that can be safely transported and hidden in a filesystem.

More information: https://dyne.org/docs/tomb/manpage/.

- Create a new tomb with an initial size of 100 MB:

```
tomb dig -s {{100}} {{encrypted_directory.tomb}}
```

- Create a new key file that can be used to lock a tomb; user will be prompted for a password for the key:

```
tomb forge {{encrypted_directory.tomb.key}}
```

- Forcefully create a new key, even if the tomb isn't allowing key forging (due to swap):

```
tomb forge {{encrypted_directory.tomb.key}} -f
```

- Initialize and lock an empty tomb using a key made with `forge`:

```
tomb lock {{encrypted_directory.tomb}} -k
{{encrypted_directory.tomb.key}}
```

- Mount a tomb (by default in `/media`) using its key, making it usable as a regular filesystem directory:

```
tomb open {{encrypted_directory.tomb}} -k
{{encrypted_directory.tomb.key}}
```

- Close a tomb (fails if the tomb is being used by a process):

```
tomb close {{encrypted_directory.tomb}}
```

- Forcefully close all open tombs, killing any applications using them:

```
tomb slam all
```

- List all open tombs:

```
tomb list
```

toolbox create

Create a new Toolbx container.

More information: https://manned.org/toolbox-create.

- Create a Toolbx container for a specific distribution:

```
toolbox create {{[-d|--distro]}} {{distribution}}
```

- Create a Toolbx container for a specific release of the current distribution:

```
toolbox create {{[-r|--release]}} {{release}}
```

- Create a Toolbx container with a custom image:

```
toolbox create {{[-i|--image]}} {{name}}
```

- Create a Toolbx container from a custom Fedora image:

```
toolbox create {{[-i|--image]}} {{quay.io/fedora/fedora:tag}}
```

- Create a Toolbx container using the default image for a specific Fedora release:

```
toolbox create {{[-d|--distro]}} {{fedora}} {{[-r|--release]}} f{{version}}
```

toolbox enter

Enter a Toolbx container for interactive use.

See also: **`toolbox run`**.

More information: https://manned.org/toolbox-enter.

- Enter a Toolbx container using the default image of a specific distribution:

  ```
  toolbox enter {{[-d|--distro]}} {{distribution}}
  ```

- Enter a Toolbx container using the default image of a specific release of the current distribution:

  ```
  toolbox enter {{[-r|--release]}} {{release}}
  ```

- Enter a Toolbx container using the default image for a specific Fedora release:

  ```
  toolbox enter {{[-d|--distro]}} {{fedora}} {{[-r|--release]}} f{{version}}
  ```

toolbox help

Display help information about Toolbx.

More information: https://manned.org/toolbox-help.

- Display the Toolbx manual:

```
toolbox help
```

- Display the Toolbx manual for a specific subcommand:

```
toolbox help {{subcommand}}
```

toolbox init-container

Initialize a running Toolbx container.

This command should not be executed by the user, and cannot be run on the host.

More information: https://manned.org/toolbox-init-container.

- Initialize a running Toolbx container:

```
toolbox init-container --gid {{group_id}} --home {{home}} --
home-link --media-link --mnt-link --monitor-host --shell
{{shell}} --uid {{user_id}} --user {{user}}
```

toolbox list

List existing Toolbx containers and images.

More information: https://manned.org/toolbox-list.

- List all Toolbx containers and images:

```
toolbox list
```

- List only Toolbx containers:

```
toolbox list {{[-c|--containers]}}
```

- List only Toolbx images:

```
toolbox list {{[-i|--images]}}
```

toolbox rm

Remove one or more Toolbx containers.

See also: **`toolbox rmi`**.

More information: https://manned.org/toolbox-rm.

- Remove a Toolbx container:

```
toolbox rm {{container_name}}
```

- Remove all Toolbx containers:

```
toolbox rm {{[-a|--all]}}
```

- Force the removal of a currently active Toolbx container:

```
toolbox rm {{[-f|--force]}} {{container_name}}
```

toolbox rmi

Remove Toolbx images.

See also: **`toolbox rm`**.

More information: https://manned.org/toolbox-rmi.

- Remove one or more Toolbx image:

```
toolbox rmi {{image_name1 image_name2 ...}}
```

- Remove all Toolbx images:

```
toolbox rmi {{[-a|--all]}}
```

- Force the removal of a Toolbx image which is currently being used by a container (the container will be removed as well):

```
toolbox rmi {{[-f|--force]}} {{image_name}}
```

toolbox run

Run a command in an existing Toolbx container.

See also: **`toolbox enter`**.

More information: https://manned.org/toolbox-run.

- Run a command inside a specific Toolbx container:

```
toolbox run {{[-c|--container]}} {{container_name}} {{command}}
```

- Run a command inside a Toolbx container for a specific release of a distribution:

```
toolbox run {{[-d|--distro]}} {{distribution}} {{[-r|--release]}} {{release}} {{command}}
```

- Run `emacs` inside a Toolbx container using the default image for a specific Fedora release:

```
toolbox run {{[-d|--distro]}} {{fedora}} {{[-r|--release]}} f{{version}} {{emacs}}
```

toolbox

Manage containerized command-line environments on Linux.

Some subcommands such as **`create`** have their own usage documentation.

More information: https://manned.org/toolbox.

- Enter a Toolbx container to use it interactively:

```
toolbox enter {{container}}
```

- Remove one or more containers:

```
toolbox rm {{container1 container2 ...}}
```

- Remove one or more images:

```
toolbox rmi {{image1 image2 ...}}
```

- Display help for a specific subcommand (such as `create`, `enter`, `rm`, etc.):

```
toolbox help {{subcommand}}
```

- Display help:

```
toolbox {{[-h|--help]}}
```

- Display version:

```
toolbox --version
```

top

Display dynamic real-time information about running processes.

See also: **`htop`**, **`atop`**, **`glances`**, **`btop`**, **`btm`**.

More information: https://manned.org/top.

- Start `top`:

```
top
```

- Do not show any idle or zombie processes:

```
top {{[-i|--idle-toggle]}}
```

- Show only processes owned by given user:

```
top {{[-u|--filter-only-euser]}} {{username}}
```

- Sort processes by a field:

```
top {{[-o|--sort-override]}} {{field_name}}
```

- Show the individual threads of a given process:

```
top {{[-Hp|--threads-show --pid]}} {{process_id}}
```

- Show only the processes with the given PID(s), passed as a comma-separated list. (Normally you wouldn't know PIDs off hand. This example picks the PIDs from the process name):

```
top {{[-p|--pid]}} $(pgrep {{[-d|--delimiter]}}
',' {{process_name}})
```

- Display help about interactive commands:

```
<?>
```

tor

Enable anonymous communication through the Tor network.

More information: https://manned.org/tor.

- Connect to the Tor network:

```
tor
```

- View Tor configuration:

```
tor --config
```

- Check Tor status:

```
tor --status
```

- Run as client only:

```
tor --client
```

- Run as relay:

```
tor --relay
```

- Run as bridge:

```
tor --bridge
```

- Run as a hidden service:

```
tor --hidden-service
```

torify

Route network traffic through the Tor network.

Note: This command is deprecated, use **`torsocks`** instead. **`torify`** is now a backwards-compatible wrapper of **`torsocks`**.

More information: https://manned.org/torify.

- Route traffic via Tor:

```
torify {{command}}
```

- Toggle Tor in shell:

```
torify {{on|off}}
```

- Spawn a Tor-enabled shell:

```
torify --shell
```

- Check for a Tor-enabled shell:

```
torify show
```

- Specify Tor configuration file:

```
torify -c {{config_file}} {{command}}
```

- Use a specific Tor SOCKS proxy:

```
torify -P {{proxy}} {{command}}
```

- Redirect output to a file:

```
torify {{command}} > {{path/to/output}}
```

torsocks

Route the traffic of any application through the Tor network.

Note: **`torsocks`** will assume that it should connect to the Tor SOCKS proxy running at 127.0.0.1:9050 being the defaults of the Tor daemon.

More information: https://manned.org/torsocks.

- Run a command using Tor:

```
torsocks {{command}}
```

- Enable or disable Tor in this shell:

```
. torsocks {{on|off}}
```

- Spawn a new Tor enabled shell:

```
torsocks --shell
```

- Check if current shell is Tor enabled (`$LD_PRELOAD` value will be empty if disabled):

```
torsocks show
```

- Isolate traffic through a different Tor circuit, improving anonymity:

```
torsocks {{[-i|--isolate]}} {{curl https://
check.torproject.org/api/ip}}
```

- Connect to a Tor proxy running on a specific address and port:

```
torsocks {{[-a|--address]}} {{ip_address}} {{[-P|--port]}}
{{port}} {{command}}
```

toybox

Multipurpose tool that provides many standard Unix utilities.

Commonly used in Android and embedded Linux systems.

More information: https://landley.net/toybox/.

- List all available Toybox commands:

```
toybox
```

- Run a Toybox command explicitly (useful if another command with the same name exists in `$PATH`):

```
toybox {{command}} {{arguments}}
```

- List files in the current directory:

```
toybox ls
```

- Remove a file:

```
toybox rm {{path/to/file}}
```

- Display help information for a specific command:

```
toybox {{command}} --help
```

- Display version:

```
toybox --version
```

trace-cmd list

Show available tracers, events, or options for tracing.

See also: **`trace-cmd record`**, **`trace-cmd report`**.

More information: https://manned.org/trace-cmd-list.

- List available tracers:

```
sudo trace-cmd list -t
```

- List available plugins:

```
sudo trace-cmd list -p
```

- List available events:

```
sudo trace-cmd list -e
```

- List available functions:

```
sudo trace-cmd list -f
```

trace-cmd record

Capture kernel trace events.

See also: **`trace-cmd list`**, **`trace-cmd report`**.

More information: https://manned.org/trace-cmd-record.

- Record a trace with a specific plugin:

```
sudo trace-cmd record -p {{plugin}}
```

- Record a trace of a specific executable:

```
sudo trace-cmd record -F {{executable}}
```

- Record a trace of a specific function:

```
sudo trace-cmd record -g {{function}}
```

- Exclude a specific function from the trace:

```
sudo trace-cmd record -n {{function}}
```

- Limit the function call graph depth:

```
sudo trace-cmd record --max-graph-depth {{depth}}
```

- Record a trace from a specific process ID:

```
sudo trace-cmd record -P {{process_id}}
```

trace-cmd report

Display recorded trace events.

See also: **`trace-cmd list`**, **`trace-cmd record`**.

More information: https://manned.org/trace-cmd-report.

- Display the recorded trace:

```
sudo trace-cmd report
```

- Display the recorded trace for a specific CPU:

```
sudo trace-cmd report --cpu {{cpu_number}}
```

trace-cmd

Utility to interact with the Ftrace Linux kernel internal tracer.

See also: **`trace-cmd list`**, **`trace-cmd record`**, **`trace-cmd report`**.

More information: https://manned.org/trace-cmd.

- Display the status of tracing system:

```
sudo trace-cmd stat
```

- List available tracers:

```
sudo trace-cmd list -t
```

- Start tracing with a specific plugin:

```
sudo trace-cmd start -p {{function|function_graph|
preemptirqsoff|irqsoff|preemptoff|wakeup|...}}
```

- View the trace output:

```
sudo trace-cmd show
```

- Stop the tracing but retain the buffers:

```
sudo trace-cmd stop
```

- Clear the trace buffers:

```
sudo trace-cmd clear
```

- Record a trace:

```
sudo trace-cmd record
```

- Display the recorded trace:

```
sudo trace-cmd report
```

tracepath

Trace the path to a network host discovering MTU along this path.

More information: https://manned.org/tracepath.

- Trace the path to a host using a specific destination port:

```
tracepath -p {{33434}} {{host}}
```

- Specify the initial destination port, useful with non-standard firewall settings:

```
tracepath -p {{destination_port}} {{host}}
```

- Print both hostnames and numerical IP addresses:

```
tracepath -b {{host}}
```

- Specify a maximum TTL (number of hops):

```
tracepath -m {{max_hops}} {{host}}
```

- Specify the initial packet length (defaults to 65535 for IPv4 and 128000 for IPv6):

```
tracepath -l {{packet_length}} {{host}}
```

- Use only IPv6 addresses:

```
tracepath -6 {{host}}
```

trap

Execute a command upon an event.

More information: https://www.gnu.org/software/bash/manual/bash.html#index-trap.

- List the available event names (e.g. `SIGWINCH`):

```
trap -l
```

- List the commands and the names of the expected events:

```
trap
```

- Execute a command when a signal is received:

```
trap 'echo "Caught signal {{SIGHUP}}"' {{[HUP|SIGHUP]}}
```

- Remove commands:

```
trap - {{SIGHUP SIGINT ...}}
```

- Ignore a signal:

```
trap '' {{[INT|SIGINT]}}
```

- Display help:

```
help trap
```

trash-empty

The examples for this command have been moved together with **`trash`**.

- View documentation for `trash-empty`:

  ```
  tldr trash
  ```

trash-list

The examples for this command have been moved together with **`trash`**.

- View documentation for `trash-list`:

```
tldr trash
```

trash-put

This command is an alias of **`trash`**.

- View documentation for the original command:

  ```
  tldr trash
  ```

trash-restore

The examples for this command have been moved together with **`trash`**.

- View documentation for `trash-restore`:

```
tldr trash
```

trash-rm

The examples for this command have been moved together with **`trash`**.

- View documentation for `trash-rm`:

  ```
  tldr trash
  ```

trash

Manage the trashcan/recycling bin.

More information: https://github.com/andreafrancia/trash-cli.

- Send a file to the trash:

```
trash {{path/to/file}}
```

- List all files in the trash:

```
trash-list
```

- Interactively restore a file from the trash:

```
trash-restore
```

- Empty the trash:

```
trash-empty
```

- Permanently delete all files in the trash which are older than 10 days:

```
trash-empty 10
```

- Remove all files in the trash, which match a specific `glob` pattern:

```
trash-rm "{{*.o}}"
```

- Remove all files with a specific original location:

```
trash-rm /{{path/to/file_or_directory}}
```

trashy

An alternative to **`rm`** and **`trash-cli`** written in Rust.

More information: https://github.com/oberblastmeister/trashy#usage.

- Move a specific file to the trash:

```
trash {{path/to/file}}
```

- Move specific files to the trash:

```
trash {{path/to/file1 path/to/file2 ...}}
```

- List items in the trash:

```
trash list
```

- Restore a specific file from the trash:

```
trash restore {{file}}
```

- Remove a specific file from the trash:

```
trash empty {{file}}
```

- Restore all files from the trash:

```
trash restore --all
```

- Remove all files from the trash:

```
trash empty --all
```

trayer

A lightweight GTK-2 based systray.

More information: https://github.com/sargon/trayer-srg.

- Run `trayer`:

```
trayer
```

- Position `trayer` to a specific edge:

```
trayer --edge {{left|right|top|bottom}}
```

- Provide a specific height and width of the panel (in pixels):

```
trayer --width {{10}} --height {{32}}
```

- Provide the width of the panel in pixels or percentages:

```
trayer --widthtype {{pixel|percent}} --width {{72}}
```

- Align `trayer` to a specific direction:

```
trayer --align {{left|center|right}}
```

- Provide spacing between icons (in pixels):

```
trayer --iconspacing {{10}}
```

treetime

Provide routines for ancestral sequence reconstruction and inference of molecular-clock phylogenies.

More information: https://treetime.readthedocs.io/en/latest/tutorials.html.

- Infer ancestral sequences maximizing the joint or marginal likelihood:

  ```
  treetime ancestral
  ```

- Analyze patterns of recurrent mutations aka homoplasies:

  ```
  treetime homoplasy
  ```

- Estimate molecular clock parameters and reroot the tree:

  ```
  treetime clock
  ```

- Map discrete character such as host or country to the tree:

  ```
  treetime mugration
  ```

trizen

Arch Linux utility for building packages from the Arch User Repository (AUR).

More information: https://github.com/trizen/trizen/blob/master/TRIZEN.md.

- Synchronize and update all AUR packages:

```
trizen -Syua
```

- Install a new package:

```
trizen -S {{package}}
```

- Remove a package and its dependencies:

```
trizen -Rs {{package}}
```

- Search the package database for a keyword:

```
trizen -Ss {{keyword}}
```

- Show information about a package:

```
trizen -Si {{package}}
```

- List installed packages and versions:

```
trizen -Qe
```

trust

Operate on the trust policy store.

More information: https://manned.org/trust.

- List trust policy store items:

```
trust list
```

- List information about specific items in the trust policy store:

```
trust list --filter={{blocklist|ca-anchors|certificates|
trust-policy}}
```

- Store a specific trust anchor in the trust policy store:

```
trust anchor {{path/to/certificate.crt}}
```

- Remove a specific anchor from the trust policy store:

```
trust anchor --remove {{path/to/certificate.crt}}
```

- Extract trust policy from the shared trust policy store:

```
trust extract --format=x509-directory --filter=ca-anchors
{{path/to/directory}}
```

- Display help for a subcommand:

```
trust {{subcommand}} --help
```

tshark

Packet analysis tool, CLI version of Wireshark.

More information: https://tshark.dev/#sitemap-in-tshark---help.

- Monitor packets from the default interface:

```
tshark
```

- Only capture packets matching a specific capture filter:

```
tshark -f '{{udp port 53}}'
```

- Only show packets matching a specific output filter:

```
tshark -Y '{{http.request.method == "GET"}}'
```

- Decode a TCP port using a specific protocol (e.g. HTTP):

```
tshark -d tcp.port=={{8888}},{{http}}
```

- Specify the format of captured output:

```
tshark -T {{json|text|ps|...}}
```

- Select specific fields to output:

```
tshark -T {{fields|ek|json|pdml}} -e {{http.request.method}}
-e {{ip.src}}
```

- Write captured packet to a file:

```
tshark -w {{path/to/file}}
```

- Analyze packets from a file:

```
tshark -r {{path/to/file.pcap}}
```

ttyplot

A realtime plotting utility for the command-line with data input from **`stdin`**.

More information: https://github.com/tenox7/ttyplot.

- Plot the values `1`, `2`, and `3` (Note: `cat` prevents `ttyplot` from exiting):

```
{ echo 1 2 3; cat; } | ttyplot
```

- Set a specific title and unit:

```
{ echo {{1 2 3}}; cat; } | ttyplot -t {{title}} -u {{unit}}
```

- Use a while loop to continuously plot random values:

```
{ while true; do echo $RANDOM; sleep {{1}}; done } | ttyplot
```

- Parse the output from `ping` and visualize it:

```
ping {{8.8.8.8}} | sed -u '{{s/^.*time=//g; s/ ms//g}}' |
ttyplot -t "{{ping to 8.8.8.8}}" -u {{ms}}
```

tune.exfat

Adjust tunable filesystem parameters on an exFAT filesystem.

More information: https://manned.org/tune.exfat.

- Print the volume label of a filesystem:

```
tune.exfat {{[-l|--print-label]}} {{/dev/sdXY}}
```

- Set the volume label of a filesystem:

```
tune.exfat {{[-L|--set-label]}} {{new_label}} {{/dev/sdXY}}
```

- Print the volume GUID of a filesystem:

```
tune.exfat {{[-u|--print-guid]}} {{/dev/sdXY}}
```

- Set the volume GUID of a filesystem:

```
tune.exfat {{[-U|--set-guid]}} {{new_guid}} {{/dev/sdXY}}
```

- Print the volume serial of a filesystem:

```
tune.exfat {{[-i|--print-serial]}} {{/dev/sdXY}}
```

- Set the volume serial of a filesystem:

```
tune.exfat {{[-I|--set-serial]}} {{new_serial}} {{/dev/sdXY}}
```

tune2fs

Adjust parameters of an ext2, ext3, or ext4 filesystem.

May be used on mounted filesystems.

More information: https://manned.org/tune2fs.

- Set the max number of counts before a filesystem is checked to 2:

```
sudo tune2fs -c 2 {{/dev/sdXN}}
```

- Set the filesystem label to `MY_LABEL`:

```
sudo tune2fs -L 'MY_LABEL' {{/dev/sdXN}}
```

- Enable discard and user-specified extended attributes for a filesystem:

```
sudo tune2fs -o discard,user_xattr {{/dev/sdXN}}
```

- Enable journaling for a filesystem:

```
sudo tune2fs -o has_journal {{/dev/sdXN}}
```

- Assign a new randomly-generated UUID to a filesystem:

```
sudo tune2fs -U random {{/dev/sdXN}}
```

tuned-adm

Manage and optimize system performance tuning profiles on Linux.

More information: https://manned.org/tuned-adm.

- List available profiles:

```
tuned-adm list
```

- Show the currently active profile:

```
tuned-adm active
```

- Set a specific tuning profile:

```
tuned-adm profile {{profile_name}}
```

- Recommend a suitable profile based on the current system:

```
tuned-adm recommend
```

- Disable tuning:

```
tuned-adm off
```

tuned

Dynamic adaptive system tuning daemon.

See also: **`tuned-adm`**.

More information: https://manned.org/tuned.

- Start the `tuned` daemon in the foreground:

```
sudo tuned
```

- Start the `tuned` daemon in the background:

```
sudo tuned {{[-d|--daemon]}}
```

- Start the `tuned` daemon with a specific profile:

```
sudo tuned {{[-p|--profile]}} {{profile_name}}
```

- Start the `tuned` daemon logging to a custom log file:

```
sudo tuned {{[-l|--log]}} {{path/to/log_file.log}}
```

- Start the `tuned` daemon writing its process ID to a custom PID file:

```
sudo tuned {{[-P|--pid]}} {{path/to/process_id_file.pid}}
```

- Start the `tuned` daemon with debugging messages:

```
sudo tuned {{[-D|--debug]}}
```

tunelp

Set various parameters for parallel port devices for troubleshooting or for better performance.

Part of **`util-linux`**.

More information: https://manned.org/tunelp.

- Check the status of a parallel port device:

```
tunelp {{[-s|--status]}} {{/dev/lp0}}
```

- Reset a given parallel port:

```
tunelp {{[-r|--reset]}} {{/dev/lp0}}
```

- Use a given IRQ for a device, each one representing an interrupt line:

```
tunelp {{[-i|--irq]}} 5 {{/dev/lp0}}
```

- Try a given number of times to output a character to the printer before sleeping for a given time:

```
tunelp {{[-c|--chars]}} {{times}} {{[-t|--time]}}
{{time_in_centiseconds}} {{/dev/lp0}}
```

- Enable or disable aborting on error (disabled by default):

```
tunelp {{[-a|--abort]}} {{on|off}}
```

turbostat

Report processor topology, frequency, temperature, power, and idle statistics.

More information: https://manned.org/turbostat.

- Display statistics every 5 seconds:

```
sudo turbostat
```

- Display statistics every specified amount of seconds:

```
sudo turbostat {{[-i|--interval]}} {{n_seconds}}
```

- Do not decode and print the system configuration header information:

```
sudo turbostat --quiet
```

- Display useful information about CPU every 1 second, without header information:

```
sudo turbostat --quiet {{[-i|--interval]}} 1 --cpu 0-
{{cpu_thread_count}} --show
"PkgWatt","Busy%","Core","CoreTmp","Thermal"
```

- Display help:

```
turbostat --help
```

tuxi

Scrape Google search results and SERPs and provide instant and concise answers.

More information: https://github.com/Bugswriter/tuxi#usage.

- Make a search using Google:

```
tuxi {{search_terms}}
```

- Display the search results in [r]aw format (no pretty output, no colors):

```
tuxi -r {{search_terms}}
```

- Display only search results (silences "Did you mean?", greetings, and usage):

```
tuxi -q {{search_terms}}
```

- Display help:

```
tuxi -h
```

tzselect

Interactively select timezone.

Note: This program doesn't actually set the timezone.

More information: https://manned.org/tzselect.

- Open the interactive menu for timezone selection and print the selected timezone to `stdout`:

```
tzselect
```

- Ask for nearest timezone to coordinates in ISO 6709 notation:

```
tzselect -c {{coordinates}}
```

ubuntu-bug

This command is an alias of **apport-bug**.

- View documentation for the original command:

```
tldr apport-bug
```

ubuntu-drivers

Install drivers on Ubuntu.

More information: https://ubuntu.com/server/docs/how-to/graphics/install-nvidia-drivers/.

- List available drivers for the current hardware:

```
sudo ubuntu-drivers list
```

- Install drivers for detected hardware:

```
sudo ubuntu-drivers install
```

- Display help:

```
ubuntu-drivers
```

ubuntu-security-status

Display information about security support for installed Ubuntu packages.

More information: https://git.launchpad.net/ubuntu/+source/update-manager/tree/ubuntu-security-status.

- Display the number of unsupported packages:

```
ubuntu-security-status
```

- List packages that are no longer available for download:

```
ubuntu-security-status --unavailable
```

- List third-party packages:

```
ubuntu-security-status --thirdparty
```

ubus

Interact with an OpenWrt ubusd server.

More information: https://openwrt.org/docs/techref/ubus.

- List available objects:

```
ubus list
```

- Retrieve system information in JSON format:

```
ubus call system board
```

- Listen to events:

```
ubus subscribe {{event_name}}
```

- Display help:

```
ubus
```

uci

Manage OpenWrt configuration files.

More information: https://openwrt.org/docs/techref/uci.

- Fetch a value:

```
uci get {{network.lan.ipaddr}}
```

- List all options and their values:

```
uci show {{network}}
```

- Set a value:

```
uci set {{config}}.{{section}}.{{option}}={{value}}
```

- Add a new section:

```
uci add {{config}} {{section}}
```

- Delete a section or value:

```
uci delete {{config}}.{{section}}.{{option}}
```

- Commit changes:

```
uci commit {{config}}
```

- Discard uncommitted changes:

```
uci revert {{config}}
```

- Display help:

```
uci
```

udevadm

Linux **udev** management tool.

More information: https://www.freedesktop.org/software/systemd/man/latest/udevadm.html.

- Monitor all device events:

```
sudo udevadm monitor
```

- Print `uevents` sent out by the kernel:

```
sudo udevadm monitor {{[-k|--kernel]}}
```

- Print device events after being processed by `udev`:

```
sudo udevadm monitor {{[-u|--udev]}}
```

- List attributes of device `/dev/sda`:

```
sudo udevadm info {{[-a|--attribute-walk]}} /dev/sda
```

- Reload all `udev` rules:

```
sudo udevadm control {{[-R|--reload]}}
```

- Trigger all `udev` rules to run:

```
sudo udevadm trigger
```

- Test an event run by simulating loading of `/dev/sda`:

```
sudo udevadm test /dev/sda
```

udevmon

Intercept and monitor input devices for launching tasks.

Filters or modifies events according to configuration file(s) (default: **`/etc/interception/udevmon.d/*.yaml`**).

More information: https://gitlab.com/interception/linux/tools/-/tree/master#udevmon.

- Start udevmon with specified configuration file:

```
udevmon -c {{path/to/config.yaml}}
```

udiskie-dmenu

A dmenu/rofi-based frontend for udiskie to mount and unmount devices interactively.

Requires udiskie and either dmenu or rofi.

More information: https://github.com/fogine/udiskie-dmenu.

- Launch the menu to mount or unmount devices:

  ```
  udiskie-dmenu
  ```

- Use rofi instead of dmenu:

  ```
  udiskie-dmenu --rofi
  ```

- Display help:

  ```
  udiskie-dmenu --help
  ```

udiskie-mount

Manually mount devices using udiskie.

See also: **`udiskie`**, **`udiskie-umount`**.

More information: https://github.com/coldfix/udiskie/wiki/Usage.

- Mount all handleable devices:

```
udiskie-mount {{[-a|--all]}}
```

- Mount a specific device:

```
udiskie-mount {{/dev/sdX1}}
```

- Mount a device with verbose output:

```
udiskie-mount --verbose {{/dev/sdX1}}
```

- Display help:

```
udiskie-mount --help
```

udiskie-umount

Manually unmount devices using udiskie.

See also: **`udiskie`**, **`udiskie-mount`**.

More information: https://github.com/coldfix/udiskie/wiki/Usage.

- Unmount a mounted device:

```
udiskie-umount {{path/to/mount}}
```

- Unmount and power down a USB device:

```
udiskie-umount --detach {{path/to/mount}}
```

- Eject an optical drive:

```
udiskie-umount --eject {{path/to/mount}}
```

- Display help:

```
udiskie-umount --help
```

udiskie

A user-level automounter for removable media using udisks2.

See also: **`udiskie-mount`**, **`udiskie-umount`**.

More information: https://github.com/coldfix/udiskie/wiki/Usage.

- Start udiskie with tray icon and notifications:

```
udiskie --tray --notify
```

- Run udiskie without using a config file:

```
udiskie --no-config
```

- Specify a custom config file:

```
udiskie --config {{path/to/config.yml}}
```

- Use a custom password prompt command:

```
udiskie --password-prompt '{{command}}'
```

- Enable verbose output:

```
udiskie --verbose
```

- Display help:

```
udiskie --help
```

- Display version:

```
udiskie --version
```

udisksctl

Interact with **`udisksd`** to query and manipulate storage devices.

See also: **`mount`**.

More information: https://storaged.org/doc/udisks2-api/latest/udisksctl.1.html.

- Show high-level information about disk drives and block devices:

```
udisksctl status
```

- Show detailed information about a device:

```
udisksctl info {{[-b|--block-device]}} {{/dev/sdX}}
```

- Show detailed information about a device partition:

```
udisksctl info {{[-b|--block-device]}} {{/dev/sdXN}}
```

- Mount a device partition and prints the mount point:

```
udisksctl mount {{[-b|--block-device]}} {{/dev/sdXN}}
```

- Unmount a device partition:

```
udisksctl unmount {{[-b|--block-device]}} {{/dev/sdXN}}
```

- Power off a device to safely remove it:

```
udisksctl power-off {{[-b|--block-device]}} {{/dev/sdX}}
```

- Monitor the daemon for events:

```
udisksctl monitor
```

ufw allow

Allow traffic through the firewall.

More information: https://manned.org/ufw.

- Allow all traffic on a port:

```
sudo ufw allow {{port}}
```

- Allow traffic for a protocol on a port:

```
sudo ufw allow {{port}}/{{protocol}}
```

- Allow incoming traffic for a protocol and add a comment for documentation:

```
sudo ufw allow in {{protocol}} comment '{{comment}}'
```

- Allow all traffic from a source address:

```
sudo ufw allow from {{source_address}}
```

- Allow all incoming traffic from the subnet 192.168.13.0/24:

```
sudo ufw allow from 192.168.13.0/24
```

- Allow TCP traffic from 192.168.1.12 to 192.168.1.100 on port 443:

```
sudo ufw allow from 192.168.1.12 to 192.168.1.100 port 443
proto tcp
```

- Allow all incoming GRE traffic to 192.168.1.100 on the eth0 interface:

```
sudo ufw allow in on eth0 to 192.168.1.100 proto gre
```

ufw default

Change the default policy for traffic based on direction.

More information: https://manned.org/ufw.

- Allow traffic going a certain direction:

  ```
  sudo ufw default allow {{incoming|outgoing|routed}}
  ```

- Deny traffic going a certain direction:

  ```
  sudo ufw default deny {{incoming|outgoing|routed}}
  ```

- Reject traffic going a certain direction:

  ```
  sudo ufw default reject {{incoming|outgoing|routed}}
  ```

ufw delete

Delete firewall rules.

More information: https://manned.org/ufw.

- Delete an exact matching rule:

```
sudo ufw delete {{rule}}
```

- Delete a rule by its rule number:

```
sudo ufw delete {{number}}
```

ufw deny

Block traffic through the firewall.

More information: https://manned.org/ufw.

- Deny all traffic on a port:

```
sudo ufw deny {{port}}
```

- Deny traffic for a protocol on a port:

```
sudo ufw deny {{port}}/{{protocol}}
```

- Deny incoming traffic for a protocol and add a comment for documentation:

```
sudo ufw deny in {{protocol}} comment '{{comment}}'
```

- Deny all traffic from a source address:

```
sudo ufw deny from {{source_address}}
```

- Deny all incoming traffic from the subnet 192.168.13.0/24:

```
sudo ufw deny from 192.168.13.0/24
```

- Deny UDP traffic from 192.168.1.12 to 192.168.1.100 on port 8080:

```
sudo ufw deny from 192.168.1.12 to 192.168.1.100 port 8080
proto udp
```

- Deny all incoming IGMP traffic to 192.168.1.100 on the eth0 interface:

```
sudo ufw deny in on eth0 to 192.168.1.100 proto igmp
```

ufw disable

Unload and disable the firewall on boot.

More information: https://manned.org/ufw.

- Simulate disabling the firewall without making changes:

```
sudo ufw --dry-run disable
```

- Unload and disable `ufw`:

```
sudo ufw disable
```

ufw enable

Reload and enable the firewall on boot.

More information: https://manned.org/ufw.

- Simulate enabling the firewall without making changes:

```
sudo ufw --dry-run enable
```

- Reload and enable `ufw`:

```
sudo ufw enable
```

ufw limit

Rate limit connections to deny an IP initiating 6 or more attempts within 30 seconds.

More information: https://manned.org/ufw.

- Simulate a rule without applying it:

```
sudo ufw --dry-run limit {{profile}}
```

- Rate limit a specific service by profile:

```
sudo ufw limit {{profile}}
```

- Rate limit a specific port and protocol:

```
sudo ufw limit {{22}}/{{tcp}}
```

- Rate limit only from a specific source address or subnet:

```
sudo ufw limit from {{192.168.0.0/16}} to any port {{22}} proto {{tcp}}
```

- Rate limit on a specific network interface:

```
sudo ufw limit in on {{eth0}} to any port {{22}}
```

- Delete a limit rule:

```
sudo ufw delete limit {{service|port}}/{{tcp}}
```

ufw status

Show the status of Uncomplicated Firewall and its rules.

More information: https://manned.org/ufw.

- Show whether the firewall is active and list the rules:

```
sudo ufw status
```

- Show rules with numbers (useful before deleting a rule by number):

```
sudo ufw status numbered
```

- Show a verbose status, including default policies and listening ports:

```
sudo ufw status verbose
```

ufw version

Show the firewall version.

More information: https://manned.org/ufw.

- Show `ufw` version:

```
sudo ufw version
```

ufw

Uncomplicated Firewall.

Frontend for **`iptables`** aiming to make configuration of a firewall easier.

Some subcommands such as **`allow`**, **`enable`**, **`delete`**, etc. have their own usage documentation.

More information: https://manned.org/ufw.

- Enable/Disable `ufw`:

```
sudo ufw {{enable|disable}}
```

- Show `ufw` rules, along with their numbers:

```
sudo ufw status numbered
```

- Allow incoming traffic on port 5432 on this host with a comment identifying the service:

```
sudo ufw allow 5432 comment "{{Service}}"
```

- Allow only TCP traffic from 192.168.0.4 to any address on this host, on port 22:

```
sudo ufw allow proto tcp from 192.168.0.4 to any port 22
```

- Allow traffic from any IP on the 192.168.0/24 subnet on this host, through port 53, only on the eth0 interface:

```
sudo ufw allow in on eth0 from 192.168.0.0/24 to any port 53
```

- Deny traffic on port 80 on this host:

```
sudo ufw deny 80
```

- Deny all UDP traffic to ports in range 8412:8500:

```
sudo ufw deny proto udp from any to any port 8412:8500
```

- Delete a particular rule. The rule number can be retrieved from the `ufw status numbered` command:

```
sudo ufw delete {{rule_number}}
```

uinput

Intercept and write input events to a virtual keyboard device using **`/dev/uinput`**.

More information: https://gitlab.com/interception/linux/tools/-/tree/master#uinput.

- Simulate merging the device descriptions and print the resulting YAML:

```
uinput -p
```

- Merge YAML device description(s) to resulting virtual device:

```
sudo uinput -c {{path/to/device1.yaml path/to/device2.yaml ...}}
```

- Merge reference device description from device node(s) to resulting virtual device:

```
sudo uinput -d {{/dev/input/eventX /dev/input/eventY ...}}
```

ukify

Build and sign Unified Kernel Images (UKIs).

More information: https://www.freedesktop.org/software/systemd/man/latest/ukify.html.

- Build a Unified Kernel Image:

```
ukify build --linux {{path/to/vmlinuz}} --initrd {{path/to/initrd.img}} --cmdline "{{root=UUID=xxxx}}"
```

- Build a UKI with multiple initrd files:

```
ukify build --linux {{path/to/vmlinuz}} --initrd {{path/to/initrd1.img}} --initrd {{path/to/initrd2.img}} --cmdline "{{root=UUID=xxxx}}"
```

- Build a UKI, specifying the output filename:

```
ukify build --linux {{path/to/vmlinuz}} --initrd {{path/to/initrd.img}} --cmdline "{{root=UUID=xxxx}}" --output {{path/to/output.efi}}
```

- Build a UKI including CPU microcode:

```
ukify build --linux {{path/to/vmlinuz}} --initrd {{path/to/initrd.img}} --microcode {{path/to/microcode.img}} --cmdline "{{root=UUID=xxxx}}"
```

- Sign the UKI for Secure Boot:

```
ukify build --linux {{path/to/vmlinuz}} --initrd {{path/to/initrd.img}} --cmdline "{{root=UUID=xxxx}}" --secureboot-private-key {{path/to/private_key.pem}} --secureboot-certificate {{path/to/certificate.pem}}
```

- Inspect a UKI file:

```
ukify inspect {{path/to/uki.efi}}
```

- Generate signing keys:

```
ukify genkey --secureboot-certificate-validity {{365}}
```

- Display help:

```
ukify {{[-h|--help]}}
```

ul

Underline a text.

Each character in a string must be underlined separately.

More information: https://manned.org/ul.

- Display the contents of the file with underlines where applicable:

```
ul {{file.txt}}
```

- Display the contents of the file with underlines made of dashes `-`:

```
ul {{[-i|--indicated]}} {{file.txt}}
```

umount

Unlink a filesystem from its mount point, making it no longer accessible.

A filesystem cannot be unmounted when it is busy.

More information: https://manned.org/umount.8.

- Unmount a filesystem, by passing the path to the source it is mounted from:

```
sudo umount {{path/to/device_file}}
```

- Unmount a filesystem, by passing the path to the target where it is mounted:

```
sudo umount {{path/to/mounted_directory}}
```

- When an unmount fails, try to remount the filesystem read-only:

```
sudo umount {{[-r|--read-only]}} {{path/to/
mounted_directory}}
```

- Recursively unmount each specified directory:

```
sudo umount {{[-R|--recursive]}} {{path/to/
mounted_directory}}
```

- Unmount all mounted filesystems (except the `proc` filesystem):

```
sudo umount {{[-a|--all]}}
```

- Detach a filesystem from the filesystem hierarchy and unmount it as soon as there are no references to it:

```
sudo umount {{[-l|--lazy]}} {{path/to/mounted_directory}}
```

uname26

This command is an alias of **`setarch uname26`**.

- View documentation for the original command:

  `tldr setarch`

uncompress

Uncompress files compressed using the Unix **`compress`** command.

More information: https://manned.org/uncompress.

- Uncompress specific files:

```
uncompress {{path/to/file1.Z path/to/file2.Z ...}}
```

- Uncompress specific files while ignoring non-existent ones:

```
uncompress -f {{path/to/file1.Z path/to/file2.Z ...}}
```

- Write to `stdout` (no files are changed and no `.Z` files are created):

```
uncompress -c {{path/to/file1.Z path/to/file2.Z ...}}
```

- Uncompress files verbosely (write to `stderr` about percentage reduction or expansion):

```
uncompress -v {{path/to/file1.Z path/to/file2.Z ...}}
```

unix2dos

Change Unix-style line endings to DOS-style.

Replaces LF with CRLF.

See also: **`unix2mac`**, **`dos2unix`**, **`mac2unix`**.

More information: https://manned.org/unix2dos.

- Change the line endings of a file:

```
unix2dos {{path/to/file}}
```

- Create a copy with DOS-style line endings:

```
unix2dos {{[-n|--newfile]}} {{path/to/file}} {{path/to/new_file}}
```

- Display file information:

```
unix2dos {{[-i|--info]}} {{path/to/file}}
```

- Keep/add/remove Byte Order Mark:

```
unix2dos --{{keep-bom|add-bom|remove-bom}} {{path/to/file}}
```

unix2mac

Change Unix-style line endings to macOS-style.

Replaces LF with CR.

See also: **`unix2dos`**, **`dos2unix`**, **`mac2unix`**.

More information: https://manned.org/unix2mac.

- Change the line endings of a file:

```
unix2mac {{path/to/file}}
```

- Create a copy with macOS-style line endings:

```
unix2mac {{[-n|--newfile]}} {{path/to/file}} {{path/to/new_file}}
```

- Display file information:

```
unix2mac {{[-i|--info]}} {{path/to/file}}
```

- Keep/add/remove Byte Order Mark:

```
unix2mac --{{keep-bom|add-bom|remove-bom}} {{path/to/file}}
```

unmount

The correct command is **`umount`** (u-mount).

- View documentation for the correct command:

  ```
  tldr umount
  ```

unopkg

LibreOffice extensions manager.

Download extensions from https://extensions.libreoffice.org.

See also: **`libreoffice`**.

More information: https://manned.org/unopkg.

- Add and deploy given extension:

```
unopkg add {{path/to/extension}}
```

- Remove extension:

```
unopkg remove {{extensions_id}}
```

- Display information about deployed extensions:

```
unopkg list
```

- Raise extensions dialog (GUI):

```
unopkg gui
```

- Reinstall all deployed extensions:

```
unopkg reinstall
```

- Display help:

```
unopkg {{[-h|--help]}}
```

unrtf

Convert RTF files to other file formats.

More information: https://manned.org/unrtf.

- Convert an RTF file to HTML (default):

```
unrtf {{path/to/file.rtf}}
```

- Convert an RTF file to plain ASCII:

```
unrtf --text {{path/to/file.rtf}}
```

- Convert an RTF file to LaTeX:

```
unrtf --latex {{path/to/file.rtf}}
```

unshadow

Utility provided by the John the Ripper project to obtain the traditional Unix password file if the system uses shadow passwords.

More information: https://www.openwall.com/john/doc/.

- Combine the `/etc/shadow` and `/etc/passwd` of the current system:

```
sudo unshadow /etc/passwd /etc/shadow
```

- Combine two arbitrary shadow and password files:

```
sudo unshadow {{path/to/passwd}} {{path/to/shadow}}
```

unshare

Execute a command in new user-defined namespaces.

More information: https://manned.org/unshare.

- Execute the default shell:

```
unshare
```

- Execute a command without sharing access to connected networks:

```
sudo unshare {{[-n|--net]}} {{command}} {{argument1 argument2 ...}}
```

- Execute a command as a child process without sharing mounts, processes, or networks:

```
sudo unshare {{[-mpnf|--mount --pid --net --fork]}} {{command}} {{argument1 argument2 ...}}
```

- Create a container manually:

```
sudo unshare {{[-puinmf|--pid --uts --ipc --net --mount --fork]}} chroot {{path/to/new_root}} {{/bin/sh}}
```

unsquashfs

Uncompress, extract, and list files in squashfs filesystems.

More information: https://manned.org/unsquashfs.

- Extract a squashfs filesystem to `squashfs-root` in the current working directory:

```
unsquashfs {{filesystem.squashfs}}
```

- Extract a squashfs filesystem to the specified directory:

```
unsquashfs {{[-d|-dest]}} {{path/to/directory}} {{filesystem.squashfs}}
```

- Display the names of files as they are extracted:

```
unsquashfs {{[-i|-info]}} {{filesystem.squashfs}}
```

- Display the names of files and their attributes as they are extracted:

```
unsquashfs {{[-li|-linfo]}} {{filesystem.squashfs}}
```

- List files inside the squashfs filesystem (without extracting):

```
unsquashfs {{[-l|-ls]}} {{filesystem.squashfs}}
```

- List files and their attributes inside the squashfs filesystem (without extracting):

```
unsquashfs {{[-ll|-lls]}} {{filesystem.squashfs}}
```

unzipsfx

Create a self-extracting compressed binary file by prepending self-extracting stubs on a Zip file.

More information: https://manned.org/unzipsfx.

- Create a self-extracting binary file of a Zip archive:

```
cat $(which unzipsfx) {{path/to/archive.zip}} > {{filename}} && chmod 755 {{filename}}
```

- Extract a self-extracting binary in the current directory:

```
{{./path/to/binary}}
```

- Test a self-extracting binary for errors:

```
{{./path/to/binary}} -t
```

- Print content of a file in the self-extracting binary without extraction:

```
{{./path/to/binary}} -c {{path/to/file}}
```

- Print comments on Zip archive in the self-extracting binary:

```
{{./path/to/binary}} -z
```

update-alternatives

Conveniently maintain symbolic links to determine default commands.

More information: https://manned.org/update-alternatives.

- Add a symbolic link:

```
sudo update-alternatives --install {{path/to/symlink}} {{command_name}} {{path/to/command_binary}} {{priority}}
```

- Configure a symbolic link for `java`:

```
sudo update-alternatives --config java
```

- Remove a symbolic link:

```
sudo update-alternatives --remove {{java}} {{/opt/java/jdk1.8.0_102/bin/java}}
```

- Display information about a specified command:

```
update-alternatives --display {{java}}
```

- Display all commands and their current selection:

```
update-alternatives --get-selections
```

update-ca-certificates

Update the CA certificates bundle and regenerate **`/etc/ssl/certs`**.

More information: https://manned.org/update-ca-certificates.

- Update certificates:

```
sudo update-ca-certificates
```

- Update certificates in verbose mode:

```
sudo update-ca-certificates {{[-v|--verbose]}}
```

- Perform a fresh update (remove all symlinks and regenerate):

```
sudo update-ca-certificates {{[-f|--fresh]}}
```

- Add a custom certificate (copy it first, then update):

```
sudo cp {{path/to/certificate.crt}} /usr/local/share/ca-certificates/ && sudo update-ca-certificates
```

update-desktop-database

Build the cache database of MIME types handled by desktop files.

More information: https://manned.org/update-desktop-database.

- Update the desktop file MIME type cache for standard system directories:

```
sudo update-desktop-database
```

- Update the cache for a specific desktop file directory:

```
update-desktop-database {{path/to/directory}}
```

- Update the cache for multiple directories:

```
update-desktop-database {{path/to/directory1 path/to/
directory2 ...}}
```

- Update the cache without displaying any output:

```
update-desktop-database {{[-q|--quiet]}}
```

- Update the cache with verbose output:

```
update-desktop-database {{[-v|--verbose]}}
```

update-grub

This command is an alias of **`grub-mkconfig --output /boot/grub/grub.cfg`**.

- View documentation for the original command:

  ```
  tldr grub-mkconfig
  ```

update-initramfs

Manage initramfs.

More information: https://manned.org/update-initramfs.

- Create a new initramfs (use `all` for all installed kernel versions):

```
sudo update-initramfs -c -k {{kernel_version}}
```

- Update an existing initramfs:

```
sudo update-initramfs -u
```

- Remove an existing initramfs (be careful when using `all` for `kernel_version`):

```
sudo update-initramfs -d -k {{kernel_version}}
```

update-rc.d

Install and remove services which are System-V style init script links.

Init scripts are in the **`/etc/init.d/`**.

More information: https://manned.org/update-rc.d.

- Install a service:

```
update-rc.d {{mysql}} defaults
```

- Enable a service:

```
update-rc.d {{mysql}} enable
```

- Disable a service:

```
update-rc.d {{mysql}} disable
```

- Forcibly remove a service:

```
update-rc.d -f {{mysql}} remove
```

updatectl

System update utility.

More information: https://www.freedesktop.org/software/systemd/man/latest/updatectl.html.

- Check to see if the system has any available updates:

```
updatectl check
```

- Update to the latest version:

```
updatectl update
```

- Show update targets:

```
updatectl
```

- Show data about a target and its versions:

```
updatectl list {{target}}
```

- Return local data about a target without fetching from the network:

```
updatectl --offline list {{target}}
```

- Apply an update to a target and then reboot the system:

```
updatectl --reboot update {{target}}
```

- Clean up old versions of a specified target:

```
updatectl vacuum {{target}}
```

- Display help:

```
updatectl {{[-h|--help]}}
```

updatedb

Create or update the database used by **`locate`**.

It is usually run daily by cron.

More information: https://manned.org/updatedb.

- Refresh database content:

```
sudo updatedb
```

- Display file names as soon as they are found:

```
sudo updatedb {{[-v|--verbose]}}
```

updpkgsums

Update the checksums of the sources in a **PKGBUILD**.

Unless a preexisting hashing algorithm is used, SHA256 will be used.

More information: https://manned.org/updpkgsums.

- Update the checksums in a PKGBUILD:

```
updpkgsums
```

- Display help:

```
updpkgsums {{[-h|--help]}}
```

- Display version:

```
updpkgsums {{[-v|--version]}}
```

upgradepkg

Upgrade Slackware packages by replacing existing packages with new versions.

See also: **`installpkg`**, **`removepkg`**, **`makepkg`**, **`pkgtool`**.

More information: https://slackware.nl/slackware/slackware64-current/source/a/pkgtools/manpages/upgradepkg.8.

- Upgrade a package:

```
sudo upgradepkg {{path/to/package.tgz}}
```

- Upgrade a package, installing it if not already present:

```
sudo upgradepkg --install-new {{path/to/package.tgz}}
```

- Reinstall a package (even if the same version is already installed):

```
sudo upgradepkg --reinstall {{path/to/package.tgz}}
```

- Simulate an upgrade, showing what would happen:

```
upgradepkg --dry-run {{path/to/package.tgz}}
```

- Upgrade a package and show detailed progress:

```
sudo upgradepkg --verbose {{path/to/package.tgz}}
```

upnpc

Configure port forwarding rules on your router via the UPnP protocol.

More information: https://manned.org/upnpc.

- Forward the external TCP port 80 to port 8080 on a local machine:

```
upnpc -a {{192.168.0.1}} 8080 80 tcp
```

- Delete any port redirection for external TCP port 80:

```
upnpc -d 80 tcp
```

- Get information about UPnP devices on your network:

```
upnpc -s
```

- List existing redirections:

```
upnpc -l
```

upower

System utility to provide power and battery information and statistics.

More information: https://upower.freedesktop.org/docs/upower.1.html.

- Display power and battery information:

```
upower {{[-d|--dump]}}
```

- List all power devices:

```
upower {{[-e|--enumerate]}}
```

- Watch for and print power status changes:

```
upower {{[-m|--monitor]}}
```

- Watch for and print detailed power status changes:

```
upower --monitor-detail
```

- Display version:

```
upower {{[-v|--version]}}
```

uprecords

Display a summary of historical uptime records.

More information: https://manned.org/uprecords.

- Display a summary of the top 10 historical uptime records:

```
uprecords
```

- Display the top 25 records:

```
uprecords -m {{25}}
```

- Display the downtime between reboots instead of the kernel version:

```
uprecords -d
```

- Show the most recent reboots:

```
uprecords -B
```

- Don't truncate information:

```
uprecords -w
```

urpme

Uninstall packages in Mageia.

See also: **`urpmi`**, **`urpmi.update`**, **`urpmi.addmedia`**, **`urpmi.removemedia`**, **`urpmf`**, **`urpmq`**.

More information: https://man.linuxreviews.org/man8/urpme.8.html.

- Uninstall a package:

```
sudo urpme {{package}}
```

- Uninstall orphan packages (Note: Use it with caution as it might unintentionally remove important packages):

```
sudo urpme --auto-orphans
```

- Uninstall a package and its dependencies:

```
sudo urpme --auto-orphans {{package}}
```

urpmf

Find files in packages and query information about them in Mageia.

See also: **`urpmi`**, **`urpme`**, **`urpmi.addmedia`**, **`urpmi.removemedia`**, **`urpmi.update`**, **`urpmq`**.

More information: https://man.linuxreviews.org/man8/urpmf.8.html.

- Search for packages that contain a file:

```
urpmf {{filename}}
```

- Search for packages that contain both a keyword [a]nd another in their summaries:

```
urpmf --summary {{keyword1}} -a {{keyword2}}
```

- Search for packages that contain a keyword [o]r another in their descriptions:

```
urpmf --description {{keyword1}} -o {{keyword2}}
```

- Search for packages that do not contain a keyword in their name ignoring case distinction using "|" as the [F]ield separator (":" by default):

```
urpmf --description ! {{keyword}} -F'|'
```

urpmi.addmedia

Add media in Mageia.

Note: Mageia documentation uses medium and repository as synonymous.

See also: **`urpmi`**, **`urpmi.update`**, **`urpme`**, **`urpmi.removemedia`**, **`urpmf`**, **`urpmq`**.

More information: https://man.linuxreviews.org/man8/urpmi.addmedia.8.html.

- Add a medium:

```
sudo urpmi.addmedia {{medium}} {{ftp://ftp.site.com/path/to/Mageia/RPMS}}
```

- Add a medium from a hard drive (run `genhdlist2` in the directory first):

```
sudo urpmi.addmedia --distrib HD file://{{path/to/repo}}
```

- Add important media from a chosen mirror:

```
sudo urpmi.addmedia --distrib ftp://{{mirror_website}}/mirror/mageia/distrib/{{version}}/{{arch}}
```

- Automatically select mirrors from a mirror list:

```
sudo urpmi.addmedia --distrib --mirrorlist {{mirrorlist}}
```

urpmi

Install packages in Mageia.

See also: **`urpmi.update`**, **`urpme`**, **`urpmi.addmedia`**, **`urpmi.removemedia`**, **`urpmf`**, **`urpmq`**.

More information: https://man.linuxreviews.org/man8/urpmi.8.html.

- Install a package from the repository or from a local RPM file:

```
sudo urpmi {{package|path/to/file.rpm}}
```

- Download a package without installing it:

```
urpmi --no-install {{package}}
```

- Update all installed packages (run `urpmi.update -a` to get the available updates):

```
sudo urpmi --auto-select
```

- Update a package of one or more machines on the network according to `/etc/urpmi/parallel.cfg`:

```
sudo urpmi --parallel local {{package}}
```

- Mark all orphaned packages as manually installed:

```
sudo urpmi $(urpmq --auto-orphans -f)
```

urpmi.removemedia

Remove media in Mageia.

Note: Mageia documentation uses medium and repository as synonymous.

See also: **`urpmi`**, **`urpme`**, **`urpmi.addmedia`**, **`urpmi.update`**, **`urpmf`**, **`urpmq`**.

More information: https://man.linuxreviews.org/man8/urpmi.removemedia.8.html.

- Remove a medium:

```
sudo urpmi.removemedia {{medium}}
```

- Remove [a]ll media:

```
sudo urpmi.removemedia -a
```

- Remove media fuzz[y] matching on media names:

```
sudo urpmi.removemedia -y {{keyword}}
```

urpmi.update

Update the list of packages from a package repository in Mageia.

Note: Mageia documentation uses medium and repository as synonymous.

See also: **`urpmi`**, **`urpme`**, **`urpmi.addmedia`**, **`urpmi.removemedia`**, **`urpmf`**, **`urpmq`**.

More information: https://man.linuxreviews.org/man8/urpmi.update.8.html.

- Update all enabled media:

```
urpmi.update -a
```

- Update specific media (including disabled media):

```
urpmi.update {{medium1 medium2 ...}}
```

- Update all media that contain a specific keyword:

```
urpmi.update {{keyword}}
```

- Update all configured media:

```
urpmi.update e
```

urpmq

Query information about packages and media in Mageia.

See also: **urpmi**, **urpmi.update**, **urpmi.addmedia**, **urpmi.removemedia**, **urpmf**, **urpme**.

More information: https://man.linuxreviews.org/man8/urpmq.8.html.

- Display information about an installable package:

```
urpmq -i {{package}}
```

- Display direct dependencies of a package:

```
urpmq --requires {{package}}
```

- Display direct and indirect dependencies of a package:

```
urpmq {{[-d|--requires-recursive]}} {{package}}
```

- List the not installed packages needed for an RPM file with their sources:

```
sudo urpmq {{[-d|--requires-recursive]}} -m --sources {{path/to/file.rpm}}
```

- List all configured media with their URLs, including inactive media:

```
urpmq --list-media --list-url
```

- Search for a package printing [g]roup, version, and [r]elease:

```
urpmq -g -r {{[-y|--fuzzy]}} {{keyword}}
```

- Search for a package with using its exact name:

```
urpmq -g -r {{package}}
```

urxvt

Rxvt-unicode.

A customizable terminal emulator.

More information: https://manned.org/urxvt.

- Open a new urxvt window:

```
urxvt
```

- Run in a specific directory:

```
urxvt -cd {{path/to/directory}}
```

- Run a command in a new urxvt window:

```
urxvt -e {{command}}
```

- Run a command and keep the window open:

```
urxvt --hold -e {{command}}
```

- Run a command within the `sh` shell:

```
urxvt -e {{sh}} -c {{command}}
```

usbip

Use USB devices remotely.

More information: https://manned.org/usbip.

- List all local USB devices and their bus ID's:

```
usbip list {{[-l|--local]}}
```

- Start a `usbip` daemon on the server:

```
systemctl start usbipd
```

- Bind a USB device to `usbip` on the server:

```
sudo usbip bind {{[-b|--busid]}} {{bus_id}}
```

- Load the kernel module required by `usbip` on the client:

```
sudo modprobe vhci-hcd
```

- Attach to the `usbip` device on the client (bus ID is the same as on the server):

```
sudo usbip attach {{[-r|--remote]}} {{ip_address}} {{[-b|--busid]}} {{bus_id}}
```

- List attached devices:

```
usbip port
```

- Detach from a device:

```
sudo usbip detach {{[-p|--port]}} {{port}}
```

- Unbind a device:

```
usbip unbind {{[-b|--busid]}} {{bus_id}}
```

useradd

Create a new user.

See also: **`users`**, **`userdel`**, **`usermod`**.

More information: https://manned.org/useradd.

- Create a new user:

```
sudo useradd {{username}}
```

- Create a new user with the specified user ID:

```
sudo useradd {{[-u|--uid]}} {{user_id}} {{username}}
```

- Create a new user with the specified shell:

```
sudo useradd {{[-s|--shell]}} {{path/to/shell}} {{username}}
```

- Create a new user belonging to additional groups (mind the lack of whitespace):

```
sudo useradd {{[-G|--groups]}} {{group1,group2,...}} {{username}}
```

- Create a new user with the default home directory:

```
sudo useradd {{[-m|--create-home]}} {{username}}
```

- Create a new user with the home directory filled by template directory files:

```
sudo useradd {{[-k|--skel]}} {{path/to/template_directory}} {{[-m|--create-home]}} {{username}}
```

- Create a new system user without the home directory:

```
sudo useradd {{[-r|--system]}} {{username}}
```

userdbctl

Inspect users, groups, and group memberships on the system.

More information: https://www.freedesktop.org/software/systemd/man/latest/userdbctl.html.

- List all known user records:

```
userdbctl
```

- Show details of a specific user:

```
userdbctl user {{username}}
```

- List all known groups:

```
userdbctl group
```

- Show details of a specific group:

```
userdbctl group {{groupname}}
```

- List all services currently providing user/group definitions to the system:

```
userdbctl services
```

userdel

Remove a user account or remove a user from a group.

See also: **`users`**, **`useradd`**, **`usermod`**.

More information: https://manned.org/userdel.

- Remove a user:

```
sudo userdel {{username}}
```

- Remove a user in other root directory:

```
sudo userdel {{[-R|--root]}} {{path/to/other_root}}
{{username}}
```

- Remove a user along with the home directory and mail spool:

```
sudo userdel {{[-r|--remove]}} {{username}}
```

usermod

Modify a user account.

See also: **`users`**, **`useradd`**, **`userdel`**.

More information: https://manned.org/usermod.

- Change a username:

```
sudo usermod {{[-l|--login]}} {{new_username}} {{username}}
```

- Change a user ID:

```
sudo usermod {{[-u|--uid]}} {{user_id}} {{username}}
```

- Change a user shell:

```
sudo usermod {{[-s|--shell]}} {{path/to/shell}} {{username}}
```

- Add a user to supplementary groups (mind the lack of whitespace):

```
sudo usermod {{[-aG|--append --groups]}}
{{group1,group2,...}} {{username}}
```

- Remove a user from specific groups:

```
sudo usermod {{[-rG|--remove --groups]}}
{{group1,group2,...}} {{username}}
```

- Change a user home directory:

```
sudo usermod {{[-m|--move-home]}} {{[-d|--home]}} {{path/to/
new_home}} {{username}}
```

- Lock an account:

```
sudo usermod {{[-L|--lock]}} {{username}}
```

- Unlock an account:

```
sudo usermod {{[-U|--unlock]}} {{username}}
```

utmpdump

Dump and load btmp, utmp, and wtmp accounting files.

More information: https://manned.org/utmpdump.

- Dump the `/var/log/wtmp` file to `stdout` as plain text:

```
utmpdump {{/var/log/wtmp}}
```

- Load a previously dumped file into `/var/log/wtmp`:

```
utmpdump {{[-r|--reverse]}} {{dumpfile}} > {{/var/log/wtmp}}
```

uuid

Generate and decode Universally Unique Identifiers (UUID).

See also: **`uuidgen`**.

More information: https://manned.org/uuid.

- Generate a UUIDv1 (based on time and system's hardware address, if present):

```
uuid
```

- Generate a UUIDv4 (based on random data):

```
uuid -v 4
```

- Generate multiple UUIDv4 identifiers at once:

```
uuid -v 4 -n {{number_of_uuids}}
```

- Generate a UUIDv4 and specify the output format:

```
uuid -v 4 -F {{BIN|STR|SIV}}
```

- Generate a UUIDv4 and write the output to a file:

```
uuid -v 4 -o {{path/to/file}}
```

- Generate a UUIDv5 (based on the supplied object name) with a specified namespace prefix:

```
uuid -v 5 ns:{{DNS|URL|OID|X500}} {{object_name}}
```

- Decode a given UUID:

```
uuid -d {{uuid}}
```

uuidd

Daemon for generating UUIDs.

More information: https://manned.org/uuidd.

- Generate a random UUID:

```
uuidd {{[-r|--random]}}
```

- Generate a bulk number of random UUIDs:

```
uuidd {{[-r|--random]}} {{[-n|--uuids]}} {{number_of_uuids}}
```

- Generate a time-based UUID, based on the current time and MAC address of the system:

```
uuidd {{[-t|--time]}}
```

uuidgen

Generate unique identifiers (UUIDs).

See also: **`uuid`**.

More information: https://manned.org/uuidgen.

- Create a random UUIDv4:

```
uuidgen {{[-r|--random]}}
```

- Create a UUIDv1 based on the current time:

```
uuidgen {{[-t|--time]}}
```

- Create a UUIDv5 of the name with a specified namespace prefix:

```
uuidgen {{[-s|--sha1]}} {{[-n|--namespace]}} {{@dns|@url|
@oid|@x500}} {{[-N|--name]}} {{object_name}}
```

uuidparse

Parse universally unique identifiers.

See also: **`uuidgen`**.

More information: https://manned.org/uuidparse.

- Parse the specified UUIDs, use a tabular output format:

```
uuidparse {{uuid1 uuid2 ...}}
```

- Parse UUIDs from `stdin`:

```
{{command}} | uuidparse
```

- Use the JSON output format:

```
uuidparse {{[-J|--json]}} {{uuid1 uuid2 ...}}
```

- Do not print a header line:

```
uuidparse {{[-n|--noheadings]}} {{uuid1 uuid2 ...}}
```

- Use the raw output format:

```
uuidparse {{[-r|--raw]}} {{uuid1 uuid2 ...}}
```

- Specify which of the four output columns to print:

```
uuidparse {{[-o|--output]}} {{UUID,VARIANT,TYPE,TIME}}
```

- Display help:

```
uuidparse {{[-h|--help]}}
```

uvcdynctrl

Manage dynamic controls in uvcvideo.

More information: https://manned.org/uvcdynctrl.

- List all available cameras:

```
uvcdynctrl {{[-l|--list]}}
```

- Use a specific device (defaults to `video0`):

```
uvcdynctrl {{[-d|--device]}} {{device_name}}
```

- List available controls:

```
uvcdynctrl {{[-c|--clist]}}
```

- Set a new control value (for negative values, use `-- -value`):

```
uvcdynctrl {{[-s|--set]}} {{control_name}} {{value}}
```

- Get the current control value:

```
uvcdynctrl {{[-g|--get]}} {{control_name}}
```

- Save the state of the current controls to a file:

```
uvcdynctrl {{[-W|--save]}} {{filename}}
```

- Load the state of the controls from a file:

```
uvcdynctrl {{[-L|--load]}} {{filename}}
```

v4l2-ctl

Control video devices.

See also: **cam**.

More information: https://manned.org/v4l2-ctl.

- List all video devices:

```
v4l2-ctl {{[-A|--list-devices]}}
```

- List supported video formats and resolutions of default video device `/dev/video0`:

```
v4l2-ctl --list-formats-ext
```

- List supported video formats and resolutions of a specific video device:

```
v4l2-ctl --list-formats-ext {{[-d|--device]}} {{path/to/video_device}}
```

- Get all details of a video device:

```
v4l2-ctl --all {{[-d|--device]}} {{path/to/video_device}}
```

- Capture a JPEG photo with a specific resolution from video device:

```
v4l2-ctl {{[-d|--device]}} {{path/to/video_device}} --set-fmt-video=width={{width}},height={{height}},pixelformat=MJPG --stream-mmap --stream-to={{path/to/output.jpg}} --stream-count=1
```

- Capture a raw video stream from video device:

```
v4l2-ctl {{[-d|--device]}} {{path/to/video_device}} --set-fmt-video=width={{width}},height={{height}},pixelformat={{format}} --stream-mmap --stream-to={{path/to/output}} --stream-count={{number_of_frames_to_capture}}
```

- List all video device's controls and their values:

```
v4l2-ctl {{[-l|--list-ctrls]}} {{[-d|--device]}} {{path/to/video_device}}
```

- Set the value of a video device control:

```
v4l2-ctl {{[-d|--device]}} {{path/to/video_device}} {{[-c|--
set-ctrl]}} {{control_name}}={{value}}
```

v4l2loopback-ctl

Control Video4Linux2 loopback devices.

More information: https://manned.org/v4l2loopback-ctl.

- List all available loopback devices:

```
sudo v4l2loopback-ctl list
```

- Add a loopback device:

```
sudo v4l2loopback-ctl add
```

Valheim

Create and start a headless Valheim server.

Note: Configure the server by editing a copy of the **`start_server.sh`** script.

More information: https://www.valheimgame.com/support/a-guide-to-dedicated-servers/.

- Start the server:

  ```
  {{path/to}}/start_server.sh
  ```

- Stop the server gracefully:

  ```
  <Ctrl c>
  ```

- Start the server using the provided Docker script:

  ```
  {{path/to/docker_start_server.sh}} {{path/to/
  start_server.sh}}
  ```

vcgencmd

Print system information for a Raspberry Pi.

More information: https://www.raspberrypi.com/documentation/computers/os.html#vcgencmd.

- List all available commands:

```
vcgencmd commands
```

- Print the current CPU temperature:

```
vcgencmd measure_temp
```

- Print the current voltage:

```
vcgencmd measure_volts
```

- Print the throttled state of the system as a bit pattern:

```
vcgencmd get_throttled
```

- Print the bootloader configuration (only available on Raspberry Pi 4 models):

```
vcgencmd bootloader_config
```

- Display help:

```
vcgencmd --help
```

ventoy

A tool to create bootable USB drives using ISO files.

More information: https://www.ventoy.net/en/doc_start.html#doc_linux_cli.

- Install Ventoy to a specific drive with the defaults:

```
sudo ventoy -i {{/dev/sdX}}
```

- Install Ventoy with GPT partition style instead of MBR:

```
sudo ventoy -i -g {{/dev/sdX}}
```

- Install Ventoy with GPT partition style and a custom partition label and secure boot disabled:

```
sudo ventoy -i -g -S -L {{LABEL_NAME}} {{/dev/sdX}}
```

- Install Ventoy and reserve space at the end of the disk:

```
sudo ventoy -i -r {{SIZE_MB}} {{/dev/sdX}}
```

- Force install Ventoy (overwrites existing installation):

```
sudo ventoy -I {{/dev/sdX}}
```

- Update Ventoy on a drive:

```
sudo ventoy -u {{/dev/sdX}}
```

- Display Ventoy information for a drive:

```
sudo ventoy -l {{/dev/sdX}}
```

- Try non-destructive installation if possible (Ventoy will not reformat the disk):

```
sudo ventoy -i -n {{/dev/sdX}}
```

veracrypt

Free and open source disk encryption software.

More information: https://arcanecode.com/2021/06/21/veracrypt-on-the-command-line-for-ubuntu-linux/.

- Create a new volume through a text user interface and use `/dev/urandom` as a source of random data:

```
veracrypt {{[-t|--text]}} {{[-c|--create]}} --random-source={{/dev/urandom}}
```

- Decrypt a volume interactively through a text user interface and mount it to a directory:

```
veracrypt {{[-t|--text]}} {{path/to/volume}} {{path/to/mount_point}}
```

- Decrypt a partition using a keyfile and mount it to a directory:

```
veracrypt {{[-k|--keyfiles]}} {{path/to/keyfile}} {{/dev/sdXN}} {{path/to/mount_point}}
```

- Dismount a volume on the directory it is mounted to:

```
veracrypt {{[-d|--dismount]}} {{path/to/mounted_point}}
```

vgcfgbackup

Back up volume group configuration metadata to files (not user data).

More information: https://manned.org/vgcfgbackup.

- Back up metadata for all volume groups (to `/etc/lvm/backup/` by default):

```
sudo vgcfgbackup
```

- Back up metadata for a specific volume group:

```
sudo vgcfgbackup {{vg_name}}
```

- Write the backup to a specific file:

```
sudo vgcfgbackup {{[-f|--file]}} {{path/to/backup}} {{vg_name}}
```

- Back up multiple VGs using a filename template (`%s` becomes the VG name):

```
sudo vgcfgbackup {{[-f|--file]}} {{/tmp/vg-backup-%s}} {{vg1 vg2 ...}}
```

- Increase verbosity (repeat `-v` for more detail):

```
sudo vgcfgbackup {{[-v|--verbose]}} {{vg_name}}
```

vgcfgrestore

Restore volume group configuration (not user data) from a text back up file produced by **`vgcfgbackup`**.

More information: https://manned.org/vgcfgrestore.

- Restore VG metadata from last backup:

```
sudo vgcfgrestore {{vg_name}}
```

- Restore VG metadata from specified backup-file:

```
sudo vgcfgrestore {{[-f|--file]}} {{path/to/file}}
{{vg_name}}
```

- List all VG metadata backups:

```
sudo vgcfgrestore {{[-l|--list]}} {{vg_name}}
```

- List one VG metadata backup file:

```
sudo vgcfgrestore {{[-l|--list]}} {{[-f|--file]}} {{path/to/
file}} {{vg_name}}
```

vgchange

Change the attributes of a Logical Volume Manager (LVM) volume group.

See also: **`lvm`**.

More information: https://manned.org/vgchange.

- Change the activation status of logical volumes in all volume groups:

```
sudo vgchange {{[-a|--activate]}} {{y|n}}
```

- Change the activation status of logical volumes in the specified volume group (determine with `vgscan`):

```
sudo vgchange {{[-a|--activate]}} {{y|n}} {{volume_group}}
```

vgcreate

Create volume groups combining multiple mass-storage devices.

See also: **`lvm`**.

More information: https://manned.org/vgcreate.

- Create a new volume group using the specified device:

```
sudo vgcreate {{volume_group}} {{/dev/sdXY}}
```

- Create a new volume group using multiple devices:

```
sudo vgcreate {{volume_group}} {{/dev/sdXY /dev/sdXZ ...}}
```

- Create a new volume group with custom physical extent size:

```
sudo vgcreate {{[-s|--physicalextentsize]}} {{8M}}
{{volume_group}} {{/dev/sdXY /dev/sdXZ ...}}
```

vgdisplay

Display information about Logical Volume Manager (LVM) volume groups.

See also: **`lvm`**.

More information: https://manned.org/vgdisplay.

- Display information about all volume groups:

```
sudo vgdisplay
```

- Display information about volume group vg1:

```
sudo vgdisplay {{vg1}}
```

vgextend

Add one or more physical volumes to an existing volume group.

More information: https://manned.org/vgextend.

- Add a physical volume to an existing volume group:

```
sudo vgextend {{vg1}} {{/dev/sda1}}
```

- Add multiple physical volumes to an existing volume group:

```
sudo vgextend {{vg1}} {{/dev/sda1 /dev/sda2 ...}}
```

vgremove

Remove volume group(s) in LVM.

More information: https://manned.org/vgremove.

- Remove a volume group with confirmation:

```
sudo vgremove {{volume_group}}
```

- Forcefully remove a volume group without confirmation:

```
sudo vgremove {{[-f|--force]}} {{volume_group}}
```

- Set the debug level for detailed logging to level 2, (repeat `--debug` up to 6 times to increase the level):

```
sudo vgremove {{[-d|--debug]}} {{[-d|--debug]}}
{{volume_group}}
```

- Use a specific config setting to override defaults:

```
sudo vgremove --config '{{global/
locking_type=1}}' {{volume_group}}
```

- Display help:

```
vgremove {{[-h|--help]}}
```

vgs

Display information about volume groups.

See also: **`lvm`**.

More information: https://manned.org/vgs.

- Display information about volume groups:

```
sudo vgs
```

- Display all volume groups:

```
sudo vgs {{[-a|--all]}}
```

- Change default display to show more details:

```
sudo vgs {{[-v|--verbose]}}
```

- Display only specific fields:

```
sudo vgs {{[-o|--options]}} {{field_name_1,field_name_2,...}}
```

- Append field to default display:

```
sudo vgs {{[-o|--options]}} +{{field_name}}
```

- Suppress heading line:

```
sudo vgs --noheadings
```

- Use separator to separate fields:

```
sudo vgs --separator =
```

vgscan

Scan for volume groups on all supported Logical Volume Manager (LVM) block devices.

See also: **`lvm`**, **`vgchange`**.

More information: https://manned.org/vgscan.

- Scan for volume groups and print information about each group found:

  ```
  sudo vgscan
  ```

- Scan for volume groups and add the special files in `/dev`, if they don't already exist, needed to access the logical volumes in the found groups:

  ```
  sudo vgscan --mknodes
  ```

viewnior

Simple and elegant image viewer.

More information: https://manned.org/viewnior.

- View an image:

```
viewnior {{path/to/image.ext}}
```

- View in fullscreen mode:

```
viewnior --fullscreen {{path/to/image.ext}}
```

- View fullscreen in slideshow mode:

```
viewnior --slideshow {{path/to/image.ext}}
```

vigr

Edit the group file.

More information: https://manned.org/vigr.

- Edit the group file:

```
vigr
```

- Display version:

```
vigr {{[-V|--version]}}
```

vipw

Edit the password file.

More information: https://manned.org/vipw.

- Edit the password file:

```
vipw
```

- Display version:

```
vipw {{[-V|--version]}}
```

virt-clone

Clone a libvirt virtual machine.

More information: https://manned.org/virt-clone.

- Clone a virtual machine and automatically generate a new name, storage path, and MAC address:

```
virt-clone {{[-o|--original]}} {{vm_name}} --auto-clone
```

- Clone a virtual machine and specify the new name, storage path, and MAC address:

```
virt-clone {{[-o|--original]}} {{vm_name}} {{[-n|--name]}} {{new_vm_name}} {{[-f|--file]}} {{path/to/new_storage}} {{[-m|--mac]}} {{ff:ff:ff:ff:ff:ff|RANDOM}}
```

virt-install

Create virtual machines with libvirt and begin OS installation.

Note: You may need to pass **`--connect URI`** to the commands or set up the URI in **`$XDG_CONFIG_HOME/libvirt/libvirt.conf`**.

More information: https://manned.org/virt-install.

- Create a virtual machine with 1 GB RAM and 12 GB storage and start a Debian installation:

```
virt-install {{[-n|--name]}} {{vm_name}} --memory {{1024}} --disk path={{path/to/image.qcow2}},size={{12}} {{[-c|--cdrom]}} {{path/to/debian.iso}}
```

- Create a x86-64, KVM-accelerated, UEFI-based virtual machine with the Q35 chipset, 4 GiB RAM, 16 GiB RAW storage, and start a Fedora installation:

```
virt-install {{[-n|--name]}} {{vm_name}} --arch {{x86_64}} --virt-type {{kvm}} --machine {{q35}} --boot {{uefi}} --memory {{4096}} --disk path={{path/to/image.raw}},size={{16}} {{[-c|--cdrom]}} {{path/to/fedora.iso}}
```

- Create a diskless live virtual machine without an emulated sound device or a USB controller. Don't start an installation and don't autoconnect to console but attach a cdrom to it (might be useful for when using a live CD like tails):

```
virt-install {{[-n|--name]}} {{vm_name}} --memory {{512}} --disk {{none}} --controller {{type=usb,model=none}} --sound {{none}} --autoconsole {{none}} --install {{no_install=yes}} {{[-c|--cdrom]}} {{path/to/tails.iso}}
```

- Create a virtual machine with 16 GiB RAM, 250 GiB storage, 8 cores with hyperthreading, a specific CPU topology, and a CPU model that shares most features with the host CPU:

```
virt-install {{[-n|--name]}} {{vm_name}} --cpu {{host-model}},topology.sockets={{1}},topology.cores={{4}},topology.threads={
--memory {{16384}} --disk path={{path/to/image.qcow2}},size={{250}} {{[-c|--cdrom]}} {{path/to/debian.iso}}
```

- Create a virtual machine and kickstart an automated deployment based on Fedora 43 using only remote resources (no ISO required):

```
virt-install {{[-n|--name]}} {{vm_name}} --memory {{2048}} --
disk path={{path/to/image.qcow2}},size={{20}} {{[-l|--
location]}} {{https://download.fedoraproject.org/pub/fedora/
linux/releases/43/Everything/x86_64/os/}} {{[-x|--extra-
args]}} "{{inst.ks=https://example.com/path/to/
kickstart.ks}}"
```

virt-manager

A desktop user interface for managing KVM and Xen virtual machines and LXC containers.

More information: https://manned.org/virt-manager.

- Launch the GUI:

```
virt-manager
```

- Connect to a hypervisor:

```
virt-manager --connect {{hypervisor_uri}}
```

- Don't fork virt-manager process into background on startup:

```
virt-manager --no-fork
```

- Print debug output:

```
virt-manager --debug
```

- Open the "New VM" wizard:

```
virt-manager --show-domain-creator
```

- Show domain details window for a specific virtual machine/container:

```
virt-manager --show-domain-editor {{name|id|uuid}}
```

- Show domain performance window for a specific virtual machine/container:

```
virt-manager --show-domain-performance {{name|id|uuid}}
```

- Show connection details window:

```
virt-manager --show-host-summary
```

virt-qemu-run

Experimental tool to run a QEMU Guest VM independent of **`libvirtd`**.

More information: https://libvirt.org/manpages/virt-qemu-run.html.

- Run a QEMU virtual machine:

```
virt-qemu-run {{path/to/guest.xml}}
```

- Run a QEMU virtual machine and store the state in a specific directory:

```
virt-qemu-run {{[-r|--root]}} {{path/to/directory}} {{path/to/guest.xml}}
```

- Run a QEMU virtual machine and display verbose information about the startup:

```
virt-qemu-run {{[-v|--verbose]}} {{path/to/guest.xml}}
```

- Display help:

```
virt-qemu-run {{[-h|--help]}}
```

virt-sparsify

Make virtual machine drive images thin-provisioned.

Note: Use only for offline machines to avoid data corruption.

More information: https://manned.org/virt-sparsify.

- Create a sparsified compressed image without snapshots from an unsparsified one:

```
virt-sparsify --compress {{path/to/image.qcow2}} {{path/to/new_image.qcow2}}
```

- Sparsify an image in-place:

```
virt-sparsify --in-place {{path/to/image.img}}
```

- Convert from one image format to another:

```
virt-sparsify {{path/to/image}} --convert {{qcow2|raw|vdi|...}} {{path/to/new_image}}
```

virt-sysprep

Reset, unconfigure, or customize a virtual machine image.

This command can be used on a virtual machine or directly on a virtual machine disk image.

Note: You may need to pass **`--connect URI`** to the commands or set up the URI in **`$XDG_CONFIG_HOME/libvirt/libvirt.conf`**.

More information: https://libguestfs.org/virt-sysprep.1.html.

- List all supported operations (default enabled operations are indicated with asterisks):

```
virt-sysprep --list-operations
```

- Run only the specified operations:

```
sudo virt-sysprep {{[-d|--domain]}} {{vm_name}} --operations {{operation1,operation2,...}}
```

- Remove sensitive system data from a virtual machine image (operations marked as default):

```
sudo virt-sysprep {{[-a|--add]}} {{path/to/image.qcow2}}
```

- Simulate running all enabled operations on a virtual machine specified by its name:

```
sudo virt-sysprep {{[-d|--domain]}} {{vm_name}} {{[-n|--dry-run]}}
```

- Reset NetworkManager network configurations, persistent MAC mappings, and the hostname to avoid network conflicts:

```
sudo virt-sysprep {{[-d|--domain]}} {{vm_name}} --operations machine-id,net-hwaddr,net-hostname,net-nmconn,customize --hostname {{new_hostname}}
```

- Set the root password for a disk image:

```
sudo virt-sysprep {{[-a|--add]}} {{path/to/image.qcow2}} --operations customize --root-password password:{{new_password}}
```

- Inject a new user with a defined password and add them to the sudo group:

```
sudo virt-sysprep {{[-a|--add]}} {{path/to/image.qcow2}} --
run-command 'useradd -m {{username}} && echo {{username}}:
{{password}} | chpasswd && usermod -aG sudo {{username}}'
```

- Install specific package(s) on a disk image (use `--update` to upgrade all installed packages to latest):

```
sudo virt-sysprep {{[-a|--add]}} {{path/to/image.qcow2}} --
operations customize --network --install
{{package_name1,package_name2,...}}
```

virt-what

Shell script that detects if you are running in a virtual machine.

Outputs a specific code for a virtual machine if detected.

More information: https://manned.org/virt-what.

- Detect if you are running in a virtual machine:

```
virt-what
```

- Log output of `virt-what` into a file:

```
virt-what > {{path/to/file}}
```

- Display version:

```
virt-what --version
```

virt-xml-validate

Validate **`libvirt`** XML files against a schema.

If a schema is not specified, the schema is determined by the root element in the XML file.

More information: https://libvirt.org/manpages/virt-xml-validate.html.

- Validate an XML file against a specific schema:

```
virt-xml-validate {{path/to/file.xml}} {{schema}}
```

- Validate the domain XML against the domain schema:

```
virt-xml-validate {{path/to/domain.xml}} domain
```

virt-xml

Edit libvirt Domain XML files with explicit command-line options.

Note: **`domain`** refers to the name, UUID, or ID for the existing VMs.

See also: **`virsh`**.

More information: https://github.com/virt-manager/virt-manager/blob/main/man/virt-xml.rst.

- List all the suboptions for a specific option:

```
virt-xml --{{option}}=?
```

- List all the suboptions for disk, network, and boot:

```
virt-xml --disk=? --network=? --boot=?
```

- Edit a value for a specific domain:

```
virt-xml {{domain}} --edit --{{option}} {{suboption}}
={{new_value}}
```

- Change the description for a specific domain:

```
virt-xml {{domain}} --edit --metadata
description="{{new_description}}"
```

- Enable/Disable the boot device menu for a specific domain:

```
virt-xml {{domain}} --edit --boot bootmenu={{on|off}}
```

- Attach host USB hub to a running VM (run `lsusb` to see a list of USB devices with their IDs):

```
virt-xml {{domain}} --update --add-device --hostdev {{bus}}.
{{device}}
```

vivaldi-stable

This command is an alias of **`chromium`**.

More information: https://vivaldi.com/.

- View documentation for the original command:

```
tldr chromium
```

vkpurge

List or remove old kernel versions left behind by **xbps**.

The **version** arguments support shell **glob**s.

More information: https://man.voidlinux.org/vkpurge.8.

- List all removable kernel versions (or those matching `version` if the argument is specified):

```
vkpurge list {{version}}
```

- Remove all unused kernels:

```
vkpurge rm all
```

- Remove kernel versions matching `version`:

```
vkpurge rm {{version}}
```

vlock

Lock virtual console.

More information: https://manned.org/vlock.

- Lock current virtual console session:

```
vlock
```

- Lock all virtual console sessions:

```
vlock {{[-a|--all]}}
```

- Display help:

```
vlock {{[-h|--help]}}
```

- Display version:

```
vlock {{[-v|--version]}}
```

vmstat

Report information about processes, memory, paging, block IO, traps, disks, and CPU activity.

More information: https://manned.org/vmstat.

- Display virtual memory statistics:

```
vmstat
```

- Display reports every 2 seconds for 5 times:

```
vmstat 2 5
```

vmware-checkvm

Check if the current host is a VMware VM or not.

More information: https://manned.org/vmware-checkvm.

- Return the current VMware software version (exit status determines whether the system is a VM or not):

```
vmware-checkvm
```

- Return the VMware hardware version:

```
vmware-checkvm -h
```

vncserver

Launch a VNC (Virtual Network Computing) desktop.

More information: https://manned.org/vncserver.1x.

- Launch a VNC Server on next available display:

```
vncserver
```

- Launch a VNC Server with specific screen geometry:

```
vncserver --geometry {{width}}x{{height}}
```

- Kill an instance of VNC Server running on a specific display:

```
vncserver --kill :{{display_number}}
```

vncviewer

Launch a VNC (Virtual Network Computing) client.

More information: https://manned.org/vncviewer.

- Launch a VNC client which connects to a host on a given display:

```
vncviewer {{host}}:{{display_number}}
```

- Launch in full-screen mode:

```
vncviewer -FullScreen {{host}}:{{display_number}}
```

- Launch a VNC client with a specific screen geometry:

```
vncviewer --geometry {{width}}x{{height}} {{host}}:
{{display_number}}
```

- Launch a VNC client which connects to a host on a given port:

```
vncviewer {{host}}::{{port}}
```

vnstat

A console-based network traffic monitor.

More information: https://manned.org/vnstat.

- Display traffic summary for all interfaces:

```
vnstat
```

- Display traffic summary for a specific network interface:

```
vnstat {{[-i|--iface]}} {{network_interface}}
```

- Display live stats for a specific network interface:

```
vnstat {{[-l|--live]}} {{[-i|--iface]}} {{network_interface}}
```

- Show traffic statistics on an hourly basis for the last 24 hours using a bar graph:

```
vnstat {{[-hg|--hoursgraph]}}
```

- Measure and show average traffic for 30 seconds:

```
vnstat {{[-tr|--traffic]}} {{30}}
```

vnstati

PNG image output support for vnStat.

More information: https://manned.org/vnstati.

- Output a summary of the last 2: months, days, and all-time:

```
vnstati --summary --iface {{network_interface}} --output
{{path/to/output.png}}
```

- Output the 10 most traffic-intensive days of all time:

```
vnstati --top 10 --iface {{network_interface}} --output
{{path/to/output.png}}
```

- Output monthly traffic statistics from the last 12 months:

```
vnstati --months --iface {{network_interface}} --output
{{path/to/output.png}}
```

- Output hourly traffic statistics from the last 24 hours:

```
vnstati --hours --iface {{network_interface}} --output
{{path/to/output.png}}
```

vpnc

A VPN client for the Cisco 3000 VPN Concentrator.

More information: https://manned.org/vpnc.

- Connect with a defined configuration file:

```
sudo vpnc {{config_file}}
```

- Terminate the previously created connection:

```
sudo vpnc-disconnect
```

vrms

Report non-free packages installed on Debian-based OSes.

More information: https://salsa.debian.org/debian/check-dfsg-status.

- List non-free and contrib packages (and their description):

```
vrms
```

- Only output the package names:

```
vrms --sparse
```

vso

Package manager, system updater, and a task automator for Vanilla OS.

More information: https://github.com/Vanilla-OS/vanilla-system-operator.

- Check for system updates to the host system:

```
vso sys-upgrade check
```

- Upgrade the host system now:

```
vso sys-upgrade upgrade --now
```

- Initialize the Pico subsystem (used for package management):

```
vso pico-init
```

- Install applications inside the subsystem:

```
vso install {{package1 package2 ...}}
```

- Remove applications from the subsystem:

```
vso remove {{package1 package2 ...}}
```

- Enter the subsystem's shell:

```
vso shell
```

- Run an application from the subsystem:

```
vso run {{package}}
```

- Display VSO configuration:

```
vso config show
```

vzdump

Backup Utility for virtual machines and containers.

More information: https://pve.proxmox.com/pve-docs/vzdump.1.html.

- Dump a guest virtual machine into the default dump directory (usually `/var/lib/vz/dump/`), excluding snapshots:

```
vzdump {{vm_id}}
```

- Back up the guest virtual machines with the IDs 101, 102, and 103:

```
vzdump {{101 102 103}}
```

- Dump a guest virtual machine using a specific mode:

```
vzdump {{vm_id}} --mode {{suspend|snapshot}}
```

- Back up all guest systems and send a notification email to the root and admin users:

```
vzdump --all --mode {{suspend}} --mailto {{root}} --mailto {{admin}}
```

- Use snapshot mode (no downtime required) and a non-default dump directory:

```
vzdump {{vm_id}} --dumpdir {{path/to/directory}} --mode {{snapshot}}
```

- Back up all guest virtual machines excluding the IDs 101 and 102:

```
vzdump --mode {{suspend}} --exclude {{101, 102}}
```

waitpid

Wait for the termination of arbitrary processes.

See also: **`wait`**.

More information: https://manned.org/waitpid.

- Sleep until all processes whose PIDs have been specified have exited:

```
waitpid {{process_id1 process_id2 ...}}
```

- Sleep for at most n seconds:

```
waitpid {{[-t|--timeout]}} {{n}} {{process_id1
process_id2 ...}}
```

- Do not error if specified PIDs have already exited:

```
waitpid {{[-e|--exited]}} {{process_id1 process_id2 ...}}
```

- Sleep until n of the specified processes have exited:

```
waitpid {{[-c|--count]}} {{n}} {{process_id1
process_id2 ...}}
```

- Display help:

```
waitpid {{[-h|--help]}}
```

wajig

Simplified all-in-one-place system support tool for Debian-based systems.

More information: https://togaware.com/linux/survivor/wajig.html.

- Update the list of available packages and versions:

```
wajig update
```

- Install a package, or update it to the latest available version:

```
wajig install {{package}}
```

- Remove a package and its configuration files:

```
wajig purge {{package}}
```

- Perform an update and then a dist-upgrade:

```
wajig daily-upgrade
```

- Display the sizes of installed packages:

```
wajig sizes
```

- List the version and distribution for all installed packages:

```
wajig versions
```

- List versions of upgradable packages:

```
wajig toupgrade
```

- Display packages which have some form of dependency on the given package:

```
wajig dependents {{package}}
```

wal-telegram

Generate themes for Telegram based the colors generated by pywal/wal.

More information: https://github.com/guillaumeboehm/wal-telegram.

- Generate with wal's palette and the current wallpaper (feh only):

```
wal-telegram
```

- Generate with wal's palette and a specified background image:

```
wal-telegram --background={{path/to/image}}
```

- Generate with wal's palette and a colored background based on the palette:

```
wal-telegram --tiled
```

- Apply a gaussian blur on the background image:

```
wal-telegram -g
```

- Specify a location for the generated theme (default is `$XDG_CACHE_HOME/wal-telegram` or `~/.cache/wal-telegram`):

```
wal-telegram --destination={{path/to/destination}}
```

- Restart the telegram app after generation:

```
wal-telegram --restart
```

walker

A Wayland-native application launcher and runner with pluggable providers.

See also: **`fuzzel`**, **`wofi`**, **`rofi`**.

More information: https://github.com/abenz1267/walker.

- Open the launcher:

```
walker
```

- Restrict the launcher to a single provider:

```
walker {{[-m|--provider]}} {{desktopapplications|calc|
clipboard|runner|...}}
```

- Read items from `stdin` and print the selected item to `stdout` (dmenu mode):

```
printf "{{Choice1\nChoice2\nChoice3}}" | walker {{[-d|--
dmenu]}}
```

- Open the launcher with a specific theme:

```
walker {{[-t|--theme]}} {{theme_name}}
```

wall

Write a message on the terminals of users currently logged in.

More information: https://manned.org/wall.

- Send a message:

```
wall {{message}}
```

- Send a message to users that belong to a specific group:

```
wall {{[-g|--group]}} {{group_name}} {{message}}
```

- Send a message from a file:

```
wall {{file}}
```

- Send a message with timeout (default 300):

```
wall {{[-t|--timeout]}} {{seconds}} {{file}}
```

wami

An open-source and easy-to-use tool that recommends suitable programs for tasks.

More information: https://github.com/evait-security/wami.

- Find expanded results in all categories from the lake and sort them in the specified order:

```
wami {{[-a|--show-all]}} {{[-S|--sort]}} {{asc|desc}} {{[-s|--search-all]}} {{search_string}}
```

- Search GitHub to find expanded results, sorted in descending order:

```
wami {{[-a|--show-all]}} {{[-S|--sort]}} desc --github {{search_string}}
```

- Search GitHub for topics that match the search string:

```
wami --list-topics {{search_string}}
```

- Search the lake for a tool used in pentests to query for default credentials and sort the results in descending order:

```
wami {{[-S|--sort]}} desc {{[-s|--search-all]}} pentest credential default
```

warpd

A modal keyboard driven pointer manipulation program.

More information: https://github.com/rvaiya/warpd/blob/master/warpd.1.md.

- Run warpd in normal mode:

```
warpd --normal
```

- Run warpd in hint mode:

```
warpd --hint
```

- Move cursor left:

```
<h>
```

- Move cursor down:

```
<j>
```

- Move cursor up:

```
<k>
```

- Move cursor right:

```
<l>
```

- Emulate left click:

```
<m>
```

waydroid

A container-based approach to boot a full Android system on a regular Linux system like Ubuntu.

More information: https://docs.waydro.id/usage/waydroid-command-line-options.

- Start Waydroid:

```
waydroid show-full-ui
```

- Initialize Waydroid (required on first run or after reinstalling Android):

```
sudo waydroid init
```

- Install a new Android app from a file:

```
waydroid app install {{path/to/file}}.apk
```

- Launch an Android app by its package name:

```
waydroid app launch {{com.example.app}}
```

- Start or stop the Waydroid session:

```
waydroid session {{start|stop}}
```

- Manage the Waydroid container:

```
sudo waydroid container {{start|stop|restart|freeze|
unfreeze}}
```

- Open Waydroid shell:

```
sudo waydroid shell
```

- Adjust Waydroid window dimensions:

```
waydroid prop set persist.waydroid.{{width|height}}
{{number}}
```

waypipe

Remotely run graphical applications under a Wayland compositor.

More information: https://manned.org/waypipe.

- Run a graphical program remotely and display it locally:

```
waypipe ssh {{user}}@{{server}} {{program}}
```

- Open an SSH tunnel to run any program remotely and display it locally:

```
waypipe ssh {{user}}@{{server}}
```

- Skip testing for Vulkan support:

```
waypipe --test-skip-vulkan ssh {{user}}@{{server}}
{{program}}
```

- Display help:

```
waypipe {{[-h|--help]}}
```

wdctl

Show the hardware watchdog status.

More information: https://manned.org/wdctl.

- Display the watchdog status:

```
wdctl
```

- Display the watchdog status in a single line in key-value pairs:

```
wdctl {{[-O|--oneline]}}
```

- Display only specific watchdog flags (list is driver specific):

```
wdctl {{[-f|--flags]}} {{flag_list}}
```

wev

Print contents of Wayland events.

More information: https://manned.org/wev.

- Monitor all occurring Wayland events:

```
wev
```

- Print all events received by a specific Wayland interface:

```
wev -f {{wl_keyboard}}
```

- Print only specific events received by a Wayland interface:

```
wev -f {{wl_keyboard}}:{{key}}
```

- Print everything but the specified wayland events:

```
wev -F {{wl_keyboard}}:{{key}}
```

- Write the `wl_keyboards`'s keymap to a file:

```
wev -M {{path/to/file}}
```

- Print Wayland globals:

```
wev -g
```

wf-recorder

Screencast for Wayland optionally with audio.

By default you need to end the process with **`<Ctrl c>`**.

More information: https://github.com/ammen99/wf-recorder.

- Record storing to an MP4 file:

```
wf-recorder {{[-f|--file]}} {{output.mp4}}
```

- Record including audio, both with mic and system sounds:

```
wf-recorder {{[-a|--audio]}} {{[-f|--file]}} /{{path/to/file_with_audio.webm}}
```

- Select and record a portion of the screen using `slurp`, outputting to default `recording.mp4`:

```
wf-recorder {{[-g|--geometry]}} "$(slurp)"
```

whatis

Display one-line descriptions from manual pages.

See also: **`man`**, **`whereis`**.

More information: https://manned.org/whatis.

- Display a description from a man page:

```
whatis {{command}}
```

- Don't cut the description off at the end of the line:

```
whatis {{[-l|--long]}} {{command}}
```

- Display descriptions for all commands matching a `glob`:

```
whatis {{[-w|--wildcard]}} {{net*}}
```

- Search man page descriptions with a `regex`:

```
whatis {{[-r|--regex]}} '{{wish[0-9]\.[0-9]}}'
```

- Display descriptions in a specific language:

```
whatis {{[-L|--locale]}} {{en}} {{command}}
```

whereis

Locate the binary, source, and manual page files for a command.

See also: **`which`**, **`whatis`**, **`type`**.

More information: https://manned.org/whereis.

- Locate binary, source, and man pages for SSH:

```
whereis {{ssh}}
```

- Locate [b]inary and [m]an pages for ls:

```
whereis -bm {{ls}}
```

- Locate [s]ource of gcc and [m]an pages for Git:

```
whereis -s {{gcc}} -m {{git}}
```

- Locate [b]inaries for gcc in `/usr/bin/` only:

```
whereis -b -B {{/usr/bin/}} -f {{gcc}}
```

- Locate [u]nusual binaries (those that have more or less than one binary on the system):

```
whereis -u *
```

- Locate binaries that have [u]nusual [m]anual entries (binaries that have more or less than one manual installed):

```
whereis -u -m *
```

whiptail

Display text-based dialog boxes from shell scripts.

See also: **`dialog`**, **`gum`**.

More information: https://manned.org/whiptail.

- Display a simple message:

```
whiptail --title "{{title}}" --msgbox
"{{message}}" {{height_in_chars}} {{width_in_chars}}
```

- Display a boolean choice, returning the result through the exit code:

```
whiptail --title "{{title}}" --yesno
"{{message}}" {{height_in_chars}} {{width_in_chars}}
```

- Customize the text on the yes/no buttons:

```
whiptail --title "{{title}}" --yes-button "{{text}}" --no-
button "{{text}}" --yesno "{{message}}" {{height_in_chars}}
{{width_in_chars}}
```

- Display a text input box:

```
{{result_variable_name}}="$(whiptail --title "{{title}}" --
inputbox "{{message}}" {{height_in_chars}} {{width_in_chars}}
{{default_text}} 3>&1 1>&2 2>&3)"
```

- Display a password input box:

```
{{result_variable_name}}="$(whiptail --title "{{title}}" --
passwordbox "{{message}}" {{height_in_chars}}
{{width_in_chars}} 3>&1 1>&2 2>&3)"
```

- Display a multiple-choice menu:

```
{{result_variable_name}}=$(whiptail --title "{{title}}" --
menu "{{message}}" {{height_in_chars}} {{width_in_chars}}
{{menu_display_height}} {{"value_1" "display_text_1"
"value_2" "display_text_2" ...}} 3>&1 1>&2 2>&3)
```

wifi-menu

Interactively connect to a wireless network.

More information: https://manned.org/wifi-menu.

- Set up a wireless connection interactively:

```
wifi-menu
```

- Interactively set up a connection to a network and obscure the password:

```
wifi-menu {{[-o|--obscure]}}
```

- Display help:

```
wifi-menu {{[-h|--help]}}
```

wine net

Start, stop, and list Windows services in a Wine prefix.

A reimplementation of a subset of the Windows **net** command.

More information: https://gitlab.winehq.org/wine/wine/-/wikis/Commands.

- List the currently running services:

```
wine net start
```

- Start a specific service:

```
wine net start {{service_name}}
```

- Stop a running service:

```
wine net stop {{service_name}}
```

- List the current network connections:

```
wine net use
```

- Display help:

```
wine net help
```

wine reg add

Add new keys and values to the Wine registry.

More information: https://learn.microsoft.com/windows-server/administration/windows-commands/reg-add.

- Add a new registry key:

```
wine reg add '{{HKEY_CURRENT_USER\path\to\key}}'
```

- Add a [v]alue with specific [d]ata under a key:

```
wine reg add '{{HKEY_CURRENT_USER\path\to\key}}' /v
{{value_name}} /d {{data}}
```

- Add a value with a specific data [t]ype (defaults to `REG_SZ`):

```
wine reg add '{{HKEY_CURRENT_USER\path\to\key}}' /v
{{value_name}} /t {{REG_SZ|REG_DWORD|REG_QWORD|REG_BINARY|
REG_MULTI_SZ|REG_EXPAND_SZ|REG_NONE}} /d {{data}}
```

- Set the default (unnamed) value of a key:

```
wine reg add '{{HKEY_CURRENT_USER\path\to\key}}' /ve /d
{{data}}
```

- Add a `REG_MULTI_SZ` value, specifying the string [s]eparator character:

```
wine reg add '{{HKEY_CURRENT_USER\path\to\key}}' /v
{{value_name}} /t REG_MULTI_SZ /s {{#}} /d
'{{string1#string2#string3}}'
```

- [f]orcefully overwrite an existing value without prompting for confirmation:

```
wine reg add '{{HKEY_CURRENT_USER\path\to\key}}' /v
{{value_name}} /d {{data}} /f
```

- Display help:

```
wine reg add /?
```

wine reg copy

Copy a registry key to a new location within the Wine registry.

More information: https://learn.microsoft.com/windows-server/administration/windows-commands/reg-copy.

- Copy a registry key to a new location:

```
wine reg copy '{{HKEY_CURRENT_USER\path\to\source_key}}'
'{{HKEY_CURRENT_USER\path\to\destination_key}}'
```

- Recursively copy a key together with all its [s]ubkeys and values:

```
wine reg copy '{{HKEY_CURRENT_USER\path\to\source_key}}'
'{{HKEY_CURRENT_USER\path\to\destination_key}}' /s
```

- [f]orcefully overwrite the destination without prompting for confirmation:

```
wine reg copy '{{HKEY_CURRENT_USER\path\to\source_key}}'
'{{HKEY_CURRENT_USER\path\to\destination_key}}' /f
```

- Recursively and [f]orcefully copy a key, overwriting the destination:

```
wine reg copy '{{HKEY_CURRENT_USER\path\to\source_key}}'
'{{HKEY_CURRENT_USER\path\to\destination_key}}' /s /f
```

- Display help:

```
wine reg copy /?
```

wine reg delete

Delete keys and values from the Wine registry.

More information: https://learn.microsoft.com/windows-server/administration/windows-commands/reg-delete.

- Delete a registry key and all of its values:

```
wine reg delete '{{HKEY_CURRENT_USER\path\to\key}}'
```

- Delete a specific [v]alue under a key:

```
wine reg delete '{{HKEY_CURRENT_USER\path\to\key}}' /v
{{value_name}}
```

- Delete the default (unnamed) value of a key:

```
wine reg delete '{{HKEY_CURRENT_USER\path\to\key}}' /ve
```

- Delete all values under a key without removing the key itself:

```
wine reg delete '{{HKEY_CURRENT_USER\path\to\key}}' /va
```

- [f]orcefully delete without prompting for confirmation:

```
wine reg delete '{{HKEY_CURRENT_USER\path\to\key}}' /f
```

- Display help:

```
wine reg delete /?
```

wine reg export

Export keys, values, and data from the Wine registry to a `.reg` file.

More information: https://learn.microsoft.com/windows-server/administration/windows-commands/reg-export.

- Export a registry key and its subkeys to a file:

```
wine reg export '{{HKEY_CURRENT_USER\path\to\key}}' {{path/to/file.reg}}
```

- Export an entire registry hive to a file:

```
wine reg export {{HKEY_CURRENT_USER}} {{path/to/file.reg}}
```

- Overwrite the output file if it already exists, without prompting:

```
wine reg export '{{HKEY_CURRENT_USER\path\to\key}}' {{path/to/file.reg}} /y
```

- Display help:

```
wine reg export /?
```

wine reg import

Import keys, values, and data into the Wine registry from a `.reg` file.

More information: https://learn.microsoft.com/windows-server/administration/windows-commands/reg-import.

- Import registry entries from a file:

```
wine reg import {{path/to/file.reg}}
```

- Display help:

```
wine reg import /?
```

wine reg query

Display keys, values, and data in the Wine registry.

More information: https://gitlab.winehq.org/wine/wine/-/wikis/Commands.

- Display all values directly under a key:

```
wine reg query '{{HKEY_CURRENT_USER\path\to\key}}'
```

- Display a specific [v]alue of a key:

```
wine reg query '{{HKEY_CURRENT_USER\path\to\key}}' /v
{{value_name}}
```

- Display the default (unnamed) value of a key:

```
wine reg query '{{HKEY_CURRENT_USER\path\to\key}}' /ve
```

- Recursively display a key together with all its [s]ubkeys and values:

```
wine reg query '{{HKEY_CURRENT_USER\path\to\key}}' /s
```

- Display help:

```
wine reg query /?
```

wine reg

Manage keys and their values in the Wine registry.

Some subcommands such as **`add`**, **`delete`**, **`query`**, etc. have their own usage documentation.

More information: https://gitlab.winehq.org/wine/wine/-/wikis/Commands.

- Add or overwrite a value under a key (creating the key if needed):

```
wine reg add '{{HKEY_CURRENT_USER\path\to\key}}' /v
{{value_name}} /d {{data}} /f
```

- Display the values stored under a key:

```
wine reg query '{{HKEY_CURRENT_USER\path\to\key}}'
```

- Delete a value from a key:

```
wine reg delete '{{HKEY_CURRENT_USER\path\to\key}}' /v
{{value_name}} /f
```

- Copy a key and all its subkeys to a new location:

```
wine reg copy '{{HKEY_CURRENT_USER\path\to\source_key}}'
'{{HKEY_CURRENT_USER\path\to\destination_key}}' /s
```

- Export a key and its subkeys to a `.reg` file:

```
wine reg export '{{HKEY_CURRENT_USER\path\to\key}}' {{path/
to/file.reg}}
```

- Import registry entries from a `.reg` file:

```
wine reg import {{path/to/file.reg}}
```

- Display help:

```
wine reg /?
```

wine sc

Create, query, and control Windows services in a Wine prefix.

A reimplementation of the Windows **sc** service control command.

More information: https://gitlab.winehq.org/wine/wine/-/wikis/Commands.

- Query the status of a service:

```
wine sc query {{service_name}}
```

- Create a new service from an executable (note the space after `binpath=`):

```
wine sc create {{service_name}} binpath= {{C:
\path\to\service.exe}}
```

- Start or stop a service:

```
wine sc {{start|stop}} {{service_name}}
```

- Set the description of a service:

```
wine sc description {{service_name}} "{{description_text}}"
```

- Delete a service:

```
wine sc delete {{service_name}}
```

- Display help:

```
wine sc /?
```

wine start

Launch a program or open a document in a Wine prefix.

A reimplementation of the Windows **`start`** command.

More information: https://gitlab.winehq.org/wine/wine/-/wikis/Commands.

- Launch a Windows program:

```
wine start {{path\to\program.exe}}
```

- Open a document with its associated program:

```
wine start {{path\to\document.ext}}
```

- Launch a program from a Unix-style path:

```
wine start /unix {{path/to/program.exe}}
```

- Launch a program and wait for it to exit, returning its exit code:

```
wine start /wait {{path\to\program.exe}}
```

- Launch a program minimized or maximized:

```
wine start {{/min|/max}} {{path\to\program.exe}}
```

- Launch a program from a specific working [d]irectory:

```
wine start /d {{path\to\directory}} {{path\to\program.exe}}
```

- Launch a program without opening a new console window:

```
wine start /b {{path\to\program.exe}}
```

- Display help:

```
wine start /?
```

wine uninstaller

List and remove Windows applications installed in a Wine prefix.

More information: https://gitlab.winehq.org/wine/wine/-/wikis/Commands.

- Open the graphical "Add/Remove Programs" dialog:

```
wine uninstaller
```

- List all installed applications and their registry keys:

```
wine uninstaller --list
```

- Remove a specific application by its registry key:

```
wine uninstaller --remove {{registry_key}}
```

- Display help:

```
wine uninstaller --help
```

wine

Run Windows executables on Unix-based systems.

More information: https://gitlab.winehq.org/wine/wine/-/wikis/Commands.

- Run a specific program inside the `wine` environment:

```
wine {{command}}
```

- Run a specific program in background:

```
wine start {{command}}
```

- Install/uninstall an MSI package:

```
wine msiexec /{{i|x}} {{path/to/package.msi}}
```

- Run `File Explorer`, `Notepad`, or `WordPad`:

```
wine {{explorer|notepad|write}}
```

- Run `Registry Editor`, `Control Panel`, or `Task Manager`:

```
wine {{regedit|control|taskmgr}}
```

- Open a virtual Wine desktop:

```
wine explorer /desktop={{shell}},{{1920x1080}}
```

- Run the configuration tool:

```
wine winecfg
```

- Add a registry key:

```
wine reg add '{{path\to\registry_key}}' /v {{Value_name}} /t
{{REG_SZ|REG_BINARY|REG_DWORD|...}} /d '{{data}}'
```

wineboot

Simulate a Windows reboot, or initialize, update, or shut down a Wine prefix.

More information: https://manned.org/wineboot.

- Perform a simulated reboot of the Wine prefix:

```
wineboot
```

- Initialize or update the prefix (e.g. after upgrading Wine):

```
wineboot {{[-u|--update]}}
```

- Restart Wine without performing a full boot:

```
wineboot {{[-r|--restart]}}
```

- Shut down the Wine session without rebooting:

```
wineboot {{[-s|--shutdown]}}
```

- End the current session, forcing unresponsive processes to close:

```
wineboot {{[-ef|--end-session --force]}}
```

- Kill all processes in the prefix without any cleanup:

```
wineboot {{[-k|--kill]}}
```

- Display help:

```
wineboot {{[-h|--help]}}
```

winecfg

Configure a Wine prefix (drives, libraries, graphics, and the emulated Windows version).

More information: https://manned.org/winecfg.

- Open the graphical Wine configuration tool:

```
winecfg
```

- Display the Windows [v]ersion the prefix currently emulates:

```
winecfg /v
```

- Set the Windows [v]ersion the prefix emulates:

```
winecfg /v {{win11|win10|win7|winxp|...}}
```

- Display help:

```
winecfg /?
```

winedbg

The Wine debugger, for debugging Windows and Winelib applications.

More information: https://manned.org/winedbg.

- Launch a program under the debugger:

```
winedbg {{path/to/program.exe}}
```

- Attach to an already-running process by its PID:

```
winedbg {{process_id}}
```

- Debug a program through a gdb proxy (drive it from gdb):

```
winedbg --gdb {{path/to/program.exe}}
```

- Load and inspect a minidump crash file:

```
winedbg {{path/to/crash.mdmp}}
```

- Display help:

```
winedbg --help
```

winedump

Dump the contents of Windows binaries (PE, NE, etc.), demangle C++ symbols, and generate Wine **`.spec`** files.

More information: https://manned.org/winedump.

- Dump the contents of a PE file, DLL, or executable:

```
winedump dump {{path/to/file.dll}}
```

- Dump only the [f]ile header information:

```
winedump dump -f {{path/to/file.dll}}
```

- Dump a specific section, such as the import or export table:

```
winedump dump -j {{import|export}} {{path/to/file.dll}}
```

- Demangle a C++ (MSVC-mangled) symbol:

```
winedump sym {{mangled_symbol}}
```

- Generate a `.spec` file and stub implementation code from a DLL:

```
winedump spec {{path/to/file.dll}}
```

- Display help:

```
winedump -h
```

winemaker

Generate build files to port Windows source code to a Winelib application.

More information: https://manned.org/winemaker.

- Generate build files for a source tree (assumes a graphical application):

```
winemaker {{path/to/source_directory}}
```

- Treat the target as a console application:

```
winemaker --console {{path/to/source_directory}}
```

- Treat the target as a DLL:

```
winemaker --dll {{path/to/source_directory}}
```

- Generate build files without modifying or renaming the original sources:

```
winemaker --nosource-fix {{path/to/source_directory}}
```

- Process a project that uses MFC:

```
winemaker --mfc {{path/to/source_directory}}
```

- Display help:

```
winemaker --help
```

winepath

Convert file paths between Windows and Unix formats for a Wine prefix.

More information: https://manned.org/winepath.

- Convert a Windows path to a Unix path:

```
winepath {{[-u|--unix]}} '{{C:\path\to\file}}'
```

- Convert a Unix path to a long Windows path:

```
winepath {{[-w|--windows]}} {{path/to/file}}
```

- Convert a short (8.3) Windows path of an existing file to its long form:

```
winepath {{[-l|--long]}} '{{C:\PROGRA~1}}'
```

- Convert a long Windows path of an existing file to its short (8.3) form:

```
winepath {{[-s|--short]}} '{{C:\Program Files}}'
```

- Separate output paths with a null character instead of a newline:

```
winepath {{[-u|--unix]}} -0 {{path1 path2 ...}}
```

- Display help:

```
winepath {{[-h|--help]}}
```

wineserver

Manage the Wine server, the daemon that backs each Wine prefix.

More information: https://manned.org/wineserver.

- Kill the current Wine server, terminating all of its Wine processes:

```
wineserver {{[-k|--kill]}}
```

- Wait until the current Wine server has finished:

```
wineserver {{[-w|--wait]}}
```

- Keep the server persistent so it does not exit when the last process closes:

```
wineserver {{[-p|--persistent]}}
```

- Display help:

```
wineserver {{[-h|--help]}}
```

- Display version:

```
wineserver {{[-v|--version]}}
```

winetricks

Manage Wine virtual Windows environments.

More information: https://gitlab.winehq.org/wine/wine/-/wikis/Winetricks.

- Start a graphical setup at the default Wine location:

```
winetricks
```

- Specify a custom Wine directory to run Winetricks in:

```
WINEPREFIX={{path/to/wine_directory}} winetricks
```

- Install a Windows DLL or component to the default Wine directory:

```
winetricks {{package}}
```

wipefs

Wipe filesystem, raid, or partition-table signatures from a device.

More information: https://manned.org/wipefs.

- Display signatures for specified device:

```
sudo wipefs {{/dev/sdX}}
```

- Wipe all available signature types for a specific device with no recursion into partitions:

```
sudo wipefs {{[-a|--all]}} {{/dev/sdX}}
```

- Wipe all available signature types for the device and partitions using a `glob` pattern:

```
sudo wipefs {{[-a|--all]}} {{/dev/sdX}}*
```

- Simulate wiping all signature types from a device without actually modifying it:

```
sudo wipefs {{[-a|--all]}} {{[-n|--no-act]}} {{/dev/sdX}}
```

- Force wipe, even if the filesystem is mounted:

```
sudo wipefs {{[-a|--all]}} {{[-f|--force]}} {{/dev/sdX}}
```

wireplumber

A modular session/policy manager for PipeWire and a GObject-based high-level library that wraps PipeWire's API.

See also: **`wpctl`**, **`pipewire`**.

More information: https://pipewire.pages.freedesktop.org/wireplumber/.

- Make WirePlumber start with the user session immediately (for systemd systems):

```
systemctl enable wireplumber --user --now
```

- Run WirePlumber, after `pipewire` is started (for non-systemd systems):

```
wireplumber
```

- Specify a different context configuration file:

```
wireplumber {{[-c|--config-file]}} {{path/to/file}}
```

- Display help:

```
wireplumber {{[-h|--help]}}
```

- Display version:

```
wireplumber {{[-v|--version]}}
```

wl-copy

Clear and copy to Wayland clipboard.

See also: **`wl-paste`**, **`xclip`**.

More information: https://github.com/bugaevc/wl-clipboard.

- Copy the text to the clipboard:

```
wl-copy "{{text}}"
```

- Pipe the command (`ls`) output to the clipboard:

```
{{ls}} | wl-copy
```

- Copy for only one paste and then clear it:

```
wl-copy --paste-once "{{text}}"
```

- Copy an image:

```
wl-copy < {{path/to/image}}
```

- Clear the clipboard:

```
wl-copy --clear
```

wl-paste

Paste content in Wayland clipboard.

See also: **`wl-copy`**, **`xclip`**.

More information: https://github.com/bugaevc/wl-clipboard.

- Paste the contents of the clipboard:

```
wl-paste
```

- Paste the contents of the primary clipboard (highlighted text):

```
wl-paste --primary
```

- Write the contents of the clipboard to a file:

```
wl-paste > {{path/to/file}}
```

- Pipe the contents of the clipboard to a command:

```
wl-paste | {{command}}
```

wmctrl

CLI for X Window Manager.

More information: https://manned.org/wmctrl.

- List all windows, managed by the window manager:

```
wmctrl -l
```

- Switch to the first window whose (partial) title matches:

```
wmctrl -a {{window_title}}
```

- Move a window to the current workspace, raise it, and give it focus:

```
wmctrl -R {{window_title}}
```

- Switch to a workspace:

```
wmctrl -s {{workspace_number}}
```

- Select a window and toggle fullscreen:

```
wmctrl -r {{window_title}} -b toggle,fullscreen
```

- Select a window and move it to a workspace:

```
wmctrl -r {{window_title}} -t {{workspace_number}}
```

wodim

This command is an alias of **`cdrecord`**.

- View documentation for the original command:

```
tldr cdrecord
```

woeusb

Windows media creation tool.

More information: https://manned.org/woeusb.

- Format a USB then create a bootable Windows installation drive:

```
sudo woeusb {{[-d|--device]}} {{path/to/windows.iso}} {{/dev/sdX}}
```

- Copy Windows files to an existing partition of a USB storage device and make it bootable, without erasing the current data:

```
woeusb {{[-p|--partition]}} {{path/to/windows.iso}} {{/dev/sdXN}}
```

wofi

An application launcher for wlroots-based Wayland compositors, similar to **`rofi`** and **`dmenu`**.

More information: https://manned.org/wofi.

- Show the list of apps:

```
wofi {{[-S|--show]}} drun
```

- Show the list of all commands:

```
wofi {{[-S|--show]}} run
```

- Pipe a list of items to `stdin` and print the selected item to `stdout`:

```
printf "{{Choice1\nChoice2\nChoice3}}" | wofi {{[-d|--dmenu]}}
```

wol

Client for sending Wake-on-LAN magic packets.

More information: https://sourceforge.net/projects/wake-on-lan/.

- Send a WoL packet to a device:

```
wol {{mac_address}}
```

- Send a WoL packet to a device in another subnet based on its IP:

```
wol {{[-i|--ipaddr]}} {{ip_address}} {{mac_address}}
```

- Send a WoL packet to a device in another subnet based on its hostname:

```
wol {{[-h|--host]}} {{hostname}} {{mac_address}}
```

- Send a WoL packet to a specific port on a host:

```
wol {{[-p|--port]}} {{port_number}} {{mac_address}}
```

- Read hardware addresses, IP addresses/hostnames, optional ports, and SecureON passwords from a file:

```
wol {{[-f|--file]}} {{path/to/file}}
```

- Turn on verbose output:

```
wol {{[-v|--verbose]}} {{mac_address}}
```

wpa_cli

Add and configure Wi-Fi interfaces.

More information: https://manned.org/wpa_cli.

- Scan for available networks:

```
sudo wpa_cli scan
```

- Show scan results:

```
sudo wpa_cli scan_results
```

- Add a network:

```
sudo wpa_cli {{[add_n|add_network]}} {{number}}
```

- Set a network's SSID:

```
sudo wpa_cli {{[set_n|set_network]}} {{number}} ssid
"{{ssid}}"
```

- Enable network:

```
sudo wpa_cli {{[en|enable_network]}} {{number}}
```

- Save config:

```
sudo wpa_cli {{[sa|save_config]}}
```

wpa_passphrase

Generate a WPA-PSK key from an ASCII passphrase for a SSID.

More information: https://manned.org/wpa_passphrase.1.

- Compute and display the WPA-PSK key for a given SSID reading the passphrase from `stdin`:

```
wpa_passphrase {{ssid}}
```

- Compute and display WPA-PSK key for a given SSID specifying the passphrase as an argument:

```
wpa_passphrase {{ssid}} {{passphrase}}
```

wpctl settings

Manage WirePlumber runtime settings.

More information: https://pipewire.pages.freedesktop.org/wireplumber/daemon/configuration/configuration_option_types.html.

- List all settings:

```
wpctl settings
```

- View the value of a specific setting:

```
wpctl settings {{setting_id}}
```

- Set the whole system to have mono audio:

```
wpctl settings node.features.audio.mono true
```

- Set if disconnecting speakers will pause playback:

```
wpctl settings linking.pause-playback {{true|false}}
```

wpctl

Manage WirePlumber, a session and policy manager for PipeWire.

Note: You can use the special name **`@DEFAULT_SINK@`** in place of **`id`** to operate on the default sink.

See also: **`pw-cli`**.

More information: https://pipewire.pages.freedesktop.org/wireplumber/.

- List all objects managed by WirePlumber:

```
wpctl status
```

- Print all properties of an object:

```
wpctl inspect {{object_id}}
```

- Set an object to be the default in its group:

```
wpctl set-default {{object_id}}
```

- Get the volume of a sink:

```
wpctl get-volume {{sink_id}}
```

- Set the volume of a sink to n percent:

```
wpctl set-volume {{sink_id}} {{n}}%
```

- Increase/Decrease the volume of a sink by n percent:

```
wpctl set-volume {{sink_id}} {{n}}%{{+|-}}
```

- Increase the volume of a sink by n percent but limit the volume below 100%:

```
wpctl set-volume {{[-l|--limit]}} 1 {{sink_id}} {{n}}%-
```

- Mute/Unmute the default audio sink or source (1 is mute, 0 is unmute):

```
wpctl set-mute @DEFAULT_{{SINK|SOURCE}}@ {{1|0|toggle}}
```

wpexec

Run WirePlumber Lua scripts.

See also: **`wpctl`**, **`wireplumber`**.

More information: https://pipewire.pages.freedesktop.org/wireplumber/scripting/lua_api/lua_introduction.html.

- Run a WirePlumber script:

```
wpexec {{path/to/file.lua}}
```

- Display help:

```
wpexec --help
```

write

Write a message on the terminal of a specified logged in user (**<Ctrl c>** to stop writing messages).

Use the **who** command to find out all terminal_ids of all active users active on the system.

See also: **mesg**.

More information: https://manned.org/write.

- Send a message to a given user on a given terminal ID:

```
write {{username}} {{terminal_id}}
```

- Send message to "testuser" on terminal `/dev/tty/5`:

```
write {{testuser}} {{tty/5}}
```

- Send message to "johndoe" on pseudo terminal `/dev/pts/5`:

```
write {{johndoe}} {{pts/5}}
```

wtf

Show the expansions of acronyms.

More information: https://manned.org/wtf.

- Expand a given acronym:

```
wtf {{IMO}}
```

- Specify a computer related search type:

```
wtf -t {{comp}} {{WWW}}
```

wtype

Simulate keyboard input on Wayland, similar to **`xdotool type`** for X11.

See also: **`ydotool`**.

More information: https://manned.org/wtype.

- Simulate typing text:

```
wtype "{{Hello World}}"
```

- Type a specific key:

```
wtype -k {{Left}}
```

- Press a modifier:

```
wtype -M {{shift|ctrl|...}}
```

- Release a modifier:

```
wtype -m {{ctrl}}
```

- Wait between keystrokes (in milliseconds):

```
wtype -d {{500}} -- "{{text}}"
```

- Read text from `stdin`:

```
echo "{{text}}" | wtype -
```

x0vncserver

TigerVNC Server for X displays.

More information: https://tigervnc.org/doc/x0vncserver.html.

- Start a VNC server using a passwordfile:

```
x0vncserver -display {{:0}} -passwordfile {{path/to/file}}
```

- Start a VNC server using a specific port:

```
x0vncserver -display {{:0}} -rfbport {{port}}
```

x11vnc

A VNC server that will enable VNC on an existing display server.

By default, the server will automatically terminate once all clients disconnect from it.

More information: https://manned.org/x11vnc.

- Launch a VNC server that allows multiple clients to connect:

```
x11vnc -shared
```

- Launch a VNC server in view-only mode, and which won't terminate once the last client disconnects:

```
x11vnc -forever -viewonly
```

- Launch a VNC server on a specific display and screen (both starting at index zero):

```
x11vnc -display :{{display}}.{{screen}}
```

- Launch a VNC server on the third display's default screen:

```
x11vnc -display :{{2}}
```

- Launch a VNC server on the first display's second screen:

```
x11vnc -display :{{0}}.{{1}}
```

x86_64

This command is an alias of **`setarch x86_64`**.

- View documentation for the original command:

  `tldr setarch`

xauth

Edit and display the authorization information used in connecting to the X server.

More information: https://manned.org/xauth.

- Start interactive mode with a specific authority file (defaults to `~/.Xauthority`):

```
xauth -f {{path/to/file}}
```

- Display information about the authority file:

```
xauth info
```

- Display authorization entries for all the displays:

```
xauth list
```

- Add an authorization for a specific display:

```
xauth add {{display_name}} {{protocol_name}} {{key}}
```

- Remove the authorization for a specific display:

```
xauth remove {{display_name}}
```

- Print the authorization entry for the current display to `stdout`:

```
xauth extract - $DISPLAY
```

- Merge the authorization entries from a specific file into the authorization database:

```
cat {{path/to/file}} | xauth merge -
```

- Display help:

```
xauth --help
```

xbacklight

Utility to adjust backlight brightness using the RandR extension.

More information: https://manned.org/xbacklight.

- Get the current screen brightness as a percentage:

```
xbacklight
```

- Set the screen brightness to 40%:

```
xbacklight -set {{40}}
```

- Increase current brightness by 25%:

```
xbacklight -inc {{25}}
```

- Decrease current brightness by 75%:

```
xbacklight -dec {{75}}
```

- Increase backlight to 100%, over 60 seconds (value given in ms), using 60 steps:

```
xbacklight -set {{100}} -time {{60000}} -steps {{60}}
```

xbanish

Hide the X11 cursor when a key is pressed and turn it back on when the mouse is used.

More information: https://manned.org/xbanish.

- Hide the cursor on key press:

```
xbanish
```

- Always keep the cursor hidden, ignoring key presses and mouse usage:

```
xbanish -a
```

- Automatically hide the cursor after n seconds of inactivity:

```
xbanish -t {{n}}
```

xbps-install

XBPS utility to (re)install and update packages.

See also: **xbps**.

More information: https://manned.org/xbps-install.

- Install a new package:

```
xbps-install {{package}}
```

- Synchronize and update all packages:

```
xbps-install {{[-Su|--sync --update]}}
```

xbps-query

XBPS utility to query for package and repository information.

See also: **xbps**.

More information: https://manned.org/xbps-query.

- Search for a package in remote repositories using a `regex` or a keyword (if `--regex` is omitted):

```
xbps-query {{[-s|--search]}} {{regex|keyword}} --repository --regex
```

- Show information about an installed package:

```
xbps-query {{[-S|--show]}} {{package}}
```

- Show information about a package in remote repositories:

```
xbps-query {{[-S|--show]}} {{package}} --repository
```

- List packages registered in the package database:

```
xbps-query {{[-l|--list-pkgs]}}
```

- List explicitly installed packages (i.e. not automatically installed as dependencies):

```
xbps-query {{[-m|--list-manual-pkgs]}}
```

xbps-remove

XBPS utility to remove packages.

See also: **xbps**.

More information: https://manned.org/xbps-remove.

- Remove a package:

```
xbps-remove {{package}}
```

- Remove a package and its dependencies:

```
xbps-remove {{[-R|--recursive]}} {{package}}
```

- Remove orphan packages (installed as dependencies but no longer required by any package):

```
xbps-remove {{[-o|--remove-orphans]}}
```

- Remove obsolete packages from the cache:

```
xbps-remove {{[-O|--clean-cache]}}
```

xbps

The X Binary Package System is the package manager used by Void Linux.

For equivalent commands in other package managers, see https://wiki.archlinux.org/title/Pacman/Rosetta.

Note: **xbps** isn't a command, but a set of commands.

More information: https://docs.voidlinux.org/xbps/index.html.

- View documentation for installing and updating packages:

```
tldr xbps-install
```

- View documentation for removing packages:

```
tldr xbps-remove
```

- View documentation for querying for package and repository information:

```
tldr xbps-query
```

xclip

X11 clipboard manipulation tool, similar to **`xsel`**.

Handles the X primary and secondary selections, plus the system clipboard (**`<Ctrl c>`**/**`<Ctrl v>`**).

See also: **`wl-copy`**.

More information: https://manned.org/xclip.

- Copy the output from a command to the X11 primary selection area (clipboard):

```
echo 123 | xclip
```

- Copy the output from a command to a given X11 selection area:

```
echo 123 | xclip {{[-se|-selection]}} {{primary|secondary|clipboard}}
```

- Copy the output from a command to the system clipboard, using short notation:

```
echo 123 | xclip {{[-se|-selection]}} {{[c|clipboard]}}
```

- Copy the contents of a file into the system clipboard:

```
xclip {{[-se|-selection]}} {{[c|clipboard]}} {{path/to/input_file.txt}}
```

- Copy the contents of a PNG into the system clipboard (can be pasted in other programs correctly):

```
xclip {{[-se|-selection]}} {{[c|clipboard]}} {{[-t|-target]}} image/png {{path/to/input_file.png}}
```

- Copy the user input in the console into the system clipboard:

```
xclip {{[-i|-in]}}
```

- Paste the contents of the X11 primary selection area to the console:

```
xclip {{[-o|-out]}}
```

- Paste the contents of the system clipboard to the console:

```
xclip {{[-o|-out]}} {{[-se|-selection]}} {{[c|clipboard]}}
```

xclock

Display the time in analog or digital form.

More information: https://manned.org/xclock.

- Display an analog clock:

```
xclock
```

- Display a 24-hour digital clock with the hour and minute fields only:

```
xclock -digital -brief
```

- Display a digital clock using a strftime format string (see strftime(3)):

```
xclock -digital -strftime {{format}}
```

- Display a 24-hour digital clock with the hour, minute, and second fields that updates every second:

```
xclock -digital -strftime '%H:%M:%S' -update 1
```

- Display a 12-hour digital clock with the hour and minute fields only:

```
xclock -digital -twelve -brief
```

xcowsay

Display a cute cow and message on your Linux desktop.

The cow is displayed for either a fixed amount of time, or an amount of time calculated from the size of the text. Click on the cow to dismiss it immediately.

More information: https://manned.org/xcowsay.

- Display a cow saying "hello, world":

```
xcowsay "{{hello, world}}"
```

- Display a cow with output from another command:

```
ls | xcowsay
```

- Display a cow at the specified X and Y coordinates:

```
xcowsay --at {{X}},{{Y}}
```

- Display a different sized cow:

```
xcowsay --cow-size {{small|med|large}}
```

- Display a thought bubble instead of a speech bubble:

```
xcowsay --think
```

- Display a different image instead of the default cow:

```
xcowsay --image {{path/to/file}}
```

xcursorgen

Create an X cursor file from a collection of PNGs.

If **`--prefix`** is omitted, the image files must be located in the current working directory.

More information: https://manned.org/xcursorgen.

- Create an X cursor file using a configuration file:

```
xcursorgen {{path/to/config.cursor}} {{path/to/output_file}}
```

- Create an X cursor file using a configuration file and specify the path to the image files:

```
xcursorgen --prefix {{path/to/image_directory}}/ {{path/to/config.cursor}} {{path/to/output_file}}
```

- Create an X cursor file using a configuration file and write the output to `stdout`:

```
xcursorgen {{path/to/config.cursor}}
```

xdg-desktop-menu

Install or uninstall desktop menu items.

More information: https://manned.org/xdg-desktop-menu.

- Install an application to the desktop menu system:

```
xdg-desktop-menu install {{path/to/file.desktop}}
```

- Install an application to the desktop menu system with the vendor prefix check disabled:

```
xdg-desktop-menu install --novendor {{path/to/file.desktop}}
```

- Uninstall an application from the desktop menu system:

```
xdg-desktop-menu uninstall {{path/to/file.desktop}}
```

- Force an update of the desktop menu system:

```
xdg-desktop-menu forceupdate --mode {{user|system}}
```

xdg-mime

Query and manage MIME types according to the XDG standard.

More information: https://portland.freedesktop.org/doc/xdg-mime.html.

- Display the MIME type of a file:

```
xdg-mime query filetype {{path/to/file}}
```

- Display the default application for opening PNGs:

```
xdg-mime query default {{image/png}}
```

- Display the default application for opening a specific file:

```
xdg-mime query default $(xdg-mime query filetype {{path/to/file}})
```

- Set imv as the default application for opening PNG and JPEG images:

```
xdg-mime default {{imv.desktop}} {{image/png}} {{image/jpeg}}
```

xdg-open

Open a file or URL in the user's preferred application.

More information: https://portland.freedesktop.org/doc/xdg-open.html.

- Open the current directory in the default file explorer:

```
xdg-open .
```

- Open a URL in the default browser:

```
xdg-open {{https://example.com}}
```

- Open an image in the default image viewer:

```
xdg-open {{path/to/image}}
```

- Open a PDF in the default PDF viewer:

```
xdg-open {{path/to/pdf}}
```

- Display help:

```
xdg-open --help
```

xdg-settings

Manage settings of XDG-compatible desktop environments.

More information: https://portland.freedesktop.org/doc/xdg-settings.html.

- Print the default web browser:

```
xdg-settings get default-web-browser
```

- Set the default web browser to Firefox:

```
xdg-settings set default-web-browser {{firefox.desktop}}
```

- Set the default mail URL scheme handler to Evolution:

```
xdg-settings set default-url-scheme-handler mailto
{{evolution.desktop}}
```

- Set the default PDF document viewer:

```
xdg-settings set {{pdf-viewer.desktop}}
```

- Display help:

```
xdg-settings --help
```

xdg-terminal-exec

Open the default terminal.

More information: https://manned.org/xdg-terminal-exec.

- Open the default terminal:

```
xdg-terminal-exec
```

- Execute a command in the default terminal:

```
xdg-terminal-exec {{command}} {{argument1 argument2 ...}}
```

- Hold the terminal open after the command has finished executing:

```
xdg-terminal-exec --hold {{command}}
```

xdg-user-dir

Retrieve XDG user directory locations.

See also: **`xdg-user-dirs-update`**.

More information: https://manned.org/xdg-user-dir.

- Display the home directory for the current user:

```
xdg-user-dir
```

- Display the location of a user directory:

```
xdg-user-dir {{DESKTOP|DOWNLOAD|TEMPLATES|PUBLICSHARE|
DOCUMENTS|MUSIC|PICTURES|VIDEOS|...}}
```

xdg-user-dirs-update

Update XDG user directories.

See also: **`xdg-user-dir`**.

More information: https://manned.org/xdg-user-dirs-update.

- Change XDG's DESKTOP directory to the specified directory:

```
xdg-user-dirs-update --set DESKTOP "/{{path/to/directory}}"
```

- Create any missing directories:

```
xdg-user-dirs-update --force
```

- Write the result to the specified file instead of the `user-dirs.dirs` file:

```
xdg-user-dirs-update --dummy-output "{{path/to/output_file}}"
--set {{xdg_user_directory}} "/{{path/to/directory}}"
```

xdotool

Automate X11 actions.

More information: https://manned.org/xdotool.

- Retrieve the X-Windows window ID of the running Firefox window(s):

```
xdotool search --onlyvisible --name firefox
```

- Perform a mouse <RightClick>:

```
xdotool click 3
```

- Get the ID of the currently active window:

```
xdotool getactivewindow
```

- Focus on the window with a specific ID:

```
xdotool windowfocus --sync {{12345}}
```

- Type a message, with a 500ms delay for each letter:

```
xdotool type --delay 500 "{{Hello world}}"
```

- Press the <Enter> key:

```
xdotool key KP_Enter
```

xdp-filter

Load and manage an eBPF XDP packet filter.

Part of the xdp-tools collection.

More information: https://github.com/xdp-project/xdp-tools/tree/main/xdp-filter#running-xdp-filter.

- Load the filter on an interface in skb (generic) mode with default allow policy:

```
sudo xdp-filter load {{[-p|--policy]}} allow {{[-m|--mode]}} skb {{network_interface}}
```

- Unload the filter from an interface:

```
sudo xdp-filter unload {{network_interface}}
```

- Deny traffic to a specific destination port:

```
sudo xdp-filter port {{destination_port}}
```

- Deny traffic from a specific source IP address:

```
sudo xdp-filter ip {{[-m|--mode]}} src {{source_ip}}
```

- Deny traffic from a specific source MAC address:

```
sudo xdp-filter ether {{[-m|--mode]}} src {{mac_address}}
```

- Poll packets and show statistics every 10000 milliseconds:

```
sudo xdp-filter poll {{[-i|--interval]}} 10000
```

xed

Edit files in Cinnamon desktop environment.

More information: https://manned.org/xed.

- Start the editor:

```
xed
```

- Open specific files:

```
xed {{path/to/file1 path/to/file2 ...}}
```

- Open files using a specific encoding:

```
xed --encoding {{WINDOWS-1252}} {{path/to/file1 path/to/
file2 ...}}
```

- Print all supported encodings:

```
xed --list-encodings
```

- Open a file and go to a specific line:

```
xed +{{10}} {{path/to/file}}
```

xeyes

Display eyes on the screen that follow the mouse cursor.

See also: **`xprop`**.

More information: https://manned.org/xeyes.

- Launch xeyes on the local machine's default display:

```
xeyes
```

- Launch xeyes on a remote machine's display 0, screen 0:

```
xeyes -display {{remote_host}}:{{0}}.{{0}}
```

xfce4-screenshooter

The XFCE4 screenshot tool.

More information: https://docs.xfce.org/apps/xfce4-screenshooter/start.

- Launch the screenshooter GUI:

```
xfce4-screenshooter
```

- Take a screenshot of the entire screen and launch the GUI to ask how to proceed:

```
xfce4-screenshooter {{[-f|--fullscreen]}}
```

- Take a screenshot of the entire screen and save it in the specified directory:

```
xfce4-screenshooter {{[-f|--fullscreen]}} {{[-s|--save]}} {{path/to/directory}}
```

- Wait some time before taking the screenshot:

```
xfce4-screenshooter {{[-d|--delay]}} {{seconds}}
```

- Take a screenshot of a region of the screen (select using the mouse):

```
xfce4-screenshooter {{[-r|--region]}}
```

- Take a screenshot of the active window, and copy it to the clipboard:

```
xfce4-screenshooter {{[-w|--window]}} {{[-c|--clipboard]}}
```

- Take a screenshot of the active window, and open it with a chosen program:

```
xfce4-screenshooter {{[-w|--window]}} {{[-o|--open]}} {{gimp}}
```

xfce4-terminal

The XFCE4 terminal emulator.

More information: https://docs.xfce.org/apps/xfce4-terminal/start.

- Open a new terminal window:

```
xfce4-terminal
```

- Set the initial title:

```
xfce4-terminal --initial-title "{{initial_title}}"
```

- Open a new tab in the current terminal window:

```
xfce4-terminal --tab
```

- Execute a command in a new terminal window:

```
xfce4-terminal --command "{{command_with_args}}"
```

- Keep the terminal around after the executed command finishes executing:

```
xfce4-terminal --command "{{command_with_args}}" --hold
```

- Open multiple new tabs, executing a command in each:

```
xfce4-terminal --tab --command "{{command1}}" --tab --command
"{{command2}}"
```

xfreerdp

Free Remote Desktop Protocol implementation.

More information: https://github.com/FreeRDP/FreeRDP/wiki/CommandLineInterface-(possibly-not-up-to-date,-check-application-help-text-for-most-up-to-date-version).

- Connect to a FreeRDP server:

```
xfreerdp /u:{{username}} /p:{{password}} /v:{{host}}
```

- Connect to a FreeRDP server with a custom window width and height:

```
xfreerdp /v:{{host}} /u:{{username}} /p:{{password}} /w:{{width_in_pixels}} /h:{{height_in_pixels}}
```

- Connect to a FreeRDP server with dynamic resolution:

```
xfreerdp /v:{{host}} /u:{{username}} /p:{{password}} /dynamic-resolution
```

- Connect to a FreeRDP server with clipboard redirection:

```
xfreerdp /v:{{host}} /u:{{username}} /p:{{password}} +clipboard
```

- Connect to a FreeRDP server ignoring any certificate checks:

```
xfreerdp /v:{{host}} /u:{{username}} /p:{{password}} /cert:ignore
```

- Connect to a FreeRDP server with a shared directory:

```
xfreerdp /v:{{host}} /u:{{username}} /p:{{password}} /drive:{{path/to/directory}},{{share_name}}
```

- Connect to a FreeRDP server and activate audio output redirection using `sys:alsa` device:

```
xfreerdp /u:{{username}} /p:{{password}} /v:{{host}} /sound:{{sys:alsa}}
```

xfreerdp3

Free Remote Desktop Protocol implementation (version 3).

More information: https://manned.org/xfreerdp3.

- Connect to a FreeRDP server:

```
xfreerdp3 /u:{{username}} /p:{{password}} /v:{{host}}
```

- Connect to a server in fullscreen mode:

```
xfreerdp3 /u:{{username}} /p:{{password}} /v:{{host}} /f
```

- Connect to a server with custom display width and height:

```
xfreerdp3 /u:{{username}} /p:{{password}} /v:{{host}} /w:
{{width_in_pixels}} /h:{{height_in_pixels}}
```

- Connect to a server with dynamic resolution scaling:

```
xfreerdp3 /u:{{username}} /p:{{password}} /v:{{host}} /
dynamic-resolution
```

- Connect to a server with clipboard redirection:

```
xfreerdp3 /u:{{username}} /p:{{password}} /v:{{host}}
+clipboard
```

- Connect to a server with a specific domain:

```
xfreerdp3 /u:{{username}} /p:{{password}} /d:{{domain}} /v:
{{host}}
```

- Connect to a server ignoring certificate checks:

```
xfreerdp3 /u:{{username}} /p:{{password}} /v:{{host}} /
cert:ignore
```

xfs_admin

Tune an XFS filesystem.

More information: https://manned.org/xfs_admin.

- Display the filesystem label:

```
sudo xfs_admin {{[-l|--list]}} {{/dev/sdX}}
```

- Set the filesystem label:

```
sudo xfs_admin {{[-L|--Label]}} "{{label}}" {{/dev/sdX}}
```

- Display the filesystem UUID:

```
sudo xfs_admin {{[-u|--uuid]}} {{/dev/sdX}}
```

- Set the filesystem UUID (use with caution):

```
sudo xfs_admin {{[-U|--UUID]}} {{uuid}} {{/dev/sdX}}
```

- Generate a new UUID for the filesystem:

```
sudo xfs_admin {{[-U|--UUID]}} generate {{/dev/sdX}}
```

- Display help:

```
xfs_admin
```

xfs_repair

Repair an XFS filesystem.

More information: https://manned.org/xfs_repair.

- Repair a partition:

```
sudo xfs_repair {{path/to/partition}}
```

xhost

Manage access control lists for X server connections.

More information: https://manned.org/xhost.

- Display the current access control list:

```
xhost
```

- Allow a specific host to connect to the X server:

```
xhost +{{hostname}}
```

- Deny a specific host from connecting to the X server:

```
xhost -{{hostname}}
```

- Allow all hosts to connect (disable access control - insecure):

```
xhost +
```

- Deny all hosts except those explicitly allowed (enable access control):

```
xhost -
```

- Remove a specific user or address using a family prefix (like `inet:hostname` or `si:localuser:username`):

```
xhost -{{family:name}}
```

xinput

List available input devices, query information about a device, and change input device settings.

More information: https://manned.org/xinput.

- List all input devices:

```
xinput list
```

- Disable an input:

```
xinput disable {{device_id}}
```

- Enable an input:

```
xinput enable {{device_id}}
```

- Disconnect an input from its master:

```
xinput float {{device_id}}
```

- Reattach an input as slave to a master:

```
xinput reattach {{device_id}} {{master_id}}
```

- List settings of an input device:

```
xinput list-props {{device_id}}
```

- Change a setting of an input device:

```
xinput set-prop {{device_id}} {{setting_id}} {{value}}
```

xman

Manual page viewer for X Window System.

More information: https://manned.org/xman.

- Start `xman` in three-button window:

  ```
  xman
  ```

- Open the manual page output stored in a given file:

  ```
  xman -helpfile {{filename}}
  ```

- Show both manual page and directory:

  ```
  xman -bothshown
  ```

xmodmap

Utility for modifying keymaps and pointer button mappings in X.

More information: https://manned.org/xmodmap.

- Swap `<LeftClick>` and `<RightClick>` on the pointer:

```
xmodmap -e 'pointer = 3 2 1'
```

- Reassign a key on the keyboard to another key:

```
xmodmap -e 'keycode {{keycode}} = {{keyname}}'
```

- Disable a key on the keyboard:

```
xmodmap -e 'keycode {{keycode}} ='
```

- Execute all xmodmap expressions in the specified file:

```
xmodmap {{path/to/file}}
```

xmount

Convert on-the-fly between multiple input and output hard disk image types with optional write cache support.

Create a virtual filesystem using FUSE (Filesystem in Userspace) that contains a virtual representation of the input image.

More information: https://manned.org/xmount.

- Mount a `.raw` image file into a DMG container file:

```
xmount --in {{raw}} {{path/to/image.dd}} --out {{dmg}} {{path/to/mount_point}}
```

- Mount an EWF image file with write-cache support into a VHD file to boot from:

```
xmount --cache {{path/to/cache.ovl}} --in {{ewf}} {{path/to/image.E??}} --out {{vhd}} {{path/to/mount_point}}
```

- Mount the first partition at sector 2048 into a new `.raw` image file:

```
xmount --offset 2048 --in {{raw}} {{path/to/image.dd}} --out raw {{path/to/mount_point}}
```

xrandr

Set the size, orientation and/or reflection of the outputs for a screen.

More information: https://www.x.org/releases/current/doc/man/man1/xrandr.1.xhtml.

- Display the current state of the system (known screens, resolutions, ...):

```
xrandr {{[-q|--query]}}
```

- Disable disconnected outputs and enable connected ones with default settings:

```
xrandr --auto
```

- Change the resolution and update frequency of DisplayPort 1 to 1920x1080, 60Hz:

```
xrandr --output DP1 --mode 1920x1080 {{[-r|--rate]}} 60
```

- Set the resolution of HDMI2 to 1280x1024 and put it on the right of DP1:

```
xrandr --output HDMI2 --mode 1280x1024 --right-of DP1
```

- Disable the VGA1 output:

```
xrandr --output VGA1 --off
```

- Set the brightness for LVDS1 to 50%:

```
xrandr --output LVDS1 --brightness 0.5
```

- Display the current state of any X server:

```
xrandr {{[-d|--display]}} :{{0}} {{[-q|--query]}}
```

xrdb

X window server's resource database utility for Unix-like systems.

More information: https://www.x.org/releases/current/doc/man/man1/xrdb.1.xhtml.

- Start `xrdb` in interactive mode:

```
xrdb
```

- Load values (e.g. style rules) from a resource file:

```
xrdb -load {{~/.Xresources}}
```

- Query the resource database and print currently set values:

```
xrdb -query
```

xsel

X11 selection and clipboard manipulation tool.

More information: https://manned.org/xsel.

- Use a command's output as input of the clipboard (equivalent to `<Ctrl c>`):

```
echo 123 | xsel {{[-ib|--input --clipboard]}}
```

- Use the contents of a file as input of the clipboard:

```
cat {{path/to/file}} | xsel {{[-ib|--input --clipboard]}}
```

- Output the clipboard's contents into the terminal (equivalent to `<Ctrl v>`):

```
xsel {{[-ob|--output --clipboard]}}
```

- Output the clipboard's contents into a file:

```
xsel {{[-ob|--output --clipboard]}} > {{path/to/file}}
```

- Clear the clipboard:

```
xsel {{[-cb|--clear --clipboard]}}
```

- Output the X11 primary selection's contents into the terminal (equivalent to a mouse `<MiddleClick>`):

```
xsel {{[-op|--output --primary]}}
```

xset

User preference utility for X.

More information: https://manned.org/xset.

- Disable the screensaver:

```
xset s off
```

- Disable the bell sound:

```
xset b off
```

- Set the screensaver to start after 60 minutes of inactivity:

```
xset s 3600 3600
```

- Disable DPMS (Energy Star) features:

```
xset -dpms
```

- Enable DPMS (Energy Star) features:

```
xset +dpms
```

- Query information on any X server:

```
xset -display :{{0}} q
```

xsetwacom

Change settings for Wacom pen tablets at runtime.

More information: https://manned.org/xsetwacom.

- List all the available Wacom devices. The device name is in the first column:

```
xsetwacom list
```

- Set Wacom area to specific screen. Get name of the screen with `xrandr`:

```
xsetwacom set "{{device_name}}" MapToOutput {{screen}}
```

- Set mode to relative (like a mouse) or absolute (like a pen) mode:

```
xsetwacom set "{{device_name}}" Mode "{{Relative|Absolute}}"
```

- Rotate the input (useful for tablet-PC when rotating screen) by 0|90|180|270 degrees from "natural" rotation:

```
xsetwacom set "{{device_name}}" Rotate {{none|half|cw|ccw}}
```

- Set button to only work when the tip of the pen is touching the tablet:

```
xsetwacom set "{{device_name}}" TabletPCButton "on"
```

xterm

A terminal emulator for the X Window System.

More information: https://manned.org/xterm.

- Open the terminal with a title of `Example`:

```
xterm -T {{Example}}
```

- Open the terminal in fullscreen mode:

```
xterm -fullscreen
```

- Open the terminal with a dark blue background and yellow foreground (font color):

```
xterm -bg {{darkblue}} -fg {{yellow}}
```

- Open the terminal with 100 characters per line and 35 lines, in screen position x=200px, y=20px:

```
xterm -geometry {{100}}x{{35}}+{{200}}+{{20}}
```

- Open the terminal using a Serif font and a font size equal to 20:

```
xterm -fa '{{Serif}}' -fs {{20}}
```

xtrlock

Lock the X display until the user supplies their password.

More information: https://manned.org/xtrlock.

- Lock the display and show a padlock instead of the cursor:

```
xtrlock
```

- Display a blank screen as well as the padlock cursor:

```
xtrlock -b
```

- Fork the xtrlock process and return immediately:

```
xtrlock -f
```

xvfb-run

Run a command in a virtual X server environment.

More information: https://manned.org/xvfb-run.

- Run the specified command in a virtual X server:

```
xvfb-run {{command}}
```

- Try to get a free server number, if the default (99) is not available:

```
xvfb-run {{[-a|--auto-servernum]}} {{command}}
```

- Pass arguments to the Xvfb server:

```
xvfb-run {{[-s|--server-args]}} "{{-screen 0
1024x768x24}}" {{command}}
```

xwinwrap

Run a player or a program as desktop background.

More information: https://github.com/r00tdaemon/xwinwrap.

- Run a video using mpv:

```
xwinwrap -b -nf -ov -- {{mpv}} --wid {{wid}} --loop --no-audio --no-resume-playback --panscan={{1.0}} {{path/to/video.mp4}}
```

- Run a video in fullscreen using mpv:

```
xwinwrap -b -nf -fs -ov -- {{mpv}} --wid {{wid}} --loop --no-audio --no-resume-playback --panscan={{1.0}} {{path/to/video.mp4}}
```

- Run a video using mpv with 80% opacity:

```
xwinwrap -b -nf -ov -o 0.8 --- {{mpv}} --wid {{wid}} --loop --no-audio --no-resume-playback --panscan={{1.0}} {{path/to/video.mp4}}
```

- Run a video using mpv in a second monitor 1600x900 with 1920 offset on X-axis:

```
xwinwrap -g 1600x900+1920 -b -nf -ov -- {{mpv}} --wid {{wid}} --loop --no-audio --no-resume-playback --panscan={{1.0}} {{path/to/video.mkv}}
```

xxhsum

Print or verify checksums using fast non-cryptographic algorithm xxHash.

More information: https://manned.org/xxhsum.

- Calculate the checksum for a file using a specific algorithm:

```
xxhsum -H{{0|32|64|128}} {{path/to/file}}
```

- Run benchmark:

```
xxhsum -b
```

yad

Display GTK+ dialogs from shell scripts.

See also: **`zenity`**.

More information: https://manned.org/yad.

- Display the contents of a file in a text information dialog:

```
yad --text-info --filename {{path/to/file}}
```

- Open a text entry dialog and return the input to `stdout`:

```
yad --entry --text "{{message}}"
```

- Open a file picker with a specific title:

```
yad --file --title "{{title_message}}"
```

- Open a date picker dialog with a specific title:

```
yad --calendar --title "{{title_message}}"
```

- Display a list dialog with multiple columns and data:

```
yad --list --column "{{col1}}" --column
"{{col2}}" {{col1_row1 col2_row1 col1_row2 col2_row2 ...}}
```

- Open a pulsating progress bar that automatically closes at 100%:

```
{{command}} | yad --progress --pulsate --auto-close --text
"{{message}}"
```

yakuake

A drop-down terminal for KDE.

See also: **guake**.

More information: https://manned.org/yakuake.

- Start up Yakuake:

  `yakuake`

- Toggle Yakuake visibility:

  `<F12>`

- Toggle fullscreen mode:

  `<F11>`

- Open a new tab:

  `<Ctrl Shift t>`

- Switch between tabs:

  `<Shift {{ArrowLeft|ArrowRight}}>`

- Create terminal splits:

  `<Ctrl {{)|(}}>`

- Switch between splits:

  `{{<Ctrl Tab>|<Ctrl Shift Tab>}}`

yaourt

Arch Linux utility for building packages from the Arch User Repository.

More information: https://archlinux.fr/yaourt-en.

- Synchronize and update all packages (including AUR):

```
yaourt -Syua
```

- Install a new package (includes AUR):

```
yaourt -S {{package}}
```

- Remove a package and its dependencies (includes AUR packages):

```
yaourt -Rs {{package}}
```

- Search the package database for a keyword (including AUR):

```
yaourt -Ss {{query}}
```

- List installed packages, versions, and repositories (AUR packages will be listed under the repository name `local`):

```
yaourt -Q
```

yay

Yet Another Yogurt: build and install packages from the Arch User Repository.

See also: **`pacman`**.

More information: https://github.com/Jguer/yay#first-use.

- Interactively search and install packages from the repos and AUR:

```
yay {{package_name|search_term}}
```

- Synchronize and update all packages from the repos and AUR:

```
yay
```

- Install a new package from the repos and AUR and do not ask to confirm transactions:

```
yay -S {{package}} --noconfirm
```

- Remove an installed package and both its dependencies and configuration files:

```
yay -Rns {{package}}
```

- Search the package database for a keyword from the repos and AUR:

```
yay -Ss {{keyword}}
```

- Remove orphaned packages (installed as dependencies but not required by any package):

```
yay -Yc
```

- Clean `pacman` and `yay` caches (old package versions kept for rollback and downgrade purposes):

```
yay -Scc
```

- Show statistics for installed packages and system health:

```
yay -Ps
```

ydotool

Control keyboard and mouse inputs via commands in a way that is display server agnostic.

More information: https://github.com/ReimuNotMoe/ydotool#usage.

- Start the ydotool daemon in the background:

```
ydotoold
```

- Perform a `<LeftClick>` input:

```
ydotool click 0xC0
```

- Perform a `<RightClick>` input:

```
ydotool click 0xC1
```

- Input `<Alt F4>`:

```
ydotool key 56:1 62:1 62:0 56:0
```

yetris

Clone of the game Tetris in the terminal.

More information: https://github.com/alexdantas/yetris#controls.

- Start a Tetris game:

  `yetris`

- Navigate the piece horizontally:

  `{{<ArrowLeft>|<ArrowRight>}}`

- Rotate the piece clockwise or counterclockwise:

  `{{<x>|<z>}}`

- Hold a piece (only one allowed at a time):

  `<c>`

- Soft drop the piece:

  `<ArrowDown>`

- Hard drop the piece:

  `<Space>`

- Pause/unpause the game:

  `<p>`

- Quit the game:

  `<q>`

yplan

Generate LaTeX code for a two-page vertical daily planner for any chosen year.

The generated output can be converted or printed using conversion tools such as **`pandoc`**, **`pdflatex`**, or **`xetex`**.

More information: https://www.ctan.org/tex-archive/macros/latex/contrib/yplan.

- Create a daily planner with specified language, lettercase (uppercase or lowercase) and year:

```
yplan {{language}} {{lettercase}} {{year}} > {{path/to/file.tex}}
```

ytfzf

Find and download videos and music. Written in POSIX shell.

See also: **`youtube-dl`**, **`yt-dlp`**, **`instaloader`**.

More information: https://manned.org/ytfzf.

- Search for videos on YouTube with thumbnail previews:

```
ytfzf {{[-t|--show-thumbnails]}} {{search_pattern}}
```

- Play only the audio of the first item in a loop:

```
ytfzf {{[-m|--audio-only]}} {{[-a|--auto-select]}} {{[-l|--loop]}} {{search_pattern}}
```

- Download a video from the history:

```
ytfzf {{[-d|--download]}} --choose-from-history
```

- Play all the music found in a search:

```
ytfzf {{[-m|--audio-only]}} {{[-A|--select-all]}} {{search_pattern}}
```

- See the trending videos in an external menu:

```
ytfzf --trending --ext-menu {{search_pattern}}
```

- Search on PeerTube instead of YouTube:

```
ytfzf --peertube {{search_pattern}}
```

yum config-manager

This command is an alias of **`dnf config-manager`**.

- View documentation for the original command:

  ```
  tldr dnf config-manager
  ```

yum

This command is an alias of **`dnf`** on modern distros.

For older distros (e.g. CentOS 7), **`yum`** is a distinct program from **`dnf`**. Some subcommands and options may be different.

- View documentation for the original command:

```
tldr dnf
```

yumdownloader

Historical YUM package downloader for Fedora installations.

This command is an alias of **`dnf download`**.

Note: This command is deprecated, use **`dnf download`** instead.

- View documentation for the original command:

  ```
  tldr dnf download
  ```

zathura

A Vim-like modal document viewer, with an integrated command-line.

Make sure a backend is installed (poppler, PostScript, or DjVu).

More information: https://pwmt.org/projects/zathura/.

- Open a file:

```
zathura {{path/to/file}}
```

- Navigate left/up/down/right:

```
{{<h>|<j>|<k>|<l>|<ArrowKeys>}}
```

- Rotate:

```
<r>
```

- Invert Colors:

```
<Ctrl r>
```

- Search for text by a given string:

```
</>{{string}}
```

- Create/delete bookmarks:

```
<:>{{bmark|bdelete}} {{bookmark_name}}<Enter>
```

- List bookmarks:

```
<:>blist<Enter>
```

- Follow links:

```
<f>{{link_number}}<Enter>
```

zbarcam

Scan and decode barcodes (and QR codes) from a video device.

More information: https://manned.org/zbarcam.

- Continuously read barcodes and print them to `stdout`:

  `zbarcam`

- Disable output video window while scanning:

  `zbarcam --nodisplay`

- Print barcodes without type information:

  `zbarcam --raw`

- Define capture device:

  `zbarcam {{/dev/video_device}}`

zdump

Print timezone information.

More information: https://manned.org/zdump.

- Print the current time in a timezone:

```
zdump {{timezone}}
```

- Display help:

```
zdump --help
```

zenity

Display dialogs from the command-line/shell scripts.

Return user-inserted values or 1 if error.

More information: https://manned.org/zenity.

- Display the default question dialog:

```
zenity --question
```

- Display an info dialog displaying a message:

```
zenity --info --text "{{message}}"
```

- Display a name/password form and output the data separated by ";" ("|" by default):

```
zenity --forms --add-entry "{{name_label}}" --add-password "{{password_label}}" --separator ";"
```

- Display a file selection form in which the user can only select directories:

```
zenity --file-selection --directory
```

- Display a progress bar which updates its message every second and show a progress percent:

```
{{(echo "#1"; sleep 1; echo "50"; echo "#2"; sleep 1; echo "100")}} | zenity --progress
```

zforce

Add a **`.gz`** extension to files compressed using **`gzip`**.

More information: https://manned.org/zforce.

- Add a `.gz` extension to the supplied Gzip files (Note: Other files are ignored):

```
zforce {{path/to/file1 path/to/file2 ...}}
```

zic

Compile timezones into binary files.

More information: https://manned.org/zic.

- Compile a timezone file from a directory:

```
zic -d {{path/to/directory}}
```

- Report warnings during compilation of a specific file:

```
zic -v {{path/to/file}}.infile
```

zile

A lightweight clone of the Emacs text editor.

More information: https://manned.org/zile.

- Start a buffer for temporary notes, which won't be saved:

```
zile
```

- Open a file:

```
zile {{path/to/file}}
```

- Save a file:

```
<Ctrl x><Ctrl s>
```

- Quit:

```
<Ctrl x><Ctrl c>
```

- Open a file at a specified line number:

```
zile +{{line_number}} {{path/to/file}}
```

- Undo changes:

```
<Ctrl x><u>
```

zipsplit

Split a Zip archive into smaller Zip archives.

More information: https://manned.org/zipsplit.

- Split Zip archive into parts that are no larger than 36000 bytes (36 MB):

```
zipsplit {{path/to/archive.zip}}
```

- Use a given [n]umber of bytes as the part limit:

```
zipsplit -n {{size}} {{path/to/archive.zip}}
```

- [p]ause between the creation of each part:

```
zipsplit -p -n {{size}} {{path/to/archive.zip}}
```

- Output the smaller Zip archives into a given directory:

```
zipsplit -b {{path/to/output_directory}} -n {{size}} {{path/to/archive.zip}}
```

znc

IRC bouncer.

More information: https://manned.org/znc.

- Run the initial setup:

```
znc {{[-c|--makeconf]}}
```

- Start the IRC bouncer daemon:

```
znc
```

- Set up `znc` for systemd:

```
sudo {{[-u|--user]}} znc znc {{[-c|--makeconf]}} {{[-d|--datadir]}} /var/lib/znc
```

- Enable `znc` to start on boot and start it now:

```
systemctl enable znc --now
```

zramctl

Set up and control zram devices.

Use **`mkfs`** or **`mkswap`** to format zram devices to partitions.

More information: https://manned.org/zramctl.

- Check if zram is enabled:

```
lsmod | grep {{[-i|--ignore-case]}} zram
```

- Enable zram with a dynamic number of devices (use `zramctl` to configure devices further):

```
sudo modprobe zram
```

- Enable zram with exactly 2 devices:

```
sudo modprobe zram num_devices={{2}}
```

- Find and initialize the next free zram device to a 2 GB virtual drive using LZ4 compression:

```
sudo zramctl {{[-f|--find]}} {{[-s|--size]}} {{2GB}} {{[-a|--algorithm]}} {{lz4}}
```

- List currently initialized devices:

```
sudo zramctl
```

zsync

Partial/differential file downloader.

HTTPS is not supported - use HTTP URLs only.

See also: **`rsync`**.

More information: https://manned.org/zsync.

- Download a file using a `.zsync` control file:

```
zsync {{path/to/url.zsync}}
```

- Use a local file as a seed to avoid re-downloading unchanged parts:

```
zsync -i {{path/to/existing_file}} {{path/to/url.zsync}}
```

- Save the updated file under a specific name:

```
zsync -i {{path/to/existing_file}} -o {{path/to/new_file}}
{{path/to/url.zsync}}
```

- Resume a partial download and keep the temporary file:

```
zsync -k {{path/to/url.zsync}}
```

- Run in quiet mode with minimal output (no progress bar, download rate, or ETA display):

```
zsync -q {{path/to/url.zsync}}
```

zypper

SUSE & openSUSE package management utility.

For equivalent commands in other package managers, see https://wiki.archlinux.org/title/Pacman/Rosetta.

More information: https://en.opensuse.org/SDB:Zypper_manual.

- Synchronize list of packages and versions available:

```
sudo zypper {{[ref|refresh]}}
```

- Install a new package:

```
sudo zypper {{[in|install]}} {{package}}
```

- Remove a package:

```
sudo zypper {{[rm|remove]}} {{package}}
```

- Upgrade installed packages to the newest available versions:

```
sudo zypper {{[up|update]}}
```

- Search package via keyword:

```
zypper {{[se|search]}} {{keyword}}
```

- Show information related to configured repositories:

```
zypper {{[lr|repos]}} --sort-by-priority
```

Netbsd

cal

Display a calendar.

More information: https://man.netbsd.org/cal.1.

- Display a calendar for the current month:

```
cal
```

- Display a calendar for a specific year:

```
cal {{year}}
```

- Display a calendar for a specific month and year:

```
cal {{month}} {{year}}
```

- Display the whole calendar for the current year using [j]ulian days (one-based, numbered from January 1):

```
cal -y -j
```

- [h]ighlight today and display [3] months spanning the date:

```
cal -h -3 {{month}} {{year}}
```

- Display the 2 months [B]efore and 3 [A]fter a specific [m]onth of the current year:

```
cal -A 3 -B 2 {{month}}
```

- Display a specific number of months before and after ([C]ontext) the specified month:

```
cal -C {{months}} {{month}}
```

- Specify the starting [d]ay of the week (0: Sunday, 1: Monday, ..., 6: Saturday):

```
cal -d {{0..6}}
```

chfn

This command is an alias of **chpass**.

- View documentation for the original command:

  ```
  tldr chpass
  ```

chpass

Add or change user database information, including login shell and password.

See also: **passwd**.

More information: https://man.netbsd.org/chpass.1.

- Set a specific login shell for the current user interactively:

```
chpass
```

- Set a specific login [s]hell for the current user:

```
chpass -s {{path/to/shell}}
```

- Set a login [s]hell for a specific user:

```
chpass -s {{path/to/shell}} {{username}}
```

- Specify a user database entry in the `passwd` file format:

```
su -c 'chpass -a
{{username:encrypted_password:user_id:group_id:...}} -s
{{path/to/shell}}' {{username}}
```

- Only update the [l]ocal password file:

```
su -c 'chpass -l -s {{path/to/shell}}' {{username}}
```

- Forcedly change the database [y]P password database entry:

```
su -c 'chpass -y -s {{path/to/shell}}' {{username}}
```

chsh

This command is an alias of **chpass**.

- View documentation for the original command:

  ```
  tldr chpass
  ```

df

Display an overview of the filesystem disk space usage.

More information: https://man.netbsd.org/df.1.

- Display all filesystems and their disk usage (using 512-byte units):

```
df
```

- Use [h]uman-readable units (based on powers of 1024):

```
df -h
```

- Display all the fields of the structure(s) returned by `statvfs`:

```
df -G
```

- Display the filesystem containing the specified file or directory:

```
df {{path/to/file_or_directory}}
```

- Include statistics on the number of free and used [i]nodes:

```
df -i
```

- Use [k]ibibyte (1024 byte) units when showing size figures:

```
df -k
```

- Display information in a [P]ortable way:

```
df -P
```

pkgin

Manage **`pkgsrc`** binary packages on NetBSD.

More information: https://pkgin.net/#usage.

- Install a package:

```
pkgin install {{package}}
```

- Remove a package and its dependencies:

```
pkgin remove {{package}}
```

- Upgrade all packages:

```
pkgin full-upgrade
```

- Search for a package:

```
pkgin search {{keyword}}
```

- List installed packages:

```
pkgin list
```

- Remove unneeded dependencies:

```
pkgin autoremove
```

sed

Edit text in a scriptable manner.

See also: **awk**, **ed**.

More information: https://man.netbsd.org/sed.1.

- Replace all `apple` (basic `regex`) occurrences with `mango` (basic `regex`) in all input lines and print the result to `stdout`:

```
{{command}} | sed 's/apple/mango/g'
```

- Execute a specific script [f]ile and print the result to `stdout`:

```
{{command}} | sed -f {{path/to/script.sed}}
```

- Delay opening each file until a command containing the related `w` function or flag is applied to a line of input:

```
{{command}} | sed -af {{path/to/script.sed}}
```

- Turn on [g]NU `regex` extension:

```
{{command}} | sed -gf {{path/to/script.sed}}
```

- Replace all `apple` (extended `regex`) occurrences with `APPLE` (extended `regex`) in all input lines and print the result to `stdout`:

```
{{command}} | sed -E 's/(apple)/\U\1/g'
```

- Print just a first line to `stdout`:

```
{{command}} | sed -n '1p'
```

- Replace all `apple` (basic `regex`) occurrences with `mango` (basic `regex`) in a specific file and overwrite the original file in place:

```
sed -i 's/apple/mango/g' {{path/to/file}}
```

sockstat

List open Internet or UNIX domain sockets.

Note: This program is a rewrite for NetBSD 3.0 from FreeBSD's **`sockstat`**.

See also: **`netstat`**.

More information: https://man.netbsd.org/sockstat.1.

- Show information for IPv4, IPv6, and Unix sockets for both listening and connected sockets:

```
sockstat
```

- Show information for IPv[4]/IPv[6] sockets [l]istening on specific [p]orts using a specific [P]rotocol:

```
sockstat -{{4|6}} -l -P {{tcp|udp|sctp|divert}} -p {{port1,port2...}}
```

- Also show [c]onnected sockets, showing [u]nix sockets:

```
sockstat -cu
```

- Only show [n]umeric output, without resolving symbolic names for addresses and ports:

```
sockstat -n
```

- Only list sockets of the specified address [f]amily:

```
sockstat -f {{inet|inet6|local|unix}}
```

Openbsd

cal

Display a calendar with the current day highlighted.

More information: https://man.openbsd.org/cal.

- Display a calendar for the current month:

```
cal
```

- Display a calendar for a specific year:

```
cal {{year}}
```

- Display a calendar for a specific month and year:

```
cal {{month}} {{year}}
```

- Display a calendar for the current [y]ear:

```
cal -y
```

- Display [j]ulian days (starting from one, numbered from January 1):

```
cal -j
```

- Use [m]onday as week start instead of Sunday:

```
cal -m
```

- Number [w]eek numbers (incompatible with `-j`):

```
cal -w
```

chfn

This command is an alias of **chpass**.

- View documentation for the original command:

  ```
  tldr chpass
  ```

chpass

Add or change user database information, including login shell and password.

See also: **passwd**.

More information: https://man.openbsd.org/chpass.

- Set a specific login shell for the current user interactively:

```
chpass
```

- Set a specific login [s]hell for the current user:

```
doas chpass -s {{path/to/shell}}
```

- Set a login [s]hell for a specific user:

```
doas chpass -s {{path/to/shell}} {{username}}
```

- Specify a user database entry in the `passwd` file format:

```
doas chpass -a {{username:encrypted_password:uid:gid:...}}
```

chsh

This command is an alias of **chpass**.

- View documentation for the original command:

  ```
  tldr chpass
  ```

df

Display an overview of the filesystem disk space usage.

More information: https://man.openbsd.org/df.

- Display all filesystems and their disk usage (using 512-byte units):

```
df
```

- Display all filesystems in [h]uman-readable form (based on powers of 1024):

```
df -h
```

- Display the filesystem containing the specified file or directory:

```
df {{path/to/file_or_directory}}
```

- Include statistics on the number of free and used [i]nodes:

```
df -i
```

- Use [k]ibibyte (1024 byte) units when showing size figures:

```
df -k
```

- Display information in a [P]ortable way:

```
df -P
```

pkg

OpenBSD package manager utility.

More information: https://www.openbsd.org/faq/faq15.html.

- View documentation for installing/updating packages:

```
tldr pkg_add
```

- View documentation for removing packages:

```
tldr pkg_delete
```

- View documentation for viewing information about packages:

```
tldr pkg_info
```

pkg_add

Install/update packages in OpenBSD.

See also: **`pkg_info`**, **`pkg_delete`**.

More information: https://man.openbsd.org/pkg_add.

- Update all packages, including dependencies:

```
pkg_add -u
```

- Install a new package:

```
pkg_add {{package}}
```

- Install packages from the raw output of `pkg_info`:

```
pkg_add -l {{path/to/file}}
```

pkg_delete

Remove packages in OpenBSD.

See also: **`pkg_add`**, **`pkg_info`**.

More information: https://man.openbsd.org/pkg_delete.

- Delete a package:

```
pkg_delete {{package}}
```

- Delete a package, including its unused dependencies:

```
pkg_delete -a {{package}}
```

- Simulate deleting a package:

```
pkg_delete -n {{package}}
```

pkg_info

View information about packages in OpenBSD.

See also: **`pkg_add`**, **`pkg_delete`**.

More information: https://man.openbsd.org/pkg_info.

- Search for a package using the package name:

```
pkg_info -Q {{package}}
```

- Output a list of installed packages for use with `pkg_add -l`:

```
pkg_info -mz
```

sed

Edit text in a scriptable manner.

See also: **awk**, **ed**.

More information: https://man.openbsd.org/sed.

- Replace all `apple` (basic `regex`) occurrences with `mango` (basic `regex`) in all input lines and print the result to `stdout`:

```
{{command}} | sed 's/apple/mango/g'
```

- Execute a specific script [f]ile and print the result to `stdout`:

```
{{command}} | sed -f {{path/to/script.sed}}
```

- Delay opening each file until a command containing the related `w` function or flag is applied to a line of input:

```
{{command}} | sed -af {{path/to/script.sed}}
```

- Replace all `apple` (extended `regex`) occurrences with `APPLE` (extended `regex`) in all input lines and print the result to `stdout`:

```
{{command}} | sed -E 's/(apple)/\U\1/g'
```

- Print just a first line to `stdout`:

```
{{command}} | sed -n '1p'
```

- Replace all `apple` (basic `regex`) occurrences with `mango` (basic `regex`) in a specific file and overwrite the original file in place:

```
sed -i 's/apple/mango/g' {{path/to/file}}
```

Osx

aa

This command is an alias of **yaa**.

- View documentation for the original command:

```
tldr yaa
```

accessorysensormgrd

Control audio accessory sensors.

Note: It should not be invoked manually.

More information: https://keith.github.io/xcode-man-pages/accessorysensormgrd.8.html.

- Start the daemon:

```
accessorysensormgrd
```

adprivacyd

Advertising privacy services.

Note: It should not be invoked manually.

More information: https://keith.github.io/xcode-man-pages/adprivacyd.8.html.

- Start the daemon:

```
adprivacyd
```

aerospace

A tiling window manager for macOS.

More information: https://nikitabobko.github.io/AeroSpace/commands.

- Reload the configuration:

```
aerospace reload-config
```

- Switch to a workspace:

```
aerospace workspace {{workspace}}
```

- Move the focused window to a workspace:

```
aerospace move-node-to-workspace {{workspace}}
```

- Focus a window in a direction:

```
aerospace focus {{left|down|up|right}}
```

- Move the focused window in a direction:

```
aerospace move {{left|down|up|right}}
```

- List all windows:

```
aerospace list-windows --all
```

- List all workspaces:

```
aerospace list-workspaces --all
```

- Change the focused window's layout:

```
aerospace layout {{tiling|floating}}
```

afinfo

Audio file metadata parser for OS X.

Built-in command of OS X.

More information: https://keith.github.io/xcode-man-pages/afinfo.1.html.

- Display info of a given audio file:

```
afinfo {{path/to/file}}
```

- Print a one line description of the audio file:

```
afinfo --brief {{path/to/file}}
```

- Print metadata info and contents of the audio file's InfoDictionary:

```
afinfo --info {{path/to/file}}
```

- Print output in XML format:

```
afinfo --xml {{path/to/file}}
```

- Print warnings for the audio file if any:

```
afinfo --warnings {{path/to/file}}
```

- Display help:

```
afinfo --help
```

afplay

Command-line audio player.

More information: https://keith.github.io/xcode-man-pages/afplay.1.html.

- Play a sound file (waits until playback ends):

```
afplay {{path/to/file}}
```

- Play a sound file at 2x speed (playback rate):

```
afplay --rate {{2}} {{path/to/file}}
```

- Play a sound file at half speed:

```
afplay --rate {{0.5}} {{path/to/file}}
```

- Play the first n seconds of a sound file:

```
afplay --time {{n}} {{path/to/file}}
```

aiac

Use OpenAI to generate IaC configurations, utilities, queries, and more.

More information: https://github.com/gofireflyio/aiac.

- Generate Terraform for Azure storage account:

  ```
  aiac get terraform {{for an azure storage account}}
  ```

- Generate a Dockerfile for `nginx`:

  ```
  aiac get dockerfile {{for a secured nginx}}
  ```

- Generate GitHub action that applies Terraform:

  ```
  aiac get github action {{that plans and applies terraform}}
  ```

- Generate a port scanner in Python:

  ```
  aiac get python {{code that scans all open ports in my
  network}}
  ```

- Generate a MongoDB query:

  ```
  aiac get mongo {{query that aggregates all documents by
  created date}}
  ```

airport

Wireless network configuration utility.

More information: https://ss64.com/mac/airport.html.

- Show current wireless status information:

```
airport --getinfo
```

- Sniff wireless traffic on channel 1:

```
airport sniff 1
```

- Scan for available wireless networks:

```
airport --scan
```

- Disassociate from current airport network:

```
sudo airport --disassociate
```

airportd

Manage wireless interfaces.

Note: It should not be invoked manually.

More information: https://keith.github.io/xcode-man-pages/airportd.8.html.

- Start the daemon:

```
airportd
```

alwaysonexclavesd

Host the Apple Exclaves framework.

Note: It should not be invoked manually.

More information: https://keith.github.io/xcode-man-pages/alwaysonexclavesd.8.html.

- Start the daemon:

```
alwaysonexclavesd
```

amfid

Mobile file integrity services.

Note: It should not be invoked manually.

More information: https://keith.github.io/xcode-man-pages/amfid.8.html.

- Start the daemon:

```
amfid
```

apachectl

Apache HTTP Server control interface for macOS.

More information: https://keith.github.io/xcode-man-pages/apachectl.8.html.

- Start the `org.apache.httpd` launchd job:

  `apachectl start`

- Stop the launchd job:

  `apachectl stop`

- Stop, then start launchd job:

  `apachectl restart`

apfsd

Manage volumes in the filesystem.

Note: It should not be invoked manually.

More information: https://keith.github.io/xcode-man-pages/apfsd.8.html.

- Start the daemon:

```
apfsd
```

appinstalld

Manage the installation of iOS app packages on macOS.

Note: It should not be invoked manually.

More information: https://keith.github.io/xcode-man-pages/appinstalld.8.html.

- Start the daemon:

```
appinstalld
```

applecamerad

Camera manager.

Note: It should not be invoked manually.

More information: https://www.theiphonewiki.com/wiki/Services.

- Start the daemon:

  ```
  applecamerad
  ```

appleeventsd

Handles cross-application interaction in macOS. It is the underlying basis of AppleScript.

Note: It should not be invoked manually.

More information: https://keith.github.io/xcode-man-pages/appleeventsd.8.html.

- Start the daemon:

```
appleeventsd
```

appsleepd

Start app sleep services.

Note: It should not be invoked manually.

More information: https://keith.github.io/xcode-man-pages/appsleepd.8.html.

- Start the daemon:

```
appsleepd
```

arch

Display the name of the system architecture, or run a command under a different architecture.

See also: **`uname`**.

More information: https://keith.github.io/xcode-man-pages/arch.1.html.

- Display the system's architecture:

```
arch
```

- Run a command using x86_64:

```
arch -x86_64 {{command}} {{argument1 argument2 ...}}
```

- Run a command using ARM:

```
arch -arm64 {{command}} {{argument1 argument2 ...}}
```

archey

Stylishly display system information.

More information: https://github.com/joshfinnie/archey-osx.

- Show system information:

```
archey
```

- Show system information without colored output:

```
archey --nocolor
```

- Show system information, using MacPorts instead of Homebrew:

```
archey --macports
```

- Show system information without IP address check:

```
archey --offline
```

as

Portable GNU assembler.

Primarily intended to assemble output from **`gcc`** to be used by **`ld`**.

More information: https://keith.github.io/xcode-man-pages/as.1.html.

- Assemble a file, writing the output to `a.out`:

```
as {{path/to/file.s}}
```

- Assemble the output to a given file:

```
as {{path/to/file.s}} -o {{path/to/output_file.o}}
```

- Generate output faster by skipping whitespace and comment preprocessing. (Should only be used for trusted compilers):

```
as -f {{path/to/file.s}}
```

- Include a given path to the list of directories to search for files specified in `.include` directives:

```
as -I {{path/to/directory}} {{path/to/file.s}}
```

asr

Restore (copy) a disk image onto a volume.

The command name stands for Apple Software Restore.

More information: https://keith.github.io/xcode-man-pages/asr.8.html.

- Restore a disk image to a target volume:

```
sudo asr restore --source {{image_file.dmg}} --target {{path/to/volume_file}}
```

- Erase the target volume before restoring:

```
sudo asr restore --source {{image_file.dmg}} --target {{path/to/volume_file}} --erase
```

- Skip verification after restoring:

```
sudo asr restore --source {{image_file.dmg}} --target {{path/to/volume_file}} --noverify
```

- Clone volumes without using an intermediate disk image:

```
sudo asr restore --source {{path/to/volume_file}} --target {{path/to/volume_file}}
```

autofsd

Run **`automount`** on startup and network configuration change events.

Note: It should not be invoked manually.

More information: https://keith.github.io/xcode-man-pages/autofsd.8.html.

- Start the daemon:

```
autofsd
```

automount

Read the **`/etc/auto_master`** file and mount **`autofs`** on the appropriate mount points to trigger the on-demand mounting of directories. Essentially, it's a way to manually initiate the system's automounting process.

Note: You'll most likely need to run with **`sudo`** if you don't have the necessary permissions.

More information: https://keith.github.io/xcode-man-pages/automount.8.html.

- Run automount, flush the [c]ache beforehand, and be [v]erbose about it (most common use):

  ```
  automount -cv
  ```

- Automatically unmount after 5 minutes (300 seconds) of inactivity:

  ```
  automount -t 300
  ```

- [u]nmount anything previously mounted by automount and/or defined in `/etc/auto_master`:

  ```
  automount -u
  ```

automountd

An automatic mount/unmount daemon for **`autofs`**. Started on demand by **`launchd`**.

Note: It should not be invoked manually.

More information: https://keith.github.io/xcode-man-pages/automountd.8.html.

- Start the daemon:

```
automountd
```

- Log more details to `syslog`:

```
automountd -v
```

autoraise

Automatically raise and/or focus a window when hovering over it with the mouse.

More information: https://github.com/sbmpost/AutoRaise.

- Run AutoRaise in the background:

```
autoraise &
```

auvaltool

AudioUnit validation tool for Mac.

More information: https://keith.github.io/xcode-man-pages/auvaltool.1.html.

- List all [a]vailable AudioUnits of any type:

```
auvaltool -a
```

- List all [a]vailable AudioUnits of any type with their [l]ocation:

```
auvaltool -al
```

avbdeviced

A service for managing Audio Video Bridging (AVB) devices.

Note: It should not be invoked manually.

More information: https://keith.github.io/xcode-man-pages/avbdeviced.1.html.

- Start the daemon:

```
avbdeviced
```

backupd

Create Time Machine backups and manages its backup history.

Note: It should not be invoked manually.

More information: https://keith.github.io/xcode-man-pages/backupd.8.html.

- Start the daemon:

```
backupd
```

base64

Encode or decode file or **`stdin`** to/from Base64, to **`stdout`** or another file.

More information: https://keith.github.io/xcode-man-pages/bintrans.1.

- Encode a file to `stdout`:

```
base64 {{[-i|--input]}} {{path/to/file}}
```

- Encode a file to the specified output file:

```
base64 {{[-i|--input]}} {{path/to/input_file}} {{[-o|--output]}} {{path/to/output_file}}
```

- Wrap encoded output at a specific width (`0` disables wrapping):

```
base64 {{[-b|--break]}} {{0|76|...}} {{path/to/file}}
```

- Decode a file to `stdout`:

```
base64 {{[-d|--decode]}} {{[-i|--input]}} {{path/to/file}}
```

- Encode from `stdin` to `stdout`:

```
{{command}} | base64
```

- Decode from `stdin` to `stdout`:

```
{{command}} | base64 {{[-d|--decode]}}
```

bc

An arbitrary precision calculator language.

See also: **dc**.

More information: https://keith.github.io/xcode-man-pages/bc.1.html.

- Start an interactive session:

```
bc
```

- Start an interactive session with the standard math library enabled:

```
bc --mathlib
```

- Calculate an expression:

```
bc --expression '{{5 / 3}}'
```

- Execute a script:

```
bc {{path/to/script.bc}}
```

- Calculate an expression with the specified scale:

```
bc --expression '{{scale = 10; 5 / 3}}'
```

- Calculate a sine/cosine/arctangent/natural logarithm/exponential function using `mathlib`:

```
bc --mathlib --expression '{{s|c|a|l|e}}({{1}})'
```

bclm

Set a custom charge limit on MacBooks.

More information: https://github.com/zackelia/bclm#usage.

- Set the charge limit to about 80% (for Intel machines, the battery charge level may be slightly lower than the set value):

```
sudo bclm write {{77}}
```

- Read the current charge limit:

```
bclm read
```

- Keep the charge limit after rebooting/smc reset:

```
sudo bclm persist
```

- Remove the persistent charge limit:

```
sudo bclm unpersist
```

biomesyncd

Synchronize data between devices registered to the same account.

Note: It should not be invoked manually.

More information: https://keith.github.io/xcode-man-pages/biomesyncd.8.html.

- Start the daemon:

```
biomesyncd
```

biometrickitd

Get support for biometric operations.

Note: It should not be invoked manually.

More information: https://keith.github.io/xcode-man-pages/biometrickitd.8.html.

- Start the daemon:

```
biometrickitd
```

bird

This supports the syncing of iCloud and iCloud Drive.

Note: It should not be invoked manually.

More information: https://keith.github.io/xcode-man-pages/bird.8.html.

- Start the daemon:

```
bird
```

bless

Set volume boot capability and startup disk options.

More information: https://keith.github.io/xcode-man-pages/bless.8.html.

- Bless a volume with only Mac OS X or Darwin, and create the BootX and `boot.efi` files as needed:

```
bless --folder {{/Volumes/Mac OS X/System/Library/
CoreServices}} --bootinfo --bootefi
```

- Set a volume containing either Mac OS 9 and Mac OS X to be the active volume:

```
bless --mount {{/Volumes/Mac OS}} --setBoot
```

- Set the system to NetBoot and broadcast for an available server:

```
bless --netboot --server {{bsdp://255.255.255.255}}
```

- Gather information about the currently selected volume (as determined by the firmware), suitable for piping to a program capable of parsing Property Lists:

```
bless --info --plist
```

bnepd

A service that handles all Bluetooth network connections.

Note: It should not be invoked manually.

More information: https://www.manpagez.com/man/8/bnepd/.

- Start the daemon:

```
bnepd
```

brightness

Get and set the brightness level of all internal and certain external displays.

More information: https://github.com/nriley/brightness.

- Show current brightness:

```
brightness -l
```

- Set a specific brightness:

```
brightness {{0..1}}
```

- Set the brightness to 50%:

```
brightness {{0.5}}
```

caffeinate

Prevent macOS from sleeping.

More information: https://keith.github.io/xcode-man-pages/caffeinate.8.html.

- Prevent the display from sleeping:

```
caffeinate -d
```

- Prevent from sleeping for 1 hour (3600 seconds):

```
caffeinate -u -t 3600
```

- Fork a process, exec "make" in it, and prevent sleep as long as that process is running:

```
caffeinate -i make
```

- Prevent from sleeping until a process with the specified PID completes:

```
caffeinate -w {{process_id}}
```

- Prevent disk from sleeping (use `<Ctrl c>` to exit):

```
caffeinate -m
```

cal

Print calendar information.

More information: https://keith.github.io/xcode-man-pages/cal.1.html.

- Display a calendar for the current month:

```
cal
```

- Display previous, current, and next month:

```
cal -3
```

- Display a calendar for a specific month (1-12 or name):

```
cal -m {{month}}
```

- Display a calendar for the current year:

```
cal -y
```

- Display a calendar for a specific year (4 digits):

```
cal {{year}}
```

- Display a calendar for a specific month and year:

```
cal {{month}} {{year}}
```

- Display date of Easter (Western Christian churches) in a given year:

```
ncal -e {{year}}
```

carthage

A dependency management tool for Cocoa applications.

More information: https://github.com/Carthage/Carthage.

- Download the latest version of all dependencies mentioned in Cartfile, and build them:

  ```
  carthage update
  ```

- Update dependencies, but only build for iOS:

  ```
  carthage update --platform ios
  ```

- Update dependencies, but don't build any of them:

  ```
  carthage update --no-build
  ```

- Download and rebuild the current version of dependencies (without updating them):

  ```
  carthage bootstrap
  ```

- Rebuild a specific dependency:

  ```
  carthage build {{dependency}}
  ```

cat

Print and concatenate files.

More information: https://keith.github.io/xcode-man-pages/cat.1.html.

- Print the contents of a file to `stdout`:

```
cat {{path/to/file}}
```

- Concatenate several files into an output file:

```
cat {{path/to/file1 path/to/file2 ...}} > {{path/to/output_file}}
```

- Append several files to an output file:

```
cat {{path/to/file1 path/to/file2 ...}} >> {{path/to/output_file}}
```

- Copy the contents of a file into an output file without buffering:

```
cat -u {{/dev/tty12}} > {{/dev/tty13}}
```

- Write `stdin` to a file:

```
cat - > {{path/to/file}}
```

- Number all output lines:

```
cat -n {{path/to/file}}
```

- Display non-printable and whitespace characters (with `M-` prefix if non-ASCII):

```
cat -v -t -e {{path/to/file}}
```

cfprefsd

Start preferences services (**`CFPreferences`**, **`NSUserDefaults`**).

Note: It should not be invoked manually.

More information: https://keith.github.io/xcode-man-pages/cfprefsd.8.html.

- Start the daemon:

```
cfprefsd
```

chflags

Change file or directory flags.

More information: https://keith.github.io/xcode-man-pages/chflags.1.html.

- Set the `hidden` flag for a file:

```
chflags hidden {{path/to/file}}
```

- Unset the `hidden` flag for a file:

```
chflags nohidden {{path/to/file}}
```

- Recursively set the `uchg` flag for a directory:

```
chflags -R uchg {{path/to/directory}}
```

- Recursively unset the `uchg` flag for a directory:

```
chflags -R nouchg {{path/to/directory}}
```

chpass

Add or change user database information, including login shell and password.

Note: It's not possible to change the user's password on Open Directory systems, use **passwd** instead.

See also: **passwd**.

More information: https://man.freebsd.org/cgi/man.cgi?query=chpass.

- Add or change user database information for the current user interactively:

```
su -c chpass
```

- Set a specific login [s]hell for the current user:

```
chpass -s {{path/to/shell}}
```

- Set a login [s]hell for a specific user:

```
chpass -s {{path/to/shell}} {{username}}
```

- Edit the user record on the directory node at the given [l]ocation:

```
chpass -l {{location}} -s {{path/to/shell}} {{username}}
```

- Use the given [u]sername when authenticating to the directory node containing the user:

```
chpass -u {{authname}} -s {{path/to/shell}} {{username}}
```

cloudd

Back the CloudKit feature.

Note: It should not be invoked manually.

More information: https://keith.github.io/xcode-man-pages/cloudd.8.html.

- Start the daemon:

```
cloudd
```

cloudphotod

This synchronizes iCloud Photos.

Note: It should not be invoked manually.

More information: https://www.manpagez.com/man/8/cloudphotosd/.

- Start the daemon:

```
cloudphotod
```

codesign

Create and manipulate code signatures for macOS.

More information: https://keith.github.io/xcode-man-pages/codesign.1.html.

- Sign an application with a certificate:

```
codesign --sign "{{My Company Name}}" {{path/to/application_file.app}}
```

- Verify the certificate of an application:

```
codesign --verify {{path/to/application_file.app}}
```

contactsd

Manage the information in your contacts database.

It provides functionality to apps using the Contacts API and performs various background maintenance tasks.

Note: It should not be invoked manually.

More information: https://keith.github.io/xcode-man-pages/contactsd.8.html.

- Start the daemon:

```
contactsd
```

container

Create and run Linux containers as lightweight virtual machines on macOS.

More information: https://github.com/apple/container.

- Start the container services (required before running containers):

```
container system start
```

- Run a container from an image interactively and remove it after it exits:

```
container run --rm {{[-it|--interactive --tty]}} {{image}} {{sh}}
```

- Run a container in the background with a name and a published port:

```
container run {{[-d|--detach]}} --name {{container_name}} {{[-p|--publish]}} {{8080:80}} {{image}}
```

- Execute a command inside a running container:

```
container exec {{[-it|--interactive --tty]}} {{container_name}} {{sh}}
```

- List all containers (running and stopped):

```
container {{[ls|list]}} {{[-a|--all]}}
```

- Follow the logs of a container:

```
container logs {{[-f|--follow]}} {{container_name}}
```

- Build an image from a Dockerfile in a directory:

```
container build {{[-t|--tag]}} {{image_name}} {{path/to/directory}}
```

- Stop or delete a container:

```
container {{stop|delete}} {{container_name}}
```

coreaudiod

Service for Core Audio, Apple's audio system.

Note: It should not be invoked manually.

More information: https://developer.apple.com/library/archive/documentation/MusicAudio/Conceptual/CoreAudioOverview/WhatisCoreAudio/WhatisCoreAudio.html.

- Start the daemon:

```
coreaudiod
```

coreautha

A system agent providing the **`LocalAuthentication`** framework.

Note: It should not be invoked manually.

See also: **`coreauthd`**.

More information: https://keith.github.io/xcode-man-pages/coreautha.8.html.

- Start the agent:

```
coreautha
```

coreauthd

A system daemon providing the **`LocalAuthentication`** framework.

Note: It should not be invoked manually.

See also: **`coreautha`**.

More information: https://keith.github.io/xcode-man-pages/coreauthd.8.html.

- Start the agent:

```
coreauthd
```

corebrightnessd

Manage Night Shift.

Note: It should not be invoked manually.

More information: https://keith.github.io/xcode-man-pages/corebrightnessd.8.html.

- Start the daemon:

```
corebrightnessd
```

coredatad

Schedule CloudKit operations for clients of NSPersistentCloudKitContainer.

Note: It should not be invoked manually.

More information: https://keith.github.io/xcode-man-pages/coredatad.8.html.

- Start the daemon:

```
coredatad
```

cot

The Plain-Text Editor for macOS.

More information: https://coteditor.com/cot.

- Start CotEditor:

```
cot
```

- Open specific files:

```
cot {{path/to/file1 path/to/file2 ...}}
```

- Open a new blank document:

```
cot --new
```

- Open a specific file and block the terminal until it is closed:

```
cot --wait {{path/to/file}}
```

- Open a specific file with the cursor at a specific line and column:

```
cot --line {{1}} --column {{80}} {{path/to/file}}
```

csrutil

Manage the System Integrity Protection configuration.

More information: https://keith.github.io/xcode-man-pages/csrutil.8.html.

- Display the System Integrity Protection status:

```
csrutil status
```

- Disable the System Integrity Protection:

```
csrutil disable
```

- Enable the System Integrity Protection:

```
csrutil enable
```

- Display the list of allowed NetBoot sources:

```
csrutil netboot list
```

- Add an IPv4 address to the list of allowed NetBoot sources:

```
csrutil netboot add {{ip_address}}
```

- Reset the System Integrity Protection status and clear the NetBoot list:

```
csrutil clear
```

csshX

Cluster SSH tool for macOS.

More information: https://github.com/brockgr/csshx.

- Connect to multiple hosts:

```
csshX {{hostname1}} {{hostname2}}
```

- Connect to multiple hosts with a given SSH key:

```
csshX {{user@hostname1}} {{user@hostname2}} --ssh_args "-i
{{path/to/key_file.pem}}"
```

- Connect to a pre-defined cluster from `/etc/clusters`:

```
csshX cluster1
```

ctkd

SmartCard daemon.

Note: It should not be invoked manually.

More information: https://keith.github.io/xcode-man-pages/ctkd.8.html.

- Start the daemon:

```
ctkd
```

cut

Cut out fields from **`stdin`** or files.

More information: https://keith.github.io/xcode-man-pages/cut.1.html.

- Print the fifth [c]haracter on each line:

```
{{command}} | cut -c 5
```

- Print the fifth to tenth [c]haracter of each line of the specified file:

```
cut -c 5-10 {{path/to/file}}
```

- Split each line in a file by a delimiter into fields and print [f]ields two and six (default delimiter is TAB):

```
cut -f 2,6 {{path/to/file}}
```

- Split each line by the specified [d]elimiter and print all from the second [f]ield onward:

```
{{command}} | cut -d "{{delimiter}}" -f 2-
```

- Use space as a [d]elimiter and print only the first 3 [f]ields:

```
{{command}} | cut -d " " -f -3
```

cvfsck

Check and repair an Xsan filesystem volume.

Part of the Xsan filesystem utilities on macOS.

More information: https://www.manpagez.com/man/1/cvfsck/.

- Check an Xsan volume for metadata corruption (read-only mode):

```
sudo cvfsck {{/Volumes/XsanVolume}}
```

- Repair a corrupted Xsan volume (make modifications to fix problems):

```
sudo cvfsck -w {{/Volumes/XsanVolume}}
```

- Log problems to the system log (used mainly during automatic startup checks):

```
sudo cvfsck -l {{/Volumes/XsanVolume}}
```

- Report free-space fragmentation on an Xsan volume:

```
sudo cvfsck -f {{/Volumes/XsanVolume}}
```

dark-mode

Control macOS dark mode.

More information: https://github.com/sindresorhus/dark-mode.

- Toggle dark mode (turn it on if it's currently off, off if it's currently on):

```
dark-mode
```

- Turn dark mode on:

```
dark-mode on
```

- Turn dark mode off:

```
dark-mode off
```

- Check if dark mode is on:

```
dark-mode status
```

darwin-rebuild

Rebuild and switch to a Nix-based Darwin (macOS) system configuration.

More information: https://github.com/nix-darwin/nix-darwin.

- Rebuild and switch to the specified Darwin configuration:

```
darwin-rebuild switch --flake {{path/to/flake}}
```

- Build the configuration but don't switch to it:

```
darwin-rebuild build --flake {{path/to/flake}}
```

- Display help:

```
darwin-rebuild --help
```

date

Set or display the system date.

More information: https://keith.github.io/xcode-man-pages/date.1.html.

- Display the current date using the default locale's format:

```
date +%c
```

- Display the current date in UTC and ISO 8601 format:

```
date -u +%Y-%m-%dT%H:%M:%SZ
```

- Display the current date as a Unix timestamp (seconds since the Unix epoch):

```
date +%s
```

- Display a specific date (represented as a Unix timestamp) using the default format:

```
date -r {{1473305798}}
```

- Display a date relative to the current date using the default format:

```
date -v {{+1d}} -v {{-20m}}
```

dd

Convert and copy a file.

More information: https://keith.github.io/xcode-man-pages/dd.1.html.

- Make a bootable USB drive from an isohybrid file (such like `archlinux-xxx.iso`) and show the progress:

```
dd if={{path/to/file.iso}} of={{/dev/usb_drive}} status=progress
```

- Clone a drive to another drive with 4 MB block, ignore errors, and show the progress:

```
dd bs=4m conv=noerror if={{/dev/source_drive}} of={{/dev/dest_drive}} status=progress
```

- Generate a file with a specific number of random bytes by using kernel random driver:

```
dd bs={{100}} count={{1}} if=/dev/urandom of={{path/to/random_file}}
```

- Benchmark the write performance of a disk:

```
dd bs={{1024}} count={{1000000}} if=/dev/zero of={{path/to/1GB_file}}
```

- Create a system backup, save it into an IMG file (can be restored later by swapping `if` and `of`), and show the progress:

```
dd if={{/dev/drive_device}} of={{path/to/file.img}} status=progress
```

- Check the progress of an ongoing `dd` operation (run this command from another shell):

```
kill -USR1 $(pgrep ^dd)
```

defaults

Read and write macOS user configuration for applications.

More information: https://keith.github.io/xcode-man-pages/defaults.1.html.

- Read system defaults for an application option:

```
defaults read "{{application}}" "{{option}}"
```

- Read default values for an application option:

```
defaults read -app "{{application}}" "{{option}}"
```

- Search for a keyword in domain names, keys, and values:

```
defaults find "{{keyword}}"
```

- Write the default value of an application option:

```
defaults write "{{application}}" "{{option}}" {{-type}} {{value}}
```

- Speed up Mission Control animations:

```
defaults write com.apple.Dock expose-animation-duration -float 0.1
```

- Delete all defaults of an application:

```
defaults delete "{{application}}"
```

deleted

Keep track of purgeable space and ask clients to purge when space is low.

Note: It should not be invoked manually.

More information: https://keith.github.io/xcode-man-pages/deleted.8.html.

- Start the daemon:

```
deleted
```

df

Display an overview of the filesystem disk space usage.

More information: https://keith.github.io/xcode-man-pages/df.1.html.

- Display all filesystems and their disk usage (using 512-byte units):

```
df
```

- Use [h]uman-readable units (based on powers of 1024) and display a grand total:

```
df -h -c
```

- Use [H]uman-readable units (based on powers of 1000):

```
df {{[-H|--si]}}
```

- Display the filesystem containing the specified file or directory:

```
df {{path/to/file_or_directory}}
```

- Include statistics on the number of free and used [i]nodes, including the filesystem t[Y]pes:

```
df -iY
```

- Use [k]ibibyte (1024 byte) units when showing size figures:

```
df -k
```

- Display information in a [P]ortable way:

```
df -P
```

dhcp6d

Stateless DHCPv6 server.

Note: It should not be invoked manually.

See also: **`InternetSharing`**.

More information: https://keith.github.io/xcode-man-pages/dhcp6d.8.html.

- Start the daemon:

  ```
  dhcp6d
  ```

- Use a custom configuration:

  ```
  dhcp6d {{path/to/config_file}}
  ```

dirs_cleaner

Recursively empty directories while the directories themselves are not deleted.

Note: On macOS 13 (Ventura) and later, **`dirs_cleaner`** is subject to AMFI launch constraints introduced in Ventura. The binary remains present at **`/usr/libexec/dirs_cleaner`** but cannot be invoked directly from a user session, including as root.

More information: https://keith.github.io/xcode-man-pages/dirs_cleaner.8.html.

- Recursively delete contents of folder structure without removing directories:

```
sudo dirs_cleaner {{path/to/directory1 path/to/directory2 ...}}
```

diskutil partitionDisk

Utility to manage partitions inside disks and volumes.

APM is only supported for macOS, MBR is optimized for DOS, while GPT is compatible for most modern systems.

Part of **`diskutil`**.

More information: https://keith.github.io/xcode-man-pages/diskutil.8.html.

- Reformat a volume using APM/MBR/GPT partitioning scheme, leaving no partitions inside (this will erase all data on the volume):

```
diskutil partitionDisk {{/dev/disk_device}} 0 {{APM|MBR|GPT}}
```

- Reformat a volume, then create a single partition using a specific filesystem filling up all free space:

```
diskutil partitionDisk {{/dev/disk_device}} 1 {{APM|MBR|GPT}}
{{partition_filesystem}} {{partition_name}}
```

- Reformat a volume, then create a single partition using a specific filesystem under specific size (e.g. `16G` for 16GB or `50%` to fill half of total volume size):

```
diskutil partitionDisk {{/dev/disk_device}} 1 {{APM|MBR|GPT}}
{{partition_filesystem}} {{partition_name}}
{{partition_size}}
```

- Reformat a volume, then create multiple partitions:

```
diskutil partitionDisk {{/dev/disk_device}}
{{number_of_partitions}} {{APM|MBR|GPT}}
{{partition_filesystem1}} {{partition_name1}}
{{partition_size1}} {{partition_filesystem2}}
{{partition_name2}} {{partition_size2}} ...
```

- List all supported filesystems for partitioning:

```
diskutil listFilesystems
```

diskutil

Utility to manage local disks and volumes.

Some subcommands such as **`partitiondisk`** have their own usage documentation.

More information: https://keith.github.io/xcode-man-pages/diskutil.8.html.

- List all currently available disks, partitions, and mounted volumes:

```
diskutil list
```

- Repair the filesystem data structures of a volume:

```
diskutil repairVolume {{/dev/disk}}
```

- Unmount a volume:

```
diskutil unmountDisk {{/dev/disk}}
```

- Eject a CD/DVD (unmount first):

```
diskutil eject {{/dev/diskX}}
```

distnoted

Start distributed notification services.

Note: It should not be invoked manually.

More information: https://keith.github.io/xcode-man-pages/distnoted.8.html.

- Start the daemon:

```
distnoted
```

ditto

Copy files and directories.

More information: https://keith.github.io/xcode-man-pages/ditto.1.html.

- Overwrite contents of destination directory with contents of source directory:

```
ditto {{path/to/source_directory}} {{path/to/
destination_directory}}
```

- Print a line to the Terminal window for every file that's being copied:

```
ditto -V {{path/to/source_directory}} {{path/to/
destination_directory}}
```

- Copy a given file or directory, while retaining the original file permissions:

```
ditto -rsrc {{path/to/source_directory}} {{path/to/
destination_directory}}
```

dmesg

Write the kernel messages to **`stdout`**.

More information: https://keith.github.io/xcode-man-pages/dmesg.8.html.

- Show kernel messages:

```
dmesg
```

- Show how much physical memory is available on this system:

```
dmesg | grep -i memory
```

- Show kernel messages 1 page at a time:

```
dmesg | less
```

dockutil

Manage macOS dock items.

More information: https://github.com/kcrawford/dockutil.

- Add an application to the end of the current user's dock:

```
dockutil --add {{path/to/application}}
```

- Replace one application with another in the current user's dock:

```
dockutil --add /{{path/to/application}} --replacing
'{{dock_item_label}}'
```

- Add a directory with view options and display it as a folder icon or stack:

```
dockutil --add /{{path/to/directory}} --view {{grid|fan|list|
auto}} --display {{folder|stack}}
```

- Add a URL dock item after another item:

```
dockutil --add {{vnc://example_server.local}} --label
'{{Example VNC}}' --after {{dock_item_label}}
```

- Remove an application from the dock given its dock label name:

```
dockutil --remove '{{dock_item_label}}'
```

- Add a spacer in a section after an application:

```
dockutil --add '' --type {{spacer|small-spacer|flex-spacer}}
--section {{apps}} --after {{dock_item_label}}
```

- Remove all spacer tiles:

```
dockutil --remove spacer-tiles
```

dot_clean

Merge `._*` files with corresponding native files.

More information: https://keith.github.io/xcode-man-pages/dot_clean.1.html.

- Merge all `._*` files recursively:

```
dot_clean {{path/to/directory}}
```

- Don't recursively merge all `._*` in a directory (flat merge):

```
dot_clean -f {{path/to/directory}}
```

- Merge and delete all `._*` files:

```
dot_clean -m {{path/to/directory}}
```

- Only delete `._*` files if there's a matching native file:

```
dot_clean -n {{path/to/directory}}
```

- Follow symlinks:

```
dot_clean -s {{path/to/directory}}
```

- Print verbose output:

```
dot_clean -v {{path/to/directory}}
```

drutil

Interact with DVD burners.

More information: https://keith.github.io/xcode-man-pages/drutil.1.html.

- Eject a disk from the drive:

```
drutil eject
```

- Burn a directory as an ISO9660 filesystem onto a DVD. Don't verify and eject when complete:

```
drutil burn -noverify -eject -iso9660
```

dtrace

A simple interface to invoke the D language compiler, retrieve buffered trace, and print traced data from the DTrace kernel facility.

Generic front-end to DTrace facility, requiring root privileges.

More information: https://keith.github.io/xcode-man-pages/dtrace.1.html.

- Set target data model for a specific architecture:

```
dtrace -arch {{arch_name}}
```

- Claim [a]nonymous tracing state and display the traced data:

```
dtrace -a
```

- Set principal trace buffer size. Supported units are `k`, `m`, `g`, or `t`:

```
dtrace -b {{2g}}
```

- Compile the specified D Program [s]ource file:

```
dtrace -s {{D_script}}
```

- Run the specified [c]ommand and exit upon its completion:

```
dtrace -c {{command}}
```

- Specify [f]unction name to trace or list (-l option). The corresponding argument can include any of the probe description forms like `provider:module:function`, `module:function`, or `function`:

```
dtrace -f {{function}}
```

- Grab the specified [p]rocess ID, cache its symbol table, and exit upon completion:

```
dtrace -p {{process_id}}
```

- Combine different options for tracing function in a process:

```
dtrace -a -b {{buffer_size}} -f {{function}} -p
{{process_id}}
```

dtruss

Trace system calls and kernel activities on **`osx`** using DTrace.

Note: Requires System Integrity Protection to be disabled.

See also: **`strace`**.

More information: https://keith.github.io/xcode-man-pages/dtruss.1m.html.

- Trace a running process by PID:

```
sudo dtruss -p {{process_id}}
```

- Run a program and trace it:

```
sudo dtruss {{program}}
```

- [W]ait for a process with a matching name and trace it:

```
sudo dtruss -W {{name}}
```

- Print [e]lapsed time, [o]n-cpu time, and [c]ount of each system call:

```
sudo dtruss -eoc -p {{process_id}}
```

- Trace a process and [f]ollow children:

```
sudo dtruss -f -p {{process_id}}
```

- Print occurrences of a specific system call:

```
sudo dtruss -t {{syscall}} -p {{process_id}}
```

du

Disk usage: estimate and summarize file and directory space usage.

More information: https://keith.github.io/xcode-man-pages/du.1.html.

- List the sizes of a directory and any subdirectories, in the given unit (KiB/MiB/GiB):

```
du -{{k|m|g}} {{path/to/directory}}
```

- List the sizes of a directory and any subdirectories, in human-readable form (i.e. auto-selecting the appropriate unit for each size):

```
du -h {{path/to/directory}}
```

- Show the size of a single directory, in human-readable units:

```
du -sh {{path/to/directory}}
```

- List the human-readable sizes of a directory and of all the files and directories within it:

```
du -ah {{path/to/directory}}
```

- List the human-readable sizes of a directory and any subdirectories, up to `n` levels deep:

```
du -h -d {{n}} {{path/to/directory}}
```

- List the human-readable size of all `.jpg` files in subdirectories of the current directory, and show a cumulative total at the end:

```
du -ch */*.jpg
```

duti

Set default applications for document types and URL schemes on macOS.

See also: **`osascript`**.

More information: https://github.com/moretension/duti.

- Set Safari as the default handler for HTML documents:

```
duti -s {{com.apple.Safari}} {{public.html}} all
```

- Set VLC as the default viewer for files with `.m4v` extensions:

```
duti -s {{org.videolan.vlc}} {{m4v}} viewer
```

- Set Finder as the default handler for the ftp:// URL scheme:

```
duti -s {{com.apple.Finder}} "{{ftp}}"
```

- Display information about the default application for a given extension:

```
duti -x {{ext}}
```

- Display the default handler for a given UTI:

```
duti -d {{uti}}
```

- Display all handlers of a given UTI:

```
duti -l {{uti}}
```

emond

Event Monitor service that accepts events from various services, runs them through a simple rules engine, and takes action.

The actions can run commands, send email, or SMS messages.

More information: https://manpagez.com/man/8/emond/.

- Start the daemon:

```
emond
```

- Specify rules for emond to process by giving a path to a file or directory:

```
emond -r {{path/to/file_or_directory}}
```

- Use a specific configuration file:

```
emond -c {{path/to/config_file}}
```

fdesetup

Set and retrieve FileVault related information.

More information: https://keith.github.io/xcode-man-pages/fdesetup.8.html.

- List current FileVault enabled users:

```
sudo fdesetup list
```

- Get current FileVault status:

```
fdesetup status
```

- Add FileVault enabled user:

```
sudo fdesetup add -usertoadd {{user1}}
```

- Enable FileVault:

```
sudo fdesetup enable
```

- Disable FileVault:

```
sudo fdesetup disable
```

filecoordinationd

Coordinates access to files by multiple processes (**`NSFileCoordinator`**, **`NSFilePresenter`**).

Note: It should not be invoked manually.

More information: https://keith.github.io/xcode-man-pages/filecoordinationd.8.html.

- Start the daemon:

```
filecoordinationd
```

fileicon

Manage custom file and folder icons.

More information: https://github.com/mklement0/fileicon.

- Set a custom icon for a specific file or directory:

```
fileicon set {{path/to/file_or_directory}} {{path/to/icon_file.png}}
```

- Remove a custom icon from a specific file or directory:

```
fileicon rm {{path/to/file_or_directory}}
```

- Save the custom icon of a file or directory as a `.icns` file into the current directory:

```
fileicon get {{path/to/file_or_directory}}
```

- Test if a specific file or directory has a custom icon:

```
fileicon test {{path/to/file_or_directory}}
```

fontd

Make fonts available to the system.

Note: It should not be invoked manually.

More information: https://keith.github.io/xcode-man-pages/fontd.8.html.

- Start the daemon:

```
fontd
```

fsck

Check the integrity of a filesystem or repair it. The filesystem should be unmounted at the time the command is run.

It is a wrapper that calls **`fsck_hfs`**, **`fsck_apfs`**, **`fsck_msdos`**, **`fsck_exfat`**, and **`fsck_udf`** as needed.

More information: https://keith.github.io/xcode-man-pages/fsck.8.html.

- Check filesystem `/dev/sdX`, reporting any damaged blocks:

  ```
  fsck {{/dev/sdX}}
  ```

- Check filesystem `/dev/sdX` only if it is clean, reporting any damaged blocks and interactively letting the user choose to repair each one:

  ```
  fsck -f {{/dev/sdX}}
  ```

- Check filesystem `/dev/sdX` only if it is clean, reporting any damaged blocks and automatically repairing them:

  ```
  fsck -fy {{/dev/sdX}}
  ```

- Check filesystem `/dev/sdX`, reporting whether it has been cleanly unmounted:

  ```
  fsck -q {{/dev/sdX}}
  ```

ftxdiff

Compare differences between two fonts.

More information: https://developer.apple.com/fonts/.

- Output differences to a specific text file:

```
ftxdiff --output {{path/to/fontdiff_file.txt}} {{path/to/font_file1.ttc}} {{path/to/font_file2.ttc}}
```

- Include glyph names in output:

```
ftxdiff --include-glyph-names
```

- Include unicode names in output:

```
ftxdiff --include-unicode-names
```

fuser

Display process IDs currently using files.

More information: https://keith.github.io/xcode-man-pages/fuser.1.html.

- Show PIDs of processes accessing a file or directory:

```
fuser {{path/to/file_or_directory}}
```

- Show PIDs and usernames of processes accessing a file or directory:

```
fuser -u {{path/to/file_or_directory}}
```

g[

This command is an alias of GNU `[`.

- View documentation for the original command:

```
tldr [
```

gb2sum

This command is an alias of GNU **`b2sum`**.

- View documentation for the original command:

  ```
  tldr b2sum
  ```

gbase32

This command is an alias of GNU **base32**.

- View documentation for the original command:

```
tldr base32
```

gbase64

This command is an alias of GNU **base64**.

- View documentation for the original command:

```
tldr {{[-p|--platform]}} common base64
```

gbasename

This command is an alias of GNU **`basename`**.

- View documentation for the original command:

```
tldr basename
```

gbasenc

This command is an alias of GNU **`basenc`**.

- View documentation for the original command:

```
tldr basenc
```

gcat

This command is an alias of GNU **cat**.

- View documentation for the original command:

```
tldr {{[-p|--platform]}} linux cat
```

gchcon

This command is an alias of GNU **chcon**.

- View documentation for the original command:

```
tldr {{[-p|--platform]}} linux chcon
```

gchgrp

This command is an alias of GNU **chgrp**.

- View documentation for the original command:

```
tldr chgrp
```

gchmod

This command is an alias of GNU **chmod**.

- View documentation for the original command:

  ```
  tldr chmod
  ```

gchown

This command is an alias of GNU **chown**.

- View documentation for the original command:

  ```
  tldr chown
  ```

gchroot

This command is an alias of GNU **`chroot`**.

- View documentation for the original command:

```
tldr chroot
```

gcksum

This command is an alias of GNU **`cksum`**.

- View documentation for the original command:

  ```
  tldr cksum
  ```

gcomm

This command is an alias of GNU **comm**.

- View documentation for the original command:

  ```
  tldr comm
  ```

gcp

This command is an alias of GNU **cp**.

- View documentation for the original command:

```
tldr cp
```

gcrane completion

Generate the autocompletion script for gcrane for the specified shell.

The available shells are Bash, fish, PowerShell, and Zsh.

More information: https://github.com/google/go-containerregistry/blob/main/cmd/gcrane/README.md.

- Generate the autocompletion script for your shell:

```
gcrane completion {{shell_name}}
```

- Disable completion descriptions:

```
gcrane completion {{shell_name}} --no-descriptions
```

- Load completions in your current shell session (Bash/Zsh):

```
source <(gcrane completion bash/zsh)
```

- Load completions in your current shell session (fish):

```
gcrane completion fish | source
```

- Load completions for every new session (Bash):

```
gcrane completion bash > $(brew --prefix)/etc/
bash_completion.d/gcrane
```

- Load completions for every new session (Zsh):

```
gcrane completion zsh > $(brew --prefix)/share/zsh/site-
functions/_gcrane
```

- Load completions for every new session (fish):

```
gcrane completion fish > ~/.config/fish/completions/
gcrane.fish
```

- Display help:

```
gcrane completion {{shell_name}} {{[-h|--help]}}
```

gcsplit

This command is an alias of GNU **`csplit`**.

- View documentation for the original command:

```
tldr {{[-p|--platform]}} linux csplit
```

gcut

This command is an alias of GNU **`cut`**.

- View documentation for the original command:

```
tldr {{[-p|--platform]}} common cut
```

gdate

This command is an alias of GNU **`date`**.

- View documentation for the original command:

```
tldr {{[-p|--platform]}} common date
```

gdd

This command is an alias of GNU **dd**.

- View documentation for the original command:

```
tldr {{[-p|--platform]}} linux dd
```

gdf

This command is an alias of GNU **df**.

- View documentation for the original command:

```
tldr {{[-p|--platform]}} linux df
```

gdir

This command is an alias of GNU **dir**.

- View documentation for the original command:

```
tldr {{[-p|--platform]}} linux dir
```

gdircolors

This command is an alias of GNU **`dircolors`**.

- View documentation for the original command:

  ```
  tldr dircolors
  ```

gdirname

This command is an alias of GNU **`dirname`**.

- View documentation for the original command:

  ```
  tldr dirname
  ```

gdnsdomainname

This command is an alias of GNU **`dnsdomainname`**.

- View documentation for the original command:

```
tldr {{[-p|--platform]}} linux dnsdomainname
```

gecho

This command is an alias of GNU **echo**.

- View documentation for the original command:

  ```
  tldr echo
  ```

ged

This command is an alias of GNU **ed**.

- View documentation for the original command:

```
tldr ed
```

gegrep

This command is an alias of GNU **`egrep`**.

- View documentation for the original command:

  ```
  tldr egrep
  ```

genv

This command is an alias of GNU **env**.

- View documentation for the original command:

  ```
  tldr env
  ```

GetFileInfo

Get information about a file in an HFS+ directory.

More information: https://keith.github.io/xcode-man-pages/GetFileInfo.1.html.

- Display information about a given file:

```
GetFileInfo {{path/to/file}}
```

- Display the [d]ate and time a given file was created:

```
GetFileInfo -d {{path/to/file}}
```

- Display the date and time a given file was last [m]odified:

```
GetFileInfo -m {{path/to/file}}
```

- Display the [c]reator of a given file:

```
GetFileInfo -c {{path/to/file}}
```

gexpand

This command is an alias of GNU **expand**.

- View documentation for the original command:

  ```
  tldr expand
  ```

gexpr

This command is an alias of GNU **expr**.

- View documentation for the original command:

```
tldr expr
```

gfactor

This command is an alias of GNU **`factor`**.

- View documentation for the original command:

```
tldr factor
```

gfalse

This command is an alias of GNU **`false`**.

- View documentation for the original command:

  ```
  tldr false
  ```

gfgrep

This command is an alias of GNU **`fgrep`**.

- View documentation for the original command:

```
tldr fgrep
```

gfind

This command is an alias of GNU **`find`**.

- View documentation for the original command:

```
tldr find
```

gfmt

This command is an alias of GNU **fmt**.

- View documentation for the original command:

```
tldr fmt
```

gfold

This command is an alias of GNU **`fold`**.

- View documentation for the original command:

```
tldr {{[-p|--platform]}} linux fold
```

gftp

This command is an alias of GNU **`ftp`**.

- View documentation for the original command:

```
tldr ftp
```

ggrep

This command is an alias of GNU **`grep`**.

- View documentation for the original command:

```
tldr grep
```

ggroups

This command is an alias of GNU **`groups`**.

- View documentation for the original command:

  ```
  tldr groups
  ```

ghead

This command is an alias of GNU **head**.

- View documentation for the original command:

```
tldr {{[-p|--platform]}} linux head
```

ghostid

This command is an alias of GNU **hostid**.

- View documentation for the original command:

```
tldr hostid
```

ghostname

This command is an alias of GNU **hostname**.

- View documentation for the original command:

```
tldr hostname
```

gid

This command is an alias of GNU **id**.

- View documentation for the original command:

```
tldr id
```

gifconfig

This command is an alias of GNU **`ifconfig`**.

- View documentation for the original command:

  ```
  tldr ifconfig
  ```

gindent

This command is an alias of GNU **`indent`**.

- View documentation for the original command:

```
tldr {{[-p|--platform]}} common indent
```

ginstall

This command is an alias of GNU **`install`**.

- View documentation for the original command:

  ```
  tldr install
  ```

gjoin

This command is an alias of GNU **`join`**.

- View documentation for the original command:

```
tldr join
```

gkill

This command is an alias of GNU **`kill`**.

- View documentation for the original command:

```
tldr {{[-p|--platform]}} linux kill
```

glibtool

This command is an alias of GNU **`libtool`**.

- View documentation for the original command:

```
tldr {{[-p|--platform]}} linux libtool
```

glibtoolize

This command is an alias of GNU **`libtoolize`**.

- View documentation for the original command:

```
tldr {{[-p|--platform]}} linux libtoolize
```

glink

This command is an alias of GNU **`link`**.

- View documentation for the original command:

  ```
  tldr link
  ```

gln

This command is an alias of GNU **`ln`**.

- View documentation for the original command:

  ```
  tldr ln
  ```

glocate

This command is an alias of GNU **`locate`**.

- View documentation for the original command:

```
tldr {{[-p|--platform]}} linux locate
```

glogger

This command is an alias of GNU **`logger`**.

- View documentation for the original command:

```
tldr {{[-p|--platform]}} linux logger
```

glogname

This command is an alias of GNU **`logname`**.

- View documentation for the original command:

```
tldr logname
```

gls

This command is an alias of GNU **`ls`**.

- View documentation for the original command:

  ```
  tldr ls
  ```

gmake

This command is an alias of GNU **make**.

- View documentation for the original command:

```
tldr make
```

gmd5sum

This command is an alias of GNU **`md5sum`**.

- View documentation for the original command:

  ```
  tldr md5sum
  ```

gmkdir

This command is an alias of GNU **`mkdir`**.

- View documentation for the original command:

```
tldr mkdir
```

gmkfifo

This command is an alias of GNU **`mkfifo`**.

- View documentation for the original command:

  ```
  tldr mkfifo
  ```

gmknod

This command is an alias of GNU **mknod**.

- View documentation for the original command:

```
tldr {{[-p|--platform]}} linux mknod
```

gmktemp

This command is an alias of GNU **mktemp**.

- View documentation for the original command:

```
tldr {{[-p|--platform]}} linux mktemp
```

gmv

This command is an alias of GNU **mv**.

- View documentation for the original command:

```
tldr mv
```

gnice

This command is an alias of GNU **`nice`**.

- View documentation for the original command:

  ```
  tldr nice
  ```

gnl

This command is an alias of GNU **`nl`**.

- View documentation for the original command:

```
tldr {{[-p|--platform]}} linux nl
```

gnohup

This command is an alias of GNU **nohup**.

- View documentation for the original command:

```
tldr nohup
```

gnproc

This command is an alias of GNU **`nproc`**.

- View documentation for the original command:

  ```
  tldr nproc
  ```

gnumfmt

This command is an alias of GNU **`numfmt`**.

- View documentation for the original command:

  `tldr numfmt`

god

This command is an alias of GNU **od**.

- View documentation for the original command:

```
tldr od
```

goku

Manage Karabiner configuration.

More information: https://github.com/yqrashawn/GokuRakuJoudo.

- Generate `karabiner.json` using the default configuration:

```
goku
```

- Generate `karabiner.json` using the specific `config.edn` file:

```
goku --config {{path/to/config.edn}}
```

- Simulate generating the new configuration and print it to `stdout` instead of updating `karabiner.json`:

```
goku --dry-run
```

- Simulate generating the whole configuration and print it to `stdout` instead of updating `karabiner.json`:

```
goku --dry-run-all
```

- Display help:

```
goku --help
```

- Display version:

```
goku --version
```

gpaste

This command is an alias of GNU **`paste`**.

- View documentation for the original command:

```
tldr paste
```

gpathchk

This command is an alias of GNU **pathchk**.

- View documentation for the original command:

  ```
  tldr pathchk
  ```

gping

This command is an alias of GNU **`ping`**.

- View documentation for the original command:

```
tldr {{[-p|--platform]}} common ping
```

gping6

This command is an alias of GNU **`ping6`**.

- View documentation for the original command:

  `tldr ping6`

gpinky

This command is an alias of GNU **`pinky`**.

- View documentation for the original command:

```
tldr pinky
```

gpr

This command is an alias of GNU **pr**.

- View documentation for the original command:

  ```
  tldr pr
  ```

gprintenv

This command is an alias of GNU **`printenv`**.

- View documentation for the original command:

  ```
  tldr printenv
  ```

gprintf

This command is an alias of GNU **`printf`**.

- View documentation for the original command:

  ```
  tldr printf
  ```

gptx

This command is an alias of GNU **ptx**.

- View documentation for the original command:

```
tldr {{[-p|--platform]}} linux ptx
```

gpwd

This command is an alias of GNU **pwd**.

- View documentation for the original command:

```
tldr pwd
```

grcp

This command is an alias of GNU **rcp**.

- View documentation for the original command:

```
tldr {{[-p|--platform]}} linux rcp
```

greadlink

This command is an alias of GNU **`readlink`**.

- View documentation for the original command:

```
tldr readlink
```

grealpath

This command is an alias of GNU **`realpath`**.

- View documentation for the original command:

```
tldr realpath
```

grexec

This command is an alias of GNU **rexec**.

- View documentation for the original command:

```
tldr {{[-p|--platform]}} linux rexec
```

grlogin

This command is an alias of GNU **rlogin**.

- View documentation for the original command:

```
tldr {{[-p|--platform]}} linux rlogin
```

grm

This command is an alias of GNU **rm**.

- View documentation for the original command:

```
tldr rm
```

grmdir

This command is an alias of GNU **`rmdir`**.

- View documentation for the original command:

```
tldr rmdir
```

grsh

This command is an alias of GNU **rsh**.

- View documentation for the original command:

```
tldr {{[-p|--platform]}} linux rsh
```

gruncon

This command is an alias of GNU **runcon**.

- View documentation for the original command:

```
tldr {{[-p|--platform]}} linux runcon
```

gsed

This command is an alias of GNU **sed**.

- View documentation for the original command:

```
tldr {{[-p|--platform]}} linux sed
```

gseq

This command is an alias of GNU **seq**.

- View documentation for the original command:

```
tldr seq
```

gsha1sum

This command is an alias of GNU **`sha1sum`**.

- View documentation for the original command:

```
tldr sha1sum
```

gsha224sum

This command is an alias of GNU **`sha224sum`**.

- View documentation for the original command:

```
tldr sha224sum
```

gsha256sum

This command is an alias of GNU **`sha256sum`**.

- View documentation for the original command:

```
tldr sha256sum
```

gsha384sum

This command is an alias of GNU **`sha384sum`**.

- View documentation for the original command:

```
tldr sha384sum
```

gsha512sum

This command is an alias of GNU **`sha512sum`**.

- View documentation for the original command:

```
tldr sha512sum
```

gshred

This command is an alias of GNU **`shred`**.

- View documentation for the original command:

  ```
  tldr shred
  ```

gshuf

This command is an alias of GNU **`shuf`**.

- View documentation for the original command:

```
tldr {{[-p|--platform]}} common shuf
```

gsleep

This command is an alias of GNU **`sleep`**.

- View documentation for the original command:

```
tldr {{[-p|--platform]}} linux sleep
```

gsort

This command is an alias of GNU **`sort`**.

- View documentation for the original command:

  ```
  tldr sort
  ```

gsplit

This command is an alias of GNU **`split`**.

- View documentation for the original command:

```
tldr {{[-p|--platform]}} common split
```

gstat

This command is an alias of GNU **`stat`**.

- View documentation for the original command:

```
tldr {{[-p|--platform]}} common stat
```

gstdbuf

This command is an alias of GNU **`stdbuf`**.

- View documentation for the original command:

  ```
  tldr stdbuf
  ```

gstty

This command is an alias of GNU **`stty`**.

- View documentation for the original command:

```
tldr stty
```

gsum

This command is an alias of GNU **`sum`**.

- View documentation for the original command:

```
tldr sum
```

gsync

This command is an alias of GNU **sync**.

- View documentation for the original command:

```
tldr sync
```

gtac

This command is an alias of GNU **tac**.

- View documentation for the original command:

```
tldr tac
```

gtail

This command is an alias of GNU **`tail`**.

- View documentation for the original command:

```
tldr {{[-p|--platform]}} common tail
```

gtalk

This command is an alias of GNU **`talk`**.

- View documentation for the original command:

```
tldr {{[-p|--platform]}} linux talk
```

gtar

This command is an alias of GNU **tar**.

- View documentation for the original command:

```
tldr tar
```

gtee

This command is an alias of GNU **tee**.

- View documentation for the original command:

```
tldr tee
```

gtelnet

This command is an alias of GNU **`telnet`**.

- View documentation for the original command:

  ```
  tldr telnet
  ```

gtest

This command is an alias of GNU **`test`**.

- View documentation for the original command:

```
tldr test
```

gtftp

This command is an alias of GNU **`tftp`**.

- View documentation for the original command:

```
tldr {{[-p|--platform]}} linux tftp
```

gtime

This command is an alias of GNU **`time`**.

- View documentation for the original command:

```
tldr time
```

gtimeout

This command is an alias of GNU **`timeout`**.

- View documentation for the original command:

```
tldr timeout
```

gtouch

This command is an alias of GNU **`touch`**.

- View documentation for the original command:

```
tldr touch
```

gtr

This command is an alias of GNU **tr**.

- View documentation for the original command:

```
tldr tr
```

gtraceroute

This command is an alias of GNU **`traceroute`**.

- View documentation for the original command:

  `tldr traceroute`

gtrue

This command is an alias of GNU **`true`**.

- View documentation for the original command:

```
tldr true
```

gtruncate

This command is an alias of GNU **`truncate`**.

- View documentation for the original command:

```
tldr truncate
```

gtsort

This command is an alias of GNU **`tsort`**.

- View documentation for the original command:

  ```
  tldr tsort
  ```

gtty

This command is an alias of GNU **`tty`**.

- View documentation for the original command:

```
tldr tty
```

guname

This command is an alias of GNU **uname**.

- View documentation for the original command:

```
tldr {{[-p|--platform]}} common uname
```

gunexpand

This command is an alias of GNU **unexpand**.

- View documentation for the original command:

```
tldr unexpand
```

guniq

This command is an alias of GNU **`uniq`**.

- View documentation for the original command:

```
tldr uniq
```

gunits

This command is an alias of GNU **`units`**.

- View documentation for the original command:

```
tldr units
```

gunlink

This command is an alias of GNU **`unlink`**.

- View documentation for the original command:

```
tldr unlink
```

gupdatedb

This command is an alias of GNU **updatedb**.

- View documentation for the original command:

```
tldr {{[-p|--platform]}} linux updatedb
```

guptime

This command is an alias of GNU **uptime**.

- View documentation for the original command:

```
tldr {{[-p|--platform]}} common uptime
```

gusers

This command is an alias of GNU **`users`**.

- View documentation for the original command:

```
tldr users
```

gvdir

This command is an alias of GNU **`vdir`**.

- View documentation for the original command:

```
tldr vdir
```

gwc

This command is an alias of GNU **`wc`**.

- View documentation for the original command:

```
tldr {{[-p|--platform]}} common wc
```

gwhich

This command is an alias of GNU **`which`**.

- View documentation for the original command:

  ```
  tldr which
  ```

gwho

This command is an alias of GNU **who**.

- View documentation for the original command:

```
tldr who
```

gwhoami

This command is an alias of GNU **`whoami`**.

- View documentation for the original command:

  ```
  tldr whoami
  ```

gwhois

This command is an alias of GNU **`whois`**.

- View documentation for the original command:

```
tldr whois
```

gxargs

This command is an alias of GNU **`xargs`**.

- View documentation for the original command:

```
tldr xargs
```

gyes

This command is an alias of GNU **yes**.

- View documentation for the original command:

```
tldr yes
```

hdid

This command is an alias of **`hdiutil attach`**.

- View documentation for the original command:

```
tldr hdiutil
```

hdiutil

Utility to create and manage disk images.

More information: https://keith.github.io/xcode-man-pages/hdiutil.1.html.

- Mount an image:

```
hdiutil attach {{path/to/image_file}}
```

- Unmount an image:

```
hdiutil detach /Volumes/{{volume_file}}
```

- List mounted images:

```
hdiutil info
```

- Create an ISO image from the contents of a directory:

```
hdiutil makehybrid -o {{path/to/output_file}} {{path/to/
directory}}
```

head

Output the first part of files.

See also: **`tail`**.

More information: https://keith.github.io/xcode-man-pages/head.1.html.

- Output the first 10 lines of a file:

```
head {{path/to/file}}
```

- Output the first 5 lines of multiple files:

```
head {{[-5|--lines 5]}} {{path/to/file1 path/to/file2 ...}}
```

- Output the first `n` lines of a file:

```
head {{[-n|--lines]}} {{n}} {{path/to/file}}
```

- Output the first `n` bytes of a file:

```
head {{[-c|--bytes]}} {{n}} {{path/to/file}}
```

herd list

List available commands in the Herd PHP platform.

More information: https://herd.laravel.com/docs/macos/advanced-usage/herd-cli.

- List all available commands:

```
herd list
```

- List all available commands in a specific namespace:

```
herd list {{namespace}}
```

- List all commands in raw format (useful for embedding a command runner):

```
herd list --raw
```

- Display the list in a specific output format:

```
herd list --format {{txt|xml|json|md}}
```

- List all commands without describing their arguments:

```
herd list --short
```

herd

An official Laravel PHP development environment for macOS.

More information: https://herd.laravel.com/docs/macos/advanced-usage/herd-cli.

- Start the Herd services:

```
herd start
```

- Stop the Herd services:

```
herd stop
```

- Restart the Herd services:

```
herd restart
```

- Link the current working directory to Herd:

```
herd link
```

- Open the site for the current directory in the browser:

```
herd open
```

- List all available commands:

```
herd list
```

hidd

HID library userland daemon.

Note: It should not be invoked manually.

More information: https://keith.github.io/xcode-man-pages/hidd.8.html.

- Start the daemon:

```
hidd
```

icalBuddy

Command-line utility for printing events and tasks from the macOS calendar database.

More information: https://hasseg.org/icalBuddy/.

- Show events later today:

```
icalBuddy --includeOnlyEventsFromNowOn eventsToday
```

- Show uncompleted tasks:

```
icalBuddy uncompletedTasks
```

- Show a formatted list separated by calendar for all events today:

```
icalBuddy --formatOutput --separateByCalendar eventsToday
```

- Show tasks for a specified number of days:

```
icalBuddy --includeOnlyEventsFromNowOn "tasksDueBefore:today+{{number_of_days}}"
```

- Show events in a time range:

```
icalBuddy eventsFrom:{{start_date}} to:{{end_date}}
```

indent

Change the appearance of a C/C++ program by inserting or deleting whitespace.

More information: https://keith.github.io/xcode-man-pages/indent.1.html.

- Format C/C++ source according to the Berkeley style:

```
indent {{path/to/source_file.c}} {{path/to/indented_file.c}} -nbad -nbap -bc -br -c33 -cd33 -cdb -ce -ci4 -cli0 -di16 -fc1 -fcb -i4 -ip -l75 -lp -npcs -nprs -psl -sc -nsob -ts8
```

- Format C/C++ source according to the style of Kernighan & Ritchie (K&R):

```
indent {{path/to/source_file.c}} {{path/to/indented_file.c}} -nbad -bap -nbc -br -c33 -cd33 -ncdb -ce -ci4 -cli0 -cs -d0 -di1 -nfc1 -nfcb -i4 -nip -l75 -lp -npcs -nprs -npsl -nsc -nsob
```

installer

Install system software and packages to a specified domain or volume.

More information: https://keith.github.io/xcode-man-pages/installer.8.html.

- Install a Python package to the root volume with verbose output:

```
sudo installer -verbose {{[-pkg|-package]}} {{path/to/python-version.pkg}} {{[-tgt|-target]}} /
```

- Display list of packages (or subpackages for `.mpkg`) that can be installed on the target volume:

```
installer -pkginfo {{[-pkg|-package]}} {{path/to/package.pkg}}
```

- Display list of volumes onto which the package can be installed:

```
installer -volinfo {{[-pkg|-package]}} {{path/to/package.pkg}}
```

- Display list of domains into which the package can be installed:

```
installer -dominfo {{[-pkg|-package]}} {{path/to/package.pkg}}
```

- Generate XML of install choices for a package:

```
installer {{[-pkg|-package]}} {{path/to/package.pkg}} -showChoiceChangesXML
```

- Install package using XML config instead of command line parameters:

```
sudo installer {{[-pkg|-package]}} {{path/to/package.pkg}} -file {{path/to/config-file}}
```

InternetSharing

Set up Internet Sharing.

Note: It should not be invoked manually.

More information: https://www.manpagez.com/man/8/InternetSharing/.

- Start the daemon:

```
InternetSharing
```

iostat

Report statistics for devices.

More information: https://ss64.com/mac/iostat.html.

- Display snapshot device statistics (kilobytes per transfer, transfers per second, megabytes per second), CPU statistics (percentages of time spent in user mode, system mode, and idle mode), and system load averages (for the past 1, 5, and 15 min):

```
iostat
```

- Display only device statistics:

```
iostat -d
```

- Display incremental reports of CPU and disk statistics every 2 seconds:

```
iostat 2
```

- Display statistics for the first disk every second indefinitely:

```
iostat -w 1 disk0
```

- Display statistics for the second disk every 3 seconds, 10 times:

```
iostat -w 3 -c 10 disk1
```

- Display using old-style `iostat` display. Shows sectors transferred per second, transfers per second, average milliseconds per transaction, and CPU statistics + load averages from default-style display:

```
iostat -o
```

- Display total device statistics (KB/t: kilobytes per transfer as before, xfrs: total number of transfers, MB: total number of megabytes transferred):

```
iostat -I
```

ipconfig

View and control IP configuration state.

More information: https://keith.github.io/xcode-man-pages/ipconfig.8.html.

- List all network interfaces:

```
ipconfig getiflist
```

- Show the IP address of an interface:

```
ipconfig getifaddr {{interface_name}}
```

istats

Show various statistics such as the CPU temperature, fan speeds, and battery status.

More information: https://github.com/Chris911/iStats.

- Show all the stats:

```
istats
```

- Show all CPU stats:

```
istats cpu
```

- Show all fan stats:

```
istats fan
```

- Scan and print temperatures:

```
istats scan
```

java_home

Return a value for **`$JAVA_HOME`** or execute command using this variable.

More information: https://www.unix.com/man-page/osx/1/java_home.

- List JVMs based on a specific version:

```
java_home --version {{1.5+}}
```

- List JVMs based on a specific [arch]itecture:

```
java_home --arch {{i386}}
```

- List JVMs based on a specific tasks (defaults to `CommandLine`):

```
java_home --datamodel {{Applets|WebStart|BundledApp|JNI|
CommandLine}}
```

- List JVMs in a XML format:

```
java_home --xml
```

- Display help:

```
java_home --help
```

kmutil

Utility for managing kernel extensions (kexts) and kext collections on disk.

More information: https://keith.github.io/xcode-man-pages/kmutil.8.html.

- Find kexts available on the operating system:

```
kmutil find
```

- Display logging information about the Kernel Management sub-system:

```
kmutil log
```

- Inspect and display a kext collection's contents according to the options provided:

```
kmutil inspect {{options}}
```

- Check the consistency of kext collections against each other:

```
kmutil check
```

- Dump kernelmanagerd state for debugging:

```
sudo kmutil dumpstate
```

- Load one or more extensions based on the bundle specified at this path in the results:

```
kmutil load --bundle-path {{path/to/extension.kext}}
```

launchctl

Control Apple's **`launchd`** manager for launch daemons (system-wide services) and launch agents (per-user programs).

`launchd` loads XML-based **`*.plist`** files placed in the appropriate locations, and runs the corresponding commands according to their defined schedule.

More information: https://keith.github.io/xcode-man-pages/launchctl.1.html.

- Activate a user-specific agent to be loaded into `launchd` whenever the user logs in:

```
launchctl load ~/Library/LaunchAgents/{{my_script}}.plist
```

- Activate an agent which requires root privileges to run and/or should be loaded whenever any user logs in (note the absence of `~` in the path):

```
sudo launchctl load /Library/LaunchAgents/
{{root_script}}.plist
```

- Activate a system-wide daemon to be loaded whenever the system boots up (even if no user logs in):

```
sudo launchctl load /Library/LaunchDaemons/
{{system_daemon}}.plist
```

- Show all loaded agents/daemons, with the PID if the process they specify is currently running, and the exit code returned the last time they ran:

```
launchctl list
```

- Unload a currently loaded agent, e.g. to make changes (Note: The plist file is automatically loaded into `launchd` after a reboot and/or logging in):

```
launchctl unload ~/Library/LaunchAgents/{{my_script}}.plist
```

- Manually run a known (loaded) agent/daemon, even if it is not the right time (Note: This command uses the agent's label, rather than the filename):

```
launchctl start {{script_file}}
```

- Manually kill the process associated with a known agent/daemon, if it is running:

```
launchctl stop {{script_file}}
```

launchd

Manage processes, both for the system and users.

You cannot invoke launchd manually, use launchctl to interact with it.

More information: https://developer.apple.com/library/archive/documentation/MacOSX/Conceptual/BPSystemStartup/Chapters/Introduction.html.

- Run init:

```
/sbin/launchd
```

- View documentation for interacting with launchd using launchctl:

```
tldr launchctl
```

leaks

Search a process's memory for unreferenced malloc buffers.

More information: https://keith.github.io/xcode-man-pages/leaks.1.html.

- Examine a running process for leaks by its name:

```
leaks {{process_name}}
```

- Examine a running process for leaks by its PID:

```
leaks {{process_id}}
```

- Launch a command and check for leaks when it exits:

```
leaks -atExit -- {{command}}
```

- Enable backtraces for each leak by setting the `MallocStackLogging` environment variable:

```
MallocStackLogging=YES leaks {{process_name}}
```

- Display results in the classic list format instead of a tree:

```
leaks -list {{process_name}}
```

- Group leaked objects by type:

```
leaks -groupByType {{process_name}}
```

- Save the memory state to a memory graph file for later analysis:

```
leaks {{process_name}} -outputGraph {{path/to/file.memgraph}}
```

- Examine a previously saved memory graph file:

```
leaks {{path/to/file.memgraph}}
```

lipo

Handle Mach-O Universal Binaries.

More information: https://keith.github.io/xcode-man-pages/lipo.1.html.

- Create a universal file from two single-architecture files:

```
lipo {{path/to/binary_file.x86_64}} {{path/to/
binary_file.arm64e}} -create -output {{path/to/binary_file}}
```

- List all architectures contained in a universal file:

```
lipo {{path/to/binary_file}} -archs
```

- Display detailed information about a universal file:

```
lipo {{path/to/binary_file}} -detailed_info
```

- Extract a single-architecture file from a universal file:

```
lipo {{path/to/binary_file}} -thin {{arm64e}} -output {{path/
to/binary_file.arm64e}}
```

llvm-lipo

This command is an alias of **`lipo`**.

- View documentation for the original command:

  ```
  tldr lipo
  ```

locate

Find filenames quickly.

More information: https://keith.github.io/xcode-man-pages/locate.1.html.

- Look for pattern in the database. Note: The database is recomputed periodically (usually weekly or daily):

```
locate "{{pattern}}"
```

- Look for a pattern while [i]gnoring cases:

```
locate -i "{{pattern}}"
```

- Look for a file by its exact filename (a pattern containing no globbing characters is interpreted as `*pattern*`):

```
locate "*/{{filename}}"
```

- Recompute the database. You need to do it if you want to find recently added files:

```
sudo /usr/libexec/locate.updatedb
```

log

View, export, and configure logging systems.

More information: https://keith.github.io/xcode-man-pages/log.1.html.

- Stream live system logs:

```
log stream
```

- Stream logs sent to `syslog` from the process with a specific PID:

```
log stream --process {{process_id}}
```

- Show logs sent to syslog from a process with a specific name:

```
log show --predicate "process == '{{process_name}}'"
```

- Export all logs to disk for the past hour:

```
sudo log collect --last {{1h}} --output {{path/to/
file.logarchive}}
```

look

Display lines beginning with a prefix in a sorted file.

See also: **`grep`**, **`sort`**.

More information: https://keith.github.io/xcode-man-pages/look.1.html.

- Search for lines beginning with a specific prefix in a specific file:

```
look {{prefix}} {{path/to/file}}
```

- Case-insensitively search only on alphanumeric characters:

```
look {{[-f|--ignore-case]}} {{[-d|--alphanum]}} {{prefix}} {{path/to/file}}
```

- Specify a string termination character (space by default):

```
look {{[-t|--terminate]}} {{,}}
```

- Search in `/usr/share/dict/words` (`--ignore-case` and `--alphanum` are assumed):

```
look {{prefix}}
```

lpstat

Display status information about the current classes, jobs, and printers.

More information: https://keith.github.io/xcode-man-pages/lpstat.1.html.

- Show a long listing of printers, classes, and jobs:

```
lpstat -l
```

- Force encryption when connecting to the CUPS server:

```
lpstat -E
```

- Show the ranking of print jobs:

```
lpstat -R
```

- Show whether or not the CUPS server is running:

```
lpstat -r
```

- Show all status information:

```
lpstat -t
```

lsappinfo

Control and query CoreApplicationServices about the app state on the system.

More information: https://keith.github.io/xcode-man-pages/lsappinfo.8.html.

- List all running applications with their details:

```
lsappinfo list
```

- Show the front application:

```
lsappinfo front
```

- Show the information for a specific application:

```
lsappinfo info {{com.apple.calculator}}
```

m

Swiss Army Knife for macOS.

More information: https://github.com/rgcr/m-cli.

- Get the battery status:

```
m battery status
```

- Turn off Bluetooth:

```
m bluetooth off
```

- List available filesystems for formatting:

```
m disk filesystems
```

- Enable Dock's auto hide feature:

```
m dock autohide YES
```

- Disable the firewall:

```
m firewall disable
```

mac-cleanup

A modern macOS cleanup tool to remove caches and junk.

More information: https://github.com/mac-cleanup/mac-cleanup-py.

- Start the cleanup process:

```
mac-cleanup
```

- Open the module configuration screen:

```
mac-cleanup {{[-c|--configure]}}
```

- Simulate the cleanup, showing what will be removed without actually deleting it:

```
mac-cleanup {{[-n|--dry-run]}}
```

- Specify the directory with custom cleanup modules:

```
mac-cleanup {{[-p|--custom-path]}} {{path/to/directory}}
```

- Automatically acknowledge all warnings and continue with force:

```
mac-cleanup {{[-f|--force]}}
```

machine

Print machine type.

More information: https://keith.github.io/xcode-man-pages/machine.1.html.

- Print CPU architecture:

```
machine
```

mas

Command-line interface for the Mac App Store.

More information: https://github.com/mas-cli/mas.

- Sign into the Mac App Store for the first time:

```
mas signin "{{user@example.com}}"
```

- Show all installed applications and their product identifiers:

```
mas list
```

- Search for an application, displaying the price alongside the results:

```
mas search "{{application}}" --price
```

- Install or update an application using exact numeric id:

```
mas install {{numeric_product_id}}
```

- Install the first application that would be returned by the respective search:

```
mas lucky "{{search_term}}"
```

- List all outdated apps with pending updates:

```
mas outdated
```

- Install all pending updates:

```
mas upgrade
```

- Upgrade a specific application:

```
mas upgrade "{{numeric_product_id}}"
```

mate

General-purpose text editor for macOS.

More information: https://macromates.com/textmate/manual/opening-files#mate.

- Start TextMate:

```
mate
```

- Open specific files:

```
mate {{path/to/file1 path/to/file2 ...}}
```

- Specify the filetype of a file:

```
mate {{[-t|--type]}} {{filetype}} {{path/to/file}}
```

- Open and wait until finished editing a specific file:

```
mate {{[-w|--wait]}} {{path/to/file}}
```

- Open a file with the cursor at a specific line and column:

```
mate {{[-l|--line]}} {{line_number}}:{{column_number}}
{{path/to/file}}
```

md5

Calculate MD5 cryptographic checksums.

More information: https://keith.github.io/xcode-man-pages/md5.1.html.

- Calculate the MD5 checksum for a file:

```
md5 {{path/to/file}}
```

- Calculate MD5 checksums for multiple files:

```
md5 {{path/to/file1 path/to/file2 ...}}
```

- Output only the MD5 checksum (no filename):

```
md5 -q {{path/to/file}}
```

- Print a checksum of the given string:

```
md5 -s "{{string}}"
```

mdfind

List files matching a query.

More information: https://keith.github.io/xcode-man-pages/mdfind.1.html.

- Find a file by its name:

```
mdfind -name {{file}}
```

- Find a file by its content:

```
mdfind "{{query}}"
```

- Find a file containing a string, in a given directory:

```
mdfind -onlyin {{directory}} "{{query}}"
```

mdls

Display the metadata attributes for a file.

More information: https://keith.github.io/xcode-man-pages/mdls.1.html.

- Display the list of metadata attributes for file:

```
mdls {{path/to/file}}
```

- Display a specific metadata attribute:

```
mdls -name {{attribute}} {{path/to/file}}
```

mdutil

Manage the metadata stores used by Spotlight for indexing.

More information: https://keith.github.io/xcode-man-pages/mdutil.1.html.

- Show the indexing status of the startup volume:

```
mdutil -s {{/}}
```

- Turn on/off the Spotlight indexing for a given volume:

```
mdutil -i {{on|off}} {{path/to/volume}}
```

- Turn on/off indexing for all volumes:

```
mdutil -a -i {{on|off}}
```

- Erase the metadata stores and restart the indexing process:

```
mdutil -E {{path/to/volume}}
```

mist

MIST - macOS Installer Super Tool.

Automatically download macOS Firmwares/Installers.

More information: https://github.com/ninxsoft/mist-cli.

- List all available macOS Firmwares for Apple Silicon Macs:

```
mist list firmware
```

- List all available macOS Installers for Intel Macs, including Universal Installers for macOS Big Sur and later:

```
mist list installer
```

- List all macOS Installers that are compatible with this Mac, including Universal Installers for macOS Big Sur and later:

```
mist list installer --compatible
```

- List all available macOS Installers for Intel Macs, including betas, also including Universal Installers for macOS Big Sur and later:

```
mist list installer --include-betas
```

- List only the latest macOS Sonoma Installer for Intel Macs, including Universal Installers for macOS Big Sur and later:

```
mist list installer --latest "macOS Sonoma"
```

- List and export macOS Installers to a CSV file:

```
mist list installer --export "/{{path/to/export.csv}}"
```

- Download the latest macOS Sonoma Firmware for Apple Silicon Macs, with a custom name:

```
mist download firmware "macOS Sonoma" --firmware-name
"{{Install %NAME% %VERSION%-%BUILD%.ipsw}}"
```

- Download a specific macOS Installer version for Intel Macs, including Universal Installers for macOS Big Sur and later:

```
mist download installer "{{13.5.2}}" application
```

mktemp

Create a temporary file or directory.

More information: https://keith.github.io/xcode-man-pages/mktemp.1.html.

- Create an empty temporary file and print its absolute path:

```
mktemp
```

- Use a custom directory (defaults to the output of `getconf DARWIN_USER_TEMP_DIR`, or `/tmp`):

```
mktemp --tmpdir /{{path/to/temporary_directory}}
```

- Use a custom path template (Xs are replaced with random alphanumeric characters):

```
mktemp {{/tmp/example.XXXXXXXX}}
```

- Use a custom file name prefix:

```
mktemp -t {{example}}
```

- Create an empty temporary directory and print its absolute path:

```
mktemp --directory
```

mo

This command is an alias of **mole**.

- View documentation for the original command:

```
tldr mole
```

mole

Deep clean and optimize your Mac.

More information: https://github.com/tw93/mole.

- Open the main menu:

```
mole
```

- Free up disk space:

```
mole clean
```

- Simulate the cleanup without making changes:

```
mole clean --dry-run
```

- Remove apps completely:

```
mole uninstall
```

- Check and maintain system:

```
mole optimize
```

- Explore disk usage:

```
mole analyze
```

- Monitor system health:

```
mole status
```

- Remove old project artifacts:

```
mole purge
```

mysides

Add, list, and remove finder favorites.

More information: https://github.com/mosen/mysides#usage.

- List sidebar favorites:

```
mysides list
```

- Add a new item to the end of the sidebar favorites:

```
mysides add {{example}} {{file:///Users/Shared/example}}
```

- Remove an item by name:

```
mysides remove {{example}}
```

- Add the current directory to the sidebar:

```
mysides add $(basename $(pwd)) file:///$(pwd)
```

- Remove the current directory from the sidebar:

```
mysides remove $(basename $(pwd))
```

netstat

Display network-related information such as open connections, open socket ports, etc.

See also: **`lsof`**.

More information: https://keith.github.io/xcode-man-pages/netstat.1.html.

- Display the PID and program name listening on a specific protocol:

```
netstat -p {{protocol}}
```

- Print the routing table and do not resolve IP addresses to hostnames:

```
netstat -nr
```

- Print the routing table of IPv4 addresses:

```
netstat -nr -f inet
```

nettop

Display updated information about the network.

More information: https://keith.github.io/xcode-man-pages/nettop.1.html.

- Monitor TCP and UDP sockets from all interfaces:

```
nettop
```

- Monitor TCP sockets from Loopback interfaces:

```
nettop -m tcp -t loopback
```

- Monitor a specific process:

```
nettop -p "{{process_id|process_name}}"
```

- Display a per-process summary:

```
nettop -P
```

- Print 10 samples of network information:

```
nettop -l 10
```

- Monitor changes every 5 seconds:

```
nettop -d -s 5
```

- While running nettop, list interactive commands:

```
<h>
```

- Display help:

```
nettop -h
```

networkQuality

Measure the network quality by connecting to the internet.

More information: https://support.apple.com/101942.

- Test the network quality for the default interface:

```
networkQuality
```

- Test the upload and download speeds sequentially instead of in parallel:

```
networkQuality -s
```

- Test a specified network interface:

```
networkQuality -I {{en0}}
```

- Test the network quality with verbose output:

```
networkQuality -v
```

networksetup

Configuration tool for Network System Preferences.

More information: https://support.apple.com/guide/remote-desktop/about-networksetup-apdd0c5a2d5/mac.

- List available network service providers (Ethernet, Wi-Fi, Bluetooth, etc.):

```
networksetup -listallnetworkservices
```

- Show network settings for a particular networking device:

```
networksetup -getinfo "{{Wi-Fi}}"
```

- Get currently connected Wi-Fi network name (Wi-Fi device usually en0 or en1):

```
networksetup -getairportnetwork {{en0}}
```

- Connect to a particular Wi-Fi network:

```
networksetup -setairportnetwork {{en0}} {{ssid}} {{password}}
```

nfcd

This daemon controls the NFC controller.

Note: It should not be invoked manually.

More information: https://keith.github.io/xcode-man-pages/nfcd.8.html.

- Start the daemon:

```
nfcd
```

notifyd

Notification server.

Note: It should not be invoked manually.

More information: https://keith.github.io/xcode-man-pages/notifyd.8.html.

- Start the daemon:

```
notifyd
```

- Log debug messages to the default log file (`/var/log/notifyd.log`):

```
notifyd -d
```

- Log debug messages to an alternate log file:

```
notifyd -d -log_file {{path/to/log_file}}
```

nvram

Manipulate firmware variables.

More information: https://keith.github.io/xcode-man-pages/nvram.8.html.

- [p]rint all the variables stored in the NVRAM:

```
nvram -p
```

- [p]rint all the variables stored in the NVRAM using [x]ML format:

```
nvram -xp
```

- Modify the value of a firmware variable:

```
sudo nvram {{name}}="{{value}}"
```

- [d]elete a firmware variable:

```
sudo nvram -d {{name}}
```

- [c]lear all the firmware variables:

```
sudo nvram -c
```

- Set a firmware variable from a specific [x]ML [f]ile:

```
sudo nvram -xf {{path/to/file.xml}}
```

ocspd

This retrieves and caches Certificate Revocation Lists (CRLs) and Online Certificate Status Protocol (OCSP) responses for certificate verification.

Note: It should not be invoked manually.

More information: https://keith.github.io/xcode-man-pages/ocspd.1.html.

- Start the daemon:

```
ocspd
```

open

Open files, directories, and applications.

More information: https://keith.github.io/xcode-man-pages/open.1.html.

- Open a file with the associated application:

```
open {{file.ext}}
```

- Run a graphical macOS [a]pplication:

```
open -a "{{Application}}"
```

- Run a graphical macOS app based on the [b]undle identifier (refer to `osascript` for an easy way to get this):

```
open -b {{com.domain.application}}
```

- Open the current directory in Finder:

```
open .
```

- [R]eveal a file in Finder:

```
open -R {{path/to/file}}
```

- Open all the files of a given extension in the current directory with the associated application:

```
open {{*.ext}}
```

- Open a [n]ew instance of an application specified via [b]undle identifier:

```
open -n -b {{com.domain.application}}
```

opensnoop

Track file opens on your system.

More information: https://keith.github.io/xcode-man-pages/opensnoop.1m.html.

- Print all file opens as they occur:

```
sudo opensnoop
```

- Track all file opens by a process by name:

```
sudo opensnoop -n "{{process_name}}"
```

- Track all file opens by a process by PID:

```
sudo opensnoop -p {{process_id}}
```

- Track which processes open a specified file:

```
sudo opensnoop -f {{path/to/file}}
```

orb

Interface for OrbStack, a fast and lightweight container and virtual machine runtime for macOS.

Provides Docker-compatible commands and Linux VM management.

More information: https://docs.orbstack.dev/headless.

- List all containers and VMs:

```
orb list
```

- Create and start a Linux virtual machine:

```
orb create {{vm_name}}
```

- Create a VM with a specific Linux distribution:

```
orb create {{vm_name}} {{ubuntu|fedora|arch|debian}}
```

- Start or stop a virtual machine:

```
orb {{start|stop}} {{vm_name}}
```

- Connect to a VM via SSH:

```
orb ssh {{vm_name}}
```

- Execute a command in a VM:

```
orb exec {{vm_name}} {{command}}
```

- Delete a virtual machine:

```
orb delete {{vm_name}}
```

- Show system status and resource usage:

```
orb status
```

osascript

Run AppleScript or JavaScript for Automation (JXA).

More information: https://keith.github.io/xcode-man-pages/osascript.1.html.

- Run an AppleScript command:

```
osascript -e '{{say "Hello world"}}'
```

- Run multiple AppleScript commands:

```
osascript -e '{{say "Hello"}}' -e '{{say "world"}}'
```

- Run a compiled (`*.scpt`), bundled (`*.scptd`), or plaintext (`*.applescript`) AppleScript file:

```
osascript {{path/to/apple.scpt}}
```

- Get the bundle identifier of an application (useful for `open -b`):

```
osascript -e 'id of app "{{Application}}"'
```

- Run a JavaScript command:

```
osascript -l JavaScript -e "{{console.log('Hello world');}}"
```

- Run a JavaScript file:

```
osascript -l JavaScript {{path/to/script.js}}
```

pbcopy

Copy data from **stdin** to the clipboard.

Comparable to pressing **<Cmd c>** on the keyboard.

More information: https://keith.github.io/xcode-man-pages/pbcopy.1.html.

- Place the contents of a specific file in the clipboard:

```
pbcopy < {{path/to/file}}
```

- Place the results of a specific command in the clipboard:

```
find . -type t -name "*.png" | pbcopy
```

pbpaste

Send the contents of the clipboard to **`stdout`**.

Comparable to pressing **`<Cmd v>`** on the keyboard.

More information: https://keith.github.io/xcode-man-pages/pbcopy.1.

- Write the contents of the clipboard to a file:

```
pbpaste > {{path/to/file}}
```

- Use the contents of the clipboard as input to a command:

```
pbpaste | {{grep search_string}}
```

photoanalysisd

Analyze photo libraries for Memories, People, and scene or object based search.

Note: It should not be invoked manually.

More information: https://keith.github.io/xcode-man-pages/photoanalysisd.8.html.

- Start the daemon:

```
photoanalysisd
```

photolibraryd

This handles all photo library requests.

Note: It should not be invoked manually.

More information: https://keith.github.io/xcode-man-pages/photolibraryd.8.html.

- Start the daemon:

```
photolibraryd
```

ping

Send ICMP ECHO_REQUEST packets to network hosts.

More information: https://keith.github.io/xcode-man-pages/ping.8.html.

- Ping the specified host:

```
ping "{{hostname}}"
```

- Ping a host a specific number of times:

```
ping -c {{count}} "{{host}}"
```

- Ping a host, specifying the interval in seconds between requests (default is 1 second):

```
ping -i {{seconds}} "{{host}}"
```

- Ping a host without trying to look up symbolic names for addresses:

```
ping -n "{{host}}"
```

- Ping a host and ring the bell when a packet is received (if your terminal supports it):

```
ping -a "{{host}}"
```

- Ping a host and print the time a packet was received (this option is an Apple addition):

```
ping --apple-time "{{host}}"
```

pkgutil

Query and manipulate Mac OS X Installer packages and receipts.

More information: https://keith.github.io/xcode-man-pages/pkgutil.1.html.

- List package IDs for all installed packages:

```
pkgutil --pkgs
```

- Verify cryptographic signatures of a package file:

```
pkgutil --check-signature {{path/to/file.pkg}}
```

- List all the files for an installed package given its ID:

```
pkgutil --files {{com.microsoft.Word}}
```

- Extract the contents of a package file into a directory:

```
pkgutil --expand-full {{path/to/file.pkg}} {{path/to/
directory}}
```

plutil

View, convert, validate, or edit property list ("plist") files.

More information: https://keith.github.io/xcode-man-pages/plutil.1.html.

- Display the contents of one or more plist files in human-readable format:

```
plutil -p {{file1.plist file2.plist ...}}
```

- Convert one or more plist files to XML format, overwriting the original files in-place:

```
plutil -convert xml1 {{file1.plist file2.plist ...}}
```

- Convert one or more plist files to binary format, overwriting the original files in-place:

```
plutil -convert binary1 {{file1.plist file2.plist ...}}
```

- Convert a plist file to a different format, writing to a new file:

```
plutil -convert {{xml1|binary1|json|swift|objc}} {{path/to/file.plist}} -o {{path/to/new_file.plist}}
```

- Convert a plist file to a different format, writing to `stdout`:

```
plutil -convert {{xml1|binary1|json|swift|objc}} {{path/to/file.plist}} -o -
```

pmset

Configure macOS power management settings, as one might do in System Preferences > Energy Saver.

Commands that modify settings must begin with **sudo**.

More information: https://keith.github.io/xcode-man-pages/pmset.1.html.

- Display the current power management settings:

```
pmset -g
```

- Display the current power source and battery levels:

```
pmset -g batt
```

- Put display to sleep immediately:

```
pmset displaysleepnow
```

- Set display to never sleep when on charger power:

```
sudo pmset -c displaysleep 0
```

- Set display to sleep after 15 minutes when on battery power:

```
sudo pmset -b displaysleep 15
```

- Schedule computer to automatically wake up every weekday at 9 AM:

```
sudo pmset repeat wake MTWRF 09:00:00
```

- Restore to system defaults:

```
sudo pmset -a displaysleep 10 disksleep 10 sleep 30 womp 1
```

pod

Dependency manager for Swift and Objective-C Cocoa projects.

More information: https://guides.cocoapods.org/terminal/commands.html.

- Create a Podfile for the current project with the default contents:

```
pod init
```

- Download and install all pods defined in the Podfile (that haven't been installed before):

```
pod install
```

- List all available pods:

```
pod list
```

- Show the outdated pods (of those currently installed):

```
pod outdated
```

- Update all currently installed pods to their newest version:

```
pod update
```

- Update a specific (previously installed) pod to its newest version:

```
pod update {{pod_name}}
```

- Remove CocoaPods from a Xcode project:

```
pod deintegrate {{xcode_project}}
```

port

Package manager for macOS.

More information: https://guide.macports.org/#using.port.

- Search for a package:

```
port search {{search_term}}
```

- Install a package:

```
sudo port install {{package}}
```

- List installed packages:

```
port installed
```

- Update port and fetch the latest list of available packages:

```
sudo port selfupdate
```

- Upgrade outdated packages:

```
sudo port upgrade outdated
```

- Remove old versions of installed packages:

```
sudo port uninstall inactive
```

powermetrics

Gather and display CPU usage, power, and interrupt wakeup statistics.

More information: https://keith.github.io/xcode-man-pages/powermetrics.1.html.

- Display CPU, power, and wakeup metrics using the default 5-second sample interval:

```
sudo powermetrics
```

- Sample metrics every 2000 milliseconds taking 10 samples then exit:

```
sudo powermetrics {{[-i|--sample-rate]}} 2000 {{[-n|--sample-count]}} 10
```

- Save output to a file instead of `stdout`:

```
sudo powermetrics {{[-o|--output-file]}} {{path/to/output.txt}}
```

- Order the process list by the specified method (default: `composite`):

```
sudo powermetrics {{[-r|--order]}} {{pid|wakeups|cputime|composite}}
```

- Display output in machine-readable property list format and print a usage summary on exit:

```
sudo powermetrics {{[-f|--format]}} plist --show-usage-summary
```

ps

Information about running processes.

More information: https://keith.github.io/xcode-man-pages/ps.1.html.

- List all running processes:

```
ps aux
```

- List all running processes including the full command string:

```
ps auxww
```

- Search for a process that matches a string:

```
ps aux | grep {{string}}
```

- Get the parent PID of a process:

```
ps -o ppid= -p {{process_id}}
```

- Sort processes by memory usage:

```
ps -m
```

- Sort processes by CPU usage:

```
ps -r
```

pwpolicy

Get and set password policies.

More information: https://keith.github.io/xcode-man-pages/pwpolicy.8.html.

- Change password for specified user:

```
sudo pwpolicy -a {{authenticator}} -u {{username}} -
setpassword "{{new_password}}"
```

- Disable a user account:

```
sudo pwpolicy -u {{username}} -disableuser
```

- Enable a user account:

```
sudo pwpolicy -u {{username}} -enableuser
```

- Get list of password hashes stored on disk for a user account:

```
sudo pwpolicy -u {{username}} -gethashtypes
```

qlmanage

QuickLook server tool.

More information: https://keith.github.io/xcode-man-pages/qlmanage.1.html.

- Display QuickLook for one or multiple files:

```
qlmanage -p {{path/to/file1 path/to/file2 ...}}
```

- Compute 300px wide PNG thumbnails of all JPEGs in the current directory and put them in a directory:

```
qlmanage {{*.jpg}} -t -s {{300}} {{path/to/directory}}
```

- Reset QuickLook:

```
qlmanage -r
```

rargs

Execute a command for each line of **`stdin`**.

Like **`xargs`**, but with pattern matching support.

More information: https://github.com/lotabout/rargs.

- Execute a command for every line of input, just like `xargs` (`{0}` indicates where to substitute in the text):

```
{{command}} | rargs {{command}} {0}
```

- Simulate which commands would be run without executing them:

```
{{command}} | rargs -e {{command}} {0}
```

- Remove the `.bak` extension from every file in a list:

```
{{command}} | rargs -p '(.*).bak mv {0} {1}
```

- Execute commands in parallel:

```
{{command}} | rargs -w {{max_procs}}
```

- Consider each line of input to be separated by a NUL character (`\0`) instead of a newline (`\n`):

```
{{command}} | rargs -0 {{command}} {0}
```

reboot

Reboot the system.

More information: https://keith.github.io/xcode-man-pages/reboot.8.html.

- Reboot immediately:

```
sudo reboot
```

- Reboot immediately without gracefully shutting down:

```
sudo reboot -q
```

rev

Reverse lines of text.

More information: https://keith.github.io/xcode-man-pages/rev.1.html.

- Reverse each line in a file to `stdout`:

```
rev {{path/to/file}}
```

- Reverse each line from `stdin` to `stdout`:

```
{{command}} | rev
```

route

Manually manipulate the routing tables.

More information: https://keith.github.io/xcode-man-pages/route.8.html.

- Add a route to a destination through a gateway:

```
sudo route add "{{destination_ip_address}}"
"{{gateway_address}}"
```

- Add a route to a `/24` subnet through a gateway:

```
sudo route add "{{subnet_ip_address}}/24"
"{{gateway_address}}"
```

- Run in test mode (does not do anything, just print):

```
sudo route -t add "{{destination_ip_address}}/24"
"{{gateway_address}}"
```

- Remove all routes:

```
sudo route flush
```

- Delete a specific route:

```
sudo route delete "{{destination_ip_address}}/24"
```

- Look up and display the route for a destination (hostname or IP address):

```
sudo route get "{{destination}}"
```

SafeEjectGPU

Eject a GPU safely.

More information: https://keith.github.io/xcode-man-pages/SafeEjectGPU.8.html.

- Eject all GPUs:

```
SafeEjectGPU Eject
```

- List all GPUs attached:

```
SafeEjectGPU gpus
```

- List apps using a GPU:

```
SafeEjectGPU gpuid {{gpu_id}} apps
```

- Get the status of a GPU:

```
SafeEjectGPU gpuid {{gpu_id}} status
```

- Eject a GPU:

```
SafeEjectGPU gpuid {{gpu_id}} Eject
```

- Launch an app on a GPU:

```
SafeEjectGPU gpuid {{gpu_id}} LaunchOnGPU {{path/to/App.app}}
```

say

Convert text to speech.

More information: https://keith.github.io/xcode-man-pages/say.1.html.

- Say a phrase aloud:

```
say "{{I like to ride my bike.}}"
```

- Read a file aloud:

```
say --input-file {{filename.txt}}
```

- Say a phrase with a custom voice and speech rate:

```
say --voice {{voice}} --rate {{words_per_minute}} "{{I'm sorry Dave, I can't let you do that.}}"
```

- List the available voices (different voices speak in different languages):

```
say --voice "?"
```

- Say something in Polish:

```
say --voice {{Zosia}} "{{Litwo, ojczyzno moja!}}"
```

- Create an audio file of the spoken text:

```
say --output-file {{filename.aiff}} "{{Here's to the Crazy Ones.}}"
```

screencapture

Utility to take screenshots and screen recordings.

More information: https://keith.github.io/xcode-man-pages/screencapture.1.html.

- Take a screenshot and save it to a file:

```
screencapture {{path/to/file.png}}
```

- Take a screenshot including the mouse cursor:

```
screencapture -C {{path/to/file.png}}
```

- Take a screenshot and open it in Preview, instead of saving:

```
screencapture -P
```

- Take a screenshot of a selected rectangular area:

```
screencapture -i {{path/to/file.png}}
```

- Take a screenshot after a delay:

```
screencapture -T {{seconds}} {{path/to/file.png}}
```

- Make a screen recording and save it to a file:

```
screencapture -v {{path/to/file.mp4}}
```

scutil

Manage system configuration parameters.

More information: https://keith.github.io/xcode-man-pages/scutil.8.html.

- Display DNS Configuration:

```
scutil --dns
```

- Display proxy configuration:

```
scutil --proxy
```

- Get computer name:

```
scutil --get ComputerName
```

- Set computer name:

```
sudo scutil --set ComputerName {{computer_name}}
```

- Get hostname:

```
scutil --get HostName
```

- Set hostname:

```
scutil --set HostName {{hostname}}
```

sdef

Get or generate a scripting definitions (**sdef**) file from a scriptable application.

More information: https://developer.apple.com/library/archive/documentation/Cocoa/Conceptual/ScriptableCocoaApplications/SApps_creating_sdef/SAppsCreateSdef.html.

- Print the scripting definitions of the given application:

```
sdef {{/Applications/XCode.app}}
```

secd

Control access to and modification of keychain items.

Note: It should not be invoked manually.

More information: https://keith.github.io/xcode-man-pages/secd.8.html.

- Start the daemon:

```
secd
```

security

Administer keychains, keys, certificates, and the Security framework.

More information: https://keith.github.io/xcode-man-pages/security.1.html.

- List all available keychains:

```
security list-keychains
```

- Delete a specific keychain:

```
security delete-keychain {{path/to/file.keychain}}
```

- Create a keychain:

```
security create-keychain -p {{password}} {{path/to/
file.keychain}}
```

- Set a certificate to use with a website or [s]ervice by its [c]ommon name (fails if several certificates with the same common name exist):

```
security set-identity-preference -s {{url|hostname|service}}
-c "{{common_name}}" {{path/to/file.keychain}}
```

- Add a certificate from file to a [k]eychain (if -k isn't specified, the default keychain is used):

```
security add-certificates -k {{file.keychain}} {{path/to/
cert_file.pem}}
```

- Add a CA certificate to the per-user Trust Settings:

```
security add-trusted-cert -k {{path/to/user-
keychain.keychain-db}} {{path/to/ca-cert_file.pem}}
```

- Remove a CA certificate from the per-user Trust Settings:

```
security remove-trusted-cert {{path/to/ca-cert_file.pem}}
```

securityd

This manages security contexts and cryptographic operations.

Works with secd for keychain access.

Note: It should not be invoked manually.

More information: https://keith.github.io/xcode-man-pages/securityd.1.html.

- Start the daemon:

```
securityd
```

sed

Edit text in a scriptable manner.

See also: **awk**, **ed**.

More information: https://keith.github.io/xcode-man-pages/sed.1.html.

- Replace all `apple` (basic `regex`) occurrences with `mango` (basic `regex`) in all input lines and print the result to `stdout`:

```
{{command}} | sed 's/apple/mango/g'
```

- Execute a specific script [f]ile and print the result to `stdout`:

```
{{command}} | sed -f {{path/to/script_file.sed}}
```

- Replace all `apple` (extended `regex`) occurrences with `APPLE` (extended `regex`) in all input lines and print the result to `stdout`:

```
{{command}} | sed -E 's/(apple)/\U\1/g'
```

- Print just a first line to `stdout`:

```
{{command}} | sed -n '1p'
```

- Replace all `apple` (basic `regex`) occurrences with `mango` (basic `regex`) in a `file` and save a backup of the original to `file.bak`:

```
sed -i bak 's/apple/mango/g' {{path/to/file}}
```

setfile

Set file attributes on files in an HFS+ directory.

More information: https://ss64.com/mac/setfile.html.

- Set creation date for specific files:

```
setfile -d "{{MM/DD/YYYY HH:MM:SS}}" {{path/to/file1 path/to/file2 ...}}
```

- Set modification date for specific files:

```
setfile -m "{{MM/DD/YYYY HH:MM:SS}}" {{path/to/file1 path/to/file2 ...}}
```

- Set modification date for symlink file (not to linked file itself):

```
setfile -P -m "{{MM/DD/YYYY HH:MM:SS}}" {{path/to/file1 path/to/file2 ...}}
```

shortcuts

Manage shortcuts.

Note: You can also use the **`Shortcuts`** app.

More information: https://support.apple.com/guide/shortcuts-mac/run-shortcuts-from-the-command-line-apd455c82f02/mac.

- Run the specified shortcut (`Count holidays`):

  ```
  shortcuts run "{{Count holidays}}"
  ```

- Print all shortcuts:

  ```
  shortcuts list
  ```

- Print all shortcut folders:

  ```
  shortcuts list --folders
  ```

- Open the specified shortcut (`Count holidays`) in the Shortcuts editor:

  ```
  shortcuts view "{{Count holidays}}"
  ```

shuf

Generate random permutations.

More information: https://manpagez.com/man/1/shuf/.

- Randomize the order of lines in a file and output the result:

```
shuf {{path/to/file}}
```

- Only output the first 5 entries of the result:

```
shuf --head-count=5 {{path/to/file}}
```

- Write output to another file:

```
shuf {{path/to/input_file}} --output {{ath/to/output_file}}
```

- Generate random numbers in the range 1 to 10:

```
shuf --input-range=1-10
```

shutdown

Shut down and reboot the system.

More information: https://keith.github.io/xcode-man-pages/shutdown.8.html.

- Power off (halt) immediately:

```
shutdown -h now
```

- Sleep immediately:

```
shutdown -s now
```

- Reboot immediately:

```
shutdown -r now
```

- Reboot in 5 minutes:

```
shutdown -r "+5"
```

- Power off (halt) at 1:00 pm (Uses 24h clock):

```
shutdown -h 1300
```

- Reboot on May 10th 2042 at 11:30 am (Input format: YYMMDDHHMM):

```
shutdown -r 4205101130
```

signal

Simplified software signal facilities.

More information: https://developer.apple.com/library/archive/documentation/System/Conceptual/ManPages_iPhoneOS/man3/signal.3.html.

- View documentation for signals in macOS:

```
man signal
```

sips

Apple Scriptable Image Processing System.

Raster/Query images and ColorSync ICC Profiles.

More information: https://keith.github.io/xcode-man-pages/sips.1.html.

- Specify an output directory so that originals do not get modified:

```
sips --out {{path/to/output_directory}}
```

- Resample image at specified size, Image aspect ratio may be altered:

```
sips --resampleHeightWidth {{1920}} {{300}}
{{image_file.ext}}
```

- Resample image so height and width aren't greater than specified size (notice the capital Z):

```
sips --resampleHeightWidthMax {{1920}} {{300}}
{{image_file.ext}}
```

- Resample all images in a directory to fit a width of 960px (honoring aspect ratio):

```
sips --resampleWidth {{960}} {{path/to/images}}
```

- Convert an image from CMYK to RGB:

```
sips --matchTo "/System/Library/ColorSync/Profiles/Generic
RGB Profile.icc" {{path/to/image.ext}} --out {{path/to/
output_directory}}
```

- Remove ColorSync ICC profile from an image:

```
sips --deleteProperty profile --
deleteColorManagementProperties {{path/to/image_file.ext}}
```

sntp

A very Simple Network Time Protocol client program.

More information: https://keith.github.io/xcode-man-pages/sntp.1.

- Query a specified SNTP server and display the time:

```
sntp {{pool.ntp.org}}
```

- Synchronize the system clock with a specified SNTP server:

```
sudo sntp -S {{pool.ntp.org}}
```

- Enable debug logging:

```
sntp -d {{pool.ntp.org}}
```

sntpd

An SNTP server.

Note: It should not be invoked manually.

More information: https://keith.github.io/xcode-man-pages/sntpd.8.html.

- Start the daemon:

```
sntpd
```

- Overwrite existing state with the local clock (stratum 1), for running a master/primary server, without synchronizing with another (higher stratum) server:

```
sntpd -L
```

- Use a custom file for the SNTP state:

```
sntpd -z {{path/to/state.bin}}
```

softwareupdate

Update macOS App Store apps.

More information: https://keith.github.io/xcode-man-pages/softwareupdate.8.html.

- List all available updates:

```
softwareupdate {{[-l|--list]}}
```

- Download and install all updates:

```
softwareupdate {{[-i|--install]}} {{[-a|--all]}}
```

- Download and install all recommended updates:

```
softwareupdate {{[-i|--install]}} {{[-r|--recommended]}}
```

- Download and install a specific app:

```
softwareupdate {{[-i|--install]}} {{update_name}}
```

spctl

Manage the security assessment policy subsystem.

Utility for managing Gatekeeper in macOS.

More information: https://keith.github.io/xcode-man-pages/spctl.8.html.

- Turn off Gatekeeper:

```
spctl --master-disable
```

- Add a rule to allow an application to run (labeling of rule is optional):

```
spctl --add --label {{rule_name}} {{path/to/file}}
```

- Turn on Gatekeeper:

```
spctl --master-enable
```

- List all rules on the system:

```
spctl --list
```

spindump

Profile entire system during a time interval.

Used for normal application force quits to display a dialog offering details and the option to report to Apple.

More information: https://keith.github.io/xcode-man-pages/spindump.8.html.

- Sample all processes for 10 seconds with 10 milliseconds of run time between samples:

```
sudo spindump
```

- Sort a specific process topmost for a custom duration and interval:

```
sudo spindump {{pid|partial_name}} {{duration_seconds}} {{interval_milliseconds}}
```

- Write output to a specific file:

```
sudo spindump {{pid|partial_name}} -o {{path/to/output.txt}}
```

split

Split a file into pieces.

More information: https://keith.github.io/xcode-man-pages/split.1.html.

- Split a file, each split having 10 lines (except the last split):

```
split -l 10 {{path/to/file}}
```

- Split a file by a `regex`. The matching line will be the first line of the next output file:

```
split -p {{cat|^[dh]og}} {{path/to/file}}
```

- Split a file with 512 bytes in each split (except the last split; use 512k for kilobytes and 512m for megabytes):

```
split -b 512 {{path/to/file}}
```

- Split a file into 5 files. File is split such that each split has same size (except the last split):

```
split -n 5 {{path/to/file}}
```

spotify

A command-line interface to Spotify.

More information: https://github.com/hnarayanan/shpotify#usage.

- Find a song by name and play it:

```
spotify play {{song_name}}
```

- Find a playlist by name and play it:

```
spotify play list {{playlist_name}}
```

- Pause (or resume) playback:

```
spotify pause
```

- Skip to the next song in a playlist:

```
spotify next
```

- Change volume:

```
spotify vol {{up|down|value}}
```

- Show the playback status and song details:

```
spotify status
```

stat

Display file status.

More information: https://keith.github.io/xcode-man-pages/stat.1.html.

- Show file properties such as size, permissions, creation date, and access date among others:

```
stat {{path/to/file}}
```

- Show file properties verbosely (more similar to Linux's `stat`):

```
stat -x {{path/to/file}}
```

- Show only octal file permissions:

```
stat -f %Mp%Lp {{path/to/file}}
```

- Show owner and group of the file:

```
stat -f "%Su %Sg" {{path/to/file}}
```

- Show the size of the file in bytes:

```
stat -f "%z %N" {{path/to/file}}
```

sw_vers

Print macOS operating system version information.

More information: https://keith.github.io/xcode-man-pages/sw_vers.1.html.

- Print all available information (OS name, version number, and build):

```
sw_vers
```

- Print only the version number of the operating system:

```
sw_vers -productVersion
```

- Print only the build identifier:

```
sw_vers -buildVersion
```

symptomsd

Provide services for **`Symptoms.framework`**.

Note: It should not be invoked manually.

More information: https://keith.github.io/xcode-man-pages/symptomsd.8.html.

- Start the daemon:

  ```
  symptomsd
  ```

sync

Flush all pending write operations to the appropriate disks.

More information: https://keith.github.io/xcode-man-pages/sync.8.html.

- Flush all pending write operations on all disks:

```
sync
```

- Flush all pending write operations on a single file to disk:

```
sync {{path/to/file}}
```

- Flush disk writes and attempt to clear inactive memory and filesystem caches:

```
sync; sudo purge
```

sysctl

Access kernel state information.

More information: https://keith.github.io/xcode-man-pages/sysctl.8.html.

- Show all available variables and their values:

```
sysctl -a
```

- Show Apple model identifier:

```
sysctl -n hw.model
```

- Show CPU model:

```
sysctl -n machdep.cpu.brand_string
```

- Show available CPU features (MMX, SSE, SSE2, SSE3, AES, etc.):

```
sysctl -n machdep.cpu.features
```

- Set a changeable kernel state variable:

```
sysctl -w {{section.tunable}}={{value}}
```

system_profiler

Report system hardware and software configuration.

More information: https://keith.github.io/xcode-man-pages/system_profiler.8.html.

- Display a report with specific details level (mini [no personal information], basic, or full):

```
system_profiler -detailLevel {{level}}
```

- Display a full system profiler report which can be opened by `System Profiler.app`:

```
system_profiler -xml > MyReport.spx
```

- Display a hardware overview (Model, CPU, Memory, Serial, etc.) and software data (System, Kernel, Name, Uptime, etc.):

```
system_profiler SPHardwareDataType SPSoftwareDataType
```

- Print the system serial number:

```
system_profiler SPHardwareDataType|grep "Serial Number (system)" | awk '{ print $4 }'
```

- Display the negotiated max wattage of the connected charger and cable:

```
system_profiler SPPowerDataType | awk '/Wattage/ {print $3}'
```

systemsetup

Configure System Preferences machine settings.

More information: https://support.apple.com/guide/remote-desktop/about-systemsetup-apd95406b8d/mac.

- Enable remote login (SSH):

```
systemsetup -setremotelogin on
```

- Specify timezone, NTP Server, and enable network time:

```
systemsetup -settimezone "{{US/Pacific}}" -setnetworktimeserver {{us.pool.ntp.org}} -setusingnetworktime on
```

- Make the machine never sleep and automatically restart on power failure or kernel panic:

```
systemsetup -setsleep off -setrestartpowerfailure on -setrestartfreeze on
```

- List valid startup disks:

```
systemsetup -liststartupdisks
```

- Specify a new startup disk:

```
systemsetup -setstartupdisk {{path/to/directory}}
```

systemsoundserverd

Core Audio related daemon.

Note: It should not be invoked manually.

- Start the daemon:

  ```
  systemsoundserverd
  ```

tag

Edit tags on Mac OS X files (10.9 Mavericks and above).

More information: https://github.com/jdberry/tag#usage.

- Add tags to a file:

```
tag {{[-a|--add]}} {{tag_name1,tag_name2,...}} {{path/to/file}}
```

- Remove a tag:

```
tag {{[-r|--remove]}} {{tag_name}} {{path/to/file}}
```

- Remove all tags from a file:

```
tag {{[-r|--remove]}} \* {{path/to/file}}
```

- Show all files with a given tag:

```
tag {{[-m|--match]}} {{tag_name}}
```

tail

Display the last part of a file.

See also: **head**.

More information: https://keith.github.io/xcode-man-pages/tail.1.html.

- Show last 8 lines in file:

```
tail -n 8 {{path/to/file}}
```

- Print a file from a specific line number:

```
tail -n +{{8}} {{path/to/file}}
```

- Print a specific count of bytes from the end of a given file:

```
tail -c {{8}} {{path/to/file}}
```

- Print the last lines of a given file and keep reading it until `<Ctrl c>`:

```
tail -f {{path/to/file}}
```

- Keep reading file until `<Ctrl c>`, even if the file is inaccessible:

```
tail -F {{path/to/file}}
```

- Show last `count` lines in a file and refresh every `seconds` seconds:

```
tail -n {{count}} -s {{seconds}} -f {{path/to/file}}
```

tart

Build, run, and manage macOS and Linux virtual machines (VMs) on Apple Silicon.

More information: https://github.com/cirruslabs/tart.

- Pull a remote VM image:

```
tart pull {{acme.io/org/name:tag}}
```

- Clone a VM from a local or remote image source:

```
tart clone {{source-vm}} {{vm-name}}
```

- Create a new Mac VM from a specific ipsw file:

```
tart create --from-ipsw {{latest|path/to/file.ipsw}} {{vm-name}}
```

- Run an existing VM:

```
tart run {{vm-name}}
```

- Run an existing VM with a specific mounted directory:

```
tart run --dir {{path/to/directory}}:/{{path/to/local_directory}} {{vm-name}}
```

- List VMs:

```
tart list
```

- Get IP address of a running VM:

```
tart ip {{vm-name}}
```

- Change a VM's display resolution:

```
tart set {{vm-name}} --display {{640}}x{{400}}
```

tccutil

Reset decisions stored in the privacy database.

Forces apps to prompt again the next time they access the service.

More information: https://ss64.com/mac/tccutil.html.

- Reset a specific service:

```
sudo tccutil reset {{service}}
```

- Reset all services:

```
sudo tccutil reset All
```

terminal-notifier

Send macOS User Notifications.

More information: https://github.com/julienXX/terminal-notifier.

- Send a notification (only the message is required):

```
terminal-notifier -group {{tldr-info}} -title {{TLDR}} -
message '{{TLDR rocks}}'
```

- Display piped data with a sound:

```
echo '{{Piped Message Data!}}' | terminal-notifier -sound
{{default}}
```

- Open a URL when the notification is clicked:

```
terminal-notifier -message '{{Check your Apple stock!}}' -
open '{{http://finance.yahoo.com/q?s=AAPL}}'
```

- Open an app when the notification is clicked:

```
terminal-notifier -message '{{Imported 42 contacts.}}' -
activate {{com.apple.AddressBook}}
```

textutil

Manipulate text files of various formats.

More information: https://keith.github.io/xcode-man-pages/textutil.1.html.

- Display information about `file.rtf`:

```
textutil -info {{path/to/file.rtf}}
```

- Convert `file.rtf` into `file.html`:

```
textutil -convert html {{path/to/file.rtf}}
```

- Convert rich text to normal text:

```
textutil {{path/to/file.rtf}} -convert txt
```

- Convert `file.txt` into `file.rtf`, using Times 10 for the font:

```
textutil -convert rtf -font Times -fontsize 10 {{path/to/
file.txt}}
```

- Load all RTF files in the current directory, concatenate their contents, and write the result out as `index.html` with the HTML title set to "Several Files":

```
textutil -cat {{html}} -title "Several Files" -output {{path/
to/index.html}} *.rtf
```

timed

Service that synchronizes system time (e.g. using NTP).

Note: It should not be invoked manually.

More information: https://keith.github.io/xcode-man-pages/timed.8.html.

- Start the daemon:

```
timed
```

tmutil

Utility for managing Time Machine backups.

More information: https://keith.github.io/xcode-man-pages/tmutil.8.html.

- Set an HFS+ drive as the backup destination:

```
sudo tmutil setdestination {{path/to/disk_mount_point}}
```

- Set an APF share or SMB share as the backup destination:

```
sudo tmutil setdestination "{{protocol://user:password@host/share}}"
```

- Append the given destination to the list of destinations:

```
sudo tmutil setdestination -a {{destination}}
```

- Enable automatic backups:

```
sudo tmutil enable
```

- Disable automatic backups:

```
sudo tmutil disable
```

- Start a backup, if one is not running already, and release control of the shell:

```
sudo tmutil startbackup
```

- Start a backup and block until the backup is finished:

```
sudo tmutil startbackup -b
```

- Stop a backup:

```
sudo tmutil stopbackup
```

top

Display dynamic real-time information about running processes.

More information: https://keith.github.io/xcode-man-pages/top.1.html.

- Start `top`, all options are available in the interface:

```
top
```

- Start `top` sorting processes by internal memory size (default order - process ID):

```
top -o mem
```

- Start `top` sorting processes first by CPU, then by running time:

```
top -o cpu -O time
```

- Start `top` displaying only processes owned by given user:

```
top -user {{user_name}}
```

- Display help about interactive commands:

```
<?>
```

translationd

Enable Translation features.

Note: It should not be invoked manually.

- Start the daemon:

  ```
  translationd
  ```

trash

Move files and directories to the user trash folder.

More information: https://keith.github.io/xcode-man-pages/trash.8.html.

- Move a file to the trash:

```
trash {{path/to/file}}
```

- Move multiple items or directories to the trash:

```
trash {{path/to/file_or_directory1 path/to/
file_or_directory2 ...}}
```

- Move files to the trash with verbose output:

```
trash {{[-v|--verbose]}} {{path/to/file1 path/to/file2 ...}}
```

- Display help:

```
trash {{[-h|--help]}}
```

uname

Print details about the current machine and the operating system running on it.

Note: For additional information about the operating system, try the **`sw_vers`** command.

More information: https://keith.github.io/xcode-man-pages/uname.1.html.

- Print kernel name:

```
uname
```

- Print system architecture and processor information:

```
uname -mp
```

- Print kernel name, kernel release, and kernel version:

```
uname -srv
```

- Print system hostname:

```
uname -n
```

- Print all available system information:

```
uname -a
```

universalaccessd

Get universal access services.

Note: It should not be invoked manually.

More information: https://keith.github.io/xcode-man-pages/universalaccessd.8.html.

- Start the daemon:

```
universalaccessd
```

uptime

Tell how long the system has been running and other information.

More information: https://keith.github.io/xcode-man-pages/uptime.1.html.

- Print current time, uptime, number of logged-in users, and other information:

```
uptime
```

usernoted

Provide notification services.

Note: It should not be invoked manually.

More information: https://keith.github.io/xcode-man-pages/usernoted.8.html.

- Start the daemon:

```
usernoted
```

uuidgen

Generate new UUID (Universally Unique IDentifier) strings.

More information: https://keith.github.io/xcode-man-pages/uuidgen.1.html.

- Generate a UUID string:

```
uuidgen
```

valet

A Laravel development environment that allows hosting sites via local tunnels on http://example.test.

More information: https://laravel.com/docs/valet.

- Start the valet daemon:

  ```
  valet start
  ```

- Register the current working directory as a path that Valet should search for sites:

  ```
  valet park
  ```

- View "parked" paths:

  ```
  valet paths
  ```

- Serve a single site instead of an entire directory:

  ```
  valet link {{application_name}}
  ```

- Share a project via an Ngrok tunnel:

  ```
  valet share
  ```

vm_stat

Show virtual memory statistics.

More information: https://keith.github.io/xcode-man-pages/vm_stat.1.html.

- Display virtual memory statistics:

```
vm_stat
```

- Display reports every 2 seconds for 5 times:

```
vm_stat -c 5 2
```

vpnd

Listen for incoming VPN connections.

Note: It should not be invoked manually.

More information: https://keith.github.io/xcode-man-pages/vpnd.8.html.

- Start the daemon:

```
vpnd
```

- Run the daemon in the foreground:

```
vpnd -x
```

- Run the daemon in the foreground and print logs to the terminal:

```
vpnd -d
```

- Run the daemon in the foreground, print logs to the terminal, and quit after validating arguments:

```
vpnd -n
```

- Run the daemon for a specific server configuration:

```
vpnd -i {{server_id}}
```

- Display help:

```
vpnd -h
```

w

Show who is logged on and what they are doing.

Print user login, TTY, remote host, login time, idle time, current process.

More information: https://keith.github.io/xcode-man-pages/w.1.html.

- Show logged-in users information:

```
w
```

- Show logged-in users information without a header:

```
w -h
```

- Show information about logged-in users, sorted by their idle time:

```
w -i
```

wacaw

Capture both still pictures and video from an attached camera.

More information: https://webcam-tools.sourceforge.net/#parameters.

- Take a picture from webcam:

```
wacaw {{filename}}
```

- Record a video:

```
wacaw --video {{filename}} {{[-D|--duration]}} {{10}}
```

- Take a picture with custom resolution:

```
wacaw {{[-x|--width]}} {{width}} {{[-y|--height]}} {{100}} {{filename}}
```

- Copy image just taken to clipboard:

```
wacaw --to-clipboard
```

- List the devices available:

```
wacaw {{[-L|--list-devices]}}
```

warmd

Control caches used during startup and login.

Note: It should not be invoked manually.

More information: https://keith.github.io/xcode-man-pages/warmd.8.html.

- Start the daemon:

```
warmd
```

watchdogd

Works with the Watchdog KEXT to ensure that the system is healthy and running.

Note: It should not be invoked manually.

More information: https://keith.github.io/xcode-man-pages/watchdogd.8.html.

- Start the daemon:

```
watchdogd
```

watchlistd

Manage the Apple TV app's watch list.

Note: It should not be invoked manually.

More information: https://keith.github.io/xcode-man-pages/watchlistd.8.html.

- Start the daemon:

```
watchlistd
```

wc

Count lines, words, or bytes.

More information: https://keith.github.io/xcode-man-pages/wc.1.html.

- Count lines in file:

```
wc -l {{path/to/file}}
```

- Count words in file:

```
wc -w {{path/to/file}}
```

- Count characters (bytes) in file:

```
wc -c {{path/to/file}}
```

- Count characters in file (taking multi-byte character sets into account):

```
wc -m {{path/to/file}}
```

- Use `stdin` to count lines, words, and characters (bytes) in that order:

```
{{find .}} | wc
```

webinspectord

Relays commands between Web Inspector and remote targets like WKWebView.

Note: It should not be invoked manually.

More information: https://www.manpagez.com/man/8/webinspectord/.

- Start the daemon:

```
webinspectord
```

whatis

Search a set of database files for short descriptions of system commands for keywords.

More information: https://www.linfo.org/whatis.html.

- Search for information about keyword:

```
whatis {{keyword}}
```

- Search for information about multiple keywords:

```
whatis {{keyword1}} {{keyword2}}
```

wifi-password

Get the password of the Wi-Fi.

More information: https://github.com/rauchg/wifi-password.

- Get the password for the Wi-Fi you are currently logged onto:

```
wifi-password
```

- Get the password for the Wi-Fi with a specific SSID:

```
wifi-password {{ssid}}
```

- Print only the password as output:

```
wifi-password -q
```

wifivelocityd

XPC helper for performing system context actions for the WiFiVelocity framework.

Note: It should not be invoked manually.

More information: https://keith.github.io/xcode-man-pages/wifivelocityd.8.html.

- Start the daemon:

```
wifivelocityd
```

wps

Assists AirPort in connecting to a network using Wireless Protected Setup.

Note: It should not be invoked manually.

More information: https://www.manpagez.com/man/8/wps/.

- Start the daemon:

```
wps
```

wwand

USB WWAN device configuration daemon.

Note: It should not be invoked manually.

More information: https://web.archive.org/web/20230331164459/https://keith.github.io/xcode-man-pages/wwand.8.html.

- Start the daemon:

```
wwand
```

xartstorageremoted

The xART Remote Storage Daemon. Receives save/fetch requests from the CoProcessor.

Note: It should not be invoked manually.

More information: https://keith.github.io/xcode-man-pages/xartstorageremoted.8.html.

- Start the daemon:

```
xartstorageremoted
```

xattr

Utility to work with extended filesystem attributes.

More information: https://keith.github.io/xcode-man-pages/xattr.1.html.

- List key:value extended attributes for a given file:

```
xattr -l {{file}}
```

- Write an attribute for a given file:

```
xattr -w {{attribute_key}} {{attribute_value}} {{file}}
```

- Delete an attribute from a given file:

```
xattr -d {{com.apple.quarantine}} {{file}}
```

- Delete all extended attributes from a given file:

```
xattr -c {{file}}
```

- Recursively delete an attribute in a given directory:

```
xattr -rd {{attribute_key}} {{directory}}
```

xcode-select

Switch between different versions of Xcode and the included developer tools.

Also used to update the path to Xcode if it is moved after installation.

More information: https://developer.apple.com/library/archive/technotes/tn2339/_index.html.

- Install Xcode's command-line tools:

```
xcode-select --install
```

- Select a given path as the active developer directory:

```
xcode-select --switch {{path/to/Xcode.app/Contents/Developer}}
```

- Select a given Xcode instance and use its developer directory as the active one:

```
xcode-select --switch {{path/to/Xcode_file.app}}
```

- Print the currently selected developer directory:

```
xcode-select --print-path
```

- Discard any user-specified developer directory so that it will be found via the default search mechanism:

```
sudo xcode-select --reset
```

xcodebuild

Build Xcode projects.

More information: https://developer.apple.com/library/archive/technotes/tn2339/_index.html.

- Build workspace:

```
xcodebuild -workspace {{workspace_name.workspace}} -scheme {{scheme_name}} -configuration {{configuration_name}} clean build SYMROOT={{SYMROOT_path}}
```

- Build project:

```
xcodebuild -target {{target_name}} -configuration {{configuration_name}} clean build SYMROOT={{SYMROOT_path}}
```

- Show SDKs:

```
xcodebuild -showsdks
```

xcodes runtimes

Manage Xcode Simulator runtimes.

More information: https://github.com/xcodesorg/xcodes#commands.

- Display all available Simulator runtimes:

```
xcodes runtimes --include-betas
```

- Download a Simulator runtime:

```
xcodes runtimes download {{runtime_name}}
```

- Download and install a Simulator runtime:

```
xcodes runtimes install {{runtime_name}}
```

- Download/install a Simulator runtime for specific iOS/watchOS/tvOS/visionOS version (must be written as case-sensitive):

```
xcodes runtimes {{download|install}} "{{iOS|watchOS|tvOS|visionOS}} {{runtime_version}}"
```

- Set a specific location where the runtime archive will be first downloaded (defaults to `~/Downloads`):

```
xcodes runtimes {{download|install}} {{runtime_name}} --directory {{path/to/directory}}
```

- Do not delete the downloaded archive when the Simulator is successfully installed:

```
xcodes runtimes install {{runtime_name}} --keep-archive
```

xcodes

Download, install, and manage multiple Xcode versions.

Some subcommands such as **`runtimes`** have their own usage documentation.

More information: https://github.com/xcodesorg/xcodes#commands.

- List all installed Xcode versions:

```
xcodes installed
```

- List all available Xcode versions:

```
xcodes list
```

- Select an Xcode version by specifying a version number or a path:

```
xcodes select {{xcode_version|path/to/Xcode.app}}
```

- Download and install a specific Xcode version:

```
xcodes install {{xcode_version}}
```

- Install the latest Xcode release and select it:

```
xcodes install --latest --select
```

- Download a specific Xcode version archive to a given directory without installing it:

```
xcodes download {{xcode_version}} --directory {{path/to/directory}}
```

xcrun

Run or locate development tools and properties.

More information: https://keith.github.io/xcode-man-pages/xcrun.1.html.

- Find and run a tool from the active developer directory:

```
xcrun {{tool}} {{arguments}}
```

- Show verbose output:

```
xcrun {{tool}} {{arguments}} --verbose
```

- Find a tool for a given SDK:

```
xcrun --sdk {{sdk_name}}
```

- Find a tool for a given toolchain:

```
xcrun --toolchain {{name}}
```

- Display help:

```
xcrun --help
```

- Display version:

```
xcrun --version
```

xctool

Build Xcode projects.

More information: https://github.com/facebookarchive/xctool#usage.

- Build a single project without any workspace:

```
xctool -project {{YourProject.xcodeproj}} -scheme
{{YourScheme}} build
```

- Build a project that is part of a workspace:

```
xctool -workspace {{YourWorkspace.xcworkspace}} -scheme
{{YourScheme}} build
```

- Clean, build, and execute all the tests:

```
xctool -workspace {{YourWorkspace.xcworkspace}} -scheme
{{YourScheme}} clean build test
```

xed

Open files for editing in Xcode.

More information: https://keith.github.io/xcode-man-pages/xed.1.html.

- Open file in Xcode:

```
xed {{path/to/file1 path/to/file2 ...}}
```

- Open file(s) in Xcode, create if it doesn't exist:

```
xed --create {{path/to/file1 path/to/file2 ...}}
```

- Open a file in Xcode and jump to line number 75:

```
xed --line 75 {{path/to/file}}
```

xip

Create or expand compressed files in a secure xip archive.

Only archives signed by Apple are trusted, so this tool should not be used to create archives.

More information: https://keith.github.io/xcode-man-pages/xip.1.html.

- Expand the archive into the current working directory:

```
xip --expand {{path/to/file.xip}}
```

xml2man

Compile MPGL to mdoc.

More information: https://developer.apple.com/library/archive/documentation/DeveloperTools/Conceptual/HeaderDoc/mpgl/mpgl.html.

- Compile an MPGL file to a viewable man page:

```
xml2man {{path/to/command_file.mxml}}
```

- Compile an MPGL file to a specific output file:

```
xml2man {{path/to/service_file.mxml}} {{path/to/service_file.7}}
```

- Compile an MPGL file to a specific output file, overwriting if it already exists:

```
xml2man -f {{path/to/function_file.mxml}} {{path/to/function_file.3}}
```

xsand

Xsan filesystem management daemon.

Provides services for the Xsan filesystem.

Note: It should not be invoked manually.

More information: https://developer.apple.com/support/downloads/Xsan-Management-Guide.pdf.

- Start the daemon:

  ```
  xsand
  ```

xsltproc

Transform XML with XSLT to produce output (usually HTML or XML).

More information: https://manned.org/xsltproc.

- Transform an XML file with a specific XSLT stylesheet:

```
xsltproc --output {{path/to/output_file.html}} {{path/to/
stylesheet_file.xslt}} {{path/to/file.xml}}
```

- Pass a value to a parameter in the stylesheet:

```
xsltproc --output {{path/to/output_file.html}} --stringparam
"{{name}}" "{{value}}" {{path/to/stylesheet_file.xslt}}
{{path/to/xml_file.xml}}
```

yaa

Create and manipulate YAA archives.

More information: https://www.manpagez.com/man/1/yaa/.

- Create an archive from a directory:

```
yaa archive -d {{path/to/directory}} -o {{path/to/
output_file.yaa}}
```

- Create an archive from a file:

```
yaa archive -i {{path/to/file}} -o {{path/to/
output_file.yaa}}
```

- Extract an archive to the current directory:

```
yaa extract -i {{path/to/archive_file.yaa}}
```

- List the contents of an archive:

```
yaa list -i {{path/to/archive_file.yaa}}
```

- Create an archive with a specific compression algorithm:

```
yaa archive -a {{algorithm}} -d {{path/to/directory}} -o
{{path/to/output_file.yaa}}
```

- Create an archive with an 8 MB block size:

```
yaa archive -b 8m -d {{path/to/directory}} -o {{path/to/
output_file.yaa}}
```

yabai

A tiling window manager for macOS based on binary space partitioning.

More information: https://github.com/asmvik/yabai/wiki.

- Send a config [m]essage for setting the layout:

```
yabai -m config layout {{bsp|stack|float}}
```

- Set the window gap in pt:

```
yabai -m config window_gap {{10}}
```

- Enable opacity:

```
yabai -m config window_opacity on
```

- Disable window shadow:

```
yabai -m config window_shadow off
```

- Enable status bar:

```
yabai -m config status_bar on
```

Sunos

devfsadm

Administer **`/dev`**.

Maintains the **`/dev`** namespace.

More information: https://www.unix.com/man-page/sunos/1m/devfsadm.

- Scan for new disks:

```
devfsadm -c disk
```

- Clean up any dangling `/dev` links and scan for new devices:

```
devfsadm -C -v
```

- Simulate what would happen but make no modifications:

```
devfsadm -C -v -n
```

dmesg

Write the kernel messages to **`stdout`**.

More information: https://www.unix.com/man-page/sunos/1m/dmesg.

- Show kernel messages:

```
dmesg
```

- Show how much physical memory is available on this system:

```
dmesg | grep -i memory
```

- Show kernel messages 1 page at a time:

```
dmesg | less
```

prctl

Get or set the resource controls of running processes, tasks, and projects.

More information: https://www.unix.com/man-page/sunos/1/prctl.

- Examine process limits and permissions:

```
prctl {{process_id}}
```

- Examine process limits and permissions in machine parsable format:

```
prctl -P {{process_id}}
```

- Get a specific limit for a running process:

```
prctl -n process.max-file-descriptor {{process_id}}
```

prstat

Report active process statistics.

More information: https://www.unix.com/man-page/sunos/1m/prstat.

- Examine all processes and report statistics sorted by CPU usage:

```
prstat
```

- Examine all processes and report statistics sorted by memory usage:

```
prstat -s rss
```

- Report total usage summary for each user:

```
prstat -t
```

- Report microstate process accounting information:

```
prstat -m
```

- Print out a list of top 5 CPU using processes every second:

```
prstat -c -n 5 -s cpu 1
```

share

Make local resource/filesystem available for mounting by remote systems.

More information: https://docs.oracle.com/cd/E36784_01/html/E36825/gntjt.html.

- List all currently shared filesystems:

```
share
```

- Share a directory with read/write access:

```
share -F nfs -o rw /{{path/to/directory}}
```

- Share a directory with read-only access:

```
share -F nfs -o ro /{{path/to/directory}}
```

- Share a directory with specific options (e.g., allow root access from a specific host):

```
share -F nfs -o rw,root={{hostname}} /{{path/to/directory}}
```

- Make sharing persistent by adding entries to `/etc/dfs/dfstab`:

```
echo "share -F nfs -o rw /{{path/to/directory}}" >> /etc/dfs/dfstab
```

snoop

Network packet sniffer.

SunOS equivalent of **`tcpdump`**.

More information: https://www.unix.com/man-page/sunos/1m/snoop.

- Capture packets on a specific network interface:

```
snoop -d {{e1000g0}}
```

- Save captured packets in a file instead of displaying them:

```
snoop -o {{path/to/file}}
```

- Display verbose protocol layer summary of packets from a file:

```
snoop -V -i {{path/to/file}}
```

- Capture network packets that come from a hostname and go to a given port:

```
snoop to port {{port}} from host {{hostname}}
```

- Capture and show a hex-dump of network packets exchanged between two IP addresses:

```
snoop -x0 -p4 {{ip1}} {{ip2}}
```

svcadm

Manipulate service instances.

More information: https://www.unix.com/man-page/sunos/1m/svcadm.

- Enable a service in the service database:

```
svcadm enable {{service_name}}
```

- Disable a service:

```
svcadm disable {{service_name}}
```

- Restart a running service:

```
svcadm restart {{service_name}}
```

- Make a service re-read its configuration files:

```
svcadm refresh {{service_name}}
```

- Clear a service from maintenance state and command it to start:

```
svcadm clear {{service_name}}
```

svccfg

Import, export, and modify service configurations.

More information: https://www.unix.com/man-page/sunos/1m/svccfg.

- Validate configuration file:

```
svccfg validate {{path/to/smf_file.xml}}
```

- Export service configurations to file:

```
svccfg export {{servicename}} > {{path/to/smf_file.xml}}
```

- Import/update service configurations from file:

```
svccfg import {{path/to/smf_file.xml}}
```

svcs

List information about running services.

More information: https://www.unix.com/man-page/sunos/1/svcs.

- List all running services:

```
svcs
```

- List services that are not running:

```
svcs -vx
```

- List information about a service:

```
svcs {{apache}}
```

- Show location of service log file:

```
svcs -L {{apache}}
```

- Display end of a service log file:

```
tail $(svcs -L {{apache}})
```

truss

Troubleshooting tool for tracing system calls.

SunOS equivalent of **`strace`**.

More information: https://www.unix.com/man-page/sunos/1/truss.

- Start tracing a program by executing it, following all child processes:

```
truss -f {{program}}
```

- Start tracing a specific process by its PID:

```
truss -p {{process_id}}
```

- Start tracing a program by executing it, showing arguments and environment variables:

```
truss -a -e {{program}}
```

- Count time, calls, and errors for each system call and report a summary on program exit:

```
truss -c -p {{process_id}}
```

- Trace a process filtering output by system call:

```
truss -p {{process_id}} -t {{system_call_name}}
```

zoneadm

Administer Oracle Solaris zones.

More information: https://docs.oracle.com/cd/E88353_01/html/E72487/zoneadm-8.html.

- List all zones and their current status:

```
zoneadm list -cv
```

- Verify the configuration of a specific zone:

```
sudo zoneadm -z {{zone_name}} verify
```

- Install a zone:

```
sudo zoneadm -z {{zone_name}} install
```

- Boot (start) a zone:

```
sudo zoneadm -z {{zone_name}} boot
```

- Reboot a zone:

```
sudo zoneadm -z {{zone_name}} reboot
```

- Halt (stop) a zone, bypassing any shutdown scripts inside the zone:

```
sudo zoneadm -z {{zone_name}} halt
```

- Uninstall a zone:

```
sudo zoneadm -z {{zone_name}} uninstall
```

Windows

Add-AppxPackage

A PowerShell utility to add a signed app package (**`.appx`**, **`.msix`**, **`.appxbundle`**, and **`.msixbundle`**) to a user account.

More information: https://learn.microsoft.com/powershell/module/appx/Add-AppxPackage.

- Add an app package:

```
Add-AppxPackage -Path {{path\to\package.msix}}
```

- Add an app package with dependencies:

```
Add-AppxPackage -Path {{path\to\package.msix}} -
DependencyPath {{path\to\dependencies.msix}}
```

- Install an app using the app installer file:

```
Add-AppxPackage -AppInstallerFile
{{path\to\app.appinstaller}}
```

- Add an unsigned package:

```
Add-AppxPackage -Path {{path\to\package.msix}} -
DependencyPath {{path\to\dependencies.msix}} -AllowUnsigned
```

assoc

Display or change associations between file extensions and file types.

More information: https://learn.microsoft.com/windows-server/administration/windows-commands/assoc.

- List all associations between file extensions and file types:

```
assoc
```

- Display the associated file type for a specific extension:

```
assoc {{.txt}}
```

- Set the associated file type for a specific extension:

```
assoc .{{txt}}={{txtfile}}
```

- View the output of `assoc` one screen at a time:

```
assoc | {{more}}
```

attrib

Display or change attributes of files or directories.

More information: https://learn.microsoft.com/windows-server/administration/windows-commands/attrib.

- Display all set attributes of files in the current directory:

```
attrib
```

- Display all set attributes of files in a specific directory:

```
attrib {{path\to\directory}}
```

- Display all set attributes of files and [d]irectories in the current directory:

```
attrib /d
```

- Display all set attributes of files in the current directory and [s]ub-directories:

```
attrib /s
```

- Add the `[r]ead-only` or `[a]rchive` or `[s]ystem` or `[h]idden` or `not content [i]ndexed` attribute to files or directories:

```
attrib +{{r|a|s|h|i}} {{path\to\file_or_directory1 path\to\file_or_directory2 ...}}
```

- Remove a specific attribute of files or directories:

```
attrib -{{r|a|s|h|i}} {{path\to\file_or_directory1 path\to\file_or_directory2 ...}}
```

autopsy

Digital forensics platform for analyzing disk images and investigating filesystems.

More information: https://sleuthkit.org/autopsy/docs/user-docs/4.14.0/command_line_ingest_page.html.

- Launch the Autopsy graphical interface:

```
autopsy64.exe
```

- Create a new case and specify the base directory to store case files:

```
autopsy64.exe --createCase --caseName {{case_name}} --caseBaseDir {{path\to\base_directory}}
```

- Add a data source to an existing case:

```
autopsy64.exe --caseDir {{path\to\case_directory}} --addDataSource --dataSourcePath {{path\to\source}}
```

- Generate a report for an existing case:

```
autopsy64.exe --caseDir {{path\to\case_directory}} --generateReports
```

- List all data sources in an existing case:

```
autopsy64.exe --caseDir {{path\to\case_directory}} --listAllDataSources
```

basicmaker

SoftMaker Office's BASIC macro editor application.

More information: https://help.softmaker.com/basicmaker2026/en/index.html.

- Launch the macro editor (omitting the file path will create a new blank file):

```
basicmaker {{path\to\file.bas}}
```

- Open a script and navigate to a specific line:

```
basicmaker -Line={{line_number}} "{{path\to\file.bas}}"
```

- Run a specific macro script [S]ilently in the background:

```
basicmaker -S "{{path\to\file.bas}}"
```

- Launch BasicMaker with [N]o open macro scripts:

```
basicmaker -N
```

- Launch BasicMaker with an interactive dialog to choose which [F]ile to [O]pen:

```
basicmaker -FO
```

- Directly [P]rint a macro script to the default printer:

```
basicmaker -P"{{path\to\file.bas}}"
```

- Directly print a macro script to a specific printer:

```
basicmaker -Q"{{printer}}","{{path\to\file.bas}}"
```

bcdboot

Configure or repair boot files.

More information: https://learn.microsoft.com/windows-hardware/manufacture/desktop/bcdboot-command-line-options-techref-di.

- Initialize the system partition by using BCD files from the source Windows folder:

```
bcdboot {{C:\Windows}}
```

- Enable [v]erbose mode:

```
bcdboot {{C:\Windows}} /v
```

- Specify the volume letter of the [s]ystem partition:

```
bcdboot {{C:\Windows}} /s {{S:}}
```

- Specify a [l]ocale:

```
bcdboot {{C:\Windows}} /l {{en-us}}
```

- Specify a [f]irmware type while copying the boot files to a specified volume:

```
bcdboot {{C:\Windows}} /s {{S:}} /f {{UEFI|BIOS|ALL}}
```

bleachbit

This command is an alias of **`bleachbit_console`**.

- View documentation for the original command:

  ```
  tldr bleachbit_console
  ```

bleachbit_console

Clean junk files on the filesystem.

More information: https://docs.bleachbit.org/doc/command-line-interface.html.

- Start the graphical user interface (GUI) version of Bleachbit:

```
bleachbit_console.exe --gui
```

- Shred a file:

```
bleachbit_console.exe --shred {{path\to\file}}
```

- List available cleaner options:

```
bleachbit_console.exe --list-cleaners
```

- Preview the files that will be deleted and other changes that will be made before actually performing the clean-up operation:

```
bleachbit_console.exe --preview {{cleaner1.option1 cleaner2.* ...}}
```

- Perform the clean-up operation and delete files:

```
bleachbit_console.exe --clean {{cleaner1.option1 cleaner2.* ...}}
```

- Select the same options as in the GUI and add more to it:

```
bleachbit_console.exe --preview --preset {{cleaner1.option1 cleaner2.* ...}}
```

cat

In PowerShell, this command may be an alias of **`Get-Content`** when the original **`cat`** program (part of **`coreutils`**) is not properly installed.

More information: https://learn.microsoft.com/powershell/module/microsoft.powershell.management/get-content.

- View documentation for the original `cat` command:

```
tldr cat {{[-p|--platform]}} common
```

- View documentation for PowerShell's `Get-Content` command:

```
tldr get-content
```

- Check whether `cat` is properly installed by printing its version number. If this command evaluates into an error, PowerShell may have substituted this command with `Get-Content`:

```
cat --version
```

cd

Display the current working directory or move to a different directory.

In PowerShell, this command is an alias of **`Set-Location`**. This documentation is based on the Command Prompt (**`cmd`**) version of **`cd`**.

More information: https://learn.microsoft.com/windows-server/administration/windows-commands/cd.

- View documentation of the equivalent PowerShell command:

```
tldr set-location
```

- Display the path of the current directory:

```
cd
```

- Go to a specific directory on the same drive:

```
cd {{path\to\directory}}
```

- Go to a specific directory on a different [d]rive:

```
cd /d {{C}}:{{path\to\directory}}
```

- Go up to the parent of the current directory:

```
cd ..
```

- Go to the home directory of the current user:

```
cd %userprofile%
```

- Go to root of current drive:

```
cd \
```

certutil

A tool to manage and configure certificate information.

More information: https://learn.microsoft.com/windows-server/administration/windows-commands/certutil.

- Dump the configuration information or files:

```
certutil {{filename}}
```

- Encode a file in hexadecimal:

```
certutil -encodehex {{path\to\input_file}}
{{path\to\output_file}}
```

- Encode a file to Base64:

```
certutil -encode {{path\to\input_file}}
{{path\to\output_file}}
```

- Decode a Base64-encoded file:

```
certutil -decode {{path\to\input_file}}
{{path\to\output_file}}
```

- Generate and display a cryptographic hash over a file:

```
certutil -hashfile {{path\to\input_file}} {{md2|md4|md5|sha1|
sha256|sha384|sha512}}
```

chdir

This command is an alias of **`cd`** in Command Prompt, and subsequently **`Set-Location`** in PowerShell.

More information: https://learn.microsoft.com/windows-server/administration/windows-commands/chdir.

- View documentation for the original Command Prompt command:

```
tldr cd
```

- View documentation for the original PowerShell command:

```
tldr set-location
```

chkdsk

Check filesystem and volume metadata for errors.

More information: https://learn.microsoft.com/windows-server/administration/windows-commands/chkdsk.

- Specify the drive letter (followed by a colon), mount point, or volume name to check:

```
chkdsk {{volume}}
```

- Fix errors on a specific volume:

```
chkdsk {{volume}} /f
```

- Dismount a specific volume before checking:

```
chkdsk {{volume}} /x
```

- Change the log file size to the specified size (only for NTFS):

```
chkdsk /l{{size}}
```

choco apikey

Manage API keys for Chocolatey sources.

More information: https://docs.chocolatey.org/en-us/create/commands/api-key/.

- Display a list of sources and their API keys:

```
choco apikey
```

- Display a specific source and its API key:

```
choco apikey {{[-s|--source]}} "{{source_url}}"
```

- Set an API key for a source:

```
choco apikey {{[-s|--source]}} "{{source_url}}" {{[-k|--api-key]}} "{{api_key}}"
```

- Remove the API key for a source:

```
choco apikey remove {{[-s|--source]}} "{{source_url}}"
```

choco config

Manage configuration file settings for Chocolatey.

More information: https://docs.chocolatey.org/en-us/choco/commands/config/.

- Display all configuration settings and their values:

```
choco config list
```

- Display the value of a specific configuration setting:

```
choco config get {{setting_name}}
```

- Set a value for a specific configuration setting:

```
choco config set {{setting_name}} {{value}}
```

- Remove a specific configuration setting:

```
choco config unset {{setting_name}}
```

choco feature

Interact with features with Chocolatey.

More information: https://docs.chocolatey.org/en-us/choco/commands/feature/.

- Display a list of available features:

  ```
  choco feature list
  ```

- Enable a feature:

  ```
  choco feature enable {{[-n|--name]}} {{name}}
  ```

- Disable a feature:

  ```
  choco feature disable {{[-n|--name]}} {{name}}
  ```

choco info

Display detailed information about a package with Chocolatey.

More information: https://docs.chocolatey.org/en-us/choco/commands/info/.

- Display information on a specific package:

```
choco info {{package}}
```

- Display information for a local package only:

```
choco info {{package}} {{[-l|--local-only]}}
```

- Specify a custom source to receive packages information from:

```
choco info {{package}} {{[-s|--source]}} {{source_url|alias}}
```

- Provide a username and password for authentication:

```
choco info {{package}} {{[-u|--user]}} {{username}} {{[-p|--password]}} {{password}}
```

choco install

Install one or more packages with Chocolatey.

More information: https://docs.chocolatey.org/en-us/choco/commands/install/.

- Install one or more packages:

```
choco install {{package1 package2 ...}}
```

- Install packages from a custom configuration file:

```
choco install {{path\to\packages_file.config}}
```

- Install a specific `.nuspec` or `.nupkg` file:

```
choco install {{path\to\file}}
```

- Install a specific version of a package:

```
choco install {{package}} --version {{version}}
```

- Force reinstallation of a package:

```
choco install {{package}} {{[-f|--force]}}
```

- Confirm all prompts automatically:

```
choco install {{package}} {{[-y|--yes]}}
```

- Specify a custom source to receive packages from:

```
choco install {{package}} {{[-s|--source]}} {{source_url|
alias}}
```

- Provide a username and password for authentication:

```
choco install {{package}} {{[-u|--user]}} {{username}} {{[-
p|--password]}} {{password}}
```

choco list

Display a list of locally installed packages with Chocolatey.

More information: https://docs.chocolatey.org/en-us/choco/commands/list/.

- List locally installed packages:

```
choco list
```

- List installed packages including system programs:

```
choco list {{[-i|--include-programs]}}
```

- List only the IDs of installed packages:

```
choco list --id-only
```

- List installed packages matching a name exactly:

```
choco list {{package}} {{[-e|--exact]}}
```

- List installed packages starting with a specific prefix:

```
choco list --id-starts-with {{prefix}}
```

- List installed packages from a specific alternative source:

```
choco list {{[-s|--source]}} {{windowsfeatures|ruby|
cygwin|...}}
```

choco new

Generate new package specification files with Chocolatey.

More information: https://docs.chocolatey.org/en-us/create/commands/new/.

- Create a new package skeleton:

```
choco new {{package}}
```

- Create a new package with a specific version:

```
choco new {{package}} --version {{version}}
```

- Create a new package with a specific maintainer name:

```
choco new {{package}} --maintainer {{maintainer_name}}
```

- Create a new package in a custom output directory:

```
choco new {{package}} {{[--out|--output-directory]}}
{{path\to\directory}}
```

- Create a new package with specific 32-bit and 64-bit installer URLs:

```
choco new {{package}} url="{{url}}" url64="{{url}}"
```

choco outdated

Check for outdated packages with Chocolatey.

More information: https://docs.chocolatey.org/en-us/choco/commands/outdated/.

- Display a list of outdated packages in table format:

```
choco outdated
```

- Ignore pinned packages in the output:

```
choco outdated --ignore-pinned
```

- Specify a custom source to check packages from:

```
choco outdated {{[-s|--source]}} {{source_url|alias}}
```

- Provide a username and password for authentication:

```
choco outdated {{[-u|--user]}} {{username}} {{[-p|--
password]}} {{password}}
```

choco pack

Package a NuGet specification into a **`.nupkg`** file.

More information: https://docs.chocolatey.org/en-us/create/commands/pack/.

- Package a NuGet specification to a `.nupkg` file:

  ```
  choco pack {{path\to\specification_file}}
  ```

- Package a NuGet specification specifying the version of the resulting file:

  ```
  choco pack {{path\to\specification_file}} --version
  {{version}}
  ```

- Package a NuGet specification to a specific directory:

  ```
  choco pack {{path\to\specification_file}} {{[--out|--output-
  directory]}} {{path\to\output_directory}}
  ```

choco pin

Pin a package at a version with Chocolatey.

Pinned packages are skipped automatically when upgrading.

More information: https://docs.chocolatey.org/en-us/choco/commands/pin/.

- Display a list of pinned packages and their versions:

```
choco pin list
```

- Pin a package at its current version:

```
choco pin add {{[-n|--name]}} {{package}}
```

- Pin a package at a specific version:

```
choco pin add {{[-n|--name]}} {{package}} --version
{{version}}
```

- Remove a pin for a specific package:

```
choco pin remove {{[-n|--name]}} {{package}}
```

choco push

Push a compiled NuGet package (`.nupkg`) to a package feed.

More information: https://docs.chocolatey.org/en-us/create/commands/push/.

- Push a compiled `.nupkg` to the specified feed:

```
choco push {{[-s|--source]}} {{https://push.chocolatey.org/}}
```

- Push a compiled `.nupkg` to the specified feed with a timeout in seconds (default is 2700):

```
choco push {{[-s|--source]}} {{https://push.chocolatey.org/}}
{{[--timeout|--execution-timeout]}} {{500}}
```

choco search

Search for a local or remote package with Chocolatey.

More information: https://docs.chocolatey.org/en-us/choco/commands/search/.

- Search for a package:

```
choco search {{query}}
```

- Search for a package locally:

```
choco search {{query}} --local-only
```

- Only include exact matches in the results:

```
choco search {{query}} {{[-e|--exact]}}
```

- Confirm all prompts automatically:

```
choco search {{query}} {{[-y|--yes]}}
```

- Specify a custom source to search for packages in:

```
choco search {{query}} {{[-s|--source]}} {{source_url|alias}}
```

- Provide a username and password for authentication:

```
choco search {{query}} {{[-u|--user]}} {{username}} {{[-p|--password]}} {{password}}
```

choco source

Manage sources for packages with Chocolatey.

More information: https://docs.chocolatey.org/en-us/choco/commands/source/.

- List currently available sources:

```
choco source list
```

- Add a new package source:

```
choco source add {{[-n|--name]}} {{name}} {{[-s|--source]}} {{url}}
```

- Add a new package source with credentials:

```
choco source add {{[-n|--name]}} {{name}} {{[-s|--source]}} {{url}} {{[-u|--user]}} {{username}} {{[-p|--password]}} {{password}}
```

- Add a new package source with a client certificate:

```
choco source add {{[-n|--name]}} {{name}} {{[-s|--source]}} {{url}} --cert {{path\to\certificate_file}}
```

- Enable a package source:

```
choco source enable {{[-n|--name]}} {{name}}
```

- Disable a package source:

```
choco source disable {{[-n|--name]}} {{name}}
```

- Remove a package source:

```
choco source remove {{[-n|--name]}} {{name}}
```

choco uninstall

Uninstall packages with Chocolatey.

More information: https://docs.chocolatey.org/en-us/choco/commands/uninstall/.

- Uninstall one or more packages:

```
choco uninstall {{package1 package2 ...}}
```

- Uninstall a specific version of a package:

```
choco uninstall {{package}} --version {{version}}
```

- Confirm all prompts automatically:

```
choco uninstall {{package}} {{[-y|--yes]}}
```

- Remove all dependencies when uninstalling:

```
choco uninstall {{package}} {{[-x|--remove-dependencies]}}
```

- Uninstall all packages:

```
choco uninstall all
```

choco upgrade

Upgrade one or more packages with Chocolatey.

More information: https://docs.chocolatey.org/en-us/choco/commands/upgrade/.

- Upgrade one or more packages:

```
choco upgrade {{package1 package2 ...}}
```

- Upgrade to a specific version of a package:

```
choco upgrade {{package}} --version {{version}}
```

- Upgrade all packages:

```
choco upgrade all
```

- Upgrade all except specified comma-separated packages:

```
choco upgrade all --except "{{package1,package2,...}}"
```

- Confirm all prompts automatically:

```
choco upgrade {{package}} {{[-y|--yes]}}
```

- Specify a custom source to receive packages from:

```
choco upgrade {{package}} {{[-s|--source]}} {{source_url|
alias}}
```

- Provide a username and password for authentication:

```
choco upgrade {{package}} {{[-u|--user]}} {{username}} {{[-
p|--password]}} {{password}}
```

choco

The Chocolatey package manager.

Some subcommands such as **`install`**, **`upgrade`**, **`pin`**, etc. have their own usage documentation.

More information: https://docs.chocolatey.org/en-us/choco/commands/.

- Install a package:

```
choco install {{package_name}}
```

- Upgrade a specific installed package:

```
choco upgrade {{package_name}}
```

- Upgrade all outdated packages and automatically confirm all prompts:

```
choco upgrade all {{[-y|--yes]}}
```

- Uninstall a package and automatically confirm all prompts:

```
choco uninstall {{package_name}} {{[-y|--yes]}}
```

- Search for packages by name or keyword:

```
choco search {{query}}
```

- List all packages installed on the machine:

```
choco list
```

- Show packages that have newer versions available:

```
choco outdated
```

- Install a package from a specific source:

```
choco install {{package_name}} {{[-s|--source]}} {{source}}
```

choice

Prompt user to select a choice and return the selected choice index.

More information: https://learn.microsoft.com/windows-server/administration/windows-commands/choice.

- Prompt the current user to select a `Y` or `N` choice:

```
choice
```

- Prompt the current user to select a [c]hoice from a specific set:

```
choice /c {{AB}}
```

- Prompt the current user to select a choice with a specific [m]essage:

```
choice /m "{{message}}"
```

- Prompt the current user to select a [c]ase-[s]ensitive [c]hoice from a specific set:

```
choice /cs /c {{Ab}}
```

- Prompt the current user to select a choice and prefer the [d]efault choice in a specific [t]ime:

```
choice /t {{5}} /d {{default_choice}}
```

- Display help:

```
choice /?
```

chrome

This command is an alias of **`chromium`**.

More information: https://www.google.com/chrome/.

- View documentation for the original command:

```
tldr chromium
```

chromium

Open-source web browser principally developed and maintained by Google.

Note: You may need to replace the **`chromium`** command with your desired web browser, such as **`brave`**, **`google-chrome`**, **`microsoft-edge`**/**`msedge`**, **`opera`**, or **`vivaldi`**.

More information: https://www.chromium.org/developers/how-tos/run-chromium-with-flags/.

- Open a specific URL or file:

```
chromium {{https://example.com|path\to\file.html}}
```

- Open in incognito mode (use `--inprivate` for Microsoft Edge):

```
{{chromium --incognito|msedge --inprivate}} {{example.com}}
```

- Open in a new window:

```
chromium --new-window {{example.com}}
```

- Open in application mode (without toolbars, URL bar, buttons, etc.):

```
chromium --app {{https://example.com}}
```

- Use a proxy server:

```
chromium --proxy-server "{{socks5://hostname:
66}}" {{example.com}}
```

- Open with a custom profile directory:

```
chromium --user-data-dir {{path\to\directory}}
```

- Open without CORS validation (useful to test an API):

```
chromium --user-data-dir {{path\to\directory}} --disable-web-
security
```

- Open with a DevTools window for each tab opened:

```
chromium --auto-open-devtools-for-tabs
```

cinst

This command is an alias of **`choco install`**.

- View documentation for the original command:

```
tldr choco install
```

cipher

Display or alter the encryption of directories and files on NTFS volumes.

More information: https://learn.microsoft.com/windows-server/administration/windows-commands/cipher.

- Display information about a specific encrypted file or directory:

```
cipher /c:{{path\to\file_or_directory}}
```

- [e]ncrypt a file or directory (files added later to the directory are also encrypted as the directory is marked):

```
cipher /e:{{path\to\file_or_directory}}
```

- [d]ecrypt a file or directory:

```
cipher /d:{{path\to\file_or_directory}}
```

- Securely remove a file or directory:

```
cipher /w:{{path\to\file_or_directory}}
```

cl

The Microsoft C/C++ compiler for compiling and linking source code files.

More information: https://learn.microsoft.com/cpp/build/reference/compiler-command-line-syntax.

- Compile a source file:

```
cl {{path\to\source.c}}
```

- Compile and create an executable with a custom name:

```
cl /Fe {{path\to\output_executable}} {{path\to\source.c}}
```

- Compile a source file with optimization enabled:

```
cl /O2 {{path\to\source.c}}
```

- Compile a source file and create a debug executable:

```
cl /Zi {{path\to\source.c}}
```

- Compile multiple source files:

```
cl {{path\to\source1.c path\to\source2.c ...}}
```

- Specify the output directory for compiled files:

```
cl /Fo {{path\to\output_directory}}\ {{path\to\source.c}}
```

- Compile with warnings as errors:

```
cl /WX {{path\to\source.c}}
```

cleanmgr

Clear unnecessary files from the computer's hard disk.

Note: This command is deprecated in newer Windows versions, use "Storage Sense" instead.

More information: https://learn.microsoft.com/windows-server/administration/windows-commands/cleanmgr.

- Open Disk Cleanup for a specific drive:

```
cleanmgr /d {{C}}
```

- Open Disk Cleanup with all options selected by default:

```
cleanmgr /d {{C}} /lowdisk
```

- Clean up all files automatically without user prompts:

```
cleanmgr /d {{C}} /verylowdisk
```

- Configure which files to clean and save the settings to a specific profile:

```
cleanmgr /sageset:{{profile_number}}
```

- Run Disk Cleanup using a previously configured profile:

```
cleanmgr /sagerun:{{profile_number}}
```

- Clean up files left after a Windows upgrade:

```
cleanmgr /autoclean
```

- Clean up files from a previous Windows installation:

```
cleanmgr /setup
```

- Display help:

```
cleanmgr /?
```

Clear-History

Delete entries from the PowerShell session command history.

Note: **`clhy`** can be used as an alias for **`Clear-History`**.

More information: https://learn.microsoft.com/powershell/module/microsoft.powershell.core/clear-history.

- Clear all command history from current session:

```
Clear-History
```

- Clear command by specific name:

```
Clear-History -CommandLine "{{command}}"
```

- Clear multiple commands by name:

```
Clear-History -CommandLine {{"command1", "command2", ...}}
```

- Clear a specific history entry by ID:

```
Clear-History -Id {{id_number}}
```

- Clear multiple IDs:

```
Clear-History -Id {{id1, id2, ...}}
```

- Clear commands within a range of IDs:

```
Clear-History -Id ({{start_id}}..{{end_id}})
```

- Simulate clearing the history, showing what would be deleted:

```
Clear-History -WhatIf
```

- Ask for confirmation before clearing:

```
Clear-History -Confirm
```

Clear-Host

Clear the screen.

Note: This command can only be used through PowerShell.

More information: https://learn.microsoft.com/powershell/module/microsoft.powershell.core/clear-host.

- Clear the screen:

```
cls
```

Clear-RecycleBin

Clear items from the Recycle Bin.

This command can only be used through PowerShell versions 5.1 and below, or 7.1 and above.

More information: https://learn.microsoft.com/powershell/module/microsoft.powershell.management/clear-recyclebin.

- Clear and delete all items inside the Recycle Bin:

  ```
  Clear-RecycleBin
  ```

- Clear the Recycle Bin for a specific drive:

  ```
  Clear-RecycleBin -DriveLetter {{C}}
  ```

- Clear the Recycle Bin without further confirmation:

  ```
  Clear-RecycleBin -Force
  ```

clear

In PowerShell, this command is an alias of **`Clear-Host`**.

- View documentation for the original command:

```
tldr clear-host
```

clhy

This command is an alias of **`Clear-History`**.

- View documentation for the original command:

```
tldr Clear-History
```

clip

Copy input content to the Windows clipboard.

More information: https://learn.microsoft.com/windows-server/administration/windows-commands/clip.

- Pipe command-line output to the Windows clipboard:

```
{{dir}} | clip
```

- Copy the contents of a file to the Windows clipboard:

```
clip < {{path\to\file.ext}}
```

- Copy text with a trailing newline to the Windows clipboard:

```
echo {{some text}} | clip
```

- Copy text without a trailing newline to the Windows clipboard:

```
echo | set /p="some text" | clip
```

clist

This command is an alias of **`choco list`**.

- View documentation for the original command:

```
tldr choco list
```

cls

Clear the screen.

In PowerShell, this command is an alias of **`Clear-Host`**. This documentation is based on the Command Prompt (**`cmd`**) version of **`cls`**.

More information: https://learn.microsoft.com/windows-server/administration/windows-commands/cls.

- View the documentation of the equivalent PowerShell command:

```
tldr clear-host
```

- Clear the screen:

```
cls
```

cmd

The Windows command interpreter.

More information: https://learn.microsoft.com/windows-server/administration/windows-commands/cmd.

- Start an interactive shell session:

```
cmd
```

- Execute specific [c]ommands:

```
cmd /c {{echo cmd is executed}}
```

- Execute a specific script:

```
cmd {{path\to\script.bat}}
```

- Execute specific commands and then enter an interactive shell:

```
cmd /k {{echo cmd is executed}}
```

- Start an interactive shell session where `echo` is disabled in command output:

```
cmd /q
```

- Start an interactive shell session with delayed [v]ariable expansion enabled or disabled:

```
cmd /v:{{on|off}}
```

- Start an interactive shell session with command [e]xtensions enabled or disabled:

```
cmd /e:{{on|off}}
```

- Start an interactive shell session with used [u]nicode encoding:

```
cmd /u
```

cmdkey

Create, show, and delete stored user names and passwords.

More information: https://learn.microsoft.com/windows-server/administration/windows-commands/cmdkey.

- List all user credentials:

```
cmdkey /list
```

- Store credentials for a user that accesses a server:

```
cmdkey /add:{{server_name}} /user:{{user_name}}
```

- Delete credentials for a specific target:

```
cmdkey /delete {{target_name}}
```

cmstp

Manage connection service profiles.

More information: https://learn.microsoft.com/windows-server/administration/windows-commands/cmstp.

- Install a specific profile:

```
cmstp "{{path\to\profile_file}}"
```

- Install without creating a desktop shortcut:

```
cmstp /ns "{{path\to\profile_file}}"
```

- Install without checking for dependencies:

```
cmstp /nf "{{path\to\profile_file}}"
```

- Only install for the current user:

```
cmstp /su "{{path\to\profile_file}}"
```

- Install for all users (requires administrator privileges):

```
cmstp /au "{{path\to\profile_file}}"
```

- Install silently without any prompts:

```
cmstp /s "{{path\to\profile_file}}"
```

- Uninstall a specific profile:

```
cmstp /u "{{path\to\profile_file}}"
```

- Uninstall silently without a confirmation prompt:

```
cmstp /u /s "{{path\to\profile_file}}"
```

color

Set the console foreground and background colors.

More information: https://learn.microsoft.com/windows-server/administration/windows-commands/color.

- Set the console colors to the default values:

  ```
  color
  ```

- List available color values and detailed information:

  ```
  color /?
  ```

- Set the console foreground and background to a specific color using hexadecimal numbers (`1-9,a-f`):

  ```
  color {{foreground_code}}{{background_code}}
  ```

comp

Compare the contents of two files or sets of files.

Use wildcards (*) to compare sets of files.

More information: https://learn.microsoft.com/windows-server/administration/windows-commands/comp.

- Compare files interactively:

```
comp
```

- Compare two specified files:

```
comp {{path\to\file1}} {{path\to\file2}}
```

- Compare two sets of files:

```
comp {{path\to\directory1}}\* {{path\to\directory2}}\*
```

- Display differences in [d]ecimal format:

```
comp /d {{path\to\file1}} {{path\to\file2}}
```

- Display differences in [a]SCII format:

```
comp /a {{path\to\file1}} {{path\to\file2}}
```

- Display [l]ine numbers for differences:

```
comp /l {{path\to\file1}} {{path\to\file2}}
```

- Compare files [c]ase-insensitively:

```
comp /c {{path\to\file1}} {{path\to\file2}}
```

- Compare only the first 5 lines of each file:

```
comp /n=5 {{path\to\file1}} {{path\to\file2}}
```

compact

Display or change the compression state of files and directories on NTFS partitions.

More information: https://learn.microsoft.com/windows-server/administration/windows-commands/compact.

- Display the compression status of files in the current directory:

```
compact
```

- Compress a specific file:

```
compact /c {{path\to\file}}
```

- Uncompress a specific file:

```
compact /u {{path\to\file}}
```

- Compress all files in a directory and its subdirectories:

```
compact /c /s {{path\to\directory}}
```

- Uncompress all files in a directory and its subdirectories:

```
compact /u /s {{path\to\directory}}
```

Compress-Archive

A cmdlet in PowerShell is used to create compressed (zipped) archive files.

More information: https://learn.microsoft.com/powershell/module/microsoft.powershell.archive/compress-archive.

- Compress a single file:

```
Compress-Archive -Path {{path\to\file.txt}} -DestinationPath
{{path\to\file.zip}}
```

- Compress multiple files:

```
Compress-Archive -Path {{path\to\file1, path\to\file2, ...}}
-DestinationPath {{path\to\files.zip}}
```

- Compress a directory:

```
Compress-Archive -Path {{path\to\directory}} -DestinationPath
{{path\to\directory.zip}}
```

- Update an existing archive:

```
Compress-Archive -Path {{path\to\file}} -DestinationPath
{{path\to\directory.zip}} -Update
```

- Set compression level:

```
Compress-Archive -Path {{path\to\directory}} -DestinationPath
{{path\to\directory.zip}} -CompressionLevel {{Optimal|
Fastest|NoCompression}}
```

copy

Copy files from one location to another.

In PowerShell, this command is an alias of **`Copy-Item`**. This documentation is based on the Command Prompt (**`cmd`**) version of **`copy`**.

More information: https://learn.microsoft.com/windows-server/administration/windows-commands/copy.

- Copy a file to another location:

```
copy {{path\to\source_file}} {{path\to\target_file}}
```

- Copy a file into another directory, keeping the filename:

```
copy {{path\to\source_file}} {{path\to\target_directory}}
```

- Copy multiple files to a directory:

```
copy {{path\to\file1 path\to\file2 ...}}
{{path\to\target_directory}}
```

- Copy all files from one directory to another directory:

```
copy {{path\to\source_directory\*}}
{{path\to\target_directory}}
```

- Copy files with a specific extension:

```
copy {{path\to\source_directory\*.ext}}
{{path\to\target_directory}}
```

- Copy a file and prompt before overwriting:

```
copy /-y {{path\to\source_file}} {{path\to\target_file}}
```

cpush

This command is an alias of **`choco push`**.

- View documentation for the original command:

  ```
  tldr choco push
  ```

cscript

Run Windows Script Host programs in the command-line interface (CLI).

See also: **`wscript`**.

More information: https://learn.microsoft.com/windows-server/administration/windows-commands/cscript.

- Set `cscript` (CLI) or `wscript` (GUI) as the default interpreter to run Windows Script Host programs:

```
cscript //h:{{cscript|wscript}}
```

- Run a script:

```
cscript {{path\to\script.vbs}}
```

- Run script in the [i]nteractive or [b]atch mode (enable or suppress alerts, prompts, and scripting errors):

```
cscript //{{i|b}} {{path\to\script.vbs}}
```

- Show or hide the Windows Script Host logo before running (useful to get Host version / suppress outputs):

```
cscript {{//logo|//nologo}} {{path\to\script.vbs}}
```

- Specify a custom execution engine to run the script (useful for using custom script filenames):

```
cscript //e:{{jscript|vbscript|custom_engine}} {{path\to\script.vbs}}
```

- Set a [t]imeout for running a given script (in seconds):

```
cscript //t:{{seconds}} {{path\to\script.vbs}}
```

- Start [d]ebugger and wait until a scripting error occurs:

```
cscript //d {{path\to\script.vbs}}
```

- Start debugging from the first script line in an IDE (e.g., Visual Studio):

```
cscript //x {{path\to\script.vbs}}
```

cuninst

This command is an alias of **`choco uninstall`**.

- View documentation for the original command:

```
tldr choco uninstall
```

curl

In PowerShell, this command may be an alias of **`Invoke-WebRequest`** when the original **`curl`** program (https://curl.se) is not properly installed.

More information: https://learn.microsoft.com/powershell/module/microsoft.powershell.utility/invoke-webrequest.

- View documentation for the original `curl` command:

  ```
  tldr curl {{[-p|--platform]}} common
  ```

- View documentation for PowerShell's `Invoke-WebRequest` command:

  ```
  tldr invoke-webrequest
  ```

- Check whether `curl` is properly installed by printing its version number. If this command evaluates into an error, PowerShell may have substituted this command with `Invoke-WebRequest`:

  ```
  curl --version
  ```

date

Display or set the system date.

More information: https://learn.microsoft.com/windows-server/administration/windows-commands/date.

- Display the current system date and prompt to enter a new date (leave empty to keep unchanged):

```
date
```

- Display the current system date without prompting for a new date:

```
date /t
```

- Change the current system date to a specific date:

```
date {{month}}-{{day}}-{{year}}
```

del

Delete one or more files.

In PowerShell, this command is an alias of **`Remove-Item`**. This documentation is based on the Command Prompt (**`cmd`**) version of **`del`**.

More information: https://learn.microsoft.com/windows-server/administration/windows-commands/del.

- View the documentation of the equivalent PowerShell command:

```
tldr remove-item
```

- Delete one or more files or patterns:

```
del {{file_pattern1 file_pattern2 ...}}
```

- Prompt for confirmation before deleting each file:

```
del {{file_pattern}} /p
```

- Force the deletion of read-only files:

```
del {{file_pattern}} /f
```

- Recursively delete file(s) from all subdirectories:

```
del {{file_pattern}} /s
```

- Do not prompt when deleting files based on a global wildcard:

```
del {{file_pattern}} /q
```

- Delete files based on specified attributes:

```
del {{file_pattern}} /a {{attribute}}
```

- Display help and list available attributes:

```
del /?
```

dir

List directory contents.

More information: https://learn.microsoft.com/windows-server/administration/windows-commands/dir.

- Show the contents of the current directory:

```
dir
```

- Show the contents of a given directory:

```
dir {{path\to\directory}}
```

- Show the contents of the current directory, including hidden ones:

```
dir /a
```

- Show the contents of a given directory, including hidden ones:

```
dir {{path\to\directory}} /a
```

- Show a bare list of directories and files, with no additional information:

```
dir /b
```

- Sort results by date/time, oldest first:

```
dir /o:d
```

diskpart

Disk, volume, and partition manager.

More information: https://learn.microsoft.com/windows-server/administration/windows-commands/diskpart.

- Run diskpart by itself in an administrative command prompt to enter its command-line:

```
diskpart
```

- List all disks:

```
list disk
```

- Select a volume:

```
select volume {{volume}}
```

- Assign a drive letter to the selected volume:

```
assign letter {{letter}}
```

- Create a new partition:

```
create partition primary
```

- Activate the selected volume:

```
active
```

- Exit diskpart:

```
exit
```

doskey

Manage macros, windows commands, and command-lines.

More information: https://learn.microsoft.com/windows-server/administration/windows-commands/doskey.

- List available macros:

```
doskey /macros
```

- Create a new macro:

```
doskey {{name}} = "{{command}}"
```

- Create a new macro for a specific executable:

```
doskey /exename={{executable}} {{name}} = "{{command}}"
```

- Remove a macro:

```
doskey {{name}} =
```

- Display all commands that are stored in memory:

```
doskey /history
```

- Save macros to a file for portability:

```
doskey /macros > {{path\to\macinit_file}}
```

- Load macros from a file:

```
doskey /macrofile = {{path\to\macinit_file}}
```

driverquery

Display information about installed device drivers.

More information: https://learn.microsoft.com/windows-server/administration/windows-commands/driverquery.

- Display a list of all installed device drivers:

```
driverquery
```

- Display a list of drivers in the specified format:

```
driverquery /fo {{table|list|csv}}
```

- Display a list of drivers with a column to indicate if they are signed:

```
driverquery /si
```

- Exclude the header in the output list:

```
driverquery /nh
```

- Display a list of drivers for a remote machine:

```
driverquery /s {{hostname}} /u {{username}} /p {{password}}
```

- Display a list of drivers with verbose information:

```
driverquery /v
```

- Display help:

```
driverquery /?
```

dvdmaker

Create and burn video DVDs.

Note: This command is deprecated.

More information: https://learn.microsoft.com/previous-versions/windows/desktop/wmmdvdm/command-line-options-for-windows-dvd-maker.

- Launch Windows DVD Maker:

  ```
  dvdmaker
  ```

- Specify the DVD disk burner drive:

  ```
  dvdmaker -drive:{{F}}
  ```

- Import assets predefined by a Windows DVD Maker import file list XML file:

  ```
  dvdmaker {{path\to\file.xml}}
  ```

- Reset Windows DVD Maker configuration to factory settings (Warning: This will reset your app settings):

  ```
  dvdmaker _clear_
  ```

Enable-PnpDevice

Enable a Plug and Play (PnP) device. You must use an Administrator account to enable a device.

Note: This command can only be used through PowerShell.

More information: https://learn.microsoft.com/powershell/module/pnpdevice/enable-pnpdevice.

- Enable a device:

```
Enable-PnpDevice -InstanceId 'RETRIEVED USING Get-PnpDevice
COMMAND'
```

- Enable all disabled PnP devices:

```
Get-PnpDevice | Where-Object {$_.Problem -eq 22} | Enable-
PnpDevice
```

- Enable a device without confirmation:

```
Enable-PnpDevice -InstanceId 'RETRIEVED USING Get-PnpDevice
COMMAND' -Confirm:$False
```

- Simulate what would happen if the cmdlet runs:

```
Enable-PnpDevice -InstanceId
'USB\VID_5986&;PID_0266&;MI_00\7&;1E5D3568&;0&;0000' -WhatIf:
$True
```

es

Command-line interface for Everything, a fast file and folder search tool for Windows.

Requires Everything to be installed and running in the background.

More information: https://www.voidtools.com/support/everything/command_line_interface/.

- Search for a file or folder by name:

```
es {{search_term}}
```

- Search using a `regex`:

```
es -r {{regex}}
```

- Match whole words:

```
es -w {{search_term}}
```

- Limit the number of results shown:

```
es -n {{10}} {{search_term}}
```

- Search within a specific folder:

```
es -path {{folder_path}} {{search_term}}
```

- List folders only:

```
es /ad
```

- List files only:

```
es /a-d
```

- Sort results (e.g., by name):

```
es -sort {{name-ascending}}
```

eventcreate

Create custom entries in the event log.

Event IDs can be any number between 1 and 1000.

More information: https://learn.microsoft.com/windows-server/administration/windows-commands/eventcreate.

- Create a new event with a given ID (1-1000) in the log:

```
eventcreate /t {{success|error|warning|information}} /id
{{event_id}} /d "{{message}}"
```

- Create an event in a specific event log:

```
eventcreate /l {{log_name}} /t {{type}} /id {{event_id}} /d
"{{message}}"
```

- Create an event with a specific source:

```
eventcreate /so {{source_name}} /t {{type}} /id
{{event_id}} /d "{{message}}"
```

- Create an event in a remote machine's event log:

```
eventcreate /s {{hostname}} /u {{username}} /p {{password}} /
t {{type}} /id {{event_id}} /d "{{message}}"
```

excel

Microsoft Office's spreadsheet application.

More information: https://support.microsoft.com/office/command-line-switches-for-microsoft-office-products-079164cd-4ef5-4178-b235-441737deb3a6#category=excel.

- Launch the spreadsheet application (omitting the file path will launch the File page):

```
excel {{path\to\file.xlsx}}
```

- Create a new workbook with a [m]acro-enabled sheet:

```
excel /m
```

- Open a workbook as a [t]emplate:

```
excel {{[/n|/t]}} {{path\to\file.xlsx}}
```

- Start Microsoft Excel in [s]afe Mode:

```
excel {{[/s|/safemode]}}
```

exit

Quit the current CMD instance or the current batch file.

More information: https://learn.microsoft.com/windows-server/administration/windows-commands/exit.

- Quit the current CMD instance:

```
exit
```

- Quit the current [b]atch script:

```
exit /b
```

- Quit using a specific exit code:

```
exit {{2}}
```

Expand-Archive

A cmdlet in PowerShell is used to extract files from a compressed archive.

More information: https://learn.microsoft.com/powershell/module/microsoft.powershell.archive/expand-archive.

- Extract a ZIP file to a folder:

```
Expand-Archive -Path {{path\to\example.zip}} -DestinationPath {{path\to\extracted_files}}
```

- Overwrite existing files:

```
Expand-Archive -Path {{path\to\example.zip}} -DestinationPath {{path\to\extracted_files}} -Force
```

- Simulate extracting an archive without extracting anything:

```
Expand-Archive -Path {{path\to\example.zip}} -DestinationPath {{path\to\extracted_files}} -WhatIf
```

expand

Uncompress Windows Cabinet files.

More information: https://learn.microsoft.com/windows-server/administration/windows-commands/expand.

- Uncompress a single-file Cabinet file to the specified directory:

```
expand {{path\to\file.cab}} {{path\to\directory}}
```

- Display the list of files in a source Cabinet file:

```
expand {{path\to\file.cab}} {{path\to\directory}} -d
```

- Uncompress all files from the Cabinet file:

```
expand {{path\to\file.cab}} {{path\to\directory}} -f:*
```

- Uncompress a specific file from a Cabinet file:

```
expand {{path\to\file.cab}} {{path\to\directory}} -f:
{{path\to\file}}
```

- Ignore the directory structure when uncompressing, and add them to a single directory:

```
expand {{path\to\file.cab}} {{path\to\directory}} -i
```

explorer

The Windows File Explorer.

More information: https://ss64.com/nt/explorer.html.

- Open Windows Explorer:

```
explorer
```

- Open Windows Explorer in the current directory:

```
explorer .
```

- Open Windows Explorer in a specific directory:

```
explorer {{path\to\directory}}
```

fc

Compare the differences between two files or sets of files.

Use wildcards (*) to compare sets of files.

More information: https://learn.microsoft.com/windows-server/administration/windows-commands/fc.

- Compare 2 specified files:

```
fc {{path\to\file1}} {{path\to\file2}}
```

- Perform a case-insensitive comparison:

```
fc /c {{path\to\file1}} {{path\to\file2}}
```

- Compare files as Unicode text:

```
fc /u {{path\to\file1}} {{path\to\file2}}
```

- Compare files as ASCII text:

```
fc /l {{path\to\file1}} {{path\to\file2}}
```

- Compare files as binary:

```
fc /b {{path\to\file1}} {{path\to\file2}}
```

- Disable tab-to-space expansion:

```
fc /t {{path\to\file1}} {{path\to\file2}}
```

- Compress whitespace (tabs and spaces) for comparisons:

```
fc /w {{path\to\file1}} {{path\to\file2}}
```

find

Find a specified string in files.

More information: https://learn.microsoft.com/windows-server/administration/windows-commands/find.

- Find lines that contain a specified string:

```
find "{{string}}" {{path\to\file_or_directory}}
```

- Display lines that do not contain the specified string:

```
find "{{string}}" {{path\to\file_or_directory}} /v
```

- Display the count of lines that contain the specified string:

```
find "{{string}}" {{path\to\file_or_directory}} /c
```

- Display line numbers with the list of lines:

```
find "{{string}}" {{path\to\file_or_directory}} /n
```

findstr

Find specified text within one or more files.

More information: https://learn.microsoft.com/windows-server/administration/windows-commands/findstr.

- Find one or more strings in all files:

```
findstr "{{string1 string2 ...}}" *
```

- Find one or more strings in a piped command's output:

```
{{dir}} | findstr "{{string1 string2 ...}}"
```

- Find one or more strings in all files recur[s]ively:

```
findstr /s "{{string1 string2 ...}}" *
```

- Find strings using a case-[i]nsensitive search:

```
findstr /i "{{string1 string2 ...}}" *
```

- Find strings in all files using `regex`:

```
findstr /r "{{regex}}" *
```

- Find a literal string (containing spaces) in all text files:

```
findstr /c:"{{string1 string2 ...}}" *.txt
```

- Display the line [n]umber before each matching line:

```
findstr /n "{{string1 string2 ...}}" *
```

- Display only the filenames that contain a [m]atch:

```
findstr /m "{{string1 string2 ...}}" *
```

finger

Return information about users on a specified system.

The remote system must be running the Finger service.

More information: https://learn.microsoft.com/windows-server/administration/windows-commands/finger.

- Display information about a specific user:

```
finger {{user}}@{{host}}
```

- Display information about all users on the specified host:

```
finger @{{host}}
```

- Display information in a longer format:

```
finger {{user}}@{{host}} -l
```

- Display help:

```
finger /?
```

fondue

Install optional Windows features.

More information: https://learn.microsoft.com/windows-server/administration/windows-commands/fondue.

- Enable a specific Windows feature:

```
fondue /enable-feature:{{feature}}
```

- Hide all output messages to the user:

```
fondue /enable-feature:{{feature}} /hide-ux:all
```

- Specify a caller process name for error reporting:

```
fondue /enable-feature:{{feature}} /caller-name:{{name}}
```

for

Conditionally execute a command several times.

More information: https://learn.microsoft.com/windows-server/administration/windows-commands/for.

- Execute given commands for the specified set:

```
for %{{variable}} in ({{item_a item_b item_c}}) do ({{echo Loop is executed}})
```

- Iterate over a given range of numbers:

```
for /l %{{variable}} in ({{from}}, {{step}}, {{to}}) do ({{echo Loop is executed}})
```

- Iterate over a given list of files:

```
for %{{variable}} in ({{path\to\file1.ext path\to\file2.ext ...}}) do ({{echo Loop is executed}})
```

- Iterate over a given list of directories:

```
for /d %{{variable}} in ({{path\to\directory1.ext path\to\directory2.ext ...}}) do ({{echo Loop is executed}})
```

- Perform a given command in every directory:

```
for /d %{{variable}} in (*) do (if exist %{{variable}} {{echo Loop is executed}})
```

forfiles

Select files to execute a specified command on.

More information: https://learn.microsoft.com/windows-server/administration/windows-commands/forfiles.

- Search for files in the current directory:

```
forfiles
```

- Search for files in a specific directory:

```
forfiles /p {{path\to\directory}}
```

- Run the specified command for each file:

```
forfiles /c "{{command}}"
```

- Search for files using a specific `glob` mask:

```
forfiles /m {{glob_pattern}}
```

- Search for files recursively:

```
forfiles /s
```

- Search for files older than 5 days:

```
forfiles /d +{{5}}
```

fsutil

Display information about filesystem volumes.

More information: https://learn.microsoft.com/windows-server/administration/windows-commands/fsutil.

- Display a list of volumes:

```
fsutil volume list
```

- Display information about a volume's filesystem:

```
fsutil fsInfo volumeInfo {{drive_letter|volume_path}}
```

- Display the current state of the filesystem auto-repair for all volumes:

```
fsutil repair state
```

- Display the dirty bit state of all volumes:

```
fsutil dirty query
```

- Set the dirty bit state of a volume:

```
fsutil dirty set {{drive_letter|volume_path}}
```

ftp

Interactively transfer files between a local and remote FTP server.

More information: https://learn.microsoft.com/windows-server/administration/windows-commands/ftp.

- Connect to a remote FTP server interactively:

```
ftp {{host}}
```

- Log in as an anonymous user:

```
ftp -A {{host}}
```

- Disable automatic login upon initial connection:

```
ftp -n {{host}}
```

- Run a file containing a list of FTP commands:

```
ftp -s:{{path\to\file}} {{host}}
```

- [Interactive] Download multiple files (`glob` expression):

```
mget {{*.png}}
```

- [Interactive] Upload multiple files (`glob` expression):

```
mput {{*.zip}}
```

- [Interactive] Delete multiple files on the remote server:

```
mdelete {{*.txt}}
```

- Display help:

```
ftp --help
```

ftype

Display or modify file types used for file extension association.

More information: https://learn.microsoft.com/windows-server/administration/windows-commands/ftype.

- Display a list of all file types:

```
ftype
```

- Display the associated program for a specific file type:

```
ftype {{file_type}}
```

- Set the associated program for a specific file type:

```
ftype {{file_type}}="{{path\to\executable_file}}"
```

gal

In PowerShell, this command is an alias of **`Get-Alias`**.

- View documentation for the original command:

  ```
  tldr get-alias
  ```

gc

In PowerShell, this command is an alias of **`Get-Content`** (equivalent to **`cat`**) when the original **`gc`** program (https://graphviz.org/pdf/gc.1.pdf) is not installed.

More information: https://learn.microsoft.com/powershell/module/microsoft.powershell.management/get-content.

- View documentation for GraphViz's `gc` command:

```
tldr gc {{[-p|--platform]}} common
```

- View documentation for the PowerShell's `Get-Content` command:

```
tldr get-content
```

- Determine whether `gc` is currently configured to GraphViz's `gc` or PowerShell's `Get-Content` by printing its help documentation:

```
gc -?
```

gcb

This command is an alias of **`Get-Clipboard`**.

- View documentation for the original command:

  ```
  tldr get-clipboard
  ```

gcrane completion

Generate the autocompletion script for gcrane for the specified shell.

The available shells are Bash, fish, PowerShell, and Zsh.

More information: https://github.com/google/go-containerregistry/blob/main/cmd/gcrane/README.md.

- Generate the autocompletion script for your shell:

```
gcrane completion {{shell_name}}
```

- Disable completion descriptions:

```
gcrane completion {{shell_name}} --no-descriptions
```

- Load completions in your current shell session (PowerShell):

```
gcrane completion powershell | Out-String | Invoke-Expression
```

- Display help:

```
gcrane completion {{shell_name}} {{[-h|--help]}}
```

Get-Acl

Get the security descriptor for a resource, such as a file or registry key.

Note: This command can only be used through PowerShell.

More information: https://learn.microsoft.com/powershell/module/microsoft.powershell.security/get-acl.

- Display the ACL for a specific directory:

```
Get-Acl {{path\to\directory}}
```

- Get an ACL for a registry key:

```
Get-Acl -Path {{HKLM:\System\CurrentControlSet\Control}} | Format-List
```

Get-Alias

List and get command aliases in the current PowerShell session.

This command can only be run under PowerShell.

More information: https://learn.microsoft.com/powershell/module/microsoft.powershell.utility/get-alias.

- List all aliases in the current session:

  ```
  Get-Alias
  ```

- Get the aliased command name:

  ```
  Get-Alias {{command_alias}}
  ```

- List all aliases assigned to a specific command:

  ```
  Get-Alias -Definition {{command}}
  ```

- List aliases that begins with `abc`, excluding those which ends at `def`:

  ```
  Get-Alias {{abc}}* -Exclude *{{def}}
  ```

Get-ChildItem

List items in a directory.

Note: This command can only be used through PowerShell.

More information: https://learn.microsoft.com/powershell/module/microsoft.powershell.management/get-childitem.

- List all non-hidden items in the current directory:

  ```
  Get-ChildItem
  ```

- List only directories in the current directory:

  ```
  Get-ChildItem -Directory
  ```

- List only files in the current directory:

  ```
  Get-ChildItem -File
  ```

- List items in the current directory, including hidden items:

  ```
  Get-ChildItem -Hidden
  ```

- List items in a directory other than the current one:

  ```
  Get-ChildItem -Path {{path\to\directory}}
  ```

Get-Clipboard

A PowerShell command to get content from clipboard.

Note: **`gcb`** can be used as an alias for **`Get-Clipboard`**.

More information: https://learn.microsoft.com/powershell/module/microsoft.powershell.management/get-clipboard.

- Get clipboard text:

  ```
  Get-Clipboard
  ```

- Get clipboard content as specific text format:

  ```
  Get-Clipboard -TextFormatType {{Text|Html|Rtf}}
  ```

- Get raw clipboard content:

  ```
  Get-Clipboard -Raw
  ```

- Retrieve an Image:

  ```
  Get-Clipboard -Format Image
  ```

- Get file paths copied in explorer:

  ```
  Get-Clipboard -Format FileDropList
  ```

Get-Command

List and get available commands in the current PowerShell session.

This command can only be run through PowerShell.

More information: https://learn.microsoft.com/powershell/module/microsoft.powershell.core/get-command.

- List all available PowerShell commands (aliases, cmdlets, functions) in the current computer:

  ```
  Get-Command
  ```

- List all available PowerShell commands in the current session:

  ```
  Get-Command -ListImported
  ```

- List only PowerShell aliases/cmdlets/functions available in the computer:

  ```
  Get-Command -Type {{Alias|Cmdlet|Function}}
  ```

- List only programs or commands available on PATH in the current session:

  ```
  Get-Command -Type Application
  ```

- List only PowerShell commands by the module name, e.g. `Microsoft.PowerShell.Utility` for utility-related commands:

  ```
  Get-Command -Module {{module}}
  ```

- Get the command information (e.g. version number or module name) by its name:

  ```
  Get-Command {{command}}
  ```

Get-Content

Get the content of the item at the specified location.

Note: This command can only be used through PowerShell.

More information: https://learn.microsoft.com/powershell/module/microsoft.powershell.management/get-content.

- Display the content of a file:

  ```
  Get-Content -Path {{path\to\file}}
  ```

- Display the first few lines of a file:

  ```
  Get-Content -Path {{path\to\file}} -TotalCount {{10}}
  ```

- Display the content of the file and keep reading from it until `<Ctrl c>` is pressed:

  ```
  Get-Content -Path {{path\to\file}} -Wait
  ```

Get-Date

Get the current date and time.

Note: This command can only be used through PowerShell.

More information: https://learn.microsoft.com/powershell/module/microsoft.powershell.utility/get-date.

- Display the current date and time:

```
Get-Date
```

- Display the current date and time with a .NET format specifier:

```
Get-Date -Format "{{yyyy-MM-dd HH:mm:ss}}"
```

- Display the current date and time in UTC and ISO 8601 format:

```
(Get-Date).ToUniversalTime()
```

- Convert a Unix timestamp:

```
Get-Date -UnixTimeSeconds {{1577836800}}
```

Get-DedupProperties

Get Data Deduplication information.

Note: This command can only be used through PowerShell.

More information: https://learn.microsoft.com/powershell/module/storage/get-deduppropertiesl.

- Get Data Deduplication information of the drive:

```
Get-DedupProperties -DriveLetter 'C'
```

- Get Data Deduplication information of the drive using the drive label:

```
Get-DedupProperties -FileSystemLabel 'Label'
```

- Get Data Deduplication information of the drive using the input object:

```
Get-DedupProperties -InputObject $(Get-Volume -DriveLetter
'E')
```

Get-FileHash

Calculate cryptographic checksums for a file.

Note: This command can only be used through PowerShell.

More information: https://learn.microsoft.com/powershell/module/microsoft.powershell.utility/get-filehash.

- Calculate the SHA256 checksum for a file:

```
Get-FileHash {{path\to\file}}
```

- Calculate the checksum for a file using a specified algorithm:

```
Get-FileHash {{path\to\file}} -Algorithm {{SHA1|SHA256|SHA384|SHA512|MD5}}
```

- Calculate the checksum for a file using a deprecated algorithm (no longer available in PowerShell 6 or later):

```
Get-FileHash {{path\to\file}} -Algorithm {{MACTripleDES|RIPEMD160}}
```

- Check a known checksum of a file:

```
(Get-FileHash {{path\to\file}} -Algorithm {{SHA1|SHA256|SHA384|SHA512|MD5}}).Hash -eq "{{known_hash}}"
```

Get-Help

Display help information and documentation for PowerShell commands (aliases, cmdlets, and functions).

This command can only be run through PowerShell.

More information: https://learn.microsoft.com/powershell/module/microsoft.powershell.core/get-help.

- Display general help information for a specific PowerShell command:

  ```
  Get-Help {{command}}
  ```

- Display a more detailed documentation for a specific PowerShell command:

  ```
  Get-Help {{command}} -Detailed
  ```

- Display the full technical documentation for a specific PowerShell command:

  ```
  Get-Help {{command}} -Full
  ```

- Print only the documentation for a specific parameter of the PowerShell command (use `*` to show all parameters), if available:

  ```
  Get-Help {{command}} -Parameter {{parameter}}
  ```

- Print only the examples of the cmdlet, if available:

  ```
  Get-Help {{command}} -Examples
  ```

- List all available cmdlet help pages:

  ```
  Get-Help *
  ```

- Update the current help and documentation knowledge base using `Update-Help`:

  ```
  Update-Help
  ```

- View an online version of PowerShell command documentation in the default web browser:

  ```
  Get-Help {{command}} -Online
  ```

Get-History

Display PowerShell command history.

Note: This command can only be used through PowerShell.

More information: https://learn.microsoft.com/powershell/module/microsoft.powershell.core/get-history.

- Display the commands history list with ID:

```
Get-History
```

- Get PowerShell history item by ID:

```
Get-History -Id {{item_id}}
```

- Display the last `n` commands:

```
Get-History -Count {{n}}
```

Get-Location

Print name of current/working directory.

This command can only be run through PowerShell.

More information: https://learn.microsoft.com/powershell/module/microsoft.powershell.management/get-location.

- Print the current directory:

```
Get-Location
```

Get-WUApiVersion

Get the Windows Update Agent version. Part of external **PSWindowsUpdate** module.

This command can only be run under PowerShell.

More information: https://github.com/mgajda83/PSWindowsUpdate.

- Get the currently-installed Windows Update Agent version:

```
Get-WUApiVersion
```

- Send the current configuration data via email (SMTP):

```
Get-WUApiVersion -SendReport -PSWUSettings
@{SmtpServer="{{smtp_server}}"; Port={{smtp_port}}
From="{{sender_email}}" To="{{receiver_email}}"}
```

Get-WUHistory

Get the history of installed updates from Windows Update. Part of external **`PSWindowsUpdate`** module.

This command can only be run under PowerShell.

More information: https://github.com/mgajda83/PSWindowsUpdate.

- Get list of update history:

```
Get-WUHistory
```

- List the last 10 installed updates:

```
Get-WUHistory -Last {{10}}
```

- List all updates installed from a specific date to today:

```
Get-WUHistory -MaxDate {{date}}
```

- List all updates installed in the past 24 hours:

```
Get-WUHistory -MaxDate (Get-Date).AddDays(-1)
```

- Send the results via email (SMTP):

```
Get-WUHistory -SendReport -PSWUSettings
@{SmtpServer="{{smtp_server}}"; Port={{smtp_port}}
From="{{sender_email}}" To="{{receiver_email}}"}
```

Get-WUSettings

Get the current Windows Update Agent configuration. Part of external **`PSWindowsUpdate`** module.

This command can only be run under PowerShell.

More information: https://github.com/mgajda83/PSWindowsUpdate.

- Get the current Windows Update Agent configuration:

  ```
  Get-WUSettings
  ```

- Send the current configuration data via email (SMTP):

  ```
  Get-WUSettings -SendReport -PSWUSettings
  @{SmtpServer="{{smtp_server}}"; Port={{smtp_port}}
  From="{{sender_email}}" To="{{receiver_email}}"}
  ```

GetHelpCmd ExpertExperienceAdminTask

Get detailed installation and configuration information on legacy Microsoft Outlook with Microsoft Office and Windows.

Note: This command is deprecated and will not work in the new Outlook application.

Part of **`GetHelpCmd.exe`**, formerly **`SaRAcmd.exe`** (Microsoft Support and Recovery Assistant).

More information: https://learn.microsoft.com/troubleshoot/microsoft-365/admin/miscellaneous/get-help-outlook-scan.

- Get detailed information and accept this command's End-User License Agreement (EULA):

```
GetHelpCmd.exe -S ExpertExperienceAdminTask -AcceptEula
```

- Get detailed information and save the logs to a specific directory:

```
GetHelpCmd.exe -S ExpertExperienceAdminTask -AcceptEula -LogFolder {{path\to\directory}}
```

- Get detailed information without showing the progress:

```
GetHelpCmd.exe -S ExpertExperienceAdminTask -AcceptEula -HideProgress
```

GetHelpCmd OfficeActivationScenario

Automatically repair activation-related issues within Microsoft Office / Microsoft 365 Apps for Enterprise.

Note: This command is deprecated and will not work in the new OneNote and Outlook applications.

Note: This command may override, deactivate, and/or remove your current volume of licensed Office product versions, so please proceed cautiously.

Part of **`GetHelpCmd.exe`**, formerly **`SaRAcmd.exe`** (Microsoft Support and Recovery Assistant).

See also: **`ospp.vbs`**.

More information: https://learn.microsoft.com/troubleshoot/microsoft-365/admin/miscellaneous/get-help-office-activation.

- Automatically fix activation-related errors, close Office, and accept this command's End-User License Agreement (EULA). Requires Administrator privileges to do so:

  ```
  GetHelpCmd.exe -S OfficeActivationScenario -AcceptEula -CloseOffice
  ```

- Detach the currently-installed Office licensing scheme from Shared Computer Activation (SCA), and activate the product separately. Requires Administrator privileges to do so:

  ```
  GetHelpCmd.exe -S OfficeActivationScenario -AcceptEula -CloseOffice -RemoveSCA
  ```

GetHelpCmd OutlookCalendarCheckTask

Scan for calendar configuration issues in legacy Microsoft Outlook applications.

Note: This command is deprecated and will not work in the new Outlook application.

Part of **`GetHelpCmd.exe`**, formerly **`SaRAcmd.exe`** (Microsoft Support and Recovery Assistant).

More information: https://learn.microsoft.com/troubleshoot/microsoft-365/admin/miscellaneous/get-help-outlook-calendar-scan.

- Analyze the calendar for the current, active profile, and accept this command's End-User License Agreement (EULA):

```
GetHelpCmd.exe -S OutlookCalendarCheckTask -AcceptEula
```

- Analyze calendar for a specific Outlook profile:

```
GetHelpCmd.exe -S OutlookCalendarCheckTask -AcceptEula -P {{profile}}
```

- Analyze the calendar for a specific profile and save the logs to a specific directory:

```
GetHelpCmd.exe -S OutlookCalendarCheckTask -AcceptEula -P {{profile}} -LogFolder {{path\to\directory}}
```

- Analyze the calendar for a specific profile without showing the progress:

```
GetHelpCmd.exe -S OutlookCalendarCheckTask -AcceptEula -P {{profile}} -HideProgress
```

GetHelpCmd TeamsAddinScenario

Troubleshoot installation-related issues with the Microsoft Teams add-in for Microsoft Outlook (Classic).

Note: This command is deprecated and will not work in the new Outlook application.

Part of **`GetHelpCmd.exe`**, formerly **`SaRAcmd.exe`** (Microsoft Support and Recovery Assistant).

More information: https://learn.microsoft.com/troubleshoot/microsoft-365/admin/miscellaneous/get-help-teams-meeting-add-in-outlook.

- Run the troubleshooter, close Outlook, and accept this command's End-User License Agreement (EULA):

  ```
  GetHelpCmd.exe -S TeamsAddinScenario -AcceptEula -CloseOutlook
  ```

GetHelpCmd

Analyze and fix common problems in Microsoft 365 Enterprise installations.

Formerly Microsoft Support and Recovery Assistant (SaRA), command-line version (**`SaRAcmd.exe`**).

Note: This command is deprecated, use the GUI troubleshooters available within Windows Settings instead. It is not related to PowerShell (**`Get-Help`**).

Some subcommands such as **`OutlookCalendarCheckTask`**, **`ExpertExperienceAdminTask`**, etc. have their own usage documentation.

More information: https://learn.microsoft.com/troubleshoot/microsoft-365/admin/miscellaneous/get-help-command-line-overview.

- View documentation for PowerShell's `Get-Help` command:

  ```
  tldr get-help
  ```

- View documentation for the `ExpertExperienceAdminTask` scenario:

  ```
  tldr gethelpcmd-expertexperienceadmintask
  ```

- View documentation for the `OutlookCalendarCheckTask` scenario:

  ```
  tldr gethelpcmd-outlookcalendarchecktask
  ```

getmac

Display the MAC addresses of a system.

More information: https://learn.microsoft.com/windows-server/administration/windows-commands/getmac.

- Display the MAC addresses for the current system:

```
getmac
```

- Display the details in a specific format:

```
getmac /fo {{table|list|csv}}
```

- Exclude the header in the output list:

```
getmac /nh
```

- Display the MAC addresses for a remote machine:

```
getmac /s {{hostname}} /u {{username}} /p {{password}}
```

- Display the MAC addresses with verbose information:

```
getmac /v
```

- Display help:

```
getmac /?
```

ghy

This command is an alias of **`Get-History`**.

- View documentation for the original command:

```
tldr Get-History
```

gl

In PowerShell, this command is an alias of **`Get-Location`**.

- View documentation for the original command:

```
tldr get-location
```

gpupdate

Check and apply Windows Group Policy settings.

More information: https://learn.microsoft.com/windows-server/administration/windows-commands/gpupdate.

- Check and apply updated Group Policy settings:

  ```
  gpupdate
  ```

- Specify the target Group Policy settings to check for update:

  ```
  gpupdate /target:{{computer|user}}
  ```

- Force all Group Policy settings to be reapplied:

  ```
  gpupdate /force
  ```

- Display help:

  ```
  gpupdate /?
  ```

h

This command is an alias of **`Get-History`**.

- View documentation for the original command:

```
tldr Get-History
```

help

Get help on DOS-style standard commands in Command Prompt.

In PowerShell, this command is an alias of **`Get-Help`**. This documentation is based on the Command Prompt (**`cmd`**) version of **`help`**.

More information: https://learn.microsoft.com/windows-server/administration/windows-commands/help.

- View documentation of the equivalent PowerShell command:

  ```
  tldr get-help
  ```

- View a list of supported Command Prompt commands:

  ```
  help
  ```

- View help for a given Command Prompt command:

  ```
  help {{command}}
  ```

history

This command is an alias of **`Get-History`**.

- View documentation for the original command:

```
tldr Get-History
```

iesetup

Build customized Internet Explorer Wizard (**`iewzd`**) installer.

Note: You may need to replace the **`iesetup`** command with your desired IEAK version and executable, such as **`Ie11setup`** for IE 11.

Part of Internet Explorer Administration Kit (IEAK).

More information: https://learn.microsoft.com/previous-versions/windows/internet-explorer/ie-it-pro/internet-explorer-11/ie11-ieak/iexpress-command-line-options.

- View the documentation for `iewzd`:

```
tldr {{[-p|--platform]}} windows iewzd
```

- Build a custom Internet Explorer Wizard executable, specifying the location of `iewzd` executable:

```
iesetup /c:"{{path\to\iewzd.exe}}"
```

- Apply custom `iewzd` program arguments into the custom installer:

```
iesetup /c:"{{path\to\iewzd.exe}} {{iewzd_args}}"
```

- Run the build process in a [q]uiet mode, assuming the user account invoking this command as an [a]dministrator or regular [u]ser:

```
iesetup /q:{{a|u}} /c:"{{path\to\iewzd.exe}} {{iewzd_args}}"
```

- Specify the [r]estart behavior after a successful installation ([a]sk, [n]ever, or alway[s]):

```
iesetup /r:{{a|n|s}} /c:"{{path\to\iewzd.exe}}
{{iewzd_args}}"
```

iewzd

Internet Explorer Setup Wizard: Programmatically configure installation of Internet Explorer.

Not to be confused with **`iesetup`**, which also bundles a customized version of Internet Explorer and **`iewzd`**.

Note: You may need to replace the **`iewzd`** command with your desired IE version and executable, such as **`Ie11wzd.exe`**, **`ie10_setup.exe`**, or **`IE9-Windows6.0-x86-en-us.exe`**.

More information: https://learn.microsoft.com/previous-versions/windows/internet-explorer/ie-it-pro/internet-explorer-11/ie11-ieak/ie-setup-command-line-options-and-return-codes.

- View the documentation for `iesetup`:

  ```
  tldr {{[-p|--platform]}} windows iesetup
  ```

- Run the Internet Explorer Wizard:

  ```
  iewzd
  ```

- Force or do not restart the computer after installing Internet Explorer:

  ```
  iewzd {{/norestart|/forcerestart}}
  ```

- Do not set Internet Explorer as the default browser:

  ```
  iewzd /no-default
  ```

- Do not check for Internet Explorer updates:

  ```
  iewzd /update-no
  ```

- Run the Wizard in passive (no interaction) or quiet (no interaction and output) mode:

  ```
  iewzd {{/passive|/quiet}}
  ```

- Save the installation log to a file:

  ```
  iewzd /log {{path\to\file}}
  ```

iexplore

Microsoft Internet Explorer.

Note: This command is deprecated and no longer maintained, use modern browsers like **`msedge`** instead.

More information: https://learn.microsoft.com/previous-versions/windows/internet-explorer/ie-developer/general-info/hh826025(v=vs.85).

- Open a specific URL or file:

```
iexplore {{https://example.com|path\to\file.html}}
```

- Open in InPrivate mode:

```
iexplore -private {{example.com}}
```

- Open in [k]iosk/application mode (without toolbars, URL bar, buttons, etc.):

```
iexplore -k {{example.com}}
```

- Open with [ext]ensions/add-ons disabled:

```
iexplore -extoff {{example.com}}
```

iexpress

Create self-extracting archive executable (**`.exe`**) or cabinet (**`.cab`**) files.

More information: https://ss64.com/nt/iexpress.html.

- Build a self-extracting ZIP archive from a given SED file:

```
iexpress /n {{path\to\file.sed}}
```

- Run the build process in a [m]inimized window:

```
iexpress /n /m {{path\to\file.sed}}
```

- Run the build process in a [q]uiet mode, assuming the user account invoking this command as an [a]dministrator or regular [u]ser:

```
iexpress /n /q:{{a|u}} {{path\to\file.sed}}
```

- Ensure the `.exe` file to [a]sk, [n]ever, or alway[s] [r]estart the computer after installation:

```
iexpress /r:{{a|n|s}} {{path\to\file.sed}}
```

if

Perform conditional processing in batch scripts.

More information: https://learn.microsoft.com/windows-server/administration/windows-commands/if.

- Execute the specified commands if the condition is true:

```
if {{condition}} ({{echo Condition is true}})
```

- Execute the specified commands if the condition is false:

```
if not {{condition}} ({{echo Condition is true}})
```

- Execute the first specified commands if the condition is true otherwise execute the second specified commands:

```
if {{condition}} ({{echo Condition is true}}) else ({{echo Condition is false}})
```

- Check whether `%errorlevel%` is greater than or equal to the specified exit code:

```
if errorlevel {{2}} ({{echo Condition is true}})
```

- Check whether two strings are equal:

```
if %{{variable}}% == {{string}} ({{echo Condition is true}})
```

- Check whether two strings are equal without respecting letter case:

```
if /i %{{variable}}% == {{string}} ({{echo Condition is true}})
```

- Check whether a file exist:

```
if exist {{path\to\file}} ({{echo Condition is true}})
```

ii

This command is an alias of **`Invoke-Item`**.

- View documentation for the original command:

```
tldr invoke-item
```

Install-Module

Install PowerShell modules from PowerShell Gallery, NuGet, and other repositories.

More information: https://learn.microsoft.com/powershell/module/powershellget/install-module.

- Install a module, or update it to the latest available version:

```
Install-Module {{module}}
```

- Install a module with a specific version:

```
Install-Module {{module}} -RequiredVersion {{version}}
```

- Install a module no earlier than a specific version:

```
Install-Module {{module}} -MinimumVersion {{version}}
```

- Specify a range of supported versions (inclusive) of the required module:

```
Install-Module {{module}} -MinimumVersion {{minimum_version}}
-MaximumVersion {{maximum_version}}
```

- Install module from a specific repository:

```
Install-Module {{module}} -Repository {{repository}}
```

- Install module from specific repositories:

```
Install-Module {{module}} -Repository {{repository1 ,
repository2 , ...}}
```

- Install the module for all/current user:

```
Install-Module {{module}} -Scope {{AllUsers|CurrentUser}}
```

- Simulate a run to determine which modules will be installed, upgraded, or removed through `Install-Module`:

```
Install-Module {{module}} -WhatIf
```

internet-explorer

This command is an alias of **`iexplore`**.

- View documentation for the original command:

```
tldr {{[-p|--platform]}} windows iexplore
```

Invoke-Item

Open files in their respective default programs.

Note: This command can only be used through PowerShell.

More information: https://learn.microsoft.com/powershell/module/microsoft.powershell.management/invoke-item.

- Open a file in its default program:

```
Invoke-Item -Path {{path\to\file}}
```

- Open all files inside a directory:

```
Invoke-Item -Path {{path\to\directory}}\*
```

- Open all PNGs inside a directory:

```
Invoke-Item -Path {{path\to\directory}}\*.png
```

- Open all files inside a directory containing a specific keyword:

```
Invoke-Item -Path {{path\to\directory}}\* -Include {{*keyword*}}
```

- Open all files inside a directory except those containing a specific keyword:

```
Invoke-Item -Path {{path\to\directory}}\* -Exclude {{*keyword*}}
```

- Simulate a run to determine which files will be opened inside a directory through `Invoke-Item`:

```
Invoke-Item -Path {{path\to\directory}}\* -WhatIf
```

Invoke-WebRequest

Perform a HTTP/HTTPS request to the Web.

Note: This command can only be used through PowerShell.

More information: https://learn.microsoft.com/powershell/module/microsoft.powershell.utility/invoke-webrequest.

- Download the contents of a URL to a file:

```
Invoke-WebRequest {{http://example.com}} -OutFile {{path\to\file}}
```

- Only return raw HTML data instead of parsing it under Internet Explorer (PowerShell 3.0-5.1 only):

```
Invoke-WebRequest {{http://example.com}} -UseBasicParsing
```

- Send form-encoded data (POST request of type `application/x-www-form-urlencoded`):

```
Invoke-WebRequest -Method Post -Body @{ name='bob' } {{http://example.com/form}}
```

- Send a request with an extra header, using a custom HTTP method:

```
Invoke-WebRequest -Headers {{@{ X-My-Header = '123' }}} -Method {{PUT}} {{http://example.com}}
```

- Send data in JSON format, specifying the appropriate content-type header:

```
Invoke-WebRequest -Body '{{{"name":"bob"}}}' -ContentType 'application/json' {{http://example.com/users/1234}}
```

- Pass a username and password for server authentication:

```
Invoke-WebRequest -Headers @{ Authorization = "Basic "+ [System.Convert]::ToBase64String([System.Text.Encoding]::ASCII.GetByte
{{http://example.com}}
```

ipconfig

Display and manage the network configuration of Windows.

More information: https://learn.microsoft.com/windows-server/administration/windows-commands/ipconfig.

- List all network adapters:

```
ipconfig
```

- Show a detailed list of network adapters:

```
ipconfig /all
```

- Renew the IP addresses for a network adapter:

```
ipconfig /renew {{adapter}}
```

- Free up the IP addresses for a network adapter:

```
ipconfig /release {{adapter}}
```

- Show the local DNS cache:

```
ipconfig /displaydns
```

- Remove all data from the local DNS cache:

```
ipconfig /flushdns
```

iscc

Compiler for Inno Setup installers.

It compiles an Inno Setup scripts into a Windows installer executable.

More information: https://jrsoftware.org/isinfo.php.

- Compile an Inno Setup script:

```
iscc {{path\to\file.iss}}
```

- Quietly compile an Inno Setup installer:

```
iscc /Q {{path\to\file.iss}}
```

- Compile a signed Inno Setup installer:

```
iscc /S={{name}}={{command}} {{path\to\file.iss}}
```

iwr

In PowerShell, this command is an alias of **`Invoke-WebRequest`**.

- View documentation for the original command:

```
tldr invoke-webrequest
```

lib

The Microsoft Library Manager for creating and managing static libraries of object files.

More information: https://learn.microsoft.com/cpp/build/reference/lib-reference.

- Create a static library from object files:

```
lib /OUT :{{path\to\library.lib}} {{path\to\file1.obj path\to\file2.obj ...}}
```

- List the contents of a library:

```
lib /LIST {{path\to\library.lib}}
```

- Add an object file to an existing library:

```
lib {{path\to\library.lib}} {{path\to\file.obj}}
```

- Remove an object file from a library:

```
lib /REMOVE :{{path\to\file.obj}} {{path\to\library.lib}}
```

- Extract an object file from a library:

```
lib /EXTRACT :{{path\to\file.obj}} {{path\to\library.lib}}
```

- Create an import library from a DLL:

```
lib /DEF :{{path\to\definition.def}} /OUT:{{path\to\import.lib}}
```

logoff

Terminate a login session.

More information: https://learn.microsoft.com/windows-server/administration/windows-commands/logoff.

- Terminate the current session:

```
logoff
```

- Terminate a session by its name or ID:

```
logoff {{session_name|session_id}}
```

- Terminate a session on a specific server connected through RDP:

```
logoff {{session_name|session_id}} /server:{{servername}}
```

Measure-Command

Measure the time it takes to run script blocks and cmdlets.

Note: This command can only be used through PowerShell.

More information: https://learn.microsoft.com/powershell/module/microsoft.powershell.utility/measure-command.

- Measure the time it takes to run a command:

```
Measure-Command { {{command}} }
```

- Pipe input to Measure-Command (objects that are piped to `Measure-Command` are available to the script block that is passed to the Expression parameter):

```
10, 20, 50 | Measure-Command -Expression { for ($i=0; $i -lt $_; $i++) {$i} }
```

Measure-Object

Calculate the numeric properties of objects, and the characters, words, and lines in string objects, such as files of text.

Note: This command can only be used through PowerShell.

More information: https://learn.microsoft.com/powershell/module/microsoft.powershell.utility/measure-object.

- Count the files and folders in a directory:

  ```
  Get-ChildItem | Measure-Object
  ```

- Pipe input to Measure-Command (objects that are piped to `Measure-Command` are available to the script block that is passed to the Expression parameter):

  ```
  "One", "Two", "Three", "Four" | Set-Content -Path
  "{{path\to\file}}"; Get-Content "{{path\to\file}}"; |
  Measure-Object -Character -Line -Word
  ```

mi

In PowerShell, this command is an alias of **`Move-Item`**.

- View documentation for the original command:

```
tldr move-item
```

microsoft-edge

The Microsoft Edge command-line utility is available as **`msedge`** on Windows and **`microsoft-edge`** for other platforms.

More information: https://microsoft.com/edge.

- View the documentation for Microsoft Edge for Windows:

```
tldr {{[-p|--platform]}} windows msedge
```

- View the documentation for Microsoft Edge for other platforms:

```
tldr {{[-p|--platform]}} common microsoft-edge
```

mimikatz crypto

Manipulate Windows cryptographic services and certificates, allowing you to list and export certificates and keys, even those marked as non-exportable.

It generally requires elevated privileges, especially when accessing system keys.

More information: https://github.com/gentilkiwi/mimikatz.

- List cryptographic providers:

```
mimikatz "crypto::providers"
```

- List keys in a cryptographic provider:

```
mimikatz "crypto::capi"
```

- Export certificates and keys:

```
mimikatz "crypto::certificates /export"
```

mimikatz dpapi

Interact with the Windows Data Protection API (DPAPI).

More information: https://github.com/gentilkiwi/mimikatz.

- List master keys:

```
mimikatz "dpapi::masterkey /list"
```

- Decrypt a DPAPI blob:

```
mimikatz "dpapi::blob /in:blob_file.bin"
```

- Retrieve Chrome credentials using DPAPI:

```
mimikatz "dpapi::chrome /in:Login Data"
```

mimikatz event

Manage Windows Event Log records.

More information: https://github.com/gentilkiwi/mimikatz.

- Clear event logs:

```
mimikatz "event::clear"
```

- Display event log sources:

```
mimikatz "event::providers"
```

mimikatz kerberos

Interact with Kerberos tickets.

More information: https://github.com/gentilkiwi/mimikatz.

- List current Kerberos tickets:

```
mimikatz "kerberos::list"
```

- Purge all Kerberos tickets:

```
mimikatz "kerberos::purge"
```

- Inject a ticket from a `.kirbi` file:

```
mimikatz "kerberos::ptt ticket.kirbi"
```

mimikatz lsadump

Dump secrets from the Windows Local Security Authority (LSA).

Requires SYSTEM privileges.

More information: https://github.com/gentilkiwi/mimikatz.

- Dump SAM hashes:

```
mimikatz "lsadump::sam"
```

- Dump secrets from the SECURITY hive:

```
mimikatz "lsadump::secrets"
```

- Dump cached domain credentials:

```
mimikatz "lsadump::cache"
```

mimikatz misc

Miscellaneous system and utility commands.

More information: https://github.com/gentilkiwi/mimikatz.

- Trigger Blue Screen of Death (for testing):

```
mimikatz "misc::bsod"
```

- List loaded kernel drivers:

```
mimikatz "misc::minidump"
```

- Change system time:

```
mimikatz "misc::systemtime"
```

mimikatz net

Perform network and domain operations.

More information: https://github.com/gentilkiwi/mimikatz.

- List domain users:

```
mimikatz "net::users"
```

- List domain computers:

```
mimikatz "net::computers"
```

- Retrieve domain controller information:

```
mimikatz "net::domaincontrollers"
```

mimikatz privilege

Manage privileges for mimikatz operations.

More information: https://github.com/gentilkiwi/mimikatz.

- Enable debug privilege (required for many modules):

```
mimikatz "privilege::debug"
```

- Check current privilege state:

```
mimikatz "privilege::whoami"
```

mimikatz process

Manage process privileges and tokens.

More information: https://github.com/gentilkiwi/mimikatz.

- List processes with their tokens:

```
mimikatz "process::list"
```

- Elevate mimikatz to a SYSTEM process:

```
mimikatz "process::token /user:NT AUTHORITY\SYSTEM"
```

mimikatz sekurlsa

Extract credentials and secrets from memory.

Requires debug privileges.

More information: https://github.com/gentilkiwi/mimikatz.

- Extract plaintext passwords:

```
mimikatz "sekurlsa::logonpasswords"
```

- List Kerberos tickets in memory:

```
mimikatz "sekurlsa::tickets"
```

- Dump LSA secrets:

```
mimikatz "sekurlsa::secrets"
```

mimikatz service

Manage Windows services through mimikatz.

More information: https://github.com/gentilkiwi/mimikatz.

- Start a service:

```
mimikatz "service::start service_name"
```

- Stop a service:

```
mimikatz "service::stop service_name"
```

- Delete a service:

```
mimikatz "service::delete service_name"
```

mimikatz standard

Basic commands and mimikatz environment management.

More information: https://github.com/gentilkiwi/mimikatz.

- Display system information:

```
mimikatz "standard::info"
```

- Clear the mimikatz command history:

```
mimikatz "standard::clearev"
```

- Show command history:

```
mimikatz "standard::history"
```

mimikatz token

List and manipulate security tokens.

More information: https://github.com/gentilkiwi/mimikatz.

- List tokens:

```
mimikatz "token::list"
```

- Elevate privileges by impersonating a token:

```
mimikatz "token::elevate"
```

- Revert to original token:

```
mimikatz "token::revert"
```

mimikatz vault

Extract credentials stored in the Windows Credential Vault.

More information: https://github.com/gentilkiwi/mimikatz.

- List vault credentials:

```
mimikatz "vault::list"
```

- Dump all vault credentials:

```
mimikatz "vault::cred"
```

mimikatz

Interact with Windows credentials, perform credential dumping, token manipulation, and more.

Requires administrator privileges and typically runs on Windows.

More information: https://github.com/gentilkiwi/mimikatz.

- Run mimikatz in interactive mode:

```
mimikatz
```

- Enable debug privileges (needed for most operations):

```
mimikatz "privilege::debug"
```

- Dump plaintext passwords, NTLM hashes, and Kerberos tickets from memory:

```
mimikatz "sekurlsa::logonpasswords"
```

- Pass-the-Hash with a specific NTLM hash and launch a command:

```
mimikatz "sekurlsa::pth /user:{{username}} /domain:
{{domain}} /ntlm:{{hash}} /run:{{cmd}}"
```

- Dump local SAM database hashes:

```
mimikatz "lsadump::sam"
```

- Extract Kerberos tickets and export to a file:

```
mimikatz "kerberos::list /export"
```

- [Interactive] Exit mimikatz:

```
exit
```

mkdir

Create a directory.

More information: https://learn.microsoft.com/windows-server/administration/windows-commands/mkdir.

- Create a directory:

```
mkdir {{path\to\directory}}
```

- Create a nested directory tree recursively:

```
mkdir {{path\to\sub_directory}}
```

mklink

Create symbolic links.

More information: https://learn.microsoft.com/windows-server/administration/windows-commands/mklink.

- Create a symbolic link to a file:

```
mklink {{path\to\link_file}} {{path\to\source_file}}
```

- Create a symbolic link to a directory:

```
mklink /d {{path\to\link_file}} {{path\to\source_directory}}
```

- Create a hard link to a file:

```
mklink /h {{path\to\link_file}} {{path\to\source_file}}
```

- Create a directory junction:

```
mklink /j {{path\to\link_file}} {{path\to\source_file}}
```

more

Display paginated output from **`stdin`** or a file.

More information: https://learn.microsoft.com/windows-server/administration/windows-commands/more.

- Display paginated output from `stdin`:

```
{{echo test}} | more
```

- Display paginated output from one or more files:

```
more {{path\to\file}}
```

- Convert tabs to the specified number of spaces:

```
more {{path\to\file}} /t{{spaces}}
```

- Clear the screen before displaying the page:

```
more {{path\to\file}} /c
```

- Display the output starting at line 5:

```
more {{path\to\file}} +{{5}}
```

- Enable extended interactive mode (see help for usage):

```
more {{path\to\file}} /e
```

- Display help:

```
more /?
```

mount

Mount Network File System (NFS) network shares.

More information: https://learn.microsoft.com/windows-server/administration/windows-commands/mount.

- Mount a share to the "Z" drive letter:

```
mount \\{{computer_name}}\{{share_name}} {{Z:}}
```

- Mount a share to the next available drive letter:

```
mount \\{{computer_name}}\{{share_name}} *
```

- Mount a share with a read timeout in seconds (defaults to 0.8, can be 0.9 or 1 to 60):

```
mount -o timeout={{seconds}} \\{{computer_name}}\
{{share_name}} {{Z:}}
```

- Mount a share and retry up to 10 times if it fails:

```
mount -o retry=10 \\{{computer_name}}\{{share_name}} {{Z:}}
```

- Mount a share with forced case sensitivity:

```
mount -o casesensitive \\{{computer_name}}\{{share_name}}
{{Z:}}
```

- Mount a share as an anonymous user:

```
mount -o anon \\{{computer_name}}\{{share_name}} {{Z:}}
```

- Mount a share using a specific mount type:

```
mount -o mtype={{soft|hard}} \\{{computer_name}}\
{{share_name}} {{Z:}}
```

Move-Item

Move or rename files, directories, registry keys, and other PowerShell data items.

This command can only be run through PowerShell.

More information: https://learn.microsoft.com/powershell/module/microsoft.powershell.management/move-item.

- Rename a file or directory when the target is not an existing directory:

```
Move-Item {{path\to\source}} {{path\to\target}}
```

- Move a file or directory into an existing directory:

```
Move-Item {{path\to\source}} {{path\to\existing_directory}}
```

- Rename or move file(s) with specific name (do not treat special characters inside strings):

```
Move-Item -LiteralPath
"{{path\to\source}}" {{path\to\file_or_directory}}
```

- Move multiple files into an existing directory, keeping the filenames unchanged:

```
Move-Item {{path\to\source1 , path\to\source2 ...}}
{{path\to\existing_directory}}
```

- Move or rename registry key(s):

```
Move-Item {{path\to\source_key1 , path\to\source_key2 ...}}
{{path\to\new_or_existing_key}}
```

- Do not prompt for confirmation before overwriting existing files or registry keys:

```
mv -Force {{path\to\source}} {{path\to\target}}
```

- Prompt for confirmation before overwriting existing files, regardless of file permissions:

```
mv -Confirm {{path\to\source}} {{path\to\target}}
```

- Simulate moving files, showing the files and directories which could be moved without executing them:

```
mv -WhatIf {{path\to\source}} {{path\to\target}}
```

move

Move or rename files and directories.

In PowerShell, this command is an alias of **`Move-Item`**. This documentation is based on the Command Prompt (**`cmd`**) version of **`move`**.

More information: https://learn.microsoft.com/windows-server/administration/windows-commands/move.

- View documentation of the equivalent PowerShell command:

```
tldr move-item
```

- Rename a file or directory when the target is not an existing directory:

```
move {{path\to\source}} {{path\to\target}}
```

- Move a file or directory into an existing directory:

```
move {{path\to\source}} {{path\to\existing_directory}}
```

- Move a file or directory across drives:

```
move {{C:\path\to\source}} {{D:\path\to\target}}
```

- Do not prompt for confirmation before overwriting existing files:

```
move /Y {{path\to\source}} {{path\to\existing_directory}}
```

- Prompt for confirmation before overwriting existing files, regardless of file permissions:

```
move /-Y {{path\to\source}} {{path\to\existing_directory}}
```

moviemk

Create and edit videos.

Note: This command is deprecated.

More information: https://learn.microsoft.com/previous-versions/windows/desktop/wmmdvdm/command-line-options-for-windows-movie-maker.

- Launch Windows Movie Maker:

```
moviemk
```

- Open an existing Windows Movie Maker project file:

```
moviemk {{path\to\file.mswmm}}
```

- Import a new audio, image, or video asset into an existing project:

```
moviemk {{path\to\asset}}
```

- Import assets predefined by a Windows Movie Maker import file list XML file:

```
moviemk {{path\to\file.xml}}
```

msaccess

Microsoft Office's database management application.

More information: https://support.microsoft.com/office/command-line-switches-for-microsoft-office-products-079164cd-4ef5-4178-b235-441737deb3a6#category=access.

- Launch the database application:

```
msaccess
```

- Open an existing database file:

```
msaccess {{path\to\file.accdb}}
```

- Open an existing database file in [r]ead-[o]nly mode:

```
msaccess /ro {{path\to\fileaccdb}}
```

- Open a database, then e[x]ecute a specific macro:

```
msaccess {{path\to\file.accdb}} /x {{MacroName}}
```

msedge

Modern web browser developed by Microsoft based on the Chromium web browser developed by Google.

This command is available instead as **`microsoft-edge`** for other platforms.

Note: Additional command arguments from **`chromium`** may also be usable to control Microsoft Edge.

More information: https://microsoft.com/edge.

- Open a specific URL or file:

```
msedge {{https://example.com|path\to\file.html}}
```

- Open in InPrivate mode:

```
msedge --inprivate {{example.com}}
```

- Open in a new window:

```
msedge --new-window {{example.com}}
```

- Open in application mode (without toolbars, URL bar, buttons, etc.):

```
msedge --app {{https://example.com}}
```

- Use a proxy server:

```
msedge --proxy-server "{{socks5://hostname:
66}}" {{example.com}}
```

- Open with a custom profile directory:

```
msedge --user-data-dir {{path\to\directory}}
```

- Open without CORS validation (useful to test an API):

```
msedge --user-data-dir {{path\to\directory}} --disable-web-
security
```

- Open with a DevTools window for each tab opened:

```
msedge --auto-open-devtools-for-tabs
```

msg

Send a message to a user or session.

More information: https://learn.microsoft.com/windows-server/administration/windows-commands/msg.

- Send a message to a specified user or session:

```
msg {{username|session_name|session_id}} {{message}}
```

- Send a message from `stdin`:

```
echo "{{message}}" | msg {{username|session_name|session_id}}
```

- Send a message to a specific server:

```
msg /server:{{server_name}} {{username|session_name|
session_id}}
```

- Send a message to all users of the current machine:

```
msg *
```

- Set a delay in seconds for a message:

```
msg /time:{{10}}
```

msiexec

Install, update, repair, or uninstall Windows programs using MSI and MSP package files.

More information: https://learn.microsoft.com/windows-server/administration/windows-commands/msiexec.

- Install a program from its MSI package:

```
msiexec /package {{path\to\file.msi}}
```

- Install a MSI package from a website:

```
msiexec /package {{https://example.com/installer.msi}}
```

- Install a MSP patch file:

```
msiexec /update {{path\to\file.msp}}
```

- Uninstall a program or patch using their respective MSI or MSP file:

```
msiexec /uninstall {{path\to\file}}
```

mv

In PowerShell, this command is an alias of **`Move-Item`**.

However, this command is not available on the Command Prompt (**`cmd`**). Use **`move`** instead for similar functionality.

- View documentation for the equivalent Command Prompt command:

  ```
  tldr move
  ```

- View documentation for the original PowerShell command:

  ```
  tldr move-item
  ```

net

System utility to view and modify network-related settings.

More information: https://learn.microsoft.com/previous-versions/windows/it-pro/windows-server-2012-r2-and-2012/gg651155(v=ws.11).

- Start or stop a Windows service synchronously:

```
net {{start|stop}} {{service}}
```

- Make sure an SMB share is available in the current console:

```
net use {{\\smb_shared_folder}} /USER:{{username}}
```

- Show the folders currently shared over SMB:

```
net share
```

- Show who is using your SMB shares (run in elevated console):

```
net session
```

- Show users in a local security group:

```
net localgroup "{{Administrators}}"
```

- Add a user to the local security group (run in elevated console):

```
net localgroup "{{Administrators}}" {{username}} /add
```

- Display help for a subcommand:

```
net help {{subcommand}}
```

- Display help:

```
net help
```

netsh interface portproxy

Configure and display the status of various network components.

More information: https://learn.microsoft.com/windows-server/networking/technologies/netsh/netsh-interface-portproxy.

- Display the current port forwarding setup:

```
netsh interface portproxy show all
```

- Set up IPv4 port forwarding (run in elevated console):

```
netsh interface portproxy add v4tov4
listenaddress={{192.168.0.1}} listenport={{8080}}
connectaddress={{10.0.0.1}} connectport={{80}}
```

- Remove IPv4 port forwarding (run in elevated console):

```
netsh interface portproxy delete v4tov4
listenaddress={{192.168.0.1}} listenport={{8080}}
```

- Display help:

```
netsh interface portproxy
```

netsh wlan

Manage wireless networks.

More information: https://www.serverwatch.com/guides/netsh-commands/.

- Show all available wireless networks:

```
netsh wlan show networks
```

- Connect to a wireless network with a specific SSID:

```
netsh wlan connect name={{ssid}}
```

- Disconnect from the current wireless network:

```
netsh wlan disconnect
```

- Show current wireless network interfaces and status:

```
netsh wlan show interfaces
```

- Export a wireless network profile to an XML file:

```
netsh wlan export profile name={{ssid}} folder={{C:\path\to\folder}} key=clear
```

- Delete a saved wireless network profile:

```
netsh wlan delete profile name={{ssid}}
```

- Enable hosted network (turn PC into Wi-Fi hotspot):

```
netsh wlan set hostednetwork mode=allow ssid={{ssid}} key={{password}}
```

- Start the hosted network:

```
netsh wlan start hostednetwork
```

netsh

Manage Windows network settings.

Some subcommands such as **`wlan`** have their own usage documentation.

More information: https://learn.microsoft.com/windows-server/administration/windows-commands/netsh.

- Add a helper Dynamic Link Library (DLL):

```
netsh add helper {{path\to\file.dll}}
```

- Show all loaded helper DLLs:

```
netsh show helper
```

- Delete a helper DLL:

```
netsh delete helper {{path\to\file.dll}}
```

- Export your network configuration settings to a file:

```
netsh dump > {{path\to\output_file.txt}}
```

- Show available network interfaces for tracing:

```
netsh trace show interfaces
```

- Exit the shell:

```
exit
```

- Display help:

```
netsh help
```

netstat

Display active TCP connections, ports on which the computer is listening, network adapter statistics, the IP routing table, IPv4 statistics, and IPv6 statistics.

More information: https://learn.microsoft.com/windows-server/administration/windows-commands/netstat.

- Display active TCP connections:

```
netstat
```

- Display all active TCP connections and the TCP and UDP ports on which the computer is listening:

```
netstat -a
```

- Display network adapter statistics, such as the number of bytes and packets sent and received:

```
netstat -e
```

- Display active TCP connections and express addresses and port numbers numerically:

```
netstat -n
```

- Display active TCP connections and include the process ID (PID) for each connection:

```
netstat -o
```

- Display the contents of the IP routing table:

```
netstat -r
```

- Display statistics by protocol:

```
netstat -s
```

- Display a list of currently open ports and related IP addresses:

```
netstat -an
```

New-Item

Create a new file, directory, symbolic link, or a registry entry.

Note: This command can only be used through PowerShell.

More information: https://learn.microsoft.com/powershell/module/microsoft.powershell.management/new-item.

- Create a new blank file (equivalent to `touch`):

  ```
  New-Item {{path\to\file}}
  ```

- Create a new directory:

  ```
  New-Item -ItemType Directory {{path\to\directory}}
  ```

- Write a new text file with specified content:

  ```
  New-Item {{path\to\file}} -Value {{content}}
  ```

- Write the same text file in multiple locations:

  ```
  New-Item {{path\to\file1 , path\to\file2 , ...}} -Value
  {{content}}
  ```

- Create a symbolic link\hard link\junction to a file or directory:

  ```
  New-Item -ItemType {{SymbolicLink|HardLink|Junction}} -Path
  {{path\to\link_file}} -Target
  {{path\to\source_file_or_directory}}
  ```

- Create a new blank registry entry (in REG_SZ, use `New-ItemProperty` or `Set-ItemProperty` to fine-tune the value type):

  ```
  New-Item {{path\to\registry_key}}
  ```

- Create a new blank registry entry with specified value:

  ```
  New-Item {{path\to\registry_key}} -Value {{value}}
  ```

nfsstat

Display or reset the number of calls made to the NFS server.

More information: https://learn.microsoft.com/windows-server/administration/windows-commands/nfsstat.

- Display the recorded number of calls made to the NFS server:

```
nfsstat
```

- Reset the recorded number of calls made to the NFS server:

```
nfsstat -z
```

ni

In PowerShell, this command is an alias of **`New-Item`**.

- View documentation for the original command:

```
tldr new-item
```

nmake

The Microsoft Program Maintenance Utility for building projects based on commands in a makefile.

More information: https://learn.microsoft.com/cpp/build/reference/nmake-reference.

- Build targets using the default makefile in the current directory:

```
nmake
```

- Build targets using a specific makefile:

```
nmake /F {{path\to\makefile}}
```

- Build a specific target:

```
nmake {{target}}
```

- Display commands without executing them:

```
nmake /N
```

- Display all macro definitions and target descriptions:

```
nmake /P
```

- Continue building unrelated targets on error:

```
nmake /K
```

- Build and ignore timestamp checks (force rebuild):

```
nmake /A
```

- Suppress copyright message:

```
nmake /NOLOGO
```

nvm

Install, uninstall, or switch between Node.js versions.

Supports version numbers like "12.8" or "v16.13.1", and labels like "stable", "system", etc.

More information: https://github.com/coreybutler/nvm-windows.

- Install a specific version of Node.js:

```
nvm install {{node_version}}
```

- Set the default version of Node.js (must be run as Administrator):

```
nvm use {{node_version}}
```

- List all available Node.js versions and highlight the default one:

```
nvm list
```

- List all remote Node.js versions:

```
nvm ls-remote
```

- Uninstall a given Node.js version:

```
nvm uninstall {{node_version}}
```

octo

Tools for Octopus Deploy.

More information: https://octopus.com/docs/cli/octopus-cli.

- Create a package:

```
octo pack --id {{package}}
```

- Push a package to a repository on the Octopus server:

```
octo push --package {{package}}
```

- Create a release:

```
octo create-release --project {{project_name}} --
packageversion {{version}}
```

- Deploy a release:

```
octo deploy-release --project {{project_name}} --
packageversion {{version}} --deployto {{environment_name}} --
tenant {{deployment_target}}
```

ogv

In PowerShell, this command is an alias of **`Out-GridView`**.

- View documentation for the original command:

```
tldr out-gridview
```

oh

In PowerShell, this command is an alias of **`Out-Host`**.

- View documentation for the original command:

```
tldr out-host
```

olk

Microsoft Outlook (New).

More information: https://support.microsoft.com/office/command-line-switches-for-microsoft-office-products-079164cd-4ef5-4178-b235-441737deb3a6#category=new_outlook.

- Open the New Outlook application:

```
olk
```

- Open under a specific profile name:

```
olk --profile "{{profile}}"
```

- Run New Outlook in Safe Mode:

```
olk --safe
```

- Check for New Outlook updates:

```
olk --force-update
```

- Reset all New Outlook application settings, including credentials, to factory settings:

```
olk --reset
```

ospp.vbs

Install, activate, and manage volume licensed versions of Microsoft Office products.

Use **`cscript`** to run this program in the CLI, or **`wscript`** in the GUI.

Note: This command may override, deactivate, and/or remove your current volume of licensed Office product versions, so please proceed cautiously.

See also: **`gethelpcmd-officeactivationscenario`**.

More information: https://learn.microsoft.com/deployoffice/vlactivation/tools-to-manage-volume-activation-of-office.

- Install a product key (Note: It replaces the existing key):

```
cscript ospp.vbs /inpkey:{{product_key}}
```

- Uninstall an installed product key with the last five digits of the product key:

```
cscript ospp.vbs /unpkey:{{product_key_digits}}
```

- Set a KMS host name:

```
cscript ospp.vbs /sethst:{{ip|hostname}}
```

- Set a KMS port:

```
cscript ospp.vbs /setprt:{{port}}
```

- Activate installed Office product keys:

```
cscript ospp.vbs /act
```

- Display license information for installed product keys:

```
cscript ospp.vbs /dstatus
```

Out-GridView

Display command outputs and objects into an interactive GUI window, allowing scrolling and search.

Supports parsing columns from PowerShell objects, and interactive filtering of **`stdout`** to be passed through **`stdin`**.

Note: This command can only be used through PowerShell and only within Windows.

More information: https://learn.microsoft.com/powershell/module/microsoft.powershell.utility/out-gridview.

- Display the command or cmdlet outputs into a new window:

  ```
  {{command}} | Out-GridView
  ```

- Display a PowerShell hashtable (such as `$PSVersionTable`), and do not finish the command until the window has been closed:

  ```
  $PSVersionTable | Out-GridView -Wait
  ```

- Read and parse a CSV file into a new window, with a custom title:

  ```
  Import-Csv {{path\to\file.csv}} | Out-GridView -Title "{{title}}"
  ```

- Interactively select a subset of rows from a previous command's `stdout` to the `stdin` input for another command (use `<Ctrl LeftClick>`, `<Shift LeftClick>`, `<Shift ArrowUp>`, or `<Shift ArrowDown>` for multi-selection):

  ```
  {{previous_command}} | Out-GridView -PassThru | {{next_command}}
  ```

- Interactively select a subset of rows of a text file to be passed as an input for another command:

  ```
  Get-Content {{path\to\file.txt}} | Out-GridView -PassThru | {{command}}
  ```

Out-Host

Handle and output **`stdout`** of any command within PowerShell session.

Can also be used as a substitute of **`more`**.

Note: This command can only be used through PowerShell.

More information: https://learn.microsoft.com/powershell/module/microsoft.powershell.core/out-host.

- Display a command output or variable's value into the command-line (equivalent to invoking the command or variable without `Out-Host` itself):

  ```
  {{command_or_variable}} | Out-Host
  ```

- Display the output into an interactive paging view (will not work in PowerShell ISE):

  ```
  {{command_or_variable}} | Out-Host -Paging
  ```

- Interactively display a text file within the paging view (equivalent to `more path/to/file`):

  ```
  Get-Content {{path\to\file}} | Out-Host -Paging
  ```

- Go to the next page within the paging view:

  ```
  <Space>
  ```

- Go to the next line within the paging view:

  ```
  <Enter>
  ```

- Exit the paging view:

  ```
  <q>
  ```

Out-String

Output input objects as a string.

Note: This command can only be used through PowerShell.

More information: https://learn.microsoft.com/powershell/module/microsoft.powershell.utility/out-string.

- Print host information as string:

```
Get-Alias | Out-String
```

- Convert each object to a string rather than concatenating all the objects into a single string:

```
Get-Alias | Out-String -Stream
```

- Use the `Width` parameter to prevent truncation:

```
@{TestKey = ('x' * 200)} | Out-String -Width {{250}}
```

pabcnetcclear

Preprocess and compile PascalABC.NET source files.

More information: https://pascalabc.net/.

- Compile the specified source file into an executable with the same name:

```
pabcnetcclear {{path\to\source_file.pas}}
```

- Compile the specified source file into an executable with the specified name:

```
pabcnetcclear /Output:{{path\to\file.exe}}
{{path\to\source_file.pas}}
```

- Compile the specified source file into an executable with the same name along with/without debug information:

```
pabcnetcclear /Debug:{{0|1}} {{path\to\source_file.pas}}
```

- Allow units to be searched in the specified path while compiling the source file into an executable with the same name:

```
pabcnetcclear /SearchDir:{{path\to\directory}}
{{path\to\source_file.pas}}
```

- Compile the specified source file into an executable, defining a symbol:

```
pabcnetcclear /Define:{{symbol}} {{path\to\source_file.pas}}
```

path

Display or set the search path for executable files.

More information: https://learn.microsoft.com/windows-server/administration/windows-commands/path.

- Display the current path:

```
path
```

- Set the path to one or more semicolon-separated directories:

```
path {{path\to\directory1 path\to\directory2 ...}}
```

- Append a new directory to the original path:

```
path {{path\to\directory}};%path%
```

- Set command prompt to only search the current directory for executables:

```
path ;
```

pathping

A trace route tool combining features of **`ping`** and **`tracert`**.

More information: https://learn.microsoft.com/windows-server/administration/windows-commands/pathping.

- Ping and trace the route to a host:

```
pathping {{hostname}}
```

- Do not perform reverse lookup of IP address to hostname:

```
pathping {{hostname}} -n
```

- Specify the maximum number of hops to search for the target (the default is 30):

```
pathping {{hostname}} -h {{max_hops}}
```

- Specify the milliseconds to wait between pings (the default is 240):

```
pathping {{hostname}} -p {{time}}
```

- Specify the number of queries per hop (the default is 100):

```
pathping {{hostname}} -q {{queries}}
```

- Force IPv4 usage:

```
pathping {{hostname}} -4
```

- Force IPv6 usage:

```
pathping {{hostname}} -6
```

- Display help:

```
pathping /?
```

ping

Send ICMP ECHO_REQUEST packets to network hosts.

Unlike Unix-like systems, Windows **`ping`** sends only 4 packets by default.

More information: https://learn.microsoft.com/windows-server/administration/windows-commands/ping.

- Ping a host 4 times:

```
ping {{host}}
```

- Ping a host a specific number of times:

```
ping -n {{count}} {{host}}
```

- Ping a host continuously (until stopped with `<Ctrl c>`):

```
ping -t {{host}}
```

- Set the timeout in milliseconds to wait for each reply:

```
ping -w {{milliseconds}} {{host}}
```

- Set the buffer size of the ping packet in bytes:

```
ping -l {{bytes}} {{host}}
```

- Ping a host using a specific source IP address:

```
ping -S {{source_ip}} {{host}}
```

- Resolve address to hostname:

```
ping -a {{host}}
```

pipwin

A tool to install unofficial Python package binaries on Windows.

More information: https://github.com/lepisma/pipwin.

- List all available packages for download:

```
pipwin list
```

- Search packages:

```
pipwin search {{partial_name|name}}
```

- Install a package:

```
pipwin install {{package}}
```

- Uninstall a package:

```
pipwin uninstall {{package}}
```

- Download a package to a specific directory:

```
pipwin download --dest {{path\to\directory}} {{package}}
```

- Install packages according to `requirements.txt`:

```
pipwin install --file {{path\to\requirements.txt}}
```

planmaker

SoftMaker Office's spreadsheet application.

More information: https://help.softmaker.com/planmaker2026/en/index.html.

- Launch the spreadsheet application (omitting the file path will create a new blank document):

```
planmaker {{path\to\file.pmdx}}
```

- Launch PlanMaker with [N]o open documents:

```
planmaker -N
```

- Launch PlanMaker with an interactive dialog to choose which [F]ile to [O]pen:

```
planmaker -FO
```

- Launch PlanMaker with an interactive dialog to choose which template [F]ile to create a [N]ew document:

```
planmaker -FN
```

- Directly [P]rint a document to the default printer:

```
planmaker -P"{{path\to\file.pmdx}}"
```

- Directly print a document to a specific printer:

```
planmaker -Q"{{printer}}","{{path\to\file.pmdx}}"
```

pnputil

Manage the driver store and driver packages on Windows.

Requires an elevated Command Prompt.

More information: https://learn.microsoft.com/windows-hardware/drivers/devtest/pnputil-command-syntax.

- List all installed driver packages:

```
pnputil /enum-drivers
```

- Install a driver package from an INF file:

```
pnputil /add-driver {{path\to\driver.inf}}
```

- Add and install all INF files in a folder (including subdirectories):

```
pnputil /add-driver {{path\to\folder\*.inf}} /subdirs
```

- Delete a driver package using its published name:

```
pnputil /delete-driver {{oemXX.inf}}
```

- Install a driver package using its published name:

```
pnputil /add-driver {{oemXX.inf}}
```

- Export all driver packages to a folder:

```
pnputil /export-driver * {{path\to\folder}}
```

- List all devices:

```
pnputil /enum-devices
```

popd

Change the current directory to the directory stored by the **pushd** command.

See also: **pushd**.

More information: https://learn.microsoft.com/windows-server/administration/windows-commands/popd.

- Switch to directory at the top of the stack:

```
popd
```

powercfg

Configure power settings and manage power schemes.

More information: https://learn.microsoft.com/windows-hardware/design/device-experiences/powercfg-command-line-options.

- Display the current power scheme:

  ```
  powercfg /getactivescheme
  ```

- List all available power schemes:

  ```
  powercfg {{[/L|/list]}}
  ```

- Set the active power scheme by its GUID:

  ```
  powercfg /setactive {{guid}}
  ```

- Turn off the display after a specific number of minutes on AC power:

  ```
  powercfg {{[/X|/change]}} monitor-timeout-ac {{minutes}}
  ```

- Turn off the display after a specific number of minutes on battery power:

  ```
  powercfg {{[/X|/change]}} monitor-timeout-dc {{minutes}}
  ```

- Put the system to sleep after a specific number of minutes on AC power:

  ```
  powercfg {{[/X|/change]}} standby-timeout-ac {{minutes}}
  ```

- Generate a system sleep diagnostics report and save it to a file:

  ```
  powercfg /sleepstudy /output {{path\to\report.html}}
  ```

- Generate a full power efficiency report and save it to a file:

  ```
  powercfg /energy /output {{path\to\report.html}}
  ```

powerpnt

Microsoft Office's presentation application.

More information: https://support.microsoft.com/office/command-line-switches-for-microsoft-office-products-079164cd-4ef5-4178-b235-441737deb3a6#category=powerpoint%2C_powerpoint_viewer.

- Launch the presentation application (omitting the file path will launch the File page):

```
powerpnt {{path\to\file.pptx}}
```

- Create a new [b]lank presentation:

```
powerpnt /b
```

- Create a [n]ew presentation from a template:

```
powerpnt /n {{path\to\file.potm}}
```

- [o]pen one or more files:

```
powerpnt /o {{path\to\file1.pptx path\to\file2.pptx ...}}
```

- Open a file in [s]lideshow mode:

```
powerpnt /s {{path\to\file.pptx}}
```

- Open a presentation, then execute a specific [m]acro:

```
powerpnt /m {{path\to\file.pptm}} "{{MacroName}}"
```

- Print a presentation via the Print dialog:

```
powerpnt /pwo {{path\to\file.pptx}}
```

- Directly [p]rint a presentation [t]o a specific printer:

```
powerpnt /pt {{printer_name}} {{path\to\file.pptx}}
```

powershell

Command-line shell and scripting language designed especially for system administration.

This command refers to PowerShell version 5.1 and below (also known as the legacy Windows PowerShell).

To use the newer, cross-platform version of PowerShell (also known as PowerShell Core), use **`pwsh`** instead of **`powershell`**.

More information: https://learn.microsoft.com/windows-server/administration/windows-commands/powershell.

- Start an interactive shell session:

```
powershell
```

- Start an interactive shell session without loading startup configs:

```
powershell -NoProfile
```

- Execute specific commands:

```
powershell -Command "{{echo 'powershell is executed'}}"
```

- Execute a specific script:

```
powershell -File {{path\to\script.ps1}}
```

- Start a session with a specific version of PowerShell:

```
powershell -Version {{version}}
```

- Prevent a shell from exit after running startup commands:

```
powershell -NoExit
```

- Describe the format of data sent to PowerShell:

```
powershell -InputFormat {{Text|XML}}
```

- Determine how an output from PowerShell is formatted:

```
powershell -OutputFormat {{Text|XML}}
```

pptview

View Microsoft PowerPoint presentations.

Note: This command is deprecated.

More information: https://support.microsoft.com/office/command-line-switches-for-microsoft-office-products-079164cd-4ef5-4178-b235-441737deb3a6#category=powerpoint%2C_powerpoint_viewer.

- Launch the application:

```
pptview
```

- Open a presentation:

```
pptview {{path\to\file.pptx}}
```

- Open at a specific slide [n]umber:

```
pptview /n{{1}} {{path\to\file.pptx}}
```

- Open a [l]ist of presentation files from a playlist file:

```
pptview /l {{path\to\playlist.txt}}
```

- [p]rint a presentation file:

```
pptview /p {{path\to\file.pptx}}
```

print

Print a text file to a printer.

More information: https://learn.microsoft.com/windows-server/administration/windows-commands/print.

- Print a text file to the default printer:

```
print {{path\to\file}}
```

- Print a text file to a specific printer:

```
print /d:{{printer}} {{path\to\file}}
```

prompt

Change the default DOS style prompt in a command window.

More information: https://learn.microsoft.com/windows-server/administration/windows-commands/prompt.

- Reset the prompt to the default setting:

```
prompt
```

- Set a specific prompt:

```
prompt {{prompt}}
```

- Change the prompt to show the current date first:

```
prompt $D $P$G
```

- Change the prompt to show the current time first:

```
prompt $T $P$G
```

- Change the prompt by adding a specific text first:

```
prompt {{text}} $P$G
```

psexec

Execute a command-line process on a remote machine.

This is an advanced command and it might potentially be dangerous.

More information: https://learn.microsoft.com/sysinternals/downloads/psexec.

- Execute a command using `cmd` in a remote shell:

```
psexec \\{{remote_host}} cmd
```

- Execute a command on a remote host (pre-authenticated):

```
psexec \\{{remote_host}} -u {{user_name}} -p {{password}}
```

- Execute a command remotely and output the result to a file:

```
psexec \\{{remote_host}} cmd /c {{command}} -an
^>{{path\to\file.txt}}
```

- Execute a program to interact with users:

```
psexec \\{{remote_host}} -d -i {{program_name}}
```

- Display the IP configuration of the remote host:

```
psexec \\{{remote_host}} ipconfig /all
```

psping

A ping tool that includes TCP ping, latency, and bandwidth measurement.

More information: https://learn.microsoft.com/sysinternals/downloads/psping.

- Ping a host using ICMP:

```
psping {{hostname}}
```

- Ping a host over a TCP port:

```
psping {{hostname}}:{{port}}
```

- Specify the number of pings and perform it quietly:

```
psping {{hostname}} -n {{pings}} -q
```

- Ping the target over TCP 50 times and produce a histogram of the results:

```
psping {{hostname}}:{{port}} -q -n 50 -h
```

- Display help:

```
psping /?
```

PSVersionTable

A read-only variable (as **`$PSVersionTable`**) to get the current PowerShell version.

This command can only be run under PowerShell.

More information: https://learn.microsoft.com/powershell/module/microsoft.powershell.core/about/about_automatic_variables#psversiontable.

- Print a summary of the currently installed PowerShell version and edition:

  ```
  $PSVersionTable
  ```

- Get the detailed (major, minor, build, and revision) version number of PowerShell:

  ```
  $PSVersionTable.PSVersion
  ```

- List all supported PowerShell script versions that this PowerShell version supports:

  ```
  $PSVersionTable.PSCompatibleVersions
  ```

- Get the latest Git commit ID where the currently-installed PowerShell version is based on (works on PowerShell 6.0 and later):

  ```
  $PSVersionTable.GitCommitId
  ```

- Check whether the user is running PowerShell Core (6.0 or later) or the original "Windows PowerShell" (version 5.1 or below):

  ```
  $PSVersionTable.PSEdition
  ```

PSWindowsUpdate

A PowerShell external module to manage Windows Update.

This tool provides multiple commands that all can only be run through PowerShell.

More information: https://github.com/mgajda83/PSWindowsUpdate.

- Install the module using `Install-Module`:

  ```
  Install-Module PSWindowsUpdate
  ```

- List all commands available under the module:

  ```
  Get-Command -Module PSWindowsUpdate
  ```

pushd

Place a directory on a stack so it can be accessed later.

See also: **popd**.

More information: https://learn.microsoft.com/windows-server/administration/windows-commands/pushd.

- Switch to directory and push it on the stack:

```
pushd {{path\to\directory}}
```

pwd

In PowerShell, this command is an alias of **`Get-Location`**.

However, this command is not available on the Command Prompt (**`cmd`**). Use **`cd`** instead for similar functionality.

- View documentation for the equivalent Command Prompt command:

  ```
  tldr cd
  ```

- View documentation for the original PowerShell command:

  ```
  tldr get-location
  ```

pwlauncher

Manage the Windows To Go startup options.

More information: https://learn.microsoft.com/windows-server/administration/windows-commands/pwlauncher.

- Display the current Windows To Go status:

  ```
  pwlauncher
  ```

- Enable or disable the Windows To Go startup options:

  ```
  pwlauncher /{{enable|disable}}
  ```

pwsh where

This command is an alias of **`Where-Object`**.

- View documentation for the original command:

```
tldr Where-Object
```

py

Python Launcher for Windows that runs with specified Python version.

See also: **`python`**.

More information: https://docs.python.org/using/windows.html#python-launcher-for-windows.

- Start a REPL (interactive shell), optionally with arguments supported by `python` (like `-c`, `-m`, etc.):

```
py {{python_arguments}}
```

- Execute a specific Python file:

```
py {{path\to\file.py}}
```

- Run specific Python version. If the version is missing, and `PYLAUNCHER_ALLOW_INSTALL` environment variable is set, auto-install via Microsoft Store or Winget:

```
py {{-2|-3.7|...}}
```

- List installed Python versions:

```
py --list
```

query

Display information about user sessions and process.

More information: https://learn.microsoft.com/windows-server/administration/windows-commands/query.

- Display all user sessions:

```
query session
```

- Display the current user sessions on a remote computer:

```
query session /server:{{hostname}}
```

- Display logged in users:

```
query user
```

- Display all running processes:

```
query process
```

- Display running processes by session or user name:

```
query process {{session_name|user_name}}
```

rd

This command is an alias of **`rmdir`** on the Command Prompt and **`Remove-Item`** in PowerShell.

- View documentation for the original Command Prompt command:

  ```
  tldr rmdir
  ```

- View documentation for the original PowerShell command:

  ```
  tldr remove-item
  ```

rdpsign

A tool for signing Remote Desktop Protocol (RDP) files.

More information: https://learn.microsoft.com/windows-server/administration/windows-commands/rdpsign.

- Sign an RDP file:

```
rdpsign {{path\to\file.rdp}}
```

- Sign an RDP file using a specific sha256 hash:

```
rdpsign {{path\to\file.rdp}} /sha265 {{hash}}
```

- Enable quiet output:

```
rdpsign {{path\to\file.rdp}} /q
```

- Display verbose warnings, messages, and statuses:

```
rdpsign {{path\to\file.rdp}} /v
```

- Test the signing by displaying the output to `stdout` without updating the file:

```
rdpsign {{path\to\file.rdp}} /l
```

reg add

Add new keys and their values to the registry.

More information: https://learn.microsoft.com/windows-server/administration/windows-commands/reg-add.

- Add a new registry key:

```
reg add {{key_name}}
```

- Add a new [v]alue under a specific key:

```
reg add {{key_name}} /v {{value}}
```

- Add a new value with specific [d]ata:

```
reg add {{key_name}} /d {{data}}
```

- Add a new value to a key with a specific data [t]ype:

```
reg add {{key_name}} /t REG_{{SZ|MULTI_SZ|DWORD_BIG_ENDIAN|
DWORD|BINARY|DWORD_LITTLE_ENDIAN|LINK|
FULL_RESOURCE_DESCRIPTOR|EXPAND_SZ}}
```

- [f]orcefully (without a prompt) overwrite the existing registry value:

```
reg add {{key_name}} /f
```

reg compare

Compare keys and their values in the registry.

More information: https://learn.microsoft.com/windows-server/administration/windows-commands/reg-compare.

- Compare all values under a specific key with another key:

```
reg compare {{key_name1}} {{key_name2}}
```

- Compare a specific [v]alue under two keys:

```
reg compare {{key_name1}} {{key_name2}} /v {{value}}
```

- Compare all [s]ubkeys and values for two keys:

```
reg compare {{key_name1}} {{key_name2}} /s
```

- Only [o]utput the matches ([s]ame) between the specified keys:

```
reg compare {{key_name1}} {{key_name2}} /os
```

- [o]utput the differences and matches ([a]ll) between the specified keys:

```
reg compare {{key_name1}} {{key_name2}} /oa
```

- Compare two keys, [o]utputting [n]othing:

```
reg compare {{key_name1}} {{key_name2}} /on
```

reg copy

Copy keys and their values in the registry.

More information: https://learn.microsoft.com/windows-server/administration/windows-commands/reg-copy.

- Copy a registry key to a new registry location:

```
reg copy {{old_key_name}} {{new_key_name}}
```

- Copy a registry key recursively (with all [s]ubkeys) to a new registry location:

```
reg copy {{old_key_name}} {{new_key_name}} /s
```

- [f]orcefully (without a prompt) copy a registry key:

```
reg copy {{old_key_name}} {{new_key_name}} /f
```

reg delete

Delete keys or their values from the registry.

More information: https://learn.microsoft.com/windows-server/administration/windows-commands/reg-delete.

- Delete a specific registry key:

```
reg delete {{key_name}}
```

- Delete a [v]alue under a specific key:

```
reg delete {{key_name}} /v {{value}}
```

- Delete [a]ll [v]alues recursively under the specified key:

```
reg delete {{key_name}} /va
```

- [f]orcefully (without a prompt) delete [a]ll [v]alues recursively under a key:

```
reg delete {{key_name}} /f /va
```

reg export

Export the specified subkeys and values to a `.reg` file.

More information: https://learn.microsoft.com/windows-server/administration/windows-commands/reg-export.

- Export all subkeys and values of a specific key:

```
reg export {{key_name}} {{path\to\file.reg}}
```

- Forcefully (assuming [y]es) overwrite of an existing file:

```
reg export {{key_name}} {{path\to\file.reg}} /y
```

reg import

Import all available keys, subkeys, and values from a `.reg` file.

More information: https://learn.microsoft.com/windows-server/administration/windows-commands/reg-import.

- Import all keys, subkeys, and values from a file:

```
reg import {{path\to\file.reg}}
```

reg load

Load saved subkeys into a different subkey in the registry.

Note: This is intended for troubleshooting and temporary keys.

More information: https://learn.microsoft.com/windows-server/administration/windows-commands/reg-load.

- Load a backup file into the specified key:

```
reg load {{key_name}} {{path\to\file.hiv}}
```

reg query

Display the values of keys and subkeys in the registry.

More information: https://learn.microsoft.com/windows-server/administration/windows-commands/reg-query.

- Display all values of a key:

```
reg query {{key_name}}
```

- Display a specific [v]alue of a key:

```
reg query {{key_name}} /v {{value}}
```

- Display all values of a key and its [s]ubkeys:

```
reg query {{key_name}} /s
```

- Search [f]or keys and values matching a specific pattern:

```
reg query {{key_name}} /f "{{query_pattern}}"
```

- Display a value of a key matching a specified data [t]ype:

```
reg query {{key_name}} /t REG_{{SZ|MULTI_SZ|EXPAND_SZ|DWORD|BINARY|NONE}}
```

- Only search in [d]ata:

```
reg query {{key_name}} /d
```

- Only search in [k]ey names:

```
reg query {{key_name}} /f "{{query_pattern}}" /k
```

- [c]ase-sensitively search for an [e]xact match:

```
reg query {{key_name}} /c /e
```

reg restore

Restore a key and its values from a native **`.hiv`** file.

See **`reg-save`** for more information.

More information: https://learn.microsoft.com/windows-server/administration/windows-commands/reg-restore.

- Overwrite a specified key with data from a backup file:

```
reg restore {{key_name}} {{path\to\file.hiv}}
```

reg save

Save a registry key, its subkeys, and values to a native `.hiv` file.

More information: https://learn.microsoft.com/windows-server/administration/windows-commands/reg-save.

- Save a registry key, its subkeys, and values to a specific file:

```
reg save {{key_name}} {{path\to\file.hiv}}
```

- Forcefully (assuming [y]es) overwrite an existing file:

```
reg save {{key_name}} {{path\to\file.hiv}} /y
```

reg unload

Remove data from the registry that was loaded using the **`reg load`** command.

More information: https://learn.microsoft.com/windows-server/administration/windows-commands/reg-unload.

- Remove data from the registry for a specified key:

```
reg unload {{key_name}}
```

reg

Manage keys and their values in the Windows registry.

Some subcommands such as **add** have their own usage documentation.

More information: https://learn.microsoft.com/windows-server/administration/windows-commands/reg.

- Execute a registry command:

```
reg {{command}}
```

- View documentation for adding and copying subkeys:

```
tldr reg {{add|copy}}
```

- View documentation for deleting keys and subkeys:

```
tldr reg {{delete|unload}}
```

- View documentation for searching, viewing, and comparing keys:

```
tldr reg {{compare|query}}
```

- View documentation for exporting and importing registry keys not preserving the key ownerships and ACLs:

```
tldr reg {{export|import}}
```

- View documentation for saving, restoring, loading, and unloading registry keys preserving the key ownerships and ACLs:

```
tldr reg {{save|restore|load|unload}}
```

- Display help:

```
reg /?
```

- Display help for a specific command:

```
reg {{command}} /?
```

Remove-AppxPackage

A PowerShell utility to remove an app package from user accounts.

More information: https://learn.microsoft.com/powershell/module/appx/Remove-AppxPackage.

- Remove an app package:

```
Remove-AppxPackage {{package}}
```

- Remove an app package for a specific user:

```
Remove-AppxPackage {{package}} -User {{username}}
```

- Remove an app package for all users:

```
Remove-AppxPackage {{package}} -AllUsers
```

- Remove an app package but preserve its app data:

```
Remove-AppxPackage {{package}} -PreserveApplicationData
```

Remove-Item

Delete files, folders, as well as registry keys and subkeys.

This command can only be run through PowerShell.

More information: https://learn.microsoft.com/powershell/module/microsoft.powershell.management/remove-item.

- Remove specific files or registry keys (without subkeys):

```
Remove-Item {{path\to\file_or_key1 ,
path\to\file_or_key2 ...}}
```

- Remove hidden or read-only files:

```
Remove-Item -Force {{path\to\file1 , path\to\file2 ...}}
```

- Remove specific files or registry keys interactively prompting before each removal:

```
Remove-Item -Confirm {{path\to\file_or_key1 ,
path\to\file_or_key2 ...}}
```

- Remove specific files and directories recursively (Windows 10 version 1909 or later):

```
Remove-Item -Recurse {{path\to\file_or_directory1 ,
path\to\file_or_directory2 ...}}
```

- Remove specific Windows registry keys and all its subkeys:

```
Remove-Item -Recurse {{path\to\key1 , path\to\key2 ...}}
```

- Simulate the deletion process:

```
Remove-Item -WhatIf {{path\to\file1 , path\to\file2 ...}}
```

ren

This command is an alias of **`Rename-Item`**.

- View documentation for the original command:

  ```
  tldr Rename-Item
  ```

Rename-Item

Powershell command to rename an item.

Note: **`ren`** and **`rni`** can both be used as an alias for **`Rename-Item`**.

More information: https://learn.microsoft.com/powershell/module/microsoft.powershell.management/rename-item.

- Rename a file:

```
Rename-Item -Path "{{path\to\file}}" -NewName
"{{new_file_name}}"
```

- Rename a directory:

```
Rename-Item -Path "{{path\to\directory}}" -NewName
"{{new_directory_name}}"
```

- Rename and move a file:

```
Rename-Item -Path "{{path\to\file}}" -NewName
"{{path\to\new_file_name}}"
```

- Rename a file by force:

```
Rename-Item -Path "{{path\to\file}}" -NewName
"{{new_file_name}}" -Force
```

- Prompt confirmation before renaming a file:

```
Rename-Item -Path "{{path\to\file}}" -NewName
"{{new_file_name}}" {{[-Confirm|-cf]}}
```

repair-bde

Attempt to repair or decrypt a damaged BitLocker-encrypted volume.

More information: https://learn.microsoft.com/windows-server/administration/windows-commands/repair-bde.

- Attempt to repair a specified volume:

```
repair-bde {{C:}}
```

- Attempt to repair a specified volume and output to another volume:

```
repair-bde {{C:}} {{D:}}
```

- Attempt to repair a specified volume using the provided recovery key file:

```
repair-bde {{C:}} -RecoveryKey {{path\to\file.bek}}
```

- Attempt to repair a specified volume using the provided numerical recovery password:

```
repair-bde {{C:}} -RecoveryPassword {{password}}
```

- Attempt to repair a specified volume using the provided password:

```
repair-bde {{C:}} -Password {{password}}
```

- Attempt to repair a specified volume using the provided key package:

```
repair-bde {{C:}} -KeyPackage {{path\to\directory}}
```

- Log all output to a specific file:

```
repair-bde {{C:}} -LogFile {{path\to\file}}
```

- Display help:

```
repair-bde /?
```

replace

Replace files.

See also: **`robocopy`**, **`move`**, **`del`**.

More information: https://learn.microsoft.com/windows-server/administration/windows-commands/replace.

- Replace the destination file with the one from the source directory:

```
replace {{path\to\file_or_directory}}
{{path\to\destination_directory}}
```

- Add files to the destination directory instead of replacing existing files:

```
replace {{path\to\file_or_directory}}
{{path\to\destination_directory}} /a
```

- Interactively copy multiple files, with a prompt before replacing or adding a destination file:

```
replace {{path\to\file_or_directory}}
{{path\to\destination_directory}} /p
```

- Replace even read only files:

```
replace {{path\to\file_or_directory}}
{{path\to\destination_directory}} /r
```

- Wait for you to insert a disk before it replaces files (originally to allow inserting a floppy disk):

```
replace {{path\to\file_or_directory}}
{{path\to\destination_directory}} /w
```

- Replace all files in subdirectories of the destination:

```
replace {{path\to\file_or_directory}}
{{path\to\destination_directory}} /s
```

- Replace only files in the destination directory which are older than the files in the source directory:

```
replace {{path\to\file_or_directory}}
{{path\to\destination_directory}} /u
```

- Display help:

```
    replace /?
```

Resolve-Path

Resolve the wildcard characters in a path, and display the path contents.

Note: This command can only be used through PowerShell.

More information: https://learn.microsoft.com/powershell/module/microsoft.powershell.management/resolve-path.

- Resolve the home folder path:

```
Resolve-Path ~
```

- Resolve a UNC path:

```
Resolve-Path -Path "\\{{hostname}}\{{path\to\file}}"
```

- Get relative paths:

```
Resolve-Path -Path {{path\to\file_or_directory}} -Relative
```

ri

In PowerShell, this command is an alias of **`Remove-Item`**.

- View documentation for the original command:

```
tldr remove-item
```

rm

In PowerShell, this command is an alias of **`Remove-Item`**.

- View documentation for the original command:

```
tldr remove-item
```

rmdir

Remove a directory and its contents.

In PowerShell, this command is an alias of **`Remove-Item`**. This documentation is based on the Command Prompt (**`cmd`**) version of **`rmdir`**.

More information: https://learn.microsoft.com/windows-server/administration/windows-commands/rmdir.

- View the documentation of the equivalent PowerShell command:

```
tldr remove-item
```

- Remove an empty directory:

```
rmdir {{path\to\directory}}
```

- Remove a directory and its contents recursively:

```
rmdir {{path\to\directory}} /s
```

- Remove a directory and its contents recursively without prompting:

```
rmdir {{path\to\directory}} /s /q
```

rni

This command is an alias of **`Rename-Item`**.

- View documentation for the original command:

  ```
  tldr Rename-Item
  ```

robocopy

Robust File and Folder Copy.

By default files will only be copied if the source and destination have different time stamps or different file sizes.

More information: https://learn.microsoft.com/windows-server/administration/windows-commands/robocopy.

- Copy all `.jpg` and `.bmp` files from one directory to another:

```
robocopy {{path\to\source_directory}}
{{path\to\destination_directory}} {{*.jpg}} {{*.bmp}}
```

- Copy all files and subdirectories, including empty ones:

```
robocopy {{path\to\source_directory}}
{{path\to\destination_directory}} /E
```

- Mirror/Sync a directory, deleting anything not in source, and include all attributes and permissions:

```
robocopy {{path\to\source_directory}}
{{path\to\destination_directory}} /MIR /COPYALL
```

- Copy all files and subdirectories, excluding source files that are older than destination files:

```
robocopy {{path\to\source_directory}}
{{path\to\destination_directory}} /E /XO
```

- List all files 50 MB or larger instead of copying them:

```
robocopy {{path\to\source_directory}}
{{path\to\destination_directory}} /MIN:{{52428800}} /L
```

- Allow resuming if network connection is lost and limit retries to 5 and wait time to 15 sec:

```
robocopy {{path\to\source_directory}}
{{path\to\destination_directory}} /Z /R:5 /W:15
```

- Display help:

```
robocopy /?
```

rpcinfo

List programs via RPC on remote computers.

More information: https://learn.microsoft.com/windows-server/administration/windows-commands/rpcinfo.

- List all programs registered on the local computer:

```
rpcinfo
```

- List all programs registered on a remote computer:

```
rpcinfo /p {{computer_name}}
```

- Call a specific program on a remote computer using TCP:

```
rpcinfo /t {{computer_name}} {{program_name}}
```

- Call a specific program on a remote computer using UDP:

```
rpcinfo /u {{computer_name}} {{program_name}}
```

runas

Run a program as another user.

More information: https://learn.microsoft.com/previous-versions/windows/it-pro/windows-server-2012-r2-and-2012/cc771525(v=ws.11).

- Run a program as the Administrator local user:

```
runas /user:.\Administrator "{{command}}"
```

- Run a program as a specific user:

```
runas /user:{{domain\username}} "{{command}}"
```

- Run a program without loading the user's profile:

```
runas /noprofile /user:{{domain\username}} "{{command}}"
```

- Open Command Prompt as another user:

```
runas /user:{{domain\username}} cmd
```

- Run Notepad as a specific user with the current user's environment variables, opening a file with escaped quotes:

```
runas /env /user:{{domain\username}} "notepad \"{{C:\path\to\file.txt}}\""
```

- Run Active Directory Users and Computers as a specific user:

```
runas /env /user:{{domain\username}} "mmc %windir%\system32\dsa.msc"
```

sal

This command is an alias of **`Set-Alias`**.

- View documentation for the original command:

```
tldr set-alias
```

SaRAcmd ExpertExperienceAdminTask

This command is an alias of **`GetHelpCmd.exe -S ExpertExperienceAdminTask`**.

- View documentation for the original command:

```
tldr gethelpcmd-expertexperienceadmintask
```

SaRAcmd OfficeActivationScenario

This command is an alias of **`GetHelpCmd.exe -S OfficeActivationScenario`**.

- View documentation for the original command:

  `tldr gethelpcmd-officeactivationscenario`

SaRAcmd OutlookCalendarCheckTask

This command is an alias of **`GetHelpCmd.exe -S OutlookCalendarCheckTask`**.

- View documentation for the original command:

  ```
  tldr gethelpcmd-outlookcalendarchecktask
  ```

SaRAcmd TeamsAddinScenario

This command is an alias of **`GetHelpCmd.exe -S TeamsAddinScenario`**.

- View documentation for the original command:

  ```
  tldr gethelpcmd-teamsaddinscenario
  ```

SaRAcmd

This command is an alias of **`GetHelpCmd.exe`**.

More information: https://learn.microsoft.com/troubleshoot/microsoft-365/admin/miscellaneous/get-help-command-line-overview.

- View documentation for the original command:

```
tldr gethelpcmd
```

SC

Communicate with the Service Control Manager and services.

More information: https://learn.microsoft.com/windows-server/administration/windows-commands/sc-query.

- Show the status of a service (no service name will list all services):

```
sc query {{service_name}}
```

- Start a service asynchronously:

```
sc start {{service_name}}
```

- Stop a service asynchronously:

```
sc stop {{service_name}}
```

- Create a service:

```
sc create {{service_name}} binpath=
{{path\to\service_binary_file}}
```

- Delete a service:

```
sc delete {{service_name}}
```

- Set the type of a service:

```
sc config {{service_name}} type= {{service_type}}
```

scb

This command is an alias of **`Set-Clipboard`**.

- View documentation for the original command:

```
tldr Set-Clipboard
```

scoop bucket

Manage buckets: Git repositories containing files which describe how scoop installs applications.

If Scoop doesn't know where the bucket is located its repository location must be specified.

More information: https://github.com/ScoopInstaller/Scoop/wiki/Buckets.

- List all buckets currently in use:

```
scoop bucket list
```

- List all known buckets:

```
scoop bucket known
```

- Add a known bucket by its name:

```
scoop bucket add {{name}}
```

- Add an unknown bucket by its name and Git repository URL:

```
scoop bucket add {{name}} {{https://example.com/repository.git}}
```

- Remove a bucket by its name:

```
scoop bucket rm {{name}}
```

scoop

The Scoop package manager.

Some subcommands such as **`bucket`** have their own usage documentation.

More information: https://github.com/ScoopInstaller/Scoop/wiki/Commands.

- Install a package:

```
scoop install {{package}}
```

- Remove a package:

```
scoop uninstall {{package}}
```

- Update all installed packages:

```
scoop update --all
```

- List installed packages:

```
scoop list
```

- Display information about a package:

```
scoop info {{package}}
```

- Search for a package:

```
scoop search {{package}}
```

- Remove old versions of all packages and clear the download cache:

```
scoop cleanup --cache --all
```

sdelete

Securely delete file/directory from disk, or clean the free space on a volume/physical disk.

More information: https://learn.microsoft.com/sysinternals/downloads/sdelete.

- Delete files with 3 [p]asses:

```
sdelete -p 3 {{path\to\file1 path\to\file2 ...}}
```

- Delete folders and its [s]ubdirectories with 1 pass (default):

```
sdelete -s {{path\to\directory1 path\to\directory2 ...}}
```

- Clean the free space of volume D: with 3 [p]asses:

```
sdelete -p 3 D:
```

- Clean the free space with [z]eros of physical disk 2, which should not contain any volumes to be cleaned:

```
sdelete -z 2
```

sdelete64

This command is the 64 bit version of **`sdelete`**.

- View documentation for the original command:

  ```
  tldr sdelete
  ```

Select-String

Find text in strings and files in PowerShell.

You can use **`Select-String`** similar to **`grep`** in UNIX or **`findstr.exe`** in Windows.

Note: This command can only be used through PowerShell.

More information: https://learn.microsoft.com/powershell/module/microsoft.powershell.utility/select-string.

- Search for a pattern within a file:

```
Select-String -Path "{{path\to\file}}" -Pattern
'{{search_pattern}}'
```

- Search for an exact string (disables `regex`):

```
Select-String -SimpleMatch
"{{exact_string}}" {{path\to\file}}
```

- Search for pattern in all `.ext` files in current dir:

```
Select-String -Path "{{*.ext}}" -Pattern '{{search_pattern}}'
```

- Capture the specified number of lines before and after the line that matches the pattern:

```
Select-String --Context {{2,3}}
"{{search_pattern}}" {{path\to\file}}
```

- Search `stdin` for lines that do not match a pattern:

```
Get-Content {{path\to\file}} | Select-String --NotMatch
"{{search_pattern}}"
```

Set-Acl

Change the security descriptor of a specified item, such as a file or a registry key.

Note: This command can only be used through PowerShell.

More information: https://learn.microsoft.com/powershell/module/microsoft.powershell.security/set-acl.

- Copy a security descriptor from one file to another:

```
$OriginAcl = Get-Acl -Path {{path\to\file}}; Set-Acl -Path {{path\to\file}} -AclObject $OriginAcl
```

- Use the pipeline operator to pass a descriptor:

```
Get-Acl -Path {{path\to\file}} | Set-Acl -Path {{path\to\file}}
```

Set-Alias

A PowerShell command to set or modify alias.

Note: **`sal`** can be used as an alias for **`Set-Alias`**.

More information: https://learn.microsoft.com/powershell/module/microsoft.powershell.utility/set-alias.

- Create or reassign new alias:

```
Set-Alias -Name {{text}} -Value {{command}}
```

- Add a description to alias:

```
Set-Alias -Name {{text}} -Value {{command}} -Description "{{description}}"
```

Set-Clipboard

PowerShell command to set content to clipboard.

Note: **`scb`** can be used as an alias for **`Set-Clipboard`**.

More information: https://learn.microsoft.com/powershell/module/microsoft.powershell.management/set-clipboard.

- Copy text to the clipboard:

```
Set-Clipboard -Value "{{text}}"
```

- Copy multiple texts to clipboard separated by new line:

```
Set-Clipboard -Value @("{{text 1}}", "{{text 2}}", "{{text 3}}")
```

- Copy files or directories to clipboard:

```
Set-Clipboard -Path "{{path\to\files_or_directories}}"
```

- Copy multiple files:

```
Set-Clipboard -Path "{{path\to\file1}}","{{path\to\file2}}","{{path\to\file3}}"
```

- Clear the clipboard:

```
Set-Clipboard ""
```

Set-Date

Change the system time on the computer to a time that you specify.

Note: This command can only be used through PowerShell.

More information: https://learn.microsoft.com/powershell/module/microsoft.powershell.utility/set-date.

- Add three days to the system date:

```
Set-Date -Date (Get-Date).AddDays({{3}})
```

- Set the system clock back 10 minutes:

```
Set-Date -Adjust -0:10:0 -DisplayHint Time
```

- Add 90 minutes to the system clock:

```
$90mins = New-TimeSpan -Minutes {{90}}; Set-Date -Adjust
$90mins
```

Set-Location

Display the current working directory or move to a different directory.

Note: This command can only be used through PowerShell.

More information: https://learn.microsoft.com/powershell/module/microsoft.powershell.management/set-location.

- Go to the specified directory:

```
Set-Location {{path\to\directory}}
```

- Go to a specific directory in a different drive:

```
Set-Location {{C}}:{{path\to\directory}}
```

- Go and display the location of specified directory:

```
Set-Location {{path\to\directory}} -PassThru
```

- Go up to the parent of the current directory:

```
Set-Location ..
```

- Go to the home directory of the current user:

```
Set-Location ~
```

- Go back/forward to the previously chosen directory:

```
Set-Location {{-|+}}
```

- Go to root of current drive:

```
Set-Location \
```

Set-Service

Start, stop, and suspend a service, and changes its properties.

Note: This command can only be used through PowerShell.

More information: https://learn.microsoft.com/powershell/module/microsoft.powershell.management/set-service.

- Change a display name:

```
Set-Service -Name {{hostname}} -DisplayName "{{name}}"
```

- Change the startup type of services:

```
Set-Service -Name {{service_name}} -StartupType {{Automatic}}
```

- Change the description of a service:

```
Set-Service -Name {{service_name}} -Description
"{{description}}"
```

Set-Volume

Set or change the filesystem label of an existing volume.

Note: This command can only be used through PowerShell.

More information: https://learn.microsoft.com/powershell/module/storage/set-volume.

- Change the filesystem label of a volume identified by drive letter:

```
Set-Volume -DriveLetter "D" -NewFileSystemLabel "DataVolume"
```

- Change the filesystem label of a volume identified by the system label:

```
Set-Volume -FileSystemLabel "OldLabel" -NewFileSystemLabel
"NewLabel"
```

- Modify the properties of a volume using a volume object:

```
Set-Volume -InputObject $(Get-Volume -DriveLetter "E") -
NewFileSystemLabel "Backup"
```

- Specify the Data Deduplication mode for the volume:

```
Set-Volume -DriveLetter "D" -DedupMode Backup
```

set

Display or set environment variables for the current instance of CMD.

More information: https://learn.microsoft.com/windows-server/administration/windows-commands/set.

- List all current environment variables:

```
set
```

- Set an environment variable to a specific value:

```
set {{name}}={{value}}
```

- List environment variables starting with the specified string:

```
set {{name}}
```

- Prompt the user for a value for the specified variable:

```
set /p {{name}}={{prompt_string}}
```

setx

Set persistent environment variables.

More information: https://learn.microsoft.com/windows-server/administration/windows-commands/setx.

- Set an environment variable for the current user:

```
setx {{variable}} {{value}}
```

- Set an environment variable for the current machine:

```
setx {{variable}} {{value}} /M
```

- Set an environment variable for a user on a remote machine:

```
setx /s {{hostname}} /u {{username}} /p {{password}} {{variable}} {{value}}
```

- Set an environment variable from a registry key value:

```
setx {{variable}} /k {{registry\key\path}}
```

sfc

Scan the integrity of Windows system files.

More information: https://learn.microsoft.com/windows-server/administration/windows-commands/sfc.

- Scan all system files and, if possible, repair any problems:

```
sfc /scannow
```

- Scan all system files without attempting to repair any:

```
sfc /verifyonly
```

- Scan a specific file and, if possible, repair any problems:

```
sfc /scanfile={{path\to\file}}
```

- Scan a specific file without attempting to repair it:

```
sfc /verifyfile={{path\to\file}}
```

- When repairing offline, specify the boot directory:

```
sfc /offbootdir={{path\to\directory}}
```

- When repairing offline, specify the Windows directory:

```
sfc /offwindir={{path\to\directory}}
```

- Display help:

```
sfc
```

Show-Markdown

Show a Markdown file or string in the console in a friendly way using VT100 escape sequences or in a browser using HTML.

Note: This command can only be used through PowerShell.

More information: https://learn.microsoft.com/powershell/module/microsoft.powershell.utility/show-markdown.

- Render markdown to console from a file:

```
Show-Markdown -Path {{path\to\file}}
```

- Render markdown to console from string:

```
"{{# Markdown content}}" | Show-Markdown
```

- Open Markdown file in a browser:

```
Show-Markdown -Path {{path\to\file}} -UseBrowser
```

showmount

Display information about NFS filesystems on Windows Server.

More information: https://learn.microsoft.com/windows-server/administration/windows-commands/showmount.

- Display all exported filesystems:

```
showmount -e
```

- Display all NFS clients and their mounted directories:

```
showmount -a
```

- Display all NFS mounted directories:

```
showmount -d
```

- Display all exported filesystems for a remote server:

```
showmount -e {{server_address}}
```

shutdown

A tool for shutting down, restarting, or logging off a machine.

More information: https://learn.microsoft.com/windows-server/administration/windows-commands/shutdown.

- Shut down the current machine:

```
shutdown /s
```

- Shut down the current machine force-closing all apps:

```
shutdown /s /f
```

- Restart the current machine immediately:

```
shutdown /r /t 0
```

- Hibernate the current machine:

```
shutdown /h
```

- Log off the current machine:

```
shutdown /l
```

- Specify a timeout in seconds to wait before shutting down:

```
shutdown /s /t {{8}}
```

- Abort a shutdown sequence whose timeout is yet to expire:

```
shutdown /a
```

- Shut down a remote machine:

```
shutdown /m {{\\hostname}}
```

silverlight-installer

Install or uninstall Microsoft Silverlight.

You may need to replace the command with the actual installer name, such as **`Silverlight.1.0.exe`**.

Note: This command is deprecated.

More information: https://download.microsoft.com/download/c/d/5/cd5aaae3-21f7-47a8-b7d5-39e36baf9ac8/silverlight_deployment_guide.docx.

- Run the Microsoft Silverlight installer in GUI:

  ```
  silverlight-installer
  ```

- Run the installer in [q]uiet mode (do not show GUI):

  ```
  silverlight-installer /q
  ```

- [u]ninstall the program in [q]uiet mode:

  ```
  silverlight-installer /qu
  ```

sl

In PowerShell, this command is an alias of **`Set-Location`**.

- View documentation for the original command:

```
tldr set-location
```

slmgr

This command is an alias of **`slmgr.vbs`**.

- View documentation for the original command:

```
tldr slmgr.vbs
```

slmgr.vbs

Install, activate, and manage Windows licenses.

Use **`cscript`** to run this program as a CLI, or **`wscript`** as a GUI.

Note: This command may override, deactivate, and/or remove your current Windows license, so please proceed cautiously.

More information: https://learn.microsoft.com/windows-server/get-started/activation-slmgr-vbs-options.

- [d]isplay the current Windows [l]icense [i]nformation:

```
cscript slmgr.vbs /dli
```

- [d]isplay the ins[t]allation [i]D for the current device. Useful for offline license activation:

```
cscript slmgr.vbs /dti
```

- Display the current license's e[xp]i[r]ation date and time:

```
cscript slmgr.vbs /xpr
```

- [i]nstall a new Windows license [p]roduct [k]ey. Requires Administrator privileges and will override the existing license:

```
cscript slmgr.vbs /ipk {{product_key}}
```

- [a]c[t]ivate the Windows product license [o]nline. Requires Administrator privileges to do so:

```
cscript slmgr.vbs /ato
```

- [a]c[t]ivate the Windows [p]roduct license offline. Requires Administrator privileges and a Confirmation ID provided by Microsoft Product Activation Center:

```
cscript slmgr.vbs /atp {{confirmation_id}}
```

- [c]lear the current license's [p]roduct [k]e[y] from the Windows Registry. This will not deactivate or uninstall the current license, but prevents the key from being stolen by malicious programs in the future:

```
cscript slmgr.vbs /cpky
```

- [u]ninstall the current license (by its [p]roduct [k]ey):

```
cscript slmgr.vbs /upk
```

sls

This command is an alias of **`Select-String`**.

- View documentation for the original command:

```
tldr select-string
```

Sort-Object

Sort objects by property values.

Note: This command can only be used through PowerShell.

More information: https://learn.microsoft.com/powershell/module/microsoft.powershell.utility/sort-object.

- Sort the current directory by name:

```
Get-ChildItem | Sort-Object
```

- Sort the current directory by name descending:

```
Get-ChildItem | Sort-Object -Descending
```

- Sort items removing duplicates:

```
"a", "b", "a" | Sort-Object -Unique
```

- Sort the current directory by file length:

```
Get-ChildItem | Sort-Object -Property Length
```

- Sort processes with the highest memory usage based on their working set (WS) size:

```
Get-Process | Sort-Object -Property WS
```

Start-Process

Start a command in a new console.

Can also be used to run Windows programs registered in the **`App Paths`** Windows Registry despite not registered in the **`$Env:PATH`** environment variable.

More information: https://learn.microsoft.com/powershell/module/microsoft.powershell.management/start-process.

- Open a specific directory on Windows Explorer (equivalent to `explorer path\to\directory`):

  ```
  Start-Process {{path\to\directory}}
  ```

- Start a specific Windows program file (command-line programs will open on a new console window):

  ```
  Start-Process {{path\to\file}}
  ```

- Start a registered Windows program name and pass its command arguments:

  ```
  Start-Process {{msedge}} {{--inprivate example.com}}
  ```

- Start a Windows program in minimized or maximized window mode:

  ```
  Start-Process -WindowStyle {{Minimized|Maximized}} {{program}}
  ```

- Start a command or Windows program with a specified working directory:

  ```
  Start-Process -WorkingDirectory {{path\to\directory}} {{command_or_program}}
  ```

- Do not finish this command until the target command or program exits:

  ```
  Start-Process -Wait {{command_or_program}}
  ```

Start-Service

Start stopped services.

Note: This command can only be used through PowerShell.

More information: https://learn.microsoft.com/powershell/module/microsoft.powershell.management/start-service.

- Start a service by using its name:

```
Start-Service -Name {{service_name}}
```

- Simulate starting a service, displaying what would happen:

```
Start-Service -DisplayName *{{name}}* -WhatIf
```

- Start a disabled service:

```
Set-Service {{service_name}} -StartupType {{manual}}; Start-Service {{service_name}}
```

start

Start a command in a new console.

Can also be used to run Windows programs registered in the **`App Paths`** Windows Registry despite not registered in the **`%PATH%`** environment variable.

In PowerShell, this command is an alias of **`Start-Process`**. This documentation is based on the Command Prompt (**`cmd`**) version of **`start`**.

More information: https://learn.microsoft.com/windows-server/administration/windows-commands/start.

- View the documentation of the equivalent PowerShell command:

```
tldr start-process
```

- Start a new shell window with a custom title:

```
start "{{window_title}}" {{cmd|powershell|python|...}}
```

- Open a specific directory on Windows Explorer (equivalent to `explorer path\to\directory`):

```
start "" "{{path\to\directory}}"
```

- Start a specific Windows program file (command-line programs will open on a new console window):

```
start {{path\to\file}}
```

- Start a registered Windows program name and pass its command arguments:

```
start {{msedge}} {{--inprivate example.com}}
```

- Start a Windows program in minimized or maximized window mode:

```
start {{/min|/max}} {{path\to\file.exe}}
```

- Start a command or Windows program with a specified working directory:

```
start /d {{path\to\directory}} {{command_or_program}}
```

- Do not finish this command until the target command or program exits:

```
start /wait {{command_or_program}}
```

Stop-Service

Stop running services.

Note: This command can only be used through PowerShell.

More information: https://learn.microsoft.com/powershell/module/microsoft.powershell.management/stop-service.

- Stop a service on the local computer:

```
Stop-Service -Name {{service_name}}
```

- Stop a service by using the display name:

```
Stop-Service -DisplayName "{{name}}"
```

- Stop a service that has dependent services:

```
Stop-Service -Name {{service_name}} -Force -Confirm
```

subst

Associate a path with a virtual drive letter.

More information: https://learn.microsoft.com/windows-server/administration/windows-commands/subst.

- List active associations:

```
subst
```

- Add an association:

```
subst {{Z:}} {{C:\Python2.7}}
```

- Remove an association:

```
subst {{Z:}} /d
```

systeminfo

Display operating system configuration for a local or remote machine.

More information: https://learn.microsoft.com/windows-server/administration/windows-commands/systeminfo.

- Display system configuration for the local machine:

```
systeminfo
```

- Display system configuration in a specified output format:

```
systeminfo /fo {{table|list|csv}}
```

- Display system configuration for a remote machine:

```
systeminfo /s {{remote_name}} /u {{username}} /p {{password}}
```

- Display help:

```
systeminfo /?
```

takeown

Take ownership of a file or directory.

More information: https://learn.microsoft.com/windows-server/administration/windows-commands/takeown.

- Take ownership of the specified file:

```
takeown /f {{path\to\file}}
```

- Take ownership of the specified directory:

```
takeown /d {{path\to\directory}}
```

- Take ownership of the specified directory and all subdirectories:

```
takeown /r /d {{path\to\directory}}
```

- Change ownership to the Administrator group instead of the current user:

```
takeown /a /f {{path\to\file}}
```

taskkill

Terminate a process by its process ID or name.

More information: https://learn.microsoft.com/windows-server/administration/windows-commands/taskkill.

- Terminate a process by its ID:

```
taskkill /pid {{process_id}}
```

- Terminate a process by its name:

```
taskkill /im {{process_name}}
```

- Forcefully terminate a specified process:

```
taskkill /pid {{process_id}} /f
```

- Terminate a process and its child processes:

```
taskkill /im {{process_name}} /t
```

- Terminate a process on a remote machine:

```
taskkill /pid {{process_id}} /s {{remote_name}}
```

- Display help:

```
taskkill /?
```

tasklist

Display a list of currently running processes on a local or remote machine.

More information: https://learn.microsoft.com/windows-server/administration/windows-commands/tasklist.

- Display currently running processes:

```
tasklist
```

- Display running processes in a specified output format:

```
tasklist /fo {{table|list|csv}}
```

- Display running processes using the specified `.exe` or `.dll` file name:

```
tasklist /m {{module_pattern}}
```

- Display processes running on a remote machine:

```
tasklist /s {{remote_name}} /u {{username}} /p {{password}}
```

- Display services using each process:

```
tasklist /svc
```

Tee-Object

Save command output in a file or variable and also send it down the pipeline.

Note: This command can only be used through PowerShell.

More information: https://learn.microsoft.com/powershell/module/microsoft.powershell.utility/tee-object.

- Output processes to a file and to the console:

```
Get-Process | Tee-Object -FilePath {{path\to\file}}
```

- Output processes to a variable and `Select-Object`:

```
Get-Process notepad | Tee-Object -Variable {{proc}} | Select-Object processname,handles
```

Test-Json

Test whether a string is a valid JSON document.

Note: This command can only be used through PowerShell.

More information: https://learn.microsoft.com/powershell/module/microsoft.powershell.utility/test-json.

- Test if a string from `stdin` is in JSON format:

```
'{{string}}' | Test-Json
```

- Test if a string JSON format:

```
Test-Json -Json '{{json_to_test}}'
```

- Test if a string from `stdin` matches a specific schema file:

```
'{{string}}' | Test-Json -SchemaFile
{{path\to\schema_file.json}}
```

Test-NetConnection

Display diagnostic information for a connection.

Note: This command can only be used through PowerShell.

More information: https://learn.microsoft.com/powershell/module/nettcpip/test-netconnection.

- Test a connection and display detailed results:

```
Test-NetConnection -InformationLevel Detailed
```

- Test a connection to a remote host using the specified port number:

```
Test-NetConnection -ComputerName {{ip_or_hostname}} -Port {{port_number}}
```

textmaker

SoftMaker Office's word processor application.

More information: https://help.softmaker.com/textmaker2026/en/index.html.

- Launch the word processor application (omitting the file path will create a new blank document):

```
textmaker {{path\to\file.tmdx}}
```

- Launch TextMaker with [N]o open documents:

```
textmaker -N
```

- Launch TextMaker with an interactive dialog to choose which [F]ile to [O]pen:

```
textmaker -FO
```

- Launch TextMaker with an interactive dialog to choose which template [F]ile to create a [N]ew document:

```
textmaker -FN
```

- Directly [P]rint a document to the default printer:

```
textmaker -P"{{path\to\file.tmdx}}"
```

- Directly print a document to a specific printer:

```
textmaker -Q"{{printer}}","{{path\to\file.tmdx}}"
```

time

Display or set the system time.

More information: https://learn.microsoft.com/windows-server/administration/windows-commands/time.

- Display the current system time and prompt to enter a new time (leave empty to keep unchanged):

```
time
```

- Display the current system time without prompting for a new time:

```
time /t
```

title

Set the title of the command prompt window.

More information: https://learn.microsoft.com/windows-server/administration/windows-commands/title.

- Set the title of the current command prompt window:

```
title {{new_title}}
```

tracert

Receive information about each step in the route between your PC and the target.

More information: https://learn.microsoft.com/windows-server/administration/windows-commands/tracert.

- Trace a route:

```
tracert {{ip_address}}
```

- Prevent `tracert` from resolving IP addresses to hostnames:

```
tracert /d {{ip_address}}
```

- Force `tracert` to use IPv4 only:

```
tracert /4 {{ip_address}}
```

- Force `tracert` to use IPv6 only:

```
tracert /6 {{ip_address}}
```

- Specify the maximum number of hops in the search for the target:

```
tracert /h {{max_hops}} {{ip_address}}
```

- Display help:

```
tracert /?
```

tree

Display a graphical tree of the directory structure for a path.

More information: https://learn.microsoft.com/windows-server/administration/windows-commands/tree.

- Display the tree for the current directory:

```
tree
```

- Display the tree for a specific directory:

```
tree {{path\to\directory}}
```

- Display the tree for a directory including [f]iles:

```
tree {{path\to\directory}} /f
```

- Display the tree using [a]SCII characters instead of extended characters:

```
tree {{path\to\directory}} /a
```

tskill

End a process running in a session on a Remote Desktop Session Host.

More information: https://learn.microsoft.com/windows-server/administration/windows-commands/tskill.

- Terminate a process by its process identifier:

```
tskill {{process_id}}
```

- Terminate a process by its name:

```
tskill {{process_name}}
```

type

Display the contents of a file.

In PowerShell, this command is an alias of **`Get-Content`**. This documentation is based on the Command Prompt (**`cmd`**) version of **`type`**.

More information: https://learn.microsoft.com/windows-server/administration/windows-commands/type.

- View documentation of the equivalent PowerShell command:

```
tldr get-content
```

- Display the contents of a specific file:

```
type {{path\to\file}}
```

tzutil

A tool for displaying or configuring the system time zone.

More information: https://learn.microsoft.com/windows-server/administration/windows-commands/tzutil.

- Get the current time zone:

```
tzutil /g
```

- Display a list of available time zones:

```
tzutil /l
```

- Set the system time zone to the specific value:

```
tzutil /s {{timezone_id}}
```

uwfmgr

Unified Write Filter (UWF).

Protect drives by redirecting any writes to the drive to a virtual overlay. Writes are discarded upon reboot unless committed by default.

More information: https://learn.microsoft.com/windows/iot/iot-enterprise/customize/unified-write-filter.

- Get the current status:

```
uwfmgr get-config
```

- Set a drive as protected:

```
uwfmgr volume protect {{drive_letter}}:
```

- Remove a drive from protection list:

```
uwfmgr volume unprotect {{drive_letter}}:
```

- Enable or disable protection (Applies after reboot):

```
uwfmgr filter {{enable|disable}}
```

- Commit changes of a file on protected drive:

```
uwfmgr file commit {{drive_letter:\path\to\file}}
```

- Commit deletion of a file on protected drive:

```
uwfmgr file commit-delete {{drive_letter:\path\to\file}}
```

vcvarsall

Set up the environment variables required for using the Microsoft Visual Studio tools.

The path of **`vcvarsall`** for a certain Visual Studio installation can be found using **`vswhere`**.

More information: https://learn.microsoft.com/cpp/build/building-on-the-command-line.

- Set up the environment for native x64:

```
vcvarsall x64
```

- Set up the environment for cross-compiled native x86 from the x64 host:

```
vcvarsall x64_x86
```

- Set up the environment for cross-compiled native Arm x64 from the x64 host:

```
vcvarsall x64_arm64
```

- Set up the environment for native UWP x64:

```
vcvarsall x64 uwp
```

ventoy

This command is an alias of **`Ventoy2Disk`**.

- View documentation for the original command:

  ```
  tldr ventoy2disk
  ```

Ventoy2Disk

A tool to create bootable USB drives using ISO files on Windows systems.

More information: https://www.ventoy.net/en/doc_windows_cli.html.

- Install Ventoy to drive D: with default settings (MBR, Secure Boot enabled):

```
Ventoy2Disk VTOYCLI /I /Drive:D:
```

- Install Ventoy with GPT partition style and disable Secure Boot:

```
Ventoy2Disk VTOYCLI /I /Drive:D: /GPT /NOSB
```

- Install Ventoy and reserve 4GB space at the end of the disk:

```
Ventoy2Disk VTOYCLI /I /Drive:D: /R:4096
```

- Install Ventoy using physical drive number 1 with NTFS filesystem:

```
Ventoy2Disk VTOYCLI /I /PhyDrive:1 /FS:NTFS
```

- Install Ventoy without USB type checking (for internal drives):

```
Ventoy2Disk VTOYCLI /I /Drive:D: /NOUSBCheck
```

- Update Ventoy on drive D: while keeping current settings:

```
Ventoy2Disk VTOYCLI /U /Drive:D:
```

- Perform non-destructive installation (preserve existing data):

```
Ventoy2Disk VTOYCLI /I /Drive:D: /NonDest
```

- Install Ventoy with all options: GPT, no Secure Boot, 2GB reserved, NTFS, no USB check:

```
Ventoy2Disk VTOYCLI /I /Drive:D: /GPT /NOSB /R:2048 /
FS:NTFS /NOUSBCheck
```

ver

Display the current Windows or MS-DOS version number.

More information: https://learn.microsoft.com/windows-server/administration/windows-commands/ver.

- Display the current version number:

```
ver
```

virtualboxvm

Manage VirtualBox virtual machines.

More information: https://www.virtualbox.org/.

- Start a virtual machine:

```
virtualboxvm --startvm {{name|uuid}}
```

- Start a virtual machine in fullscreen mode:

```
virtualboxvm --startvm {{name|uuid}} --fullscreen
```

- Mount the specified DVD image file:

```
virtualboxvm --startvm {{name|uuid}} --dvd
{{path\to\image_file}}
```

- Display a command-line window with debug information:

```
virtualboxvm --startvm {{name|uuid}} --debug-command-line
```

- Start a virtual machine in a paused state:

```
virtualboxvm --startvm {{name|uuid}} --start-paused
```

vol

Display information about volumes.

More information: https://learn.microsoft.com/windows-server/administration/windows-commands/vol.

- Display the label and serial number for the current drive:

```
vol
```

- Display the label and serial number for a specific volume:

```
vol {{D:}}
```

vol.py

Forensics framework used to analyze volatile memory (RAM) dumps.

With volatility3, plugins are now based on operating system. Examples below will use Windows.

More information: https://volatility3.readthedocs.io/en/latest/index.html.

- Get information about a memory dump file:

```
python3 vol.py {{[-f|--filename]}}
{{path\to\memory_dump_file}} windows.info
```

- List active processes:

```
python3 vol.py {{[-f|--filename]}}
{{path\to\memory_dump_file}} windows.pslist
```

- List hashes of users on system:

```
python3 vol.py {{[-f|--filename]}}
{{path\to\memory_dump_file}} windows.hashdump
```

- List active network connections:

```
python3 vol.py {{[-f|--filename]}}
{{path\to\memory_dump_file}} windows.netstat
```

- Display help:

```
python3 vol.py {{[-h|--help]}}
```

vswhere

Locate Visual Studio 2017 and newer installations.

More information: https://github.com/microsoft/vswhere.

- Find the path of `vcvarsall.bat` to set environment variables:

```
vswhere -products * -latest -prerelease -find
**\VC\Auxiliary\Build\vcvarsall.bat
```

- Find the directory of the x64 MSVC compiler (`cl.exe`, etc.):

```
vswhere -products * -latest -prerelease -find
**\Hostx64\x64\*
```

- Find the directory of Clang bundled with Visual Studio bundled (clang-cl, clang-tidy, etc.):

```
vswhere -products * -latest -prerelease -find **\Llvm\bin\*
```

- Find the path of `MSBuild.exe`:

```
vswhere -products * -latest -prerelease -find
MSBuild\**\Bin\MSBuild.exe
```

w32tm

Query and control the w32time time synchronization service.

More information: https://learn.microsoft.com/windows-server/networking/windows-time-service/windows-time-service-tools-and-settings.

- Show the current status of time synchronization:

```
w32tm /query /status /verbose
```

- Show a time offset graph against a time server:

```
w32tm /stripchart /computer:{{time_server}}
```

- Show an NTP reply from a time server:

```
w32tm /stripchart /packetinfo /samples:1 /computer:
{{time_server}}
```

- Show the state of the currently used time servers:

```
w32tm /query /peers
```

- Show configuration of the w32time service (run in elevated console):

```
w32tm /query /configuration
```

- Force time resynchronization immediately (run in elevated console):

```
w32tm /resync /force
```

- Write w32time debug logs into a file (run in elevated console):

```
w32tm /debug /enable /file:{{path\to\debug.log}} /size:
{{10000000}} /entries:{{0-300}}
```

Wait-Process

Wait for the processes to be stopped before accepting more input.

Note: This command can only be used through PowerShell.

More information: https://learn.microsoft.com/powershell/module/microsoft.powershell.management/wait-process.

- Stop a process and wait:

```
Stop-Process -Id {{process_id}}; Wait-Process -Id {{process_id}}
```

- Wait for processes for a specified time:

```
Wait-Process -Name {{process_name}} -Timeout {{30}}
```

wget

In PowerShell, this command may be an alias of **`Invoke-WebRequest`** when the original **`wget`** program (https://www.gnu.org/software/wget) is not properly installed.

Note: If version command returns an error, PowerShell may have substituted this command with **`Invoke-WebRequest`**.

More information: https://learn.microsoft.com/powershell/module/microsoft.powershell.utility/invoke-webrequest.

- View documentation for the original `wget` command:

```
tldr wget {{[-p|--platform]}} common
```

- View documentation for PowerShell's `Invoke-WebRequest` command:

```
tldr invoke-webrequest
```

- Check whether `wget` is properly installed by printing its version number. If this command evaluates into an error, PowerShell may have substituted this command with `Invoke-WebRequest`:

```
wget --version
```

Where-Object

Select objects from a collection based on their property values.

Note: This command can only be used through PowerShell.

More information: https://learn.microsoft.com/powershell/module/microsoft.powershell.core/where-object.

- Filter aliases by its name:

```
Get-Alias | Where-Object -{{Property}} {{Name}} -{{eq}} {{name}}
```

- List all services that are currently stopped. The `$_` automatic variable represents each object that is passed to the `Where-Object` cmdlet:

```
Get-Service | Where-Object {$_.Status -eq "Stopped"}
```

- Use multiple conditions:

```
Get-Module -ListAvailable | Where-Object { $_.Name -NotLike "Microsoft*" -And $_.Name -NotLike "PS*" }
```

where

Display the location of files that match the search pattern.

Defaults to current work directory and paths in the **`%PATH%`** environment variable.

In PowerShell, this command is an alias of **`Where-Object`**. This documentation is based on the Command Prompt (**`cmd`**) version of **`where`**.

More information: https://learn.microsoft.com/windows-server/administration/windows-commands/where.

- View the documentation of the equivalent PowerShell command:

```
tldr where-object
```

- Display the location of file pattern:

```
where {{file_pattern}}
```

- Display the location of file pattern including file size and date:

```
where /T {{file_pattern}}
```

- Recursively search for file pattern at specified path:

```
where /R {{path\to\directory}} {{file_pattern}}
```

- Silently return the error code for the location of the file pattern:

```
where /Q {{file_pattern}}
```

whoami

Display details about the current user.

More information: https://learn.microsoft.com/windows-server/administration/windows-commands/whoami.

- Display the username of the current user:

```
whoami
```

- Display the groups that the current user is a member of:

```
whoami /groups
```

- Display the privileges of the current user:

```
whoami /priv
```

- Display the user principal name (UPN) of the current user:

```
whoami /upn
```

- Display the logon ID of the current user:

```
whoami /logonid
```

- Display all information for the current user:

```
whoami /all
```

winget

Windows Package Manager.

More information: https://learn.microsoft.com/windows/package-manager/winget.

- Install a package (use `--source` when package is available from multiple sources):

```
winget {{[add|install]}} {{package}}
```

- Remove a package (Note: `remove` can also be used instead of `uninstall`):

```
winget {{[rm|uninstall]}} {{package}}
```

- Display information about a package:

```
winget show {{package}}
```

- Search for a package:

```
winget search {{package}}
```

- Upgrade all packages to the latest versions:

```
winget upgrade {{[-r|--all]}}
```

- List all packages installed that can be managed with `winget`:

```
winget {{[ls|list]}} {{[-s|--source]}} winget
```

- Import packages from a file, or export installed packages to a file:

```
winget {{import|export}} {{--import-file|--output}} {{path\to\file}}
```

- Validate manifests before submitting a PR to the winget-pkgs repository:

```
winget validate {{path\to\manifest}}
```

winword

Microsoft Office's word processor application.

More information: https://support.microsoft.com/office/command-line-switches-for-microsoft-office-products-079164cd-4ef5-4178-b235-441737deb3a6#category=word.

- Launch the word processor application (omitting the file path will launch the File page):

```
winword {{path\to\file.docx}}
```

- Launch Word with [n]o open documents:

```
winword /n
```

- [w]rite a new blank document:

```
winword /w
```

- Create a new document [f]rom (based on) an existing file:

```
winword /f {{path\to\file.docx}}
```

- Open one or more files for edi[t]ing:

```
winword /t {{path\to\file1.docx path\to\file2.docx ...}}
```

- Open a file with all AutoExec [m]acros disabled:

```
winword /m {{path\to\file.docm}}
```

- Open a file with all AutoExec [m]acros disabled, then run a specific macro:

```
winword /m{{MacroName}} {{path\to\file.docm}}
```

- Start Microsoft Word in Safe Mode:

```
winword /safe
```

wmic

Interactive shell for detailed information about running processes.

More information: https://learn.microsoft.com/windows-server/administration/windows-commands/wmic.

- Run a command using the fundamental grammar:

```
wmic {{alias}} {{where_clause}} {{verb_clause}}
```

- Show brief details about the currently running processes:

```
wmic process list brief
```

- Show full details about the currently running processes:

```
wmic process list full
```

- Access specific fields such as process name, process ID, and parent process ID:

```
wmic process get {{name,process_id,parent_process_id}}
```

- Display information about a specific process:

```
wmic process where {{name="example.exe"}} list full
```

- Display specific fields for a specific process:

```
wmic process where processid={{process_id}} get
{{name,commandline}}
```

- Kill a process:

```
wmic process {{process_id}} delete
```

wmpconfig

Manage network sharing for Windows Media Player (legacy).

Note: This command requires administrator privileges.

See also: **`wmpnscfg`**.

More information: https://learn.microsoft.com/previous-versions/windows/desktop/wmp/command-line-parameters.

- Turn network sharing on or off:

```
wmpconfig {{HMEOn|HMEOff}}
```

- Stop a specific network device from sharing to this computer using its MAC address:

```
wmpconfig DisableHMEDevice {{mac_address}}
```

- Remove a network device from sharing to this computer:

```
wmpconfig RemoveHMEDevice {{mac_address}}
```

- Restore a network device from sharing to this computer:

```
wmpconfig RestoreHMEDevice {{mac_address}}
```

- Set the parental control level for playing DVD content:

```
wmpconfig SetDVDParentalLevel {{3}}
```

wmplayer

Play and manage media files using Windows Media Player.

Note: This command only applies to Windows Media Player versions released prior to Windows 10.

More information: https://learn.microsoft.com/previous-versions/windows/desktop/wmp/command-line-parameters.

- Launch Windows Media Player:

```
wmplayer
```

- Play an audio, video, or playlist file:

```
wmplayer {{path\to\file}}
```

- Play a DVD or Audio CD:

```
wmplayer /device:{{dvd|audiocd}}
```

- Play a file in fullscreen mode:

```
wmplayer {{path\to\file}} /fullscreen
```

- Specify a user interface skin when playing a file:

```
wmplayer "{{path\to\file}}?wmpskin={{skin_name}}"
```

- Show the Media Library page:

```
wmplayer /Task MediaLibrary
```

- Show the Now Playing page:

```
wmplayer /Task NowPlaying
```

wmpnscfg

Manage network sharing for Windows Media Player (legacy).

Note: It should not be invoked manually.

See also: **`wmpconfig`**.

More information: https://learn.microsoft.com/previous-versions/windows/desktop/wmp/command-line-parameters.

- Start the daemon:

```
wmpnscfg
```

- Close all instances of the daemon:

```
wmpnscfg /close
```

wscript

Run Windows Script Host programs in the graphical user interface (GUI).

See also: **`cscript`**.

More information: https://learn.microsoft.com/windows-server/administration/windows-commands/cscript.

- Set `cscript` (CLI) or `wscript` (GUI) as the default interpreter to run Windows Script Host programs:

```
wscript //h:{{cscript|wscript}}
```

- Run a script:

```
wscript {{path\to\script.vbs}}
```

- Run script in the [i]nteractive or [b]atch mode (enable or suppress alerts, prompts, and scripting errors):

```
wscript //{{i|b}} {{path\to\script.vbs}}
```

- Show or hide the Windows Script Host logo before running (useful to get Host version / suppress outputs):

```
wscript {{//logo|//nologo}} {{path\to\script.vbs}}
```

- Specify a custom execution engine to run the script (useful for using custom script filenames):

```
wscript //e:{{jscript|vbscript|custom_engine}} {{path\to\script.vbs}}
```

- Set a [t]imeout for running a given script (in seconds):

```
wscript //t:{{seconds}} {{path\to\script.vbs}}
```

- Start the [d]ebugger and wait until a scripting error occurs:

```
wscript //d {{path\to\script.vbs}}
```

- Start debugging from the first script line in an IDE (e.g., Visual Studio):

```
wscript //x {{path\to\script.vbs}}
```

wsl-open

Open a file or URL from within Windows Subsystem for Linux in the user's default Windows GUI application.

More information: https://gitlab.com/4U6U57/wsl-open.

- Open the current directory in Windows Explorer:

```
wsl-open .
```

- Open a URL in the user's default web browser in Windows:

```
wsl-open {{https://example.com}}
```

- Open a specific file in the user's default application in Windows:

```
wsl-open {{path\to\file}}
```

- Set `wsl-open` as the shell's web browser (open links with `wsl-open`):

```
wsl-open -w
```

- Display help:

```
wsl-open -h
```

wsl

Manage the Windows Subsystem for Linux.

More information: https://learn.microsoft.com/windows/wsl/reference.

- Start a Linux shell (in the default distribution):

```
wsl {{shell_command}}
```

- Run a Linux command without using a shell:

```
wsl {{[-e|--exec]}} {{command}} {{command_arguments}}
```

- Specify a particular distribution:

```
wsl {{[-d|--distribution]}} {{distribution}}
{{shell_command}}
```

- List available distributions:

```
wsl {{[-l|--list]}}
```

- Export a distribution to a `.tar` file:

```
wsl --export {{distribution}} {{path\to\distro_file.tar}}
```

- Import a distribution from a `.tar` file:

```
wsl --import {{distribution}} {{path\to\install_location}}
{{path\to\distro_file.tar}}
```

- Change the version of wsl used for the specified distribution:

```
wsl --set-version {{distribution}} {{version}}
```

- Shut down Windows Subsystem for Linux:

```
wsl --shutdown
```

xcopy

Copy files and directory trees.

More information: https://learn.microsoft.com/windows-server/administration/windows-commands/xcopy.

- Copy the file(s) to the specified destination:

```
xcopy {{path\to\file_or_directory}}
{{path\to\destination_directory}}
```

- List files that will be copied before copying:

```
xcopy {{path\to\file_or_directory}}
{{path\to\destination_directory}} /p
```

- Copy the directory structure only, excluding files:

```
xcopy {{path\to\file_or_directory}}
{{path\to\destination_directory}} /t
```

- Include empty directories when copying:

```
xcopy {{path\to\file_or_directory}}
{{path\to\destination_directory}} /e
```

- Keep the source ACL in the destination:

```
xcopy {{path\to\file_or_directory}}
{{path\to\destination_directory}} /o
```

- Allow resuming when network connection is lost:

```
xcopy {{path\to\file_or_directory}}
{{path\to\destination_directory}} /z
```

- Disable the prompt when the file exists in the destination:

```
xcopy {{path\to\file_or_directory}}
{{path\to\destination_directory}} /y
```

- Display help:

```
xcopy /?
```
